Fig. 3 Preparation of fecal samples for negative staining using an agarose slide method. 2 ml of agarose is added to a glass microscope slide and allowed to spread to form a uniform film. Once the agarose has set the sample collected from a cesium chloride gradient can be pipetted onto the agarose film and a TEM grid with previously glow discharged carbon-formvar film placed on top of the sample droplet. The cesium chloride will diffuse into the agarose leaving virus particles attached to the grid.

Specialist EM sample processing strategies have emerged to minimize or avoid these limitations. The capacity of EM can be enhanced by correlative light and electron microscopy (CLEM) workflows, where light microscopy (LM) events are co-localized with underlying ultrastructure. In its simplest form, LM generates a “Google Earth”-like map to identify areas of interest, which are then studied at the ultrastructural level by EM, so overcoming both the physical size limitations imposed on samples by EM and the diffraction limits of resolution imposed by LM. Pioneering groups now employ correlation in workflows which allow single particle analysis cryoEM techniques to be applied directly to structures in cells and tissues. Electron tomography is required to first determine the 3D structures of irregular samples such as cells and organelles. Once good tomograms are available, it is possible to extract multiple copies of a structure of interest and then apply single particle methods to obtain averages with greatly improved signal to noise ratios.

By minimizing the use of chemical fixatives, immuno-electron microscopy (IEM) is also possible. IEM is based on the serological principles of the ELISA and can be used for specific virus identification during routine TEM diagnosis. IEM has the advantage that it works directly with raw serum, so no purification of immunoglobulins or conjugation steps are necessary and only small reaction volumes are required. If cell or tissue samples are prepared following the protocol as described by Tokuyasu in 1973, sections of tissue can be labeled with gold conjugated antibodies and ultrastructural details of virus replication processes revealed.

A TEM DEM laboratory can maintain, refrigerated, active stable collections of antisera specific to a broad spectrum of virus species and isolates. Depending on the composition of antigens, as well as the epitopes present in the original virus purification, polyclonal antisera can be suitable for capturing multiple viruses within a genus. This versatility can be valuable in DEM, where serological relationships are revealed in the EM through strength of antibody attachment in the labeling step. A “strong” homologous reaction will be seen as a virion tightly packed with antibodies. For emerging isolates or a “less specific” heterogenous virus only weak antibody labeling will be seen. It is also possible to use monoclonal antibodies which targeting single epitopes to provide high specificity and reproducibility for distinguishing different virus isolates.

Immuno-electron microscopy may be performed on fecal extract by; centrifugation of 1 ml fecal extract at 20,000 rpm for one hour. Remove the supernatant and resuspend the deposit in 0.2 ml PBS. Add 0.1 ml serum at the required dilution (dilute in PBS). Cover the tube with parafilm and leave at room temperature for one hour and at 4°C overnight. Add cold PBS to fill the tube. Centrifuge at 18,000 rpm for one hour. Drain the tube well, resuspend the deposit in a few drops of distilled water and stain as in the ultracentrifugation method described above (method 1).

Cryo Electron Microscopy

Recently, cryo-fixation has been adopted as a physical fixation strategy. The morphology and dimensions of the living material are retained, and soluble cellular components are not displaced, which means that processing artefacts commonly encountered in more conventional room-temperature EM techniques are either reduced or removed. Cryo-EM often allows direct observation of specimens that have not been stained or chemically fixed.

Cryo-fixation has two distinct advantages over chemical fixation. It is rapid (measured in milliseconds), which means that the sample is preserved, hydrated and in a “close-to-life” state at the point of initiating fixation, and ensures simultaneous immobilization of all macromolecular components. Many protein networks are labile and prone to disruption with even a slight osmotic or temperature change; cryo-fixation minimizes these effects. Cryo-techniques also allow the study of biological samples with improved ultrastructural preservation and may facilitate the study of dynamic processes. Rapid freezing prevents artefactual aggregations of proteins because tissue fixation and processing can be performed with no or minimal use of cross-linking fixatives, which means that samples retain higher antigenicity.

This level of preservation relies on vitrification (the transformation of water from a liquid to an amorphous state without inducing the nucleation of ice crystals). The nucleation of ice crystals is temperature- and pressure-dependent. Crystallization depends on the cooling rate, itself dependent on the thermal properties of water, the sample thickness, and the heat extraction flow at the surface of the specimen. Freezing is a time-dependent process. Vitrification sits at the beginning of a workflow where the sample is either subsequently processed to a stable room-temperature state for imaging or maintained in its vitreous state throughout. Due to the poor thermal conductivity of water, cooling of virus samples by simply plunging into liquid nitrogen (LN) would be too slow to allow for vitrification and samples would thus be badly damaged by ice crystals.

Water was vitrified by vapor deposition on a cold surface as early as 1935 and by fast cooling of micro-droplets in 1980, however, these were either not useful or not amenable for direct observation at the TEM. It was Jacques Dubochet’s group which first successfully vitrified thin films of water containing small particles supported by the surface tension of water itself between the bars of

Fig. 4 Cryo electron microscopy for near atomic resolution structural studies. The workflow is presented from left to right. The first step is the blotting of a small volume of pure virus particles ($\sim 4 \mu\text{l}$) on a TEM grid with a suitable support film containing small regular holes. The blotting step produces a thin film of virus particles with many supported by surface tension across the holes in the film. The sample is then rapidly frozen by plunging into a cryogenic liquid to create a vitrified film of virus in water. The vitrified film will contain many individual particles which are imaged in the transmission electron microscope. These particles are randomly arranged and can be categorized as “ideal” (green boxed) when single isolated particles are held in the vitrified solution or “non-ideal” (red boxed) when particles are in contact with the air-water interface which can cause denaturing of structure. In “thick” areas of the film, resolution can be limited by the volume or overlapping of particles. The resulting TEM images are relatively low contrast as no heavy metal stains are added to the sample. Individual particles are subsequently “boxed out” of many individual micrographs and classified on a basis of similarity before finally being processed to generate a high resolution 3D structure.

EM grids. The water films could be vitrified because they were plunged into liquid ethane rather than into liquid nitrogen or helium, which are not good cryogens due to the influence of the Leidenfrost effect (a film of insulating vapor which slows down cooling). The frozen samples could then be observed directly at their frozen hydrated state in the cryo-electron microscope and vitrification could be verified by electron diffraction. The plunging technique developed by this group is the basis of sample preparation used for modern single particle analysis and reconstruction, reaching near atomic resolution (Fig. 4). The success of the method lies not only in choosing the right cryogen but also in the high cooling rates that can be achieved during the freezing of extremely thin aqueous films ($\sim 100 \text{ nm}$), which are in the range of 10^7 C s^{-1} . As Jacques Dubochet wrote: “It is the good fortune of the electron microscopist that, reducing sample size in order to increase the cooling speed, vitrification becomes easy just when the dimensions of the specimen are those suitable for electron microscopy.” This technique as the preparation step for single particle analysis was, together with transformative advances in understanding of EM image formation and image processing, rewarded by the award of the Noble Prize for Chemistry in 2017 for developing cryo-electron microscopy for the high-resolution structure determination of biomolecules in solution to Jacques Dubochet, Richard Henderson and Joachim Frank.

There are a variety of methods for rapid freeze fixation of larger samples e.g., plant or animal tissue or even cell monolayers that are few μm in thickness. The depth of vitrification is often limited (e.g., a few microns) for samples plunged into liquid cryogen. The simplest add cryoprotectants to prevent ice crystal growth and achieve vitrification by plunging the sample into liquid nitrogen. An alternative technology is high-pressure freezing (HPF). First introduced by Moor and Riehle in 1968, HPF exploits the physical benefit of high pressure (210 MPa) to reduce the cooling rate required for the vitrification of water from several $100,000 \text{ K s}^{-1}$ to a few 1000 K s^{-1} , making vitrification of relatively thick samples practicable. HPF machines synchronize pressurization and cooling of the sample (to below the glass transition temperature (T_g)) within 20 ms, in a highly reproducible manner, extending the depth of vitrification to as much as 200 μm . These HPF machines are now incorporating added functionality to achieve a high degree of temporal resolution. For example, light-sensitive cation channels can be expressed in cells and tissues, stimulated in the HPF pressure chamber at different time intervals (ranging from ms to s) and immediately cryo immobilized. Electron micrographs acquired from many time points reveal in minute detail sequences of morphological changes at ms precision. Using this approach, the process of ultrafast endocytosis has been characterized during neurotransmission. Recently, electrical stimulation has also been adapted to the HPF allowing electron microscopy to reveal complex events previously identified by electrophysiology.

Tissue samples prepared this way require further modification to make them compatible with the transmission electron microscope. They must either be converted to a room-temperature stable state (e.g., by freeze substitution into a resin) or be sectioned to make them thin enough for the TEM electron beam to pass through the sample. This sectioning must be carried out whilst remaining below the glass transition temperature (T_g); when this is done, images close to the native structure of biological specimens can be achieved. The significant technical challenges of these techniques preclude them from use for DEM.

Advances in Scanning Electron Microscopy

Cryo-FEGSEM has become well established as a research tool. The stability and emitter life of a FEG source, coupled with the stability and low keV sensitivity of a modern scanning electron microscope, is a powerful tool. Unlike TEM, in which high accelerating voltages are used to transmit the electrons through the specimen, SEM benefits from low accelerating voltages that

limit beam interaction with the specimen. This is key to successful cryo-SEM but creates a challenge around generating sufficient signal for high-resolution imaging. Freeze fracture followed by cryo-FEGSEM can reveal ultrastructural details of viruses and permits high resolution direct visualization of cell membranes and the budding of virus particles (**Fig. 1**). Modern FEGSEM systems (with improved detector sensitivity and signal-to-noise ratios) are now achieving sub-nm resolution at 1 kV, making them highly capable tools for life science research, particularly when combined with high-resolution coating and fracture techniques. When equipped with a STEM detector it is possible to collect images of NS samples using the SEM similar to those generated by the TEM (**Fig. 1**). However, the use of a rasterizing scan to generate the image makes rapid screening of NS samples for DEM challenging. The operator must wait until the scan is complete before seeing the full scanned area. This prevents rapid DEM screening of samples. RKI have developed a field-based bioterrorism SEM protocol for the rapid detection of bacterial spores using portable “table-top” SEM’s. This approach provides a rapid direct test to determine if an unidentified powder is biological (i.e., anthrax spore) or chemical (i.e., talcum powder).

Conclusion

Electron microscopy of viruses is largely determined by the quality of the sample preparation technique used. By optimizing the sample preparation steps, remarkable structural details of viruses, their organization and replication strategies can be revealed. Cell culture can be used to study the mode of replication and when combined with EM and protocols which allow thin sections of cells and tissues to be studied, direct observation of virus replication achieved.

Selection of the most suitable technique is important. The diagnostic role of EM is principally by negative staining. Rapid sample preparation readily and flexibly applied to a wide range of samples facilitates rapid detection and identification of a viral pathogen. Higher resolution cryoEM approaches are better adapted for research applications where sufficient time is available for optimization of all conditions necessary to achieve near atomic resolution structures. The versatility of EM for virus detection maintains its critical role as a tool for diagnosis of viral diseases.

Serological Approaches for Viral Diagnosis

Klaus Hedman, University of Helsinki, Helsinki, Finland and Helsinki University Hospital, Helsinki, Finland

Visa Nurmi, University of Helsinki, Helsinki, Finland

This is an update of R. Vainionpää, M. Waris, P. Leinikki, 2015. Diagnostic Techniques: Serological and Molecular Approaches, In Reference Module in Biomedical Sciences, Elsevier Inc., doi:10.1016/B978-0-12-801238-3.02558-7.

Introduction

Virus serodiagnostics (serology) can be employed for a number of clinical indications, including determination of the etiology and respective time(s) of primary infections or of secondary infections or recurrences, the latter comprising endogenous reactivations and exogenous reinfections. Based on several characteristics of virus-specific B-cell immune response, serology firstly aims at identifying and dating a recent active (i.e., replicative) infection (when infected?), and secondly at determining an individual's lifelong infection history (ever infected?). The former question serves the clinician in diagnosis of diseases associated temporally with the corresponding infection types (primary; other). The latter question can serve two wide (and diverse) purposes: (1) Assessment of an individual's status of immunity versus susceptibility; and (2) Uncovering the possibilities of infection chronicity or reactivation (via latency), or of other longer-term manifestations linked with lifelong history of contagion by some of the many human viruses that exist.

Serology, in a nutshell, suits best for diagnostic assessment of such viruses that tend to infect the human body systemically (widely; deeply) rather than superficially (mucosa; skin). Understandably, for the immune response to ensue, the individual ought to be immunocompetent.

This article briefly describes the principles of serological approaches and their utilities in essential (exemplary) clinical settings. Excluded is virus antigen detection (using antibodies as a tool), despite its ongoing or growing importance in management of e.g., some "heavyweight" pathogens such as HIV or hepatitis B.

Following transmission, the virus begins to multiply, and after an ostensibly silent incubation period, the production of infectious virus begins, and the clinical symptoms appear simultaneously or subsequently, pending virus species, patient and clinical context. I.e., the appearance of virus-specific antibodies follows the primary contagion by a "window" of initial seronegativity lasting days to weeks, and a subsequent phase of antibody maturation lasting months. Having reached the detection level, the first antiviral immunoglobulin (Ig) class is IgM, followed by IgG. Around this time the infectious (or antigenic) virus in blood, termed viraemia, as a rule (pending methods sensitivity) disappears. In the first encounter with a given virus – termed a primary infection, or immune response – the IgG level tends to rise relatively slowly; as opposed to a subsequent encounter with the same virus/antigen – a secondary infection/response – in which the IgG level rises and peaks more rapidly; whereas the corresponding IgM may remain undetectable. Typical course of virus infection and antiviral antibody response are summarized in **Fig. 1**. The antiviral antibodies may be searched in two (or even more) successive serum samples taken at the acute and convalescent phases. In selected cases, other body fluids such as cerebrospinal fluid, saliva or potentially even urine can be analyzed for antiviral antibodies.

Principles of Serological Assays

Serological diagnosis is usually based on either the demonstration of the presence of specific IgM or a significant increase in the levels of specific IgG between two consecutive samples taken 1–4 weeks apart. The antigen for the test can be either viable or inactivated virus or some of its components (proteins; epitopes) prepared by virological or molecular methods. Specific markers or physical separation are used to demonstrate the isotype of the antiviral antibody. In some cases, even IgG subclass specificities are determined although they have limited value in diagnostic work.

In primary infection the antiviral IgM usually peaks at 7–10 days after onset of symptoms, and typically disappears during the subsequent weeks or months. However, it is not exceptional for the circulating IgMs to remain detectable even for years (IgM persistence). By contrast, in secondary infections – endogenous reactivation or exogenous reinfection – an IgM response often remains absent altogether.

After primary infection the antiviral IgG usually becomes detectable a week or two later than the IgM, and often persists through life. This characteristic renders IgG an important hallmark of an individual's lifelong infection history (with regard to a given immunogen/pathogen) – and thereby (pending assay calibration) an indicator of antiviral immunity vs. susceptibility – and (pending taxonomy and crossreactivity versus specificity) of infection latency, linked with the potentials for secondary infections, chronicity or other sequelae.

In the early phase of primary infection, the avidity (functional affinity; average binding force) of antiviral IgG tends to be low, followed by increase during several months along with maturation of the immunoglobulin response. Diagnostic applications of IgG-avidity assays have been developed to help distinguish serological responses due to acute infections from those of chronic or past infections, and for a number of indications addressed below.

Fig. 1 The course of virus infection, including shedding of infectious virus after incubation period and typical antiviral antibody response. Some typical diagnostic approaches have been marked.

Serological assays in general provide information of many types and perspectives, and for a number of clinical contexts/conditions. By dating primary infection they can tell the etiology of an acute illness even when infectious virus or its components no longer are detectable. The assays are used widely for determination of the immune status, in screening of blood products for the risk of infectious-agent transmission, and for the need of prophylactic procedures. They are also widely used for epidemiological studies, determination of vaccine-induced immunity, and other similar public health purposes.

IgG Avidity

IgG avidity, or functional affinity, is the average binding strength of an antibody population towards an antigen. Low-avidity IgG antibodies usually appear within 2–3 weeks after primary infection or immunization. Reflecting B-cell affinity maturation, IgG avidity increases during the following months. Subsequently, including re-infections and re-activations, the avidity remains elevated. On top of IgM and IgG, IgG avidity measurement provides an additional tool for sorting out the different stages of infection (low avidity during primary infection – increasing avidity during convalescence – high avidity as a marker of past infection, including chronic or recurrent infections). Indeed, valuable information is achieved when traditional IgM and IgG assays are combined with those of IgG avidity. During the past 3 decades, IgG avidity measurement has in the literature been adopted into use with numerous viral pathogens. During pregnancy, adverse clinical outcomes with certain pathogens (e.g., cytomegalovirus, parvovirus B19 and rubella virus) are mainly due to primary infection, moreover with the clinical picture and severity depending on the stage of pregnancy of the maternal infection. This highlights the importance of IgG avidity measurement in timing (dating) of obstetric infections. In addition to viral diagnostics, IgG avidity is increasingly utilized in other branches of clinical microbiology. More recently, the clinical relevance of antibody avidity is being investigated in many autoimmune diseases as well. In epidemiology, IgG avidity (along with IgM) measurement in a single sample has been proposed to be a cost-effective alternative to consecutive sampling, for assessment of new cases (primary infections).

Most IgG avidity assays employ a chaotropic protein denaturant (e.g., urea) to disrupt the antigen-antibody bond. As high-affinity bonds tend to be more resistant to denaturation than those of low affinity, the result can be expressed by comparison of residual (continuously antigen-bound) antibody levels obtained with and without the denaturant. An approach more recently adopted from basic immunology into clinical use employs a soluble antigen to capture the high-avidity antibodies, while those of low avidity remain to bind selectively to the solid phase antigen (displaying higher epitope density required for low-affinity interaction). In analogy with the chaotrope approach, the avidity result can be expressed by comparing the results obtained with versus without the antigen in solution. Indeed, this approach lacks the chaotrope that can crystallize and hamper assay automation.

Unlike the unequivocal affinity of a monoclonal antibody, the avidity of a polyclonal antibody population represents an approximation of the average of affinities, and tends to be expressed in arbitrary/relative values. The simplest is a ratio of signals obtained from two parallel measurements, often referred to as an avidity index ($AI = (\text{signal with denaturation})/(\text{signal without denaturation}) = \text{relative proportion of denaturant resistant high avidity antibodies}$). As the AI is, to some extent, affected by the concentration of the corresponding IgG, the working dilution of the measurement may be chosen according to the IgG level. Due to its simplicity and acceptable sensitivity and specificity, the AI has gained notable popularity. Another approach employs serial dilutions of sample, whereupon avidity is calculated by the ratio of IgG end-point titers generated from titration curves. This latter approach has a broader dynamic range than the former and permits avidity measurement from samples the IgG concentration of which is too low for the AI approach. The sample titration though, understandably is more laborious and costly.

Clinical specimens other than serum/plasma are useful in some situations. Whole blood e.g., dried on filter paper (Guthrie card) facilitates transport over or storage in challenging conditions (climatic; financial). Cerebrospinal fluid can identify immune response (reflecting infection) within the central nervous system (CNS), even if nucleic acid testing (NAT) is overtaking large parts of CNS diagnostics. Increasing attention in serodiagnostics is being paid to the use of noninvasive sample materials such as saliva – and recently, urine. The former has found use e.g., in epidemiology, while the latter's value in clinical virology calls for in-depth assessment!

General Considerations and Sources of Error

The antigens used in serological assays play a central role in their clinical performance. Some epitopes are more immunogenic than others; and the immunoreactivity towards certain antigens/epitopes even correlates with the stage of infection (or duration/time from immunization). e.g., the antibodies against hepatitis B virus s-antigen indicate past infection or vaccination and are generally undetectable during acute or chronic infection. Low purity of antigen conceivably leads to increased background via nonspecific binding and some of the serological methods are more prone to this than others. Antibody responses elicited against certain viruses can also react against other, usually closely related, viral species through shared or similar epitopes. These cross-reacting antibodies can thus cause false positives unless: only unique epitopes are assayed; or cross-reacting antibodies are blocked and depleted with other viral antigens (e.g., anti-dengue virus antibodies with anti-zika virus cross-reactivity and anti-zika antibodies with anti-dengue cross-reactivity can be blocked with dengue antigen, leaving only zika specific antibodies unaffected). Not only serodiagnostics, but the entire antibody response against a virus can be influenced by cross-reacting antibodies of a previous infection. In the phenomenon called original antigenic sin, immune response against a virus can profoundly affect subsequent responses elicited against other viruses. e.g., infection by human bocavirus 1 produces a classical primary immune response. Subsequent infection by human bocavirus 2 can lead to activation of cross-reacting anti-bocavirus 1 memory B cells instead of primary immune response against bocavirus 2. Original antigenic sin not only hampers serodiagnostics but can also lead to weaker immune protection and more severe disease. Rheumatoid factor is an autoantibody and a diagnostic marker for autoimmune diseases such as rheumatoid arthritis and Sjögren's syndrome. It binds the Fc portion of IgG and is usually of IgM class. Rheumatoid factor can thus cause false positives in indirect IgM assays by binding to antigen-specific IgG, if the sample contains said antiviral IgG. In current IgM assays this is rarely an issue since they either are based on methodology not affected by rheumatoid factor, include removal of the bridging IgG or the sample is assayed for rheumatoid factor. A rare but extremely elusive source of false positives are serum antibodies against assay components that are generally considered immunogenically inert. Human antibodies against both streptavidin and its ligand biotin, a popular tool in molecular biology, have been reported in the literature and shown to cause false positives in several assays utilizing the streptavidin-biotin bond.

Restrictions and Limitations

Serological assays have their restrictions. In some infections, e.g. superficially confined to the skin or mucosal membranes, the antibody response is not strong enough. Immunocompromised patients are often unable to mount a B-cell response. In newborns or infants the presence of (residual) maternal IgG can hamper identification of the baby's own antibodies (hallmarking intrauterine infection). The converse also holds; functional comparison with the mother's antibodies especially combined with follow-up can reveal significant qualitative differences, e.g., in antibody isotype, antigen-recognition or avidity, to indicate the emergence of the infant's endogenous immunoreactivity.

Principles of Widely Used Serological Tests

Immunoassays

Immunoassays by definition take advantage of the highly specific antigen-antibody bond to recognize analytes (which in the context of this review are antibodies) in the sample. The majority of immunoassays used in serodiagnostics of viruses are based on sequential binding reactions that, step by step, build a molecular complex onto a solid surface, often beginning with antibodies in the sample targeting the antigen. Each reaction is separated by a washing step to remove unbound reagents. Provided that antiviral antibodies are present in the sample, the process ends at binding of a label generating a measurable signal that is proportional to the amount of those antiviral antibodies. Although many of the assays are rather time consuming and labor intensive, they also are robust, in general have high sensitivity and specificity, and are available in many optional formats. Commercial kits are available for numerous viruses and the assays can be run either manually or in automated systems, up to fully automated high-throughput pipelines used with many clinically relevant viruses. The different immunoassay approaches can also be adapted into multiplexing (i.e., simultaneous detection of antibodies against different viruses or epitopes).

Solid-phase microwell immunoassays

Indirect immunoassays: The by far most popular format in antibody detection is indirect solid-phase enzyme immunoassay (EIA, Fig. 2(A)) alternatively termed enzyme-linked immunosorbent assay (ELISA). Antigens are first immobilized onto the surface of a

Fig. 2 The most popular immunoassay formats: indirect (A), competitive (B) and capture (C) immunoassay.

microwell and then incubated with the sample. Alternatively, immobilization onto soluble magnetic microspheres can provide increased total surface area leading to higher sensitivity as well as to faster reaction times, as diffusion from the solution phase onto the surface of the microwell is no longer the limiting factor. The specific antibodies bind to the solid-phase antigen and are then detected with anti-immunoglobulin secondary antibodies. Commonly either anti-IgG or anti-IgM are used to assay IgG and IgM antibodies, respectively. With appropriate secondary antibodies, other immunoglobulin classes or subclasses can be assayed. The secondary antibody is coupled with a label that allows its detection. The signal furthermore is amplified, as several secondary antibodies can bind a primary antibody. Depending on the label, the assay nomenclature can vary, although the principle remains the same. In EIAs the label is an enzyme (e.g., horseradish peroxidase or alkaline phosphatase) that can activate multiple substrate molecules thus amplifying the signal (e.g., color reaction measured via absorbance). If fluorescent label is used the method may be called fluoro- (or fluorescence) immunoassay (FIA). A method utilizing chemiluminescence can be called chemiluminescence immunoassay (CLIA). The label can even be a strand of DNA that is amplified and quantified in a subsequent PCR-step. Nonspecific binding of antibodies can cause problems since they are equally recognized by the secondary antibody. This can be largely prevented by blocking the solid-phase with an inert protein or detergent. The indirect immunoassays remain, however, susceptible to cross reacting antibodies if additional measures are not taken to block them.

Competitive immunoassays: In competitive immunoassays (Fig. 2(B)) labeled mono- or polyclonal antibody generates the signal by binding to its antigen. If a sample contains antibodies against the same epitope(s) they compete with the labeled antibody preventing it from binding. This results in a lower signal and the level of this inhibition is proportional to the amount of specific antibodies in the sample. Competitive immunoassays are highly specific since nonspecific or cross-reacting antibodies binding to other epitopes are not detected, unless they are bound close enough to cause steric hindrance. Provided that suitable monoclonal antibodies exist, competitive immunoassays can measure antibodies against single epitopes (e.g., a neutralizing epitope) without the need to separate said epitope from the rest of the antigen (which might not even be feasible). Competitive assays as such cannot distinguish between immunoglobulin classes, but the IgG can be removed or precipitated from the sample to reveal possible underlying IgM reactivity.

Capture immunoassays: Instead of antigens, the solid-phase of capture immunoassays (Fig. 2(C)) consists of anti-IgM or anti-IgG capture-antibodies (or IgG-binding proteins such as protein A or G) that bind and "capture" the total IgM or IgG populations in the sample. Labeled antigen is then added and bound only by antibodies specific to it if present in the captured immunoglobulin population. This makes the method highly specific, although cross-reacting antibodies can still cause false positives. With IgG only a small fraction of the captured total antibody population is specific to a given antigen which can cause problems with sensitivity if signal is not sufficiently amplified. With IgM this is less of an issue since it is primarily produced during acute infections and generally does not persist afterwards. Capture immunoassays are also not affected by rheumatoid factor which makes them especially well suited for IgM diagnostics.

Immunoblotting

Immunoblotting is a classical method for measuring antibody responses against multiple different antigens (i.e., a multiplex assay, actually). The separated antigen molecules are adsorbed as discrete bands on a solid strip and then incubated with the clinical sample. Antibodies present in the sample bind each to their respective antigens and are detected with a labeled secondary antibody visualizing or otherwise identifying the antibody-tagged bands. The latter are then compared to controls on another strip. Immunoblotting is useful (1) for control of antibody specificity, and (2) when the labeling pattern towards several molecules is required for diagnosis; although improved multiplex immunoassays of other types have decreased the popularity. Immunoblotting is still commonly used to ascertain the results of sensitive first-line serodiagnostics for e.g., HIV and hepatitis C virus (HCV).

Immunofluorescence microscopy

Immunofluorescence assay (IFA) follows the same basic principle as the other indirect solid-phase assays. Infected cells immobilized on a microscope slide act as the antigen, and bound antibodies of a sample are detected by a fluorophore-labeled secondary (anti-immunoglobulin) antibody. The method is specific and sensitive, but quite labor intensive, and reading of the

result with a microscope calls for experience. IFA has been a popular approach in the past but has now, to a large extent, been replaced by immunoassays of EIA-type.

Lateral-flow immunoassays

In lateral-flow immunoassays the sample is applied on one end of a porous capillary strip and then diffuses along it, passing through several sections containing different reagents (analogous to distinct reaction steps of other immunoassays). Labeled secondary antibodies can bind those of the sample and move along with them. A band of immobilized antigen captures the specific antiviral antibodies whereby the labeled secondary antibody makes the band detectable. A control band further downstream captures the labeled secondary antibody indicating that excess reagents and nonspecific antibodies have successfully diffused through the system. One strip can hold several antigenic bands, and many of the assays are compatible with whole blood as sample. Performance of the test is often simple and the result is available in a few minutes to hours, making the approach, together with latex agglutination, the most popular form of POC serodiagnostics. While the sensitivity and specificity of these tests can be good, they tend to fall behind those of the more laborious immunoassays such as EIA.

Homogenous wash-free immunoassays

Unlike the other, homogenous assays lack the laborious washing steps, whereby the results are obtained simply by combining the reagents with the sample. The assay can rely on proximity sensing techniques such as Förster resonance energy transfer, two-photon excitation energy transfer or their fluoro-chemical analogs. Briefly, included are two indicator molecules (or complexes) that generate a distinct signal only when in close proximity of each other. When coupled to antigens and/or antibodies, their binding brings the two indicators sufficiently close to generate the signal. In the absence of binding the indicator remains quiescent. Although such techniques have been successfully employed with PCR and microscopic imaging, they still are in their infancy in antibody detection. Commercial kits are available for antigen detection, but presently are more research than diagnostics oriented. Since the homogenous assay format is faster and simpler than the conventional immunoassays, it has great potential in POC diagnostics. Compared with lateral flow and latex agglutination it does require particular instrumentation, but with ongoing development of inexpensive portable technology this is becoming less of an issue.

Neutralizing Antibody Assay

All antiviral antibodies by definition bind viral antigens. Neutralizing antibodies are such that, through this binding and without other components of the immune system, reduce or “neutralize” the infectious capacity of a virus (e.g., blocking the interaction between the virus and its receptor). They can be of IgG, IgM or IgA class and generally persist during lifetime.

In neutralizing antibody assay (Fig. 3(A)), known amounts of infectious virus are mixed with the sample and incubated for a short period after which the residual infectivity is measured by infecting cultured cells and observing the outcome. This infectivity is then compared with the infectivity obtained without the sample and the neutralizing capacity is calculated by comparing the two results. Neutralizing antibody assay is specific and sensitive, but time-consuming and laborious, and therefore not widely used in routine diagnostic services. It measures, however, something the other serological methods do not: the function and efficacy of antiviral immunity, not its mere presence. For this reason neutralizing antibody assays are useful in more in-depth studies of the humoral immune response and especially with vaccines, as successful vaccination (i.e., immunity against the pathogen) generally both requires and can be demonstrated by the presence of neutralizing antibodies.

Neutralizing antibodies can also be measured, to some extent, with conventional immunoassays with regard to neutralizing epitopes, e.g., using neutralizing antibodies in a competitive assay. This requires that, for a given virus: such epitopes have been discovered; a combination of all the relevant ones can be assayed; and they can be assayed independently from the non-neutralizing epitopes.

Fig. 3 Neutralizing antibody (A) and latex agglutination (B) assays.

Latex Agglutination

Latex agglutination (or fixation) assays, **Fig. 3(B)** are based on aggregation of antigen-coated beads (e.g., of latex) mixed with a sample containing antibodies against the antigen. When the bi- or multivalent antigen-binding sites of an antibody (IgG or IgM, respectively) attach to different latex beads, the latter are cross-linked and aggregate. The aggregation (or agglutination) may be observed visually or by increased light-scattering spectrophotometrically. The agglutination tests tend to be rapid (within minutes) and easy to perform. Their popularity as POC assays also is due to independence of complex/expensive equipment. The reaction, however, is sensitive to the prozone effect. Paradoxically, excessive concentrations of specific antibodies can bring about a negative result, when the cross-linking fails due to bead coverage. This in turn can be overcome by assaying at serial dilutions of the sample.

Hemagglutination Inhibition

Many viruses bind to hemagglutinins, molecules at the surface of red blood cells (RBC) of various animal species, and causing in suitable conditions RBC aggregation leading to (hem)agglutination. Inhibition of the phenomenon by antiviral antibodies in patients' sera has historically been used widely for diagnostic purposes. In the test, a virus preparation of predetermined hemagglutinating capacity, and standardized amount of red blood cells as well as the sample are mixed, and after incubation the residual hemagglutination is recorded. Both IgG and IgM antibodies are functional. Presently the hemagglutination inhibition test is used in seroepidemiological studies and as a reference test, most notably with influenza viruses. As the test utilizes complete virions it is well suited for assaying antibodies even on serotype level. The hemagglutination inhibition test is seldom used for diagnostic purposes nowadays.

Complement Fixation

Complement fixation test is a classical diagnostic approach based on the capacity of complement, a group of heat-labile plasma proteins of the innate immune system, to bind antibodies in antigen-antibody complexes. When such complexes are present on the surfaces of red blood cells, the complement brings about their lysis which can be observed visually or measured. The sample's endogenous complement is first deactivated by heating; the sample is then mixed with the viral antigen and a fixed amount of exogenous complement; and RBCs coated with anti-erythrocyte antibodies are finally added as an indicator. If the sample contains antibodies against the antigen, the exogenous complement gets depleted (fixed) by the immunocomplexes leaving the RBCs intact. If the antiviral antibodies are absent, the complement lyses the cells. The assay measures both IgG and IgM. Since the assay is laborious, calls for standardization of several biological variables and less sensitive than many other immunoassays it is rarely used nowadays.

Sequencing Analysis of Antibody Repertoire

Advances in high-throughput DNA and RNA sequencing (HTS) and bioinformatics have made it possible to sequence, reconstruct and analyze the entire repertoire of B cell immunoglobulin genes (Ig-Seq). These data include all the different B cell clones of an individual and thus contain sequences for all the antibodies they produce. Compared with conventional PCR assays, HTS requires more extensive sample preparation, and the raw data typically comprise around 100 base pair fragments (reads) totaling up to 10^{12} base pairs per sample. Extensive data processing is thus required for comprehensible results.

At present the process of sample preparation, sequencing and data analysis is too resource-demanding for most diagnostic purposes. The vast complexity and constant microevolution of the B cell population is also a challenge; and clear-cut, standardized and diagnostic-grade protocols are yet to be established. Ig-Seq has, however, already become an important and popular tool in research, including in-depth study of humoral immune responses elicited by viral infections or vaccinations. With further advancement in sequencing technology and above all in sequence analysis, clinical applications can be expected in the future. The unresolved challenge for HTS-based serodiagnosis is to link the amino acid sequence of an antigen-binding-site to its specific epitope (i.e. to deduce antibody function based on its sequence). Databases of confirmed antibody sequence-epitope pairs and predictive algorithms are being constructed to resolve the issue but are still at their early stages. The potential of such assays is, however, vast since a single test could reveal the entire infection history (all the pathogens against which antibodies are being produced) or susceptibility (absence of protective antibodies) of the patient.

Point-of-Care Serodiagnostics

POC tests are becoming increasingly common in clinical practice. In proper use, they provide cost-efficient diagnostic guidance for quick clinical decision making. Their performance is rarely as good as that of conventional laboratory tests; their use should be quality-controlled, and a back up should be arranged with a virology lab. Most of them are based on easy-to-use lateral-flow or latex particle technology and yield the result in a few minutes. To curtail the diagnostic window, antibody and antigen detection can be combined into the same POC cassette (e.g., HIV Ag/Ab assay). While nucleic acid detection has largely replaced antigen detection and is now increasingly available in POC format, it does not provide equally straightforward synergy with antibody detection. POC tests are nowadays available for antibody screening of an increasing number of virus infections (HIV, HCV, varicella-zoster virus (VZV), cytomegalovirus (CMV), Epstein-Barr virus (EBV)).

Future Perspectives

Driven by public health, scientific and commercial interests, new diagnostic tests for laboratory diagnosis of viral infections are continuously designed. The development of new molecular detection methods continues on two lines. On the one hand, it includes compact, fully integrated automates requiring minimal training to run and suitable for POC use. On the other hand, separate instruments for specimen handling, serological assays, nucleic acid extraction, PCR set-up, and amplification are integrated into high throughput flow systems, which allow efficient use of both commercial and laboratory designed assays.

The use of multianalyte methods is becoming practical reality in antibody, antigen and nucleic acid detection and might significantly improve infectious disease diagnosis in the future. The current multiplex approaches, however, still lack a comprehensive library of compatible virus specific reagents (from which any combination of pathogens could be assayed). In antibody detection, multiplex approaches have so far been used mainly for research purposes. Multiplex PCR in a single tube or miniature format, on the other hand, still is to reach the sensitivity of standard PCRs targeting single or few analytes. Next-generation sequencing has paved the way to identification of new or emerging viruses. Simple microarrays, readable without bioinformatics, would reduce the cost of serological screening and allow the use of control measures to improved quality of results. Beyond classical virus diagnostics, analysis of virus-induced interferon gene response is an emerging scope in diagnostics. Inspired by single-molecule sequencing, state of the art EIAs also can detect individual antibodies or immunocomplexes and could significantly improve sensitivity. On the other hand, homogenous wash-free immunoassays can omit most hands-on steps that require expensive labor or instrumentation; their results can be read directly after adding a droplet of sample into a premade reagent mix. Use of noninvasive sample materials (urine or saliva) instead of whole blood, serum or plasma furthermore can allow for self-sampling, for convenience of the patient and cost-benefit of the society.

A Brief History of the Development of Diagnostic Molecular-Based Assays

Hubert GM Niesters, Department of Medical Microbiology and Infection Prevention, Division of Clinical Virology, University Medical Center Groningen, Groningen, The Netherlands

Isothermal Amplification

Companies have developed isothermal amplification technologies to conquer the market without having to deal with the PCR patent rights. These technologies are not suitable for the development of lab-developed assays. Quantitation is possible and the branched-DNA technology (bDNA) (Urdea *et al.*, 1993) (Fig. 1) and the NASBA or Nucleic Acid Sequence Based Amplification (Vandamme *et al.*, 1995) (Fig. 2) have been commercially introduced for the detection of HIV-1; the bDNA has also been introduced for the detection of HBV and HCV. Isothermal amplification technologies have been successful in the early days of molecular-based assays; however, with the rapid development of PCR-based technologies in a number of research laboratories, these isothermal amplification technologies cannot currently compete with the clinical diagnostic market anymore.

Only one isothermal amplification has been able to penetrate the diagnostic market and has retained its position successfully. This is the TMA or Transcription-Mediated Amplification (Stevens *et al.*, 2009) technology, currently owned by Hologic. This is a variant of the NASBA technology and can amplify RNA as well as DNA by using an RNA polymerase and a reverse transcriptase. This latter enzyme also exhibits DNA polymerase activity for single-stranded DNA or single-stranded RNA.

Finally, the so-called LAMP or loop-mediated isothermal amplification method (Notomi *et al.*, 2015) was developed by Notomi and coworkers. This method can be used for RNA as well as DNA targets and amplifies long loop-like structures containing the target sequences. Although it is very rapid and specific, its use in clinical virology is rather limited.

Non-Isothermal PCR Based Technologies

The first paper describing the PCR reaction (Fig. 3) was written by Saiki *et al.* in 1985 (Saiki *et al.*, 1985). With the introduction of commercially available heat-stable enzymes like the *Taq*-DNA polymerase and the subsequent recombinant made enzymes in 1989, the technology was made available for the scientific community, as well as the basis for the introduction of commercial assays. The first one made available was for the detection of HIV-1 in 1992. Detection of any virus did become possible, and with the implementation of a new enzyme, the recombinant Tth DNA polymerase, even the reverse transcriptase step needed to transcribe viral RNA into the first DNA step needed for the PCR reaction became possible.

The steps needed to implement these technologies into clinical practice were subsequently developed and introduced. The most important steps were to automate isolation of nucleic acids to ensure that larger quantities of patient materials could be processed. The methodology mostly used is based on the so-called Boom technology (Boom *et al.*, 2002) (Fig. 4), which involves extracting nucleic acids using silica particles in a high salt chaotropic solution. Also, automation in PCR cyclers was further developed to ensure the repeated cycling of the PCR reaction. But most importantly, the development of the 5'-nuclease technology in 1991 that opened the road to the introduction of so-called TaqMan probes enabled the detection of the amplification products generated by the PCR method in real-time (Lee *et al.*, 1993; Higuchi *et al.*, 1993).

Fig. 2 Principles of the NASBA method.

Fig. 3 Principle of the PCR method.

Fig. 4 The Boom method to isolate nucleic acids from clinical samples.

Fig. 5 Relation between Ct value and nucleic acid concentration. The higher the concentration, less cycles are needed to reach a plateau value. So low Ct value with high concentration. High Ct values indicate low concentration and more cycles are needed to reach the plateau value.

This real-time PCR method finally led to the introduction of the quantification of viral RNA or DNA in clinical samples. It opened up the ability to follow the effect of antiviral treatment in patients with, for instance, HIV-1, HBV, or HCV. In principle, every target could be quantified more accurately. To ensure standardization, reference materials were developed, and WHO international standards were slowly introduced. External quality control programs were set up, like from National Institute for Biological Standards and Control (NIBSC) (Shyamala *et al.*, 2004), Quality control for molecular diagnostics (QCMD) (Matheeußen *et al.*, 2020), or Institut für Standardisierung und Dokumentation (INSTAND), to ensure that data generated in different laboratories or by the assays developed by different commercial companies could be compared with one another. Also, with more strict accreditation guidelines in several countries like the ISO 15189:2015, more accurate and standardized data are being produced by clinical laboratories all over the world.

The possibility of detecting any viral target in any clinical sample has given us a lot of new options and imposes new challenges. We have the technologies to detect new viruses very quickly, as has been done with SARS-CoV-2. We can also quantify the amount of virus in clinical specimens based on the so-called cycle threshold (Ct) of the PCR (Fig. 5); a low Ct value of 12–20 implies a very high viral load, while a high Ct value, 35 or higher, implies a low viral load. In clinical follow-up based on consecutive samples over time, the first patient samples usually show low Ct values indicating high viral load and the follow-up samples show low and

Table 1 Overview of technologies used in clinical virology. Some examples of assays are mentioned, as well as the companies who have initially developed the technology. Some of them have been bought by other companies

<i>Molecular Based Technologies</i>				
		<i>Used common name</i>	<i>Targets detected</i>	<i>Developed by/Current company (not complete)</i>
Isothermal technologies	Signal Amplification	Branched DNA	HIV-1, HBV, HCV	Chiron/Bayer

subsequently not detectable viral load (high Ct value). The question still waiting to be answered is what the viral load level is that means that an individual is still infectious to others.

The question of clinical relevance is important with respect to the new CE-IVD guidelines, which come into effect in 2022. It is clear that for viruses like HIV, HBV or SARS-CoV-2, a patient should not have an infection with these viruses at all. Bert, I'm not sure I understand what you are saying here? Every positive test value, therefore, has clinical implications. However, for viruses that are latent in our body, like the herpesviruses CMV or EBV, the viral dynamic of the amount of target DNA is more relevant in relation to disease. But a rule of thumb is that low viral loads are better than higher loads. And there are always exceptions, such as HSV type 1, where detection has implications in specific clinical compartments. For example, a patient with HSV DNA in cerebrospinal fluid or in blood will be more severely ill than an individual with a vesicular eruption around the side of the mouth.

There are, however, still open questions that need to be answered. PCR technologies are currently one of the most used amplification technologies and further developments in automation and multiplexing of targets have resulted in systems that can detect around 15–20 targets simultaneously. These so-called syndromic testing solutions are currently used to detect many viral and non-viral targets in respiratory, gastroenteric, or neurological samples simultaneously. Companies have introduced cartridge-based systems to detect multiple targets on a single sample for a short period of time, mostly between 45 and 90 min. Although viral targets are often detected, the clinical interpretation can remain a challenge if more than a single target is detected. A relative quantitation number is not always provided because an internationally accepted standard is not made available yet (Dien Bard and Alby, 2018; Leber *et al.*, 2018; Babady *et al.*, 2018).

Topics related to the use of amplification technologies will be presented in several articles of this volume (Table 1).

Glossary

Base-calling The computational process of translating the raw output (chemiluminescence, fluorescence, change in pH or current flow, etc.) of the sequencing platforms into nucleotides.

Contig (Contiguous sequences) are long DNA segments, reconstructed from the assembly of short sequences, based on the degrees of overlap among them.

De novo sequencing Denotes sequencing a novel genome for which no reference sequence is available for alignment.

Deep sequencing Deep sequencing is a next-generation sequencing approach denoting sequencing a particular genetic region multiple times, often hundreds or thousands of times. This approach allows detection of rare viruses or viral quasiespecies that comprise less than 1% of the sample.

Degenerate primers Degenerate primers are a pool of similar but non-identical oligonucleotide primers, designed from an alignment of closely related sequences that have certain variabilities at the primer binding sites. These primers are useful and amplify similar genetic regions from closely related viral genomes.

High-throughput sequencing This term is associated with the next-generation sequencing approach, which allows sequencing of hundreds of millions of DNA molecules in parallel, resulting in large volumes of data output.

Oligonucleotide primer Oligonucleotides are short DNA or RNA molecules (mostly 10–50 bases) which bind to specific regions of target nucleic acids and act as an initiation point for amplification or sequencing reactions.

Polymerase chain reaction PCR is one of the most widely used molecular techniques for nucleic acid amplification (generating several million copies of the target DNA segment), which uses a thermostable DNA polymerase to mimic DNA replication, *in vitro*.

Reverse transcription A reaction to generate complementary DNA (cDNA) from RNA using reverse transcriptase (RT) enzymes.

Shotgun sequencing This is a rapid technique for sequencing large genomes. This technique involves fragmenting large pieces of nucleic acids into smaller ones, which are then randomly sequenced on NGS platforms. Resulting short sequences are assembled to reconstruct larger contiguous pieces or contigs.

Viral quasiespecies Evolution of viruses results in populations of closely related mutants that are beneficial to virus persistence in hosts or help the virus by immune escape.

Zero-Mode Waveguide (ZMW) It is a photonic nanostructure that allows observation of fluorescent reactions occurring at a single-molecule level.

General Overview

During the last few decades, risk of emerging and re-emerging viral diseases has significantly increased globally. Due to diverse human activities – including rapid and unplanned deforestation for agriculture and urbanization purposes, humans, animals, and plants are increasingly being exposed to wildlife, resulting in transmission and outbreaks of variant as well as new viruses. Moreover, improved facilities for global trade and transportation have hastened the transfer of viruses emerging in one part of the globe to other parts. Recent episodes of emergence/re-emergence and spread of Ebola, Nipah, Zika, Hantavirus, SARS (Severe acute respiratory syndrome), virulent forms of Influenza viruses, MERS (Middle east respiratory syndrome coronavirus), and SARS-CoV-2 viruses attest to this changing epidemiology and predict future outbreaks with still unknown viruses. Additionally, detection and monitoring of viruses is also challenging due to their wide variability and rapid evolution. Apart from these natural consequences, a potential hazard of use of microbes, especially deadly human/animal viruses or highly damaging agricultural viruses, for acts of bioterrorism/agroterrorism, has also increased in recent years. Irrespective of the source, exact identification of the etiological agent is of prime importance to understand transmission routes and to formulate management strategies including quarantine, development of diagnostic tools, and therapeutic/prophylactic possibilities. Since most of the viruses are uncultivable *in vitro*, exact identification is primarily based on molecular virology methods such as PCR (Polymerase chain reaction) and/or nucleic acid sequencing.

Due to their high evolutionary rates and wide diversity, amplification and sequencing of viral genomes is a big challenge to researchers. Before the availability of molecular biology tools, viral identification was mostly based on infection of vulnerable cell cultures, followed by morphological analyses of cytopathic changes in the cells and visualization of virus particles by

electron microscopy. These classic methods were labor-intensive, time-consuming, and mostly unsuccessful as most of the viruses are uncultivable.

During the last four decades, enormous development in science and technology has revolutionized the field of virology by obviating culture-based methods, significantly reducing the turnaround time, and allowing identification of non-cultivable viruses. Among the molecular tools, discoveries of rapid nucleic acid amplification and sequencing technologies have played a crucial role in understanding viral genome and evolution, resulting in development of diagnostics, therapeutics, and prophylactic agents. Sequencing has now become a “gold standard” technique in virology and with the introduction of next-generation technologies, speed of virus genome sequencing has exponentially increased the number of virus taxa and viral genomes in databases by permitting identification and taxonomic classification of numerous novel viruses.

As a result of gradual evolution of sequencing methods and enormous technological refinements, three distinct generations of sequencing technologies are presently available. Each of these technologies has its own features and has distinct applications in virology. This article is intended to introduce the reader to available sequencing technologies and their specific applications in the field of virology so that the readers can decide the sequencing strategy best suited for their research.

First Generation Sequencing Technology

Efforts to sequence nucleic acids started just after description of the double-helical model of DNA by Watson and Crick. Interestingly, it was an RNA molecule that was first sequenced. For the first time, nucleotide sequence of one of the smallest biologically active nucleic acid molecules (alanine transfer RNA, tRNA^{Ala}) was reported by Robert Holley in 1965, for which he was awarded the Nobel Prize in Physiology or Medicine, in 1968. However, it took quite a long time to come across suitable techniques to routinely sequence larger nucleic acids. During the 1970s, two brilliant methods for sequencing DNA strands were discovered and published almost simultaneously: The “dideoxy chain termination” method developed by Frederick Sanger and colleagues and the “chemical modification” based method developed by Allan Maxam and Walter Gilbert. These two techniques established the first-generation sequencing technologies and were revolutionary discoveries in the field of molecular biology, for which Frederick Sanger and Walter Gilbert were honored with the Nobel Prize in Chemistry in 1980.

Initially, Maxam–Gilbert’s chemical modification-based sequencing method became instantly popular due to its simplicity in sample preparation, as compared to the Sanger’s dideoxy chain termination method. However, introduction of fluorescent-tagged dideoxy chain terminators made Sanger’s method more suitable for automation. The discovery of PCR further simplified sample preparation for sequencing by Sanger’s technique, significantly shortening turnaround time. Gradual refinement in instrumentation made this technique ready for high-throughput automated sequencing of comparatively large genomes. Due to its accuracy and robustness, Sanger’s sequencers are still the method of choice for validation of sequences obtained from technologically even more advanced next-generation sequencing (NGS) platforms. On the other hand, due to its limited prospect for automation, use of hazardous chemicals, and difficulties with sequencing long strands, use of Maxam–Gilbert’s technique gradually declined. Nevertheless, during the initial stages of development and testing of different sequencing techniques, viruses, primarily bacteriophages – served as a source for high-quality DNA in sufficient quantities, since they were easy to culture in the laboratory and had relatively smaller genome sizes. Bacteriophage phiX174 and MS2 DNA were the first to be sequenced, while the SV40 genome was the first animal virus genome to be sequenced.

The Sanger sequencing technique, also known as “chain-termination sequencing” or “dye-terminator sequencing”, is principally based on the incorporation of chain-terminating dideoxynucleotides. In its present format, in a PCR-like reaction, template DNA is copied into single strands of DNA complementary to the target template using a DNA polymerase, a specific oligonucleotide primer, normal deoxynucleotides (dNTPs), and a lower molar concentration of four different dideoxynucleotides (ddNTPs, each being tagged with a particular fluorescent dye). While polymerization of nucleotides occurs by chance, whenever a particular ddNTP is incorporated into the growing chain, further polymerization is inhibited due to the absence of the 3′-hydroxyl group in the ddNTPs. Through repeat cycling of this reaction, *n* numbers (*n* being the number of bases in the template DNA) of DNA fragments of variable lengths (each different by a single nucleotide) are generated, having a fluorescently labeled dideoxynucleotide at the 3′ end.

These tagged amplicons are then electrophoretically separated through a capillary filled with an optimized polymer matrix, capable of resolving single-stranded fragments differing by only one base. As a result, a continuous flow of fragments is generated, with shorter fragments moving faster, while the longer ones move slower. At the capillary terminal, fluorescent tags on the fragments sequentially passing through a laser are excited, while a photoreceptor placed opposite registers the wavelength of the light emitted by the excited tags. Since each of the four ddNTPs are tagged with four distinct fluorescent dyes having precise emission spectra, a chromatogram of fluorescent peaks is generated by the continuous flow of tagged fragments through the laser-detector couple. Concurrently, depending upon the wavelength and intensity of a particular fluorescent tag, corresponding base is identified (technically termed “base-calling”) and this continuous “base-calling” represents the nucleotide sequence in the target sequence. Years of refinement in technologies and chemistries associated with this sequencing technique has resulted in highly reliable Sanger sequencing platforms that can analyze accurate sequence information of up to 900–1000 bases. Due to its unmatched reliability, this technology has dominated for almost four decades and is still considered the “gold standard” for DNA sequencing. Readers are encouraged to visit the website with the link provided at the end of this article. These online resources present sequencing technologies in the form of animated videos for better understanding.

Owing to the need for pure, homogenous DNA, prior to the discovery of PCR, application of Sanger sequencing in virology was initially limited to cultivable viruses, including bacteriophages and certain other animal viruses for which cell culture was available. This requirement limited its wide application in virus sequencing, directly from human, animal, and plant samples, as viruses present in these are mostly heterogeneous and are present with large quantities of DNA from the host and other contaminating microorganisms. The discovery of PCR in the late 1980s by Kary Mullis (honored with the Nobel Prize in Chemistry in 1993) and coupling of reverse transcription with PCR (RT-PCR) entirely transformed the state of virus sequencing by facilitating rapid and targeted amplification of minute amounts of viral nucleic acids (DNA/RNA) from complex biological samples, hallmarking the era of culture-independent targeted sequencing of viruses.

Second Generation or Parallel Sequencing Technologies

While the Sanger technology contributed enormously and significantly towards virus detection and discovery projects, evolution and commercial development of parallel sequencing technologies (aka next-generation sequencing, NGS) since 2000 has entirely changed the application and magnitude of sequencing in almost every field of biological research, including virology. In fact, the necessity to expand the scale of sequencing by several orders of magnitude to accomplish large-scale genome projects, like the human genome project, led to the invention of parallel or second-generation sequencing technologies. The glory of parallel sequencing technologies resides in its ability to simultaneously sequence millions of strands of heterogeneous nucleic acids with high sensitivity. Furthermore, unlike Sanger sequencing, parallel sequencing technology has enabled sequencing of samples in a sequence-independent manner, obviating the need for prior knowledge of the nucleic acid sequences. These second-generation sequencing technologies were built on newer sequencing chemistries, several innovations in microfluidics, amplification methodologies, and detection technologies. Since these platforms sequence nucleic acids in a massively parallel fashion, the volume of data generated by these platforms is huge, which prompted rapid advancement in the field of computation and bioinformatics.

Unlike the Sanger method where a single large stretch of DNA is sequenced in each run, NGS platforms require larger DNA molecules to be fragmented into smaller sizes, which are then sequenced in parallel, and millions of short “sequence reads” are generated in each run. These short reads are subsequently assembled into larger contigs through complex computer programs. Due to their extremely large dynamic range of detection and sensitivity, presently available bench-top NGS platforms can sequence complete or near-complete genomes of viruses (known, unknown, or even unexpected) in a single run and within a few hours. NGS has the power to resolve sequences of minor target genomes from a highly complex mixture of non-target nucleic acids, where a computational subtraction method is used to remove non-target sequences (such as that of host sequences) while retaining the target virus sequences. Although, in such circumstances, yield and coverage of target viral sequences are often low, as the predominant non-target nucleic acids fiercely compete with the low abundant target viral nucleic acids for resources during sequencing. As an alternative to this approach, sensitivity, specificity, and turnaround time for NGS-based viral genome sequencing applications can be enhanced dramatically by enrichment of virus particles/genomes or depletion of host/non-target nucleic acids through ultracentrifugation/filtration and nuclease treatment-based methods. Nucleic acids can then be extracted from the resulting enriched viral particles, sequenced directly on NGS platforms or can be amplified through non-specific application techniques such as SISPA (Sequence-independent, single-primer amplification), VIDISCA (Virus Discovery based on cDNA Amplification), RCA (Rolling Circle amplification) and others, followed by running on NGS.

Unlike Sanger sequencing, NGS does not require target-specific primers or any other sample-specific components, thereby allowing a uniform sequencing methodology that is similar for virtually all sample types. These features make NGS systems an indispensable tool in modern viral outbreak investigation. Once the sequence of a potential causative agent is determined, specific diagnostic assays could then be developed easily to monitor and contain further spread of the agent.

Apart from the discovery of new viruses, NGS has numerous applications in virology, which include the study of virus integration sites, evolution, quasispecies, and emergence of antiviral/vaccine-escape mutations.

Virus particle enrichment and nucleic acid amplification protocols coupled with NGS technologies have further enabled the efficient metagenomic study of viromes associated with humans, plants, and the environment. Over the years, NGS has become economically affordable, smaller in size (bench-top), while speed, quality, and quantity of data output have dramatically increased. Available benchtop models offer incredible NGS capabilities at very affordable costs.

NGS technologies were commercially popularized through the 454 FLX pyrosequencer (Roche) and the Illumina Genome Analyzer (Illumina) and later, by the SOLiD platform (Life Technologies). Despite its huge success, Roche has discontinued marketing of its pyrosequencing based NGS platforms, although many of these instruments are still used in several laboratories. Eventually, rapid research and development has resulted in newer NGS platforms like the Ion Torrent PGM (Life Technologies). Although Roche 454 and Illumina are the most extensively represented technologies in virology related literature, in recent years, SOLiD (Sequencing by Oligonucleotide Ligation and Detection) has also gradually emerged as a robust and reliable platform.

Even though each of these platforms exploit different sequencing chemistries and detection technologies, basic procedure is similar in principle and based on the “shotgun” sequencing technique. Initially, nucleic acid samples are fragmented by mechanical (ultrasonic based) or enzymatic (transposon-based) methods to produce nearly uniform length fragments between 100 and 1000 bases, depending on the sequencing platform being used. Mechanical fragmentation is preferred for clinical and environmental samples since it can withstand possible impurities that may inhibit enzymatic fragmentation methods. Enzymatic

methods are suitable for relatively pure samples since fragmentation and adapter ligation can be done in a single reaction, thereby reducing time and handling steps for library preparation. Subsequently, a fragment library is prepared by ligation of adapters (for attachment to the sequencing matrix) and sample-specific barcodes (to identify the sample source after sequencing) to each of the fragments, attachment of each fragment on the sequencing matrix, amplification of the attached fragments and, finally, sequencing takes place. Different NGS platforms use their proprietary adapters and barcodes to fragment libraries for amplification (e.g., emulsion PCR in 454 & SOLiD platforms, and bridge amplification in Illumina platforms). Using distinct barcodes for each sample, samples from different sources can be prepared and sequenced collectively, making the maximum use of high throughput NGS sequencers, thereby cutting-down the per-sample sequencing costs.

Different NGS platforms use distinct sequencing chemistries and detection technologies. The 454 platforms use sequencing-by-synthesis (SBS) chemistry where chemiluminescence, generated during incorporation of a nucleotide, is detected. Illumina platforms also use the SBS technology with reversible fluorescent dye-terminator chemistry where fluorescence signals generated during incorporation of nucleotides are detected. Similarly, Ion-Torrent also uses SBS technology with a novel semiconductor-based detection technology, which registers the drop in pH that occurs during incorporation of each specific nucleotide. Simply based on detection of voltage change, semiconductor-based signal capture technology is much faster, low-cost, and smaller than fluorescence or chemiluminescence detection-based technologies that require complex and sophisticated optics for fluorescence/chemiluminescence image capture and advanced computational tools for image processing and data analyses. On the other hand, the SOLiD platform uses a rather complex sequencing-by-ligation (SBL) technology that uses a mixture of fluorescent-tagged oligonucleotide probes of various lengths and the mismatch sensitivity of DNA ligase to sequence the target DNA. Irrespective of the sequencing chemistry (SBS or SBL) used in these platforms, chemiluminescence/fluorescence image or pH changes occurring on the sequencing chip is collected periodically, integrated, and quality-assessed through computer-intensive complex image/voltage processing algorithms to infer actual nucleotide sequence data from each fragment, which typically results in several gigabases (Gb) of sequence data. Despite being extensively used, different NGS platforms have certain limitations including base calling bias, reproducibility, errors associated with certain sequence motifs, or homopolymers containing regions. Therefore, it is recommended to get samples analyzed on two different NGS platforms simultaneously to reduce errors, albeit depending on the availability of funds. Nevertheless, with consistently improving chemistries, hardware, and software, many of the issues have either been resolved or will be resolved in newer platforms.

For applications in virology, especially virus discovery and metagenomics, NGS platforms that can yield longer sequence reads are preferred since long reads are more suitable for *de novo* assembly of unknown genomes. On the contrary, for analysis of virus evolution and quasispecies, platforms that generate shorter but high-quality reads with increased depth should be preferred. For virus sequence detection, at certain levels of the target template, Illumina has been shown to have analytical sensitivity comparable to that of optimized qPCR but, at low target levels, reads generated by the Illumina platform are insufficient for *de novo* assembly of the genomes. Despite massive refinement in computational procedures for analysis of huge volumes of NGS data, *de novo* assembly and identification of short viral reads is still challenging, particularly for new viruses or highly variable viruses for which reference complete genome sequences are not available in the relevant databases. Therefore, development of a standardized universal bioinformatics pipeline for analysis of NGS data is required before these technologies can be adopted for routine viral diagnostics.

Application of NGS in Virology

NGS has been extensively used by researchers for several interesting applications in virology. One of them is vector enabled metagenomics (VEM), where NGS analysis of nucleic acids of insect vector specimens collected in the field could be done to monitor viruses present in a given environment. Using this method, new plant and zoonotic viruses have been identified in different insects, such as whiteflies and mosquitoes, providing a powerful tool for vector-borne virus discovery and surveillance programs. Similarly, using NGS, clinically important novel viruses were detected in gastrointestinal tissue samples obtained from bats that are believed to be reservoirs for several emerging zoonotic viruses (Paramyxoviruses, SARS-CoV, Lyssaviruses, Filoviruses). The first complete genome sequence of the SARS-CoV2, etiological agent of the ongoing COVID-19 global pandemic was also determined by performing direct NGS of bronchoalveolar lavage fluid RNA extract from a patient suffering from severe pneumonia.

Apart from directly detecting viruses in samples, an alternate strategy of virus discovery through NGS based sequencing of total small RNAs (sRNAs) from invertebrates is gaining importance. RNA silencing-based antiviral defense mechanisms in eukaryotes respond to viral infection by processing the invading viral RNA genomes into sRNAs of distinct lengths (~21–24 nucleotides). NGS-based deep sequencing of these sRNAs rich in processed viral genome, followed by assembly, could reconstruct the sequence of the original viral genome. This strategy has been successfully demonstrated in describing known and unknown viruses from diverse plants and animals, showing the universality of the mechanism. However, this strategy is challenging in cases of multiple infections with novel viruses, where small sequence reads from different viruses may interfere with the *de novo* assembly of each other, resulting in incorrect identification.

Very recently, studies have successfully reconstructed complete or nearly complete ancient viral genomes, such as the hepatitis B virus, from archeological human genome NGS datasets through computational methods of screening for specific viruses. This has opened a new field for analyzing ancient viral sequences and the study of viral evolution over long periods of time. A similar approach of transcriptome subtraction has been used in the discovery of new viruses such as MCPyV associated with Merkel cell carcinoma. Additionally, deep sequencing of amplicons generated by primers that target highly conserved genetic regions within a virus family has led to the discovery of several new polyomavirus and papillomavirus genotypes. Deep sequencing NGS technology

has also been used to determine retrovirus integration sites in natural infections, as well as those resulting from retroviral vector-based gene therapy experiments.

Choosing an NGS technology among the platforms available today is very important for specific applications, especially in virology. Sequencing viruses where a reference sequence is not available involves post-sequencing *de novo* (reference-independent) assembly of sequence reads. For such projects, datasets containing relatively long reads are preferable. On the other hand, when a reference genome is available, short-read technologies could be used to obtain high coverage of the genomes. Earlier, due to relatively long reads, pyrosequencing technology was the preferred NGS technology for metagenomic applications in virology. Following the discontinuation of pyrosequencing platforms in 2016, the consistent improvement in the read length of other NGS platforms has now enabled these alternative NGS technologies for wider applications in virology.

Third Generation Sequencing Technologies

Subsequent to the second generation of sequencers, another class of parallel sequencers have arrived, the third-generation sequencers that are capable of sequencing extremely long stretches of DNA, generating sequence reads in kilobases. These technologies are, therefore, popularly termed “long-read sequencing” parallel technologies to distinguish them from “short-read sequencing” second-generation technologies. In comparison to the second-generation technologies that break long strands of nucleic acids into smaller fragments before amplification and sequencing, third-generation technologies neither need fragmentation nor amplification (thereby reducing time, cost, and amplification bias) and directly read long stretches of nucleic acids at the single-molecule level, providing nucleotide sequence in real-time. Although wide applications of the third-generation technologies are largely restricted due to their relatively high running costs and limited throughput capabilities. Since these technologies are still under active development, these limitations are expected to be addressed in the near future.

Two of the third-generation sequencing technologies are commercially available, namely, the single-molecule real-time (SMRT) technology (Pacific Biosciences) and the Nanopore sequencing technology (Oxford Nanopore Technologies). In SMRT technology, sequencing takes place inside nano-phonic structures having zero-mode waveguide (ZMW) properties, which enables illumination of extremely small observation volumes (as small as zeptoliter), small enough to detect optical reactions occurring at the single DNA molecule level. Each SMRT chip contains many ZMWs and within each of these, one single-stranded DNA template with an active DNA polymerase is immobilized at the bottom of the well. Every time the polymerase incorporates a nucleotide into the growing complementary DNA strand, the dye linked to the incorporated nucleotide is cleaved off, causing it to illuminate the bottom of the wells and decay exponentially, which is detected by the optical sensors at the bottom of each ZMW. Optical signals from each of the ZMWs are detected continuously, resulting in real-time, parallelized single-molecule DNA sequencing. With presently available SMRT technology, extremely long reads ranging from > 190 kb with > 99.999% consensus accuracy can be achieved.

On the other hand, nanopore sequencing uses biological nanopores (nanometer diameter) formed by transmembrane proteins (porins), such as the heptameric transmembrane α -hemolysin (α -HL) from *Staphylococcus aureus*. Like SMRT, this technology also does not need amplification or any other modification to the nucleic acids. Using the principles of electrophoresis, nucleic acid strands are transported through the nanopores under a steady flow of ions. As the density of current flowing across the nanopore surfaces depends on the dimensions of the pores, there is a change in current flow across the nanopore depending on the dimension of the nucleotides occupying the pore. This modulation in current flow is detected by highly sensitive sensors and compared with previously optimized data to interpret the nucleotide sequence from current flow change data, in real-time. Presently, nanopore sequencers as small as USB drives (weighing only ~ 100 g) are commercially available, which offer sufficiently long-read sequence data amounting up to 30 Gb of DNA sequences or 12 million reads of RNA. Being simple, requiring no DNA pre-treatment or amplification, operable at a wide range of conditions, this technology has allowed researchers to sequence samples collected at locations in the field. This technology has been successfully used in a number of field applications such as detection and monitoring of viral pathogens, such as during Ebola outbreaks, genotyping, antibiotic resistance, food safety to humans, and plant genome sequencing.

Sample Preparation Strategies for Sequencing Viruses

Most of the time, virus samples are present with abundant non-target nucleic acids. Therefore, successful sequencing of virus nucleic acids needs specific strategies for sample preparation to achieve desired results.

Nucleic Acid Sequence Dependent Strategies for Known Viruses

Sequencing of viruses, whose partial or complete genome is known, can be easily done by PCR/RT-PCR mediated amplification of the genome using specific primers, followed by sequencing on a Sanger platform. Owing to its high sensitivity, specificity, and capability to amplify non-cultivable viral nucleic acids from a mix of nucleic acids, introduction of PCR and RT-PCR based techniques have almost replaced classical methods, enabling rapid sequencing of viruses. However, unlike the highly conserved prokaryotic rRNA or the eukaryotic ITS genetic regions, there are no ubiquitously conserved genetic regions across all the virus families to design universal viral amplification PCR primers that can broadly amplify all virus families for sequencing-based identification. Therefore, for diagnostic purposes, primers can be designed targeting highly conserved regions in a particular virus

family/genus for broad identification of variant or novel viruses belonging to the same family/genus, while type-specific primers can be designed by including type-specific variation at the 3' end. Amplicons generated can then be directly sequenced on a Sanger platform for confirmation. This strategy can be used for sequencing pure virus preparations (culture supernatant/ultracentrifuge purified samples) as well as field samples (from infected plants, clinics, or environment) where the target virus type is present in a mix of abundant contaminating nucleic acids. Generally, primers are designed to amplify 600–800 bp fragments (which is the limit of Sanger sequencing per run), having an overlap of at least 100–150 bp (for post-sequencing assembly of the fragments) with the neighboring fragment. Alternatively, virus genomes can be PCR-amplified to generate large amplicons (1–2 Kb) that can then be sequenced using nested overlapping primers covering 500–600 bases.

Due to high genetic variability, it is often difficult to design virus family-specific PCR primers or even genus-specific PCR primers, especially for RNA viruses. So, for sequencing a particular virus, primers can be designed based on the type specimen sequence directly. However, for sequencing related viruses (different strains/types belonging to the same group), PCR primers must be designed to target highly conserved regions. For this, if available, complete genome sequences can be obtained from the database (e.g., GenBank RefSeq database) for the target virus and its related viruses, align them using a standard nucleic acid alignment algorithm, and manually inspect the alignment for highly conserved regions that flank a variable region within PCR amplifiable length. The conserved regions allow the design of broadly reacting primers, while the intervening variable regions allow the identification of the specific virus after sequencing. Designing broadly acting virus family/genus consensus primers is technically challenging and may require the introduction of a certain degree of degeneracy in the primers. However, degeneracy should be kept at a minimum, since increasing degeneracy compromises the specificity and sensitivity of the amplification.

Since the Sanger method sequences a single strand of DNA at a time, it is essential to ensure that amplicons processed for direct sequencing are homogenous (i.e., no sequence variation among the amplicons). If related viruses are present, variants and quasispecies are expected in samples, which is very usual in field samples; cloning based library preparation of the PCR/RT-PCR amplicons should be carried out before Sanger sequencing. This can be done by simply using commercially available T-A/U-A based cloning vectors for amplicons generated by conventional Taq DNA polymerases. Alternatively, cloning can be carried out through engineering specific restriction endonuclease (RE) digestion sites at the 5' ends of the amplifying primers while designing, subsequently PCR/RT-PCR generated amplicons that can be digested by the respective RE, ligated into a suitable cloning vector and clonal DNA amplified, and isolated through routine laboratory methods. This ensures that an individual amplicon is present in each clone. Finally, random sequencing of DNA from individual clones is done to resolve the variants and quasispecies. In general, the more clones sequenced, the better the chances are for detecting minor populations of variant viruses in the sample.

Nucleic Acid Sequence Independent Strategies for Sequencing

In contrast, sequence-dependent amplification strategies are not applicable for viruses where absolutely no sequence information is available in the relevant databases. Such unknown viruses can also be sequenced on the Sanger platform by adopting sequence-independent metagenomic sequencing approaches. This does not require any prior knowledge of sequences present in a given sample.

The first step involves physical enrichment of virus particles from the sample and depletion of host genetic material or non-target genetic material through nuclease digestion. Enrichment of virus particles starts with homogenization of the samples and suitable dilution for removal of particulate matter (coarse particles, bacteria, host cells) through centrifugation. Following centrifugation, samples can then be ultra-centrifuged through a suitable medium such as a cesium chloride density gradient to obtain pure virus particles. However, due to the requirement of expensive instrumentation, chemicals, and technical knowledge for ultracentrifugation dependent methods, alternative methods based on simple membrane ultra-filtration – through an appropriate pore size (0.45 μ and 0.22 μ), or PEG (Polyethylene glycol)-based virus particle precipitation are frequently used. Filtered or PEG precipitated intact virus particles are then treated with nucleases to remove non-viral or host-associated nucleic acids. Subsequently, nuclease resistant, capsid-protected viral nucleic acids are extracted and purified for downstream enzymatic reactions for cDNA preparation, conversion of single-stranded DNA/cDNA into double-stranded DNA, amplification of the viral genetic material using sequence-independent priming methods such as SISPA, virus discovery based on cDNA-AFLP (VIDISCA), or RCA to produce sufficient amounts of genetic material for sequence analyses.

The Phi29 DNA polymerase-based RCA does not need prior virus particle separation, since this enzyme is capable of selectively amplifying circular DNA templates in a complex mix or non-target genetic material, thus very useful for enrichment of a number of human, animal, and plant viruses that have circular DNA genomes. These amplified viral genetic materials can then either be directly sequenced on NGS platforms or cloned to generate vector libraries for Sanger sequencing using vector-specific primers. These pre-sequencing enrichment methods reduce huge amounts of background non-target sequence data, thereby increasing the sensitivity of the sequencing methods and sequence coverage of the target nucleic acids. Nevertheless, owing to its parallel sequencing capabilities, application of target enrichment methods followed by NGS in viral metagenomics can immensely improve the chances of discovery of highly divergent or novel viruses compared to PCR-Sanger sequencing techniques. Although alleged to be associated with PCR bias, these methods have been extensively used for the discovery of a number of important viruses, especially in clinical, veterinary, and plant samples. Being based on non-specific amplification methods, extreme care should be exercised to prevent cross-contamination from the laboratory environment while performing sequence-independent amplification experiments.

Virus Databases

Successful completion of any sequencing project leads to the beginning of another involving analyses. Traditionally, after inspection and manual editing of the sequence data from a Sanger sequence, data are submitted to BLAST (Basic local alignment search tool) for a homology search (based on similarity) to determine if the sequence is the same as expected or is a potentially new sequence (no significant match in the database). The latter may warrant further analysis. On the other hand, analyses of large volumes of NGS data need specialized hardware and software solutions for storage and analyses. There are also several data analysis servers that can do the basic analyses as required. Primarily, short-read NGS data requires assembly of the short sequence stretches to create contigs (larger fragments, assembled on the similarity of the overlapping regions in short reads), which are then subjected to homology searches. Nevertheless, irrespective of the source of sequence data, its organization, analysis, and identification require searching for homology in the reference sequence data archived in the international databases. Since sequence databases play an important role in primer designing and sequence analysis, a certain amount of knowledge about databases is essential before embarking on a sequencing project.

Instantly after the discovery of the first-generation sequencer, the volume of sequence data started to increase in molecular biology laboratories and there was a high requirement for data storage and retrieval management systems.

Initially, nucleic acid sequence databases were largely localized to laboratories. In 1979, the Los Alamos Sequence Database was created at the Los Alamos National Laboratory, New Mexico, USA, which was later renamed as GenBank in 1982 and made available to the public. Simultaneously, in 1980, the EMBL Nucleotide Sequence Data Library (now EMBL-Bank, part of European Nucleotide Archive, ENA) was created as a centralized nucleotide repository at EMBL (European Molecular Biology Laboratory), Heidelberg, Germany. On the other hand, another database, the DNA Data Bank of Japan (DDBJ), was created in 1986 at the National Institute of Genetics at Mishima, Japan. Later, with the establishment of the International Nucleotide Sequence Database Collaboration (INSDC), these three primary international sequence databases, GenBank, EMBL-Bank, and the DDBJ – were linked to share data submissions and retrieval tools and to provide unrestricted access to publicly available data to everyone. By the end of 1981, the LANL database contained 263 sequences, including 50 sequences from eukaryotic viruses and 12 bacteriophage sequences, which, after the wide availability of automated Sanger sequencers, increased by doubling every 18 months. Following the commercialization of NGS platforms and the commencement of large-scale genome and metagenome projects, the volume of sequence data generation increased as never before, which required specialized virus databases for storage and retrieval.

The Viral Genomes Resource hosted by the NCBI is one specialized virus reference sequence database, where annotated viral genome sequences cataloged at species level (RefSeq and genome neighbors) are available, which is very helpful in viral sequence identification and taxonomy. Similarly, the ViralZone database, hosted by the Swiss Institute of Bioinformatics, is another useful reference resource for viral sequence analyses. These primary and reference sequence databases have enabled rapid archival, assembly, annotation, taxonomy, discovery, and study of viral evolution, helping enormously at times of crisis. It is estimated that since 2000, there was almost a nine-fold increase in viral sequence data submitted to the primary databases, as well as for novel viruses, as seen by the proportionate increase in the RefSeq database. Considering the clinical significance of certain viruses, seven different modules have been created for influenza virus, Dengue virus, West Nile virus, Ebolavirus, MERS coronavirus, Rotavirus A, and Zika virus at the NCBI Viral Genomes Resource. These specialized modules have additionally improved analyses of new sequences related to these viruses. It is worth mentioning that the first virus genome of the SARS-CoV2 was shared on January 10th, 2020 via the GISAID (Global initiative on sharing all influenza data) platform, which is an international database for sharing information from all influenza viruses. With the COVID-19 pandemic and exponential increase in submission of virus sequences, a separate EpiCov™ database was created to accommodate these sequences. This database is freely accessible and features a number of analysis options including highly customised sequence search, sequence alignment phylogenetic analysis and clade identification, coordinates for diagnostic primers/probes, 3D structures of various virus proteins and drug targets etc., which has helped the scientists enormously in designing improved diagnostic approaches for tracing and tracking the virus, studying evolution and dynamics and also in identifying potential management strategies. Nevertheless, since January 10th, 2020 a total of 2,39,600 SARS-CoV2 complete genome sequences have been submitted by December 4th 2020, nearly all of which were obtained by NGS. This gives an excellent idea of how modern sequencing technologies coupled with highly advanced bioinformatics and a curated database can help in management of a pandemic.

Most of the time, homology-based search approaches (nucleotide BLAST) are useful in determining the identity of the query sequence by searching highly similar sequences deposited in the non-redundant (nr) database (megablast). However, sequences, especially arising from metagenomic studies, have very little or no similarity to sequences belonging to known viruses. In such cases, the search can be performed by low stringency searches – discontinuous megablast (searches more dissimilar sequences) and BLASTn (searches somewhat similar sequences). If the searches still do not return any similar sequences, a blastx search (searches protein databases using a translated nucleotide sequence query) can be done to identify sequences based on protein conserved domains that the query-sequence might encode. Apart from these, a proportion of sequences from metagenomic datasets may not be classified through any of the above-mentioned search strategies. These unclassified sequences are supposed to originate from truly unknown viruses or other “biological dark matter”, and detection of such coding sequences with no homologs, also termed as “ORFans”, may help in the discovery of novel viral species. The unknown protein sequences encoded in these sequences can be used for isolation and purification of the viruses from original samples, followed by sequencing of their complete genomes.

During the last four decades, the field of molecular biology has grown vastly due to a number of discoveries and huge technological leaps. The discovery of nucleic acid sequencing and amplification technologies (primarily PCR) and the subsequent

innovations in the sequencing chemistries and incorporation of various signal detection technologies has now enabled us to completely sequence complex genomes from higher organisms within days. For smaller genomes, especially from most of the pathogenic viruses, entire genome of an unknown virus can be sequenced and analyzed within a few hours. This can keep us a step ahead during viral outbreaks, where early detection, identification, and monitoring of the causative agent makes a great difference. Nowadays, third-generation sequencers that can be easily taken to the field for on-site investigations are available. Nevertheless, in addition to its increasing applications in virus discovery and viral genome sequencing, currently available parallel sequencing technologies are being widely used in monitoring of antiviral drug resistance, viral evolution, and quasispecies diversity. However, the application of sequencing for viruses has certain major challenges, which include low abundance of the target virus nucleic acids in a complex mix of non-target nucleic acids. Therefore, additional steps for enrichment of viral sequences are often needed.

At present, three different generations of sequencing technologies are available; the basic technology, features, and specific applications of which have been discussed. Although, as with any other technology, these sequencing technologies have certain advantages as well as certain limitations. Therefore, the choice of sequencing platform is an important prerequisite for the success of a virus-related project and must be done carefully considering the specific objectives of the project.

Validating Real-Time Polymerase Chain Reaction (PCR) Assays

Melvyn Smith, Viapath Analytics, Specialist Virology Centre, King's College NHS Foundation Trust, London, United Kingdom

© 2021 Published by Elsevier Ltd.

Abbreviations

CLIA United States clinical laboratory improvement amendments. This is a regulatory body or program to ensure quality laboratory testing.

Ct Crossing threshold, the cycle number at which the PCR enters the exponential phase.

FDA United States food and drug administration. The FDA is a Federal agency responsible for protecting the public health through the control and supervision of medical devices, the FDA are one of the agencies responsible for developing and implementing CLIA.

IVD In-vitro diagnostic products. These are the reagents or instruments used to diagnose a disease, in this case the PCR assay.

LDT Laboratory developed test.

LOD Limit of detection, the lowest amount of analyte detected in an assay.

rt PCR Real-time polymerase chain reaction.

RT-PCR Reverse transcription PCR.

ΔRn The maximum difference in fluorescence between the start and end of the PCR.

Introduction

For many years, the development of assays took place in the laboratories where the test was required, the so-called in-house or LDT. Although more and more commercially-developed tests have become available, novel assays continue to be developed in academic hospital laboratories. These laboratories are more able to respond quickly to new and re-emerging infections and crucially have the samples necessary to develop the test. This was the case with the new human coronavirus causing clusters of pneumonia epidemiologically linked to a seafood market in Wuhan, China in December 2019. Researchers from Shanghai, Wuhan, Beijing and Sydney sequenced a sample from a patient who had worked at the market; the sequence was deposited in the publicly available GenBank database on 10th January. Further sequencing showed the virus shared 85% identity with a SARS-like coronavirus found in bats. The first LDT was published on 23rd January 2020, followed a month later by the first of the commercial tests.

Although often more expensive than LDTs, commercial kits enable the rapid introduction of new tests, with the further advantage of being CE marked or FDA approved, providing some form of reassurance to the laboratory. However, CE marking is only a declaration of compliance with European legislative requirements; it does not necessarily guarantee the rigorous validation of the assay, or give any details of how and when a test should be used. Furthermore, commercial assays, by definition, have to be commercially attractive. Therefore, specialist, small-scale tests for rarely occurring infectious pathogens will not be cost-effective. Thus, there will continue to be a need for laboratory-developed assays.

The Need for Validation

In-House Assays

Over the years many laboratories have established methodologies for validating their assays. However, the literature continues to show a lack of detail in some critical areas, e.g., optimization of extraction techniques, methods used in primer and probe design, no evidence of amplicon sequencing to confirm specificity, imprecise estimates of sensitivity and specificity and assays that do not include internal or extraction controls. Such lack of detailed experimental information makes assessing the clinical utility of the assay difficult. Some of these problems lie with the scientific literatures' approach to publishing, where space limitations restrict the amount of detail permitted in a paper. These difficulties have led to a number of papers calling for an improvement in the standards of reporting diagnostic assays, including the STARD initiative (standards for reporting of diagnostic accuracy) and the MIQE guidelines (the minimum information for publication of quantitative real-time PCR experiments; [Bustin et al., 2009](#)). In addition to the fundamental requirements of good scientific practice, there are a number of regulatory bodies that require assays to be validated to certain standards, such as the FDA and CLIA requirements in the USA and the IVD Regulations (EU) 2017/7462017 in Europe. There is also an obligation on health institutions to be accredited according to the ISO 15189 standard. There has been an ongoing debate in Europe regarding CE marking of LDTs, similarly in the USA the FDA announced its intention to shift from a policy of enforcement discretion to exercising regulatory oversight at a future date on LDTs. However, the imposition of rigorous controls on the development of assays must not stifle innovation and the ability of front-line laboratories to respond quickly to new and emerging threats. Under these circumstances it makes sense for laboratories developing and publishing assays to ensure

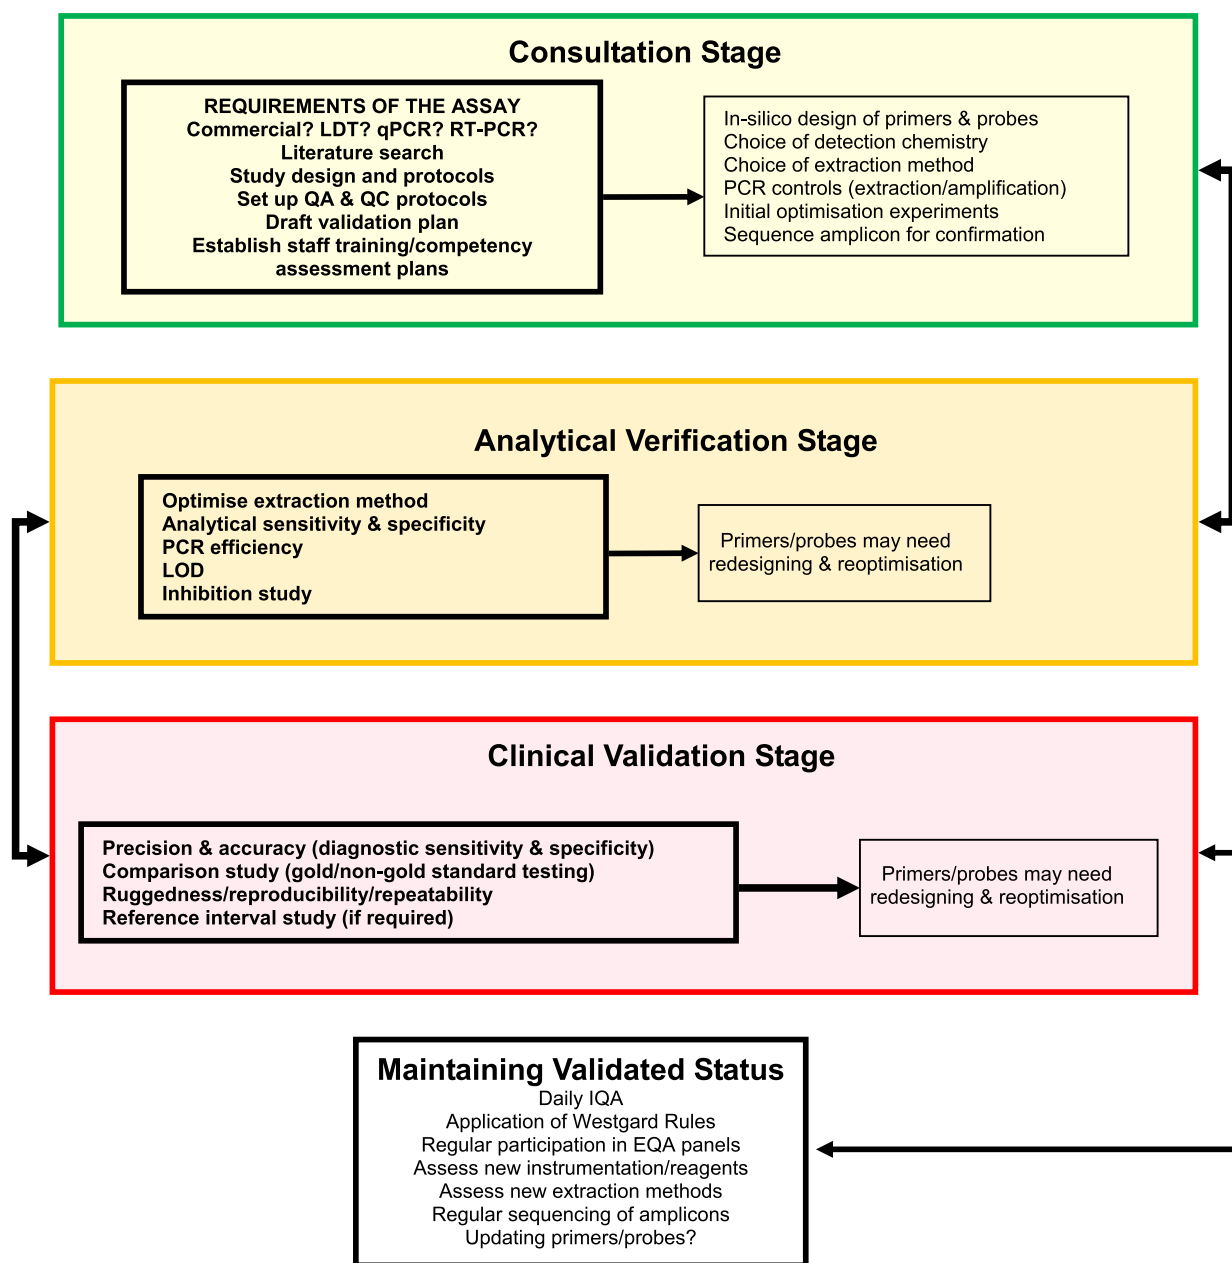

Fig. 1 Assay validation: Key concepts.

that they produce rigorously documented experimental proof to support any potential CE-marking/IVDD requirements that may be necessary in the future.

Commercial Assays

Although commercial assays are typically CE marked or FDA approved this does not necessarily mean the assay has been validated for all applications. Furthermore, although the assay may perform acceptably in the commercial developer's laboratory, a number of factors can affect the assay's performance elsewhere, e.g., staff competences and workflow systems, where not all laboratories may have separate working areas recommended to reduce contamination. There may also be differences in equipment maintenance schedules, including anything from freezers and pipettes to thermal cyclers, which can fundamentally affect the assay. Therefore, it is necessary for laboratories to verify the stated criteria. Although there are no formal requirements in the UK for laboratories to evaluate newly-introduced commercial assays, in the USA, FDA-approved, FDA-modified (i.e., tests modified from the manufacturer's

instructions but with performance characteristics determined by the user laboratory, consistent with CLIA requirements) and LDTs require verification before introducing the test into the clinical laboratory. CLIA stipulates that prior to implementation of an FDA-cleared test laboratories must verify the manufacturer's performance specifications. Where a FDA-modified test or LDT is to be introduced, CLIA stipulates that, additionally, analytical sensitivity and specificity must be established.

In an attempt to clarify the situation, it is the intention in this article to provide a set of basic working guidelines for the validation process. These guidelines can be applied throughout the continuous process of maintaining the validated status of an assay. The key concepts in the process of validating an assay are illustrated in [Fig. 1](#).

The Validation Process: Consultation Stage

The process begins with the development of a validation plan and involves decisions based on the clinical need for the assay, e.g., epidemiological studies, infection control or screening. As discussed previously, there are differences between the levels of validation laboratories perform when introducing commercial or LDTs. As a minimum, the laboratory introducing a commercial test must establish that the manufacturer's performance claims can be reproduced. Once the performance characteristics of an assay have been met, whether commercial or LDT, the validation exercise must continue on a daily basis (see [Fig. 1](#)). This involves continually monitoring the levels of internal and external positive controls to ensure the validation status of the assay is maintained.

Preliminary Considerations

The initial step is to define the purpose of the assay; all the subsequent steps in the validation process are guided by this decision. The following three variables that can affect an assay's performance must be considered at this stage:

- (1) The sample-type and the host/pathogen interactions that determine whether a qualitative or quantitative assay is required.
- (2) The assay system: the biological, technical and operator-related factors that affect the assay's ability to detect the target in the specific sample-type. All assays are considered multiplex, since they must include a co-amplified extraction control.
- (3) The result: will the result accurately predict the status of an individual or population in regard to the analyte detected?

The sample-type (e.g., tissue, whole blood, CSF) may contain inhibitors that affect the activity of the polymerase in the PCR. Therefore, the extraction process needs to be evaluated and necessary alternatives considered. Quantification assays are useful in the management of patients, where pathogen load can be monitored during therapy. Some viral pathogens, such as EBV and CMV can establish a primary low-level latent infection and subsequently become reactivated, switching to a productive lytic infection. Is more than one pathogen to be identified in a multiplex assay? Another significant factor is the availability of sufficient numbers of well-characterized positive control samples to enable the validation. In order to maintain objectivity, the method chosen to resolve discrepant results must be established as part of the validation plan before testing begins.

A quality assurance plan must be established for the assay. Consideration must also be given to the availability of external QA reagents. This can be a problem with new assays targeting rare pathogens, where QA panels are unlikely to be available; the laboratory may need to consider working with the providers to produce suitable reagents. Once the requirement for a test has been established, the next decision is whether to use a commercial assay or develop a LDT. In the USA the CLIA specify that laboratories using FDA-cleared assays must verify that the manufacturer's performance specifications for accuracy, precision, reportable range and reference intervals can be replicated. For modified commercial assays the following should also be tested:

- (1) Analytical Sensitivity (LOD).
- (2) Analytical Specificity to include inhibitory substances.
- (3) Any other performance characteristics required for test performance.

When assessing a commercial assay, the extraction process also needs to be verified. In most cases the manufacturer's protocol includes details on the extraction process to use. However, the assay may need to be validated with a number of different extraction methods, depending on the type of equipment available.

The Validation plan

Verification: the process of establishing whether the individual components of an assay meet the analytical performance requirements established at the start of the development process.

Validation: the process of ensuring that the completed assay conforms to the users' needs, requirements, and/or specifications under defined operating conditions.

There are numerous aspects of an assay that need to be continuously monitored throughout its use in the laboratory. Micro-organisms, particularly viruses, often mutate. This means that the efficiency of the PCR needs to be monitored for potential false-negative results, as this may be the first sign that the primers and/or probe need to be updated and revalidated. Manufacturers continually develop new

Table 1 Theoretical number of samples from subjects of known infection status required for establishing diagnostic specificity and sensitivity estimates using likely estimated specificity/sensitivity value and desired error margin and confidence

Estimated specificity/sensitivity value	2% error in estimated specificity/sensitivity			5% error in estimated specificity/sensitivity		
	Confidence			Confidence		
	90%	95%	99%	90%	95%	99%
90%	610	864	1493	98	138	239
92%	466	707	1221	75	113	195
94%	382	542	935	61	87	150
95%	372	456	788	60	73	126
96%	260	369	637	42	59	102
97%	197	279	483	32	45	77
98%	133	188	325	21	30	52
99%	67	95	164	11	15	26

buffers, enzymes and extraction kits, these must be assessed and if adopted, re-verified, and the assay revalidated. New types of probe chemistry are constantly being introduced and these, too, need testing to maintain or improve the assay's performance.

Although each new assay may present its own particular challenges, the basic criteria for validation, such as specificity, sensitivity and reproducibility apply and any specific differences can be incorporated without difficulty. The first steps concern decisions based on the clinical need for the test, i.e., the scope, purpose and application of the assay and whether a commercial or a LDT will be required. For all in-house developments it is strongly recommended that the comprehensive MIQE guidelines are followed.

Analytical Verification Stage

Reference Materials and Sample Numbers

The first question that arises when developing a LDT, particularly for rare and emerging infectious disease pathogens, is the availability of samples. If sufficient samples are not available, are they obtainable elsewhere? If not, it may be necessary to construct test samples by spiking various concentrations of the analyte into a suitable matrix. Other sources of suitable samples may be other clinical/research laboratories or commercial standards, quality control materials or proficiency panels. Typically, 100 samples of 50–80 positive and 20–50 negative specimens are used. Consideration also needs to be given to potential inhibitory substances likely to be found in the specimens tested. Therefore, paired control specimens should be prepared by adding low concentrations of the analyte, with and without the known inhibitors, to suitable negative samples. However, such artificially constructed samples are unlikely to have the same properties as clinical samples. Therefore, when sufficient numbers of genuine samples become available, the assay and extraction methods will need to be re-assessed. Where samples are available, more than one specimen type may be required, e.g., respiratory pathogens can be extracted from nasopharyngeal aspirates, bronchoalveolar lavages or nose and throat swabs. A literature search should always be carried out to determine the type of specimens to be assessed and the most efficient extraction method for each of the sample type determined.

When sufficient samples numbers are available, the numbers need to be calculated. Ideally this should be determined by statistical analyzes, where the sample size required to detect a significant difference is determined by the standard deviation from the difference of the means of paired samples used in the test under development and the gold standard comparator. Alternatively, they can be estimated from [Table 1](#) below. This method allows for either a 2% or a 5% calculated error in diagnostic sensitivity and specificity. So, for example, if a 2% error is assumed, the number of samples required for an assay with 99% confidence and 99% estimated sensitivity/specificity is 164. However, if the same assay achieved a 95% estimated sensitivity/specificity then the samples required to achieve a high confidence (99%) would be 788.

Template, Primers and Probes: *In-Silico* Design

A thorough literature review is first carried out to identify a suitable locus to be amplified. It may be necessary to consider using degenerate primers and possibly probes to cover sequence variants that occur in different strains of the pathogen. Thorough sequence searches with BLAST (Basic Local Alignment Search Tool; See "Relevant Websites section") are required to ensure as many variants as possible are included in the design. A local database can be constructed and aligned using one (or more) of the sequence alignment program available, such as CLUSTALW (See "Relevant Websites section"). Optimal primer and probe function is critical to successful PCR. There a number of software packages available to assist in primer and probe design, such as Primer Express (Applied Biosystems) and OLIGO (See "Relevant Websites section"). If the assay is a multiplex, the sets of primers and probes must be checked for cross-reactivity, to eliminate any inhibition due to co-amplification issues. Multiplexing is a useful method of syndromic testing and reducing the cost diagnoses by targeting more than one pathogen in a sample. Furthermore, most, if not all assays will be multiplexed, due to the co-amplified EC.

Any matches with other sequences, particularly from other pathogens likely to be encountered in the sample types under investigation will necessitate redesign. It must be stressed that this preliminary specificity check against the databases is not conclusive evidence. The assay itself must be tested against the range of pathogens likely to be encountered in the sample types under investigation.

Choice of the Quantification Standards

There are two main options for quantifying by a real time PCR, either absolute or relative. In most diagnostic assays absolute quantification is chosen. A set of separately amplified, log-diluted previously quantified templates are used to form a standard curve, derived from Ct values plotted against the log concentrations of each standard. The copy number of any sample is estimated from its Ct intercept on the standard curve. The accuracy of the standards can be confirmed by testing against external QA controls. The National Institute for Biological Standards and Control in the UK produce over 300 WHO International standards. Several standards designed for nucleic acid based assay testing are also commercially available, including HIV, hepatitis, CMV, EBV, and B19 parvovirus and are reportable in international units/milliliter (IU/ml).

Reaction Controls

The LDT must include positive controls (PC), negative, no template controls (NTC) and extraction controls (EC). The Ct values of the positive control must be recorded as part of the routine quality assurance. Typically, a single positive control for each specific pathogen, a NTC after every eight samples, and a further NTC as the last sample on the run is used to monitor the assay. Placing a NTC at the start of the set-up could give a false impression of any contamination problems. The PC can be produced from extracted clinical samples or from commercial sources and should be diluted to be reproducibly amplified at the lowest detectable level (typically a Ct of 30). An internal PCR or amplification control (IC) is an absolute requirement for any diagnostic assay. Nucleic acid from a suitable non-target pathogen can be spiked into each extracted specimen prior to the PCR and amplified and detected with a separate set of primers and probe. Preferably, an EC, using a non-related virus or bacterium is used to monitor extraction efficiency. Using this approach, the EC is spiked into the sample before extraction. This has the advantage over using naked nucleic acid as an EC, because it controls for all the steps in the extraction process. Phocine herpesvirus is a useful EC for assays detecting viral DNA pathogens and for RNA viruses, MS2 phage or mengovirus can be used. The use of an RNA template in RT-PCR controls for both the critical reverse transcription step and the PCR. Inhibition can be assessed by comparing the Ct values of the amplified EC in samples with the Ct value of the control extracted in a negative matrix, e.g., water or elution buffer. A difference, typically greater than three Cts (approximately equivalent to one log) indicates inhibition and a potentially false negative result. It is necessary to establish that the primers and probes and the amount of control added to the reaction does not interfere with the amplification of the pathogen target.

Reverse Transcription PCR

Reverse transcription PCR is used to detect RNA viruses, but the use of differential gene-expression assays is becoming more widespread to distinguish between infection and colonization in other infectious micro-organisms. Reverse transcription-PCR can be carried out as a two-step reaction, where the RT step is carried out separately and an aliquot of the reaction transferred to the PCR. More usually, in infectious disease assays, a one-step reaction is employed, where the reverse transcription and PCR occur in the same tube on the thermocycler. The one-step is quicker and more suited to high-throughput diagnostic laboratories, since the potential for contamination is lessened by number of steps that require opening tubes. The choice of priming the RT step needs to be considered; typically, the downstream, anti-sense primer is used. However, random hexamers may be more efficient. Often the choice is down to a sensitivity/efficiency balance between the hexamers ability to bind and hence copy all the RNA species in the sample and the sensitivity provided by the sequence-specific binding of the downstream primer.

Table 2 The Basic Westgard Rules

A	1_2 SD	If one control measure exceeds the mean $\pm 2 \text{ SD}$, the control values from the previous run should be considered to rule out a trend.
B	2_2 SD	This rule detects systematic error. The rule is violated when two consecutive control values exceed the same mean $\pm 2 \text{ SD}$ limit.
C	4_1 SD	This rule detects systematic error. The rule is violated when 4 consecutive control values exceed the same (mean $+1 \text{ SD}$ or mean -1 SD) limit. The run need not be rejected if this rule is violated but should trigger recalibration or equipment maintenance.
D	1_3 SD	This rule detects random error. Violation of this rule may also point to systematic error. The assay run is rejected if one control value exceeds the mean $\pm 3 \text{ SD}$.
E	$R_4 \text{ SD}$	This is a range rule and it detects random error. The rule is violated when the difference in the SD between 2 control values exceeds 4 SD (i.e., -2 SD and $+2 \text{ SD}$).
F	10_x	This rule detects systematic error. The rule is violated when the last 10 consecutive values are on the same side of the mean. Its violation often indicates the deterioration of assay reagents.

Westgard Rules

For each run the Ct values of controls are plotted on Levy-Jennings or Shewhart charts to monitor the performance of the assay; visual presentation of the control data is helpful in spotting variations in the operation of the assay (see [Table 2](#)). Westgard rules can also be applied to determine when a corrective action should be taken and give some indication of the nature of the analytical error. The use of Westgard rules and Shewhart charts must form part of the ongoing monitoring of the assay's validated status.

Experimental Optimization

Optimal primer and probe concentrations must be verified, together with the PCR program itself. A well characterized, stable positive control must be used throughout this verification process to provide an invariant baseline from which the effects of changes to the various components can be measured. The formation of primer dimers and the degree of non-specific amplification can be assessed by analytical agarose gel electrophoresis which also provides evidence of the size of the amplicon. To optimize primer and probe concentrations, ideally two log-dilutions of the positive control are used in a checkerboard layout of varying primer/probe combinations. The optimal concentrations and thermal cycling conditions are those that provide the lowest Ct values, the greatest ΔR_n and a consistent C_t difference of approximately three cycles between the two log-diluted samples. Once the basic parameters of the assay have been established it will be necessary to confirm the amplicon product by sequencing and BLAST analysis. Due to the short amplicon lengths in real-time PCR, the fragment may need to be cloned into a suitable plasmid vector.

Normalization

Expression analyzes with reverse transcription PCRs is not normally used in diagnostic PCR. However, the range of diseases and their associated pathogens being diagnosed by RT-PCR is increasing. In some cases, e.g., with fungal species, there is a need to distinguish between carriage, environmental contamination and infection. Therefore, assays capable of detecting and quantifying differentially expressed genes indicative of the disease condition are needed. This requires carefully selected reference genes to control for variations in extraction, reverse-transcription and amplification efficiencies, so that comparisons across different mRNA concentrations can be made and fold changes in expression levels determined. A detailed literature search for suitable reference gene mRNA targets must be made and the selected candidates experimentally tested for stable expression in both diseased and non-diseased samples.

Analytical Specificity and Sensitivity

Analytical specificity: the LDT's ability to detect the target it was designed for and not cross-react with other analytes in the sample.

Specificity is demonstrated either by spiking samples with a range of different pathogens prior to extraction, or adding the extracted nucleic acid from these pathogens to the extracted sample under investigation. All reactions should be analyzed by agarose gel electrophoresis to ensure that amplification has not occurred in any of the samples expected to be negative. In some cases, primers may amplify non-target templates, which may not be detected by the probe. This will compromise the sensitivity of the assay and must be eliminated, either by re-evaluating the PCR conditions (typically raising the annealing temperature), or preferably by redesigning the primers.

Analytical sensitivity: The LDT's ability to detect very low levels of a given analyte in a biological specimen.

This is synonymous with the assay's LOD, i.e., the lowest concentration of the analyte consistently detected in $\geq 95\%$ of samples tested with acceptable precision. The LOD is usually determined for diagnostic assays by using a set of log-diluted controls, such as patient samples, a suitable cell line, or proficiency panels. It is important to include a NTC in the LOD study to ensure that the PCR does not generate a signal that could interfere with true low-level positive signals from a sample.

There is no hard and fast rule as to how many samples to use, The Clinical and Laboratory Standards Institute suggests a minimum of 60 data-points (12 separate measurements from each of 5 samples) are required from a manufacturer to establish the LOD. This seems a reasonable figure to adopt as a standard approach for both LDTs and commercially produced assays and will provide the necessary intra-assay variation measurements. This measurement should also be carried out on a second thermocycler to establish machine-to-machine variation.

Estimation of the LOD is usually carried out by probit analysis, a type of regression used to analyze binomial response variables, where a sigmoid dose-response curve is transformed into a straight line that can be analyzed by regression either through least squares or maximum likelihood. For PCR assays the lowest concentration of analyte that can be detected with a stated probability can be determined by plotting the data from positive replicate results versus the analyte concentration.

Inhibition Study

The factors that inhibit or prevent the amplification of nucleic acids by PCR can be present in the extracts from a number of sources. Inhibitors typically act by: (1) interference with the cell lysis necessary for extraction of nucleic acids, (2) interference by degrading the

nucleic acid or inhibiting its capture, (3) inhibiting polymerase activity during amplification of the target DNA, resulting in false-negative results or inaccurate quantification. Different sample types present different problems due to the range of endogenous inhibitors found, for example in fecal samples, complex polysaccharides, breakdown products from hemoglobin, and bile acids can all be present and careful thought needs to be given to the method of extraction. Other potential inhibitors include metabolites resulting from pathological conditions such as diabetes mellitus and homeostatic hepatitis, or from medications used in treatment.

Manufacturers continue to develop their PCR reagents specifically to overcome many of the common endogenous inhibitors found in clinical specimens and it is recommended that a number of different commercial amplification kits are evaluated for their performance in this respect. As discussed previously, inhibitors can be detected using an IC. If the IC fails to amplify or exhibits suppression below the acceptable threshold, the amplification of the intended target sequence may also be inhibited. To avoid reducing the sensitivity of the assays, the IC should be used at the lowest concentrations that can be reproducibly amplified to minimize any competition between its amplification and that of the target pathogen.

The IC must demonstrate inhibition by the substances expected to be found in the sample, for which an inhibition study needs to be carried out. The study must first identify what types of inhibitors are likely to be present in the sample types used in the assay. The IC can be tested in negative samples with and without the interfering substance(s) in parallel and the effect on the C_t values monitored. This test must be repeated with the full assay (including the pathogen detection primers and probes) using paired samples, with and without the target analyte to fully validate the assay. Once interference is found, of either or both the IC and target, samples can be serially diluted to test the limit at which the target will amplify. In most cases dilution of inhibited samples provides a straightforward method of enabling amplification. The assay must then be tested against clinical samples; this is because artificially constructed inhibition control samples may not accurately reflect the assays performance in routine use.

PCR Efficiency

The efficiency of the PCR can have a significant impact on the robustness and precision of the assay. The efficiency of the reaction is determined by a number of factors, including primer design, cycling conditions and the reagents used in the reaction mixture. PCR efficiency is particularly important in assays reporting fold changes of mRNA for target genes relative to those of reference genes, where both templates must be amplified with equal efficiencies. PCR amplification efficiency is typically established using calibration curves and it makes sense to use the dilution series (covering 5–6 orders of magnitude) from the LOD analyzes for this purpose. The equation of the linear regression line, together with Pearson's correlation coefficient (r) and the coefficient of determination (r^2) are used to determine amplification efficiency. Amplification efficiency itself is determined from the slope of the log-linear portion of the calibration curve and is given by Eq. (1):

$$E = 10^{(-1/\text{slope})}. \quad (1)$$

Ideally the amount of template will double during each round of exponential amplification, this translates to a reaction efficiency of 2, therefore, using equation 1: $2 = 10^{(-1/\text{slope})}$ which gives a slope for the standard curve of -3.32 . This ideal figure of 3.32 also represents the difference in cycle number for each log dilution in the series. The efficiency can also be expressed as a percentage of the template amplified in each cycle using Eq. (2):

$$\% \text{ Efficiency} = (E - 1) \times 100\% \quad (2)$$

In the ideal example given above; $\% \text{ Efficiency} = (2 - 1) \times 100\% = 100\%$.

The experimental measurement should be carried out in triplicate on at least two thermal cyclers and the information included in the validation documentation. In practice acceptable assays should achieve efficiencies of 90%–100%. Reaction efficiencies lower than this may be caused by suboptimal reaction conditions or poor primer design. Reaction efficiencies of more than 100% could be due to measurement errors e.g., in preparation of the dilution series, or co-amplification of primer-dimers. Improving specificity will improve the sensitivity and increase the dynamic range of the assay, by reducing competition between the specific and non-specific amplification products.

Linear Dynamic Range or Reportable Range

The linear dynamic range can be determined during the LOD analysis by extending the range of the dilution series. The dilution series is often set at the range one would expect the analyte to be found in clinical specimens, although this may not always be known, especially for a novel pathogen and so initial testing can be carried out from 1 up to 10^7 or higher copies/ml of target. If using a generic assay to detect a range of pathogens, e.g., a pan-fungal PCR, each of the species the assay is designed to detect must be tested. Similarly, for multiplex assays, the LOD must be determined individually for each target analyte in the assay and must include the individual targets in the multiplex at high and low concentrations to ensure competitive amplification does not prevent all targets being identified. The reportable range is defined as the lowest and highest results (in suitable units of concentration) reliably detected in the assay. The linearity of the range can be established by calibration curves, where an r^2 value (coefficient of determination) of 1.00 indicates a perfect fit of the data points. Generally, in qPCR assays an r^2 of not less than 0.99 is considered acceptable. The linearity and reportable range should be carried out on at least 5 log-dilutions of the target nucleic

acid extracted from an appropriate sample type (serum, urine, NPA etc.) in triplicate, ideally on two different thermocyclers. Quantitative results from the test can only be reported when they fall within the linear range of the assay. A reportable range is not applicable to qualitative assays, since the result is simply positive or negative (below the LOD). However, a log-diluted panel should be tested, because the information derived is useful in assessing both the efficiency and clinical utility of the test and the results (as C_t values) reported as part of the supporting documentation for the assay.

Clinical Validation Stage

Precision, Accuracy and Trueness

Precision: a measure of the closeness of agreement between independent test results obtained under defined conditions.

Accuracy: the level of agreement between the true value of an analyte and the value obtained by the new test.

Trueness: defines the level of agreement between the average value obtained from a large series, the test and the accepted reference value.

Precision experiments are designed to measure the random error of an assay over a pre-determined period of time by multiple measurements of an aliquot derived from a homogeneous sample. For qualitative assays random error can be established by testing the PC and NC material in triplicate over a period of 10 days on two different thermocyclers. For qPCR assays estimates can be determined from the quantification standards and two positive controls at the lower and upper ends of the assay's reportable range.

Accuracy refers to the closeness in agreement between a single measurement and the true value of the analyte under investigation. Trueness is determined by analyzing the average value obtained from a series of measurements with the new assay and the true value of the analyte (if an international standard is available) or a reference method (if a standard is not available). There are two approaches to evaluating trueness (Burd, 2010):

- (1) A comparison of methods study, where split samples are tested in parallel with an appropriate gold standard method.
- (2) A recovery study, where proficiency samples, or other verified sample types are compared with the assay under development.

Although either of these methods is acceptable, a split sample, comparative study using clinical samples is preferred. However, in some cases, e.g., when developing an assay for a novel pathogen, a suitable gold standard assay may not be available and a recovery study will have to suffice.

The Gold Standard Comparative Study

The comparative study is the cornerstone of the validation exercise. Estimates of sensitivity and specificity are derived from comparisons between the LDT and an established gold standard, which, ideally, is the same type of test and has an assumed sensitivity and specificity of 100%. By definition the gold standard assay is an error-free diagnostic method, which, rarely (if ever) exists. Consequently, an earlier PCR assay, or a culture-based method is often used.

Samples for the comparative study should be representative of the disease and population being investigated and also suitably distributed across both age range and gender. Where only limited samples are available, it may be necessary to use archived positive and negative specimens, or cultured material spiked into negative clinical samples. Other sources may be commercial standards, quality control materials or proficiency panels. Sample numbers can be determined as described previously. However, the sample numbers are more often selected for more pragmatic reasons, such as cost and feasibility and therefore, less than the statistically optimal number will be tested. This is often the case for a new or re-emerging infectious disease.

The difficulty comes in interpreting the results of a study where the comparative test is not a "perfect" gold standard, (i.e., the alloyed standard). This is particularly so if the comparative method is cell culture, which is thought to be 100% specific, but provides less than optimal sensitivity. The strength of the PCR lies in its sensitivity (theoretically a single DNA copy). Thus a newly developed PCR assay may produce many more positive results than the reference method, leading to a misleading, lower estimate of specificity. The researcher is then left with the problem of deciding whether these are true or false positives. A thorough and detailed assessment of the sample derivation, clinical history and sequencing can help to determine the true status of any sample, together with discrepant analysis. In discrepant analysis the discordant results are resolved by a third test, such as another PCR directed to a different gene-target and the results from this resolver test are used to definitively assign the final results. It is important to include a number of randomly selected samples with concordant results for discrepant analysis so as to reduce bias.

Further statistical analysis can be carried out to improve confidence in the results from the new LDT, particularly when the true disease status of the samples is difficult to evaluate. The agreement between the new test and comparator test can be expressed as the

New Test	Gold Standard		
	Positive	Negative	Totals
Positive	TP	FP	TP + FP
Negative	FN	TN	FN + TN
Totals	TP + FN	FP + TN	n

Fig. 2 Fig. 2 2 × 2 Contingency Table.

kappa value. The kappa statistic is a generic term for a number of similar measures of agreement applied to categorical data and is a measure of the proportion of agreement between results beyond chance. It is used in assessing the degree to which two or more raters, (i.e., tests) examining the same data, (i.e., specimens) agree in assigning the data to categories (positive or negative results). A kappa value of 1.00 indicates perfect agreement; a value of 0.00 indicates no agreement above that expected by chance, and a kappa value of -1.00 indicates complete disagreement. Generally, kappa statistics above 0.80 are considered almost perfect. The kappa value is calculated from the results in the standard 2×2 contingency table, used to record the results from the comparative test (see Fig. 2).

$$OP = \frac{TP + TN}{n}$$

$$EP = \left[\frac{TP + FP}{n} \right] \times \left[\frac{TP + FN}{n} \right] + \left[\frac{FN + TN}{n} \right] \times \left[\frac{FP + TN}{n} \right]$$

$$K = \frac{OP - EP}{1 - EP}$$

where:

K = Kappa value.

OP = observed proportion of agreement.

EP = expected proportion of agreement.

TP = true positive.

FP = false positive.

TN = true negative.

FN = false negative.

n = total number of samples.

Diagnostic sensitivity and specificity (DSe and DSp) are also calculated from the results in the contingency table.

$$DSe = \frac{TP}{TP + FN}$$

$$DSp = \frac{TN}{FP + TN}$$

Two further important probabilities can be calculated from the data derived from the trueness study, the positive and negative predictive values (PPV and NPV). The PPV is a measure of a positive result from the test to truly predict the presence of disease/infection, while the NPV is the probability that a negative result accurately indicate a non-diseased/uninfected status.

$$PPV = \frac{TP}{TP + FP}$$

$$NPV = \frac{TN}{FN + TN}$$

The Study Without a Gold Standard

In many cases, particularly for novel pathogens, a comparative method will not be available. Under these circumstances the gold standard may be a diagnosis determined by accepted clinical methods. It may also be necessary to incorporate results from more than one method to provide the comparative results. Whatever the approach chosen, estimating the performance characteristics of a new assay without a true comparative test is a challenging task. Typically, agreement is measured as the overall percentage or fraction of samples that have the same result (i.e., both either positive or negative). The difficulty with these simple agreement measures is that they do not take agreement by chance into account. A number of models have been proposed, based on latent class analysis, log-linear modeling and other techniques. Latent class analysis involves multiple imperfect tests that are used to construct a gold standard. Such models are based on the concept that the observed results of different, imperfect, tests for the same disease are influenced by a common but unobserved (latent) variable i.e., the true disease status.

Inter-Laboratory Testing

The ultimate evidence of an assay's fitness for purpose is its successful integration into other laboratories. The LDT reagents and samples used for the comparative study should be sent to a minimum of three laboratories willing to participate in testing. This will also provide additional data on the assay's reproducibility and robustness.

Maintaining the Validated Status and Re-Validation

The validated assay must be monitored consistently for repeatability through the performance of the run controls to evaluate any potential changes in the assay's precision and accuracy. All reagents should be assigned batch numbers and new batches tested with the controls and a suitable number of positive and negative samples from a previous run to ensure consistent efficiencies between batches. If more than one thermal cycler is used, each machine should be referenced and each test carried out on it identified. The results of the PCR controls and quantification standards must be plotted daily on Shewhart charts and assessed by Westgard rules to ensure that reaction efficiencies are maintained.

Participation in regular IQA and EQA schemes is fundamental to maintaining an assay's validated status. The purpose of EQA testing is not solely to monitor the performance of the assay, but assesses all aspects of the test procedure, including the extraction method and reporting accuracy. If an external panel is not available, alternatives can include blind sample testing, sample exchange with other laboratories, or clinical note reviews.

Technical modifications continually arise as manufacturers develop and improve their reagents for extracting nucleic acids, the PCR and instrumentation. Assessment of new probe chemistry or the transfer of an assay to full or semi-automated instrumentation, normally only requires a methods comparison study. In this way any changes to the diagnostic sensitivity and specificity can be assessed quickly and accurately and the updated assay introduced with the minimum delay.

Over time it is likely that an assay will require some degree of revalidation, either for purely technical reasons, or because of changes in the nature of the analyte detected. Regular monitoring of amplification efficiency together with clinical information will give an early warning of any changes in the sequence of the amplicon detected in an assay. Point mutations are common in the genomes of many infectious microorganisms, particularly RNA viruses. New viral lineages may also be introduced into the population being tested due to travel from abroad. Under such circumstances, significant modifications to the primers and probe may be required, necessitating reverification and revalidation of the assay. Amplicon sequencing should be part of the validation plan and an integral part of routine trouble-shooting algorithms, since it is capable of resolving errors due to non-specific binding of primers and probes.

Rapid Point-of-Care Assays

Jan G Lisby and Uffe V Schenider, Copenhagen University Hospital Hvidovre, Hvidovre, Denmark

Introduction

The first report of viruses as pathogenic agents was published in 1892, when the transmission of the tobacco mosaic disease by liquid filtered through porcelain filters capable of retaining bacteria was reported (Iwanowski, 1892). Subsequently, Loeffler and Frosch using similar techniques, reported the transmission of the causative agent of foot-and-mouth disease in 1898. The first human viral pathogen was reported in 1902, when it was reported that a filterable agent was the causative agent of yellow fever (Reed, 1902). Virology as a clinical diagnostic enterprise emerged with the development by Enders *et al.* in 1949 of the monolayer cell culture technology, allowing for growth of viruses outside the host or laboratory animals (Weller *et al.*, 1949). For the subsequent decades, clinical diagnostic virology applied viral propagation in cell cultures, such as plaque assays, first described in 1952 (Dulbecco, 1952) and in the 1960s, detection of viral antigens or human antibodies raised against viral antigens was established. The first solid-phase assays, termed Enzyme Immunoassays (EIA) were made possible by the discovery in 1966 that antibodies (initially polyclonal) could be labeled with enzymes providing a detectable staining result (Nakane and Pierce Jr, 1966). The substitution of enzymes with a radioactive label in 1967 further enhanced the signal (Catt and Tregar, 1967). The description of the polymerase chain reaction (PCR) in 1985 (Saiki *et al.*, 1985) and the subsequent upgrade of the technology by application of a heat-stable DNA polymerase (Saiki *et al.*, 1988) resulted in a paradigm shift in clinical virology diagnostics and within the next decade, PCR almost completely replaced culture and serology methods as the preferred diagnostic intervention for acute viral infections (Mackay *et al.*, 2002; Niesters, 2002).

The primary purpose of human clinical viral diagnostics is to prove or disprove a definite viral diagnosis in the case of a clinical infection. The secondary purpose of the diagnostic efforts is to impact on clinical patient management, which may be in the form of cessation of unnecessary antibacterial treatment (if no other indication of a bacterial infection is present), initiation of specific antiviral treatment (if possible/available) and decision on contact isolation if the patient is admitted to a hospital or other infection control measures. Besides operational knowledge of specific immune and vaccination status, impact on clinical patient management requires availability of diagnostic results within a time window where impact is possible and patient outcome may be altered, which most often will be limited to the first few hours or days after patient symptom debut. For the first several decades of clinical diagnostic virology, this was problematic. Diagnostic methods based upon serology may deliver rapid results, especially methods based upon lateral flow technology (Koczula and Galotta, 2016), but while detection of a matured immune response to a previous infection with a viral pathogen – or a previous vaccination – by detection of IgG against the viral target is sensitive and specific, especially when matured IgG antibodies are detected (Prince and Lapé-Nixon, 2014), rapid detection of viral antigens in an acute infection by lateral flow is specific but insensitive (Chartrand *et al.*, 2015) and detection of an acute viral infection by detection of IgM is sensitive but unspecific (Prince and Lapé-Nixon, 2014). With the emergence of the PCR technology, sensitive and specific detection of an acute viral infection became possible. Initially in the 1990s, diagnostic PCR in general was time consuming and cumbersome (Lisby, 1998; Smith *et al.*, 1992), but eventually, fully automated PCR platforms were developed in the mid to late 2010s for the clinical diagnostic laboratory, bringing the turn-around-time of the diagnostic process in the laboratory down to a few hours (Wirten *et al.*, 2017; Cobb *et al.*, 2017). However, for most patients, a considerable time must be added for logistic delays, such as patient sample transportation to the laboratory, receipt and registration within the laboratory, reporting of test results and clinical action upon the test result. Often, the total turn-around-time from patient sample to clinical action upon the diagnostic result is more than 6–8 h. For acute viral infections, such as viral meningitis/encephalitis, viral respiratory infections and viral gastrointestinal infections, a diagnostic delay of 6–8 h or more may compromise the diagnostic impact on e.g., differential diagnostics (e.g., Influenza vs meningitis in an adult with high fever and muscle/head ache), antimicrobial use (at least the first 1–2 doses) and use of contact isolation facilities.

PoC Technologies

The choice of technology for detection of viruses depends greatly upon the specific pathogen. In general, urine or throat swabs are well-suited specimens for virus detection, since virus often can be detected for a long time and specimens are easy to obtain. But, depending on the specific virus, blood, fecal or other specimens may be more adequate sampling sites (Paz-Bailey *et al.*, 2018). Likewise, greater sampling volume and the processing of a greater fraction of the sample volume increases the sensitivity of detection.

Some viruses such as the genus of flaviviruses can only be isolated from the blood stream in humans for a short time after infection. The preferred tests for such viruses such as yellow fever, dengue-, zika- or west nile virus are therefore lateral flow tests that are testing for virus specific antigens in combination with IgM and IgG human antibodies. The direct detection of virus is hence combined with the detection of host response by seroconversion.

Other viruses, such as viruses infecting the respiratory tract or the gastro-intestinal channel of humans are well-detected by PCR based assays. PCR based amplification is especially beneficial when detection of multiple viruses (multiplex assays) is requested

(e.g., respiratory tract infections) or viruses with high mutations rates such as RNA viruses are being detected. Detection by isothermal amplification have been shown to work well with virus detection. Still, PCR is often preferred over isothermal amplification, as additional conserved nucleic acid regions are requested for design of isothermal amplifications assays compared to PCR based assays.

To detect multiple viruses, current Point-of-care multiplex platforms are utilizing different strategies. In the Biofire Filmarray from BioMérieux, nested PCR amplification by a multiplex first round PCR is combined with second round nested monoplex pathogen specific PCR on microarray with fluorescence detection (Poritz *et al.*, 2011). The ePlex platform from Genmark Dx is also based on microarray detection but with electrochemical detection in combination with multiplex PCR (Babady *et al.*, 2018). Another strategy is applied by the QIAstat Dx platform from Qiagen in which the extracted nucleic acids are fractioned into several separate PCR chambers. Each chamber allows for a five-plex multiplex PCR with an internal control and the detection of fluorescence signal from hydrolysis probes (Parcina *et al.*, 2020). A similar approach was applied by the Idylla Platform from Biocartis which initially was launched with a multiplex respiratory panel for detection of viral pathogens (Wouters *et al.*, 2019).

Most platforms that only detect a few pathogens simultaneously are based on the hydrolysis probe PCR technology, e.g., the Cobas Liat from Roche (Tanriverdi *et al.*, 2010), the GeneXpert from Cepheid (Jenny *et al.*, 2010), the Aries instrument from Luminex Corp (Voermans *et al.*, 2016), the BD max from BD (Cárdenas *et al.*, 2014), the Accula system from Mesa Biotech and the Simplexa from Focus Diagnostics (Woodberry *et al.*, 2013). In contrast to these platforms, the IDnow instrument from Abbott is based on the isothermal nicking enzyme amplification reaction (NEAR) technology, which allows for faster amplification, but at the risk of non-specific amplification products (Nie *et al.*, 2014; Tan *et al.*, 2008). As the landscape of instruments in the PoC field increases, other technologies and combinations hereof are expected to be introduced. Hopefully, the choice of technology by the end-user will reflect the strategy and the implementation hereof, as envisioned by the manufacturer.

PoC Strategy and Implementation

In general, any assay selected for use at a PoC setting should bring value to clinical patient management that cannot be obtained by testing the patient sample for the same microbial targets in the central clinical microbiology laboratory. The patient management value of any test will depend upon the actual patient population and the actual clinical setting, e.g., in an adult Emergency Room, Influenza A/B may be the only respiratory assay providing enough patient management value to be able to show a satisfactory benefit/cost ratio, but in a pediatric ED, a highly multiplexed respiratory panel may be preferable. Ideally, for each Point-of-Care setting (Fig. 1), for each diagnostic question (e.g., contact isolation yes/no, upper respiratory tract infection yes/no) and for each patient population (e.g., adult/pediatric), a specific business case should be established, detailing the impact on clinical patient management obtained by PoC testing as well as the cost of PoC testing.

PoC infectious disease testing performed outside the geography of the central clinical microbiology laboratory may in the near future be performed by individuals with different educations and skillsets, from highly trained biotechnicians to patients themselves. Depending upon the actual geographical location (Fig. 1), PoC testing may be classified as:

Point-of-Care Laboratory Grade 1A

In this setting, PoC for infectious disease testing is performed “in hospital – in lab” in a 24/7 laboratory staffed with dedicated and trained biotechnicians. This may be considered as a satellite clinical microbiology laboratory and may be operated by trained clinical microbiology technicians but may also be operated by trained biotechnicians from other clinical specialties, such as clinical biochemistry or clinical pathology. If available 24/7, any assay performed within the geography of the clinical microbiology laboratory is considered as PoC Grade 1A.

Point-of-Care Laboratory Grade 1B

In this setting, PoC for infectious disease testing is performed “in hospital – outside lab” by local healthcare professionals in e.g., the Emergency Department (ED), the Intensive Care Unit (ICU) or the Pediatrics Department. As the healthcare professionals performing the assays in this setting are not dedicated laboratory professionals, but most likely special trained nurses or nurse assistants, assays must be low complexity, easy to perform and fail-safe.

Point-of-Care Laboratory Grade 2A

In this setting, PoC for infectious disease testing is performed “outside hospital – in healthcare facility” by healthcare professionals in e.g., a General Practitioners office or laboratory. In this setting, the assays may be performed in the actual office or in a side room facility. The healthcare professionals performing the assays will most likely not be professional laboratory workers but may be physicians, nurses or other trained staff. Thus, assays performed in this setting should be low complexity, easy to perform and fail-safe.

Fig. 1 Different Point-of-Care settings. Point-of-Care Laboratory Grade 1A – in hospital – in lab; Point-of-Care Laboratory Grade 1B – in hospital – outside lab; Point-of-Care Laboratory Grade 2A – outside hospital – in healthcare facility; Point-of-Care Laboratory Grade 2B - outside hospital – outside healthcare facility; Point-of-Care Laboratory Grade 3 – home setting.

Point-of-Care Laboratory Grade 2B

In this setting, PoC for infectious disease testing is performed “outside hospital – outside healthcare facility” by healthcare or other professionals in e.g., a third world field use or a military setting. Thus, assays performed in this setting should be low complexity, CLIA-waived or similar. The Clinical Laboratory Improvement Amendments of 1988 (CLIA) provides federal standards applicable to all US facilities performing diagnostic testing on human specimens. Waived tests include tests that have been cleared by The United States Food and Drug Administration (FDA) for home use (“see Relevant Websites section”).

Point-of-Care Laboratory Grade 3

In this setting, PoC for infectious disease testing is performed in a “home setting” by laymen individuals without any formal or informal previous training. Assays performed in this setting must be low complexity, CLIA-waived or similar.

The basic requirement for any infectious disease PoC diagnostic assay should be equality regarding performance when compared to assays performed within the central laboratory. For Point-of-Care Laboratory Grades 1A and 1B, it is strongly recommended to establish local institutional or regional committees with participation of the local stakeholders and may include establishing local, regional or national guidelines. According to guidelines published by The American Society for Microbiology (Dolen *et al.*, 2017) and The Danish Society for Clinical Microbiology (Lisby *et al.*, 2017), it is recommended to maintain clinical microbiology laboratory oversight and expertise when PoC testing for infectious diseases is implemented.

This may ensure selection of optimal assays and platform, verification of assays locally before implementation, test reporting and interpretation, quality control procedures and participation in quality control programs and – especially – electronic communication between the local PoC platform and the institutional Electronic Patient Record and/or the institutional Laboratory Information System. For Point-of-Care Laboratory Grade 2A, in some countries or regions, these recommendations may be implemented, in other countries/regions, this may not be feasible due to various factors such as organization of the local healthcare system. Analyzing more patient sample at the PoC setting and sending fewer samples to a central clinical microbiology service provider will increase the necessity to focus on “the full infectious disease picture” for each PoC geographical location. Without an established electronic communication between the individual PoC location and the central clinical microbiology

service provider, expert guidance regarding diagnostic workup, test indication and interpretation, and, especially, surveillance of microbial identification and resistance patterns may be compromised. For Point-of-Care Laboratory Grade 2B settings, the same considerations as for Grade 2A may be applied. However, as this setting will likely be without readily accessible central clinical microbiology service providers (e.g., by military use or use in low-resource settings), electronic communication of individual patient test results and clinical microbiology oversight in general may not be relevant. The biggest challenge to clinical microbiology oversight and surveillance of microbial prevalence may arise from infectious disease testing performed in future Point-of-Care Laboratory Grade 3 settings (home use). Unless regulatory requirements regarding test result management, e.g., mandatory upload to cloud-based databases, are established, most likely test results based upon PoC testing in this setting will not be available for clinical microbiology guidance or local/national surveillance. The potential negative impact on local and national surveillance and antimicrobial use, especially in regions with unrestricted access to antimicrobials, may override the potential positive impact by use of infectious disease diagnostics in this PoC setting, e.g., patient/user satisfaction.

PoC Menus

A variety of companies are marketing assays for immunofluorescence detection of antigens or antibodies on serum or feces e.g., Biocan or Abbott ("see Relevant Websites section"). Such test portfolios include viruses like adenovirus, Barmah Forest virus, Chikungunya virus, CMV, dengue virus, Ebolavirus, EBV, Hantaan virus, HAV, HBV, HCV, HIV, HSV 1 or 2, Influenza A and B virus, norovirus, Ross River virus, rotavirus, RSV, SARS-CoV-2, rubellavirus and Zika virus.

The current amplification based PoC tests are currently marketing panels targeting respiratory infections, gastrointestinal infections, CNS infections, HIV and HSV ([Table 1](#)). As such assays are being implemented in the clinical setting, it is anticipated that several companies will market returning travelers panels and post transplantation panels in the future.

A pragmatic approach to selecting PoC menus for current and future PoC platforms could be to select "low hanging fruits" according to business cases based upon the designated geographic location of the PoC instrument in question ([Fig. 1](#)). E.g., for PoC Grade 1a and 1b, assays targeting pathogens requiring contact isolation of the patient (such as SARS-CoV-2, Influenza A&B, RSV, MRSA, VRE, CPO, norovirus) would most likely emerge as the most attractive assays seen from a benefit-cost perspective.

In general, there is currently a lack of rapid open access amplification based PoC platforms that would allow end-users to apply laboratory developed assays allowing for fast detection of viruses according to local requirements for special diagnostics.

PoC Clinical Impact

The clinical impact of PoC testing can be evaluated in several ways including (1) intervention studies in which the change in patient management of a positive test is compared to negative test results, (2) prospective or retrospective case-control studies comparing the effect on patient management of the introduction of a PoC compared to a previous standard of care and (3) randomized studies comparing current standard of care with PoC and the effect on patient management. Such studies have primarily been published on respiratory illness evaluating influenza PoC testing. As the results of these studies have been conflicting, further studies are needed to understand the clinical impact of PoC testing.

Modeling and intervention studies in which the clinicians are blinded for PoC results have suggested that the introduction of PoC may result in better use of side room contact isolation ([Pedersen et al., 2018](#)), reduced prescription of antibiotics ([Pedersen et al., 2018](#); [Kaku et al., 2018](#)), targeted use of antiviral treatment ([Pedersen et al., 2018](#)) and cost savings due deferred admissions and shortened hospital stay ([Rathamat-Langendoen et al., 2019](#)). The potential for cost savings has been supported by one study investigating the use of PoC in adults in the emergency room, in which a positive test lead to deferred admission and reduction in antiviral prescribing and resulted in overall cost savings of approximately \$200 per emergency room visit ([Hansen et al., 2018](#)). A study on pediatric patients could not demonstrate an impact on admission or antibiotic prescription with exception of lower admission rate for children positive for influenza B but supported more appropriate prescription of antiviral treatment ([Busson et al., 2019](#)).

Studies before and after introduction of PoC for influenza testing support a more targeted use of antiviral treatment for children and adults ([Vos et al., 2019](#); [Vecino-Ortiz et al., 2018](#); [Benirschke et al., 2019](#)) and better use of side room contact isolation facilities for immunocompromised adults ([Vos et al., 2019](#)), but the use of PoC testing did not change length of hospital stay for children ([Vecino-Ortiz et al., 2018](#)) or immunocompromised adults ([Vos et al., 2019](#)). Similar, no positive effect on antibiotic prescription could be established for adults in urgent care settings or for immunocompromised adults ([Vos et al., 2019](#); [Benirschke et al., 2019](#)).

Randomized studies on adults agrees on more appropriate use of antiviral treatment by use of PoC testing ([Brendish et al., 2017](#); [Andrews et al., 2017](#)), but the studies are conflicting regarding whether PoC testing may shorten duration of antibiotics ([Brendish et al., 2017](#); [Shengchen et al., 2019](#)) or stay in hospital ([Brendish et al., 2017](#); [Andrews et al., 2017](#); [Shengchen et al., 2019](#)). In one study, the duration of antibiotics was shortened in the intervention group ([Shengchen et al., 2019](#)), but in another study no difference in initiation or mean duration of antibiotics could be established ([Brendish et al., 2017](#)). The two studies agree that stay in hospital was shortened in the PoC test group ([Brendish et al., 2017](#); [Shengchen et al., 2019](#)), but a third study, having length of stay as the primary outcome, could only demonstrate a reduction in time-to-test-result, whereas the length of stay in hospital was not associated with PoC testing ([Andrews et al., 2017](#)). The cost of hospitalization was compared between

the PoC group and the standard of care group in one study, finding an average reduction in cost of approximately \$200 (Shengchen *et al.*, 2019).

Most studies agree on PoC testing resulting in a more appropriate use of antiviral treatment, whereas the data are conflicting on the impact of PoC testing on use of antibiotics and the effect on length of stay in hospital, whereas the data the impact of PoC testing on use of side room contact isolation facilities are sparse. Based on current studies, it seems that PoC testing may impact patient management of adults seen in the emergency room more than children and immunocompromised adults, but more studies are needed to understand the true impact of PoC testing on patient management.

Conclusion

Clinical virology diagnostics is currently undergoing a paradigm shift. The diagnostic procedure is no longer confined within the geography of a central medical/clinical microbiology/virology laboratory but may be performed closer to the patient by non-laboratory trained personnel. The different versions of “Point-of-Care” testing may present challenges to platform and assay selection, verification of assay performance, training of non-laboratory personnel performing the tests as well as quality control. Clinical microbiology/virology oversight is highly recommended in order to maintain the same level of diagnostic quality compared to diagnostics by gold standard assays performed by a central laboratory. Furthermore, clinical microbiology laboratory oversight may ensure capture of the PoC assay result in the patient’s electronic medical record and in the laboratory information system. Thus, the likely loss of data caused by manual recording of test results in the electronic patient records may be avoided, maintaining local, regional and national surveillance of select infections, such as Influenza Virus infections. With limited resources available to the healthcare sector, benefit-cost assessments of new diagnostic interventions should be mandatory. The impact of PoC testing on clinical patient management and healthcare costs, such as use of antimicrobials, use of antivirals, use of side room contact isolation facilities and length of stay in hospital/ICU should be documented, as limited data is yet available.

Glossary

International Standard Internationally recognized measurement standard established by the WHO.

International Unit Value given to WHO International Standards.

WHO World Health Organization.

Introduction

In clinical virology laboratories, diagnostic testing is performed to confirm the cause of viral infections, whether they are acute or chronic or represent reactivation of latent infections. The diagnostic test results help inform physicians about the best course of patient management, for example, whether to prescribe antiviral drugs or treat patients with specific immunoglobulins or administer vaccines prophylactically or therapeutically. Assay standardization is essential in order to compare diagnostic testing results produced by different laboratories, ensure robust testing procedures as well as to develop clinical practice guidelines where diagnostic test results such as viral loads, for example, are used in clinical decision making.

In this article, we describe different aspects of standardization including the development and use of reference materials, the role of written standards as well as principles of quality assurance. Standardization has been applied extensively to the detection of viral DNA and RNA by nucleic acid amplification technology (nucleic acid testing (NAT) or nucleic acid amplification testing (NAAT)). In the case of serological assays used to detect viral antigens or specific antibodies induced following viral infections, standardization has been useful for a more limited range of assays. Testing of an immune response to an organism is not straightforward. When testing for antibodies against human immunodeficiency virus (HIV), for example, the different antigens derived from particular viral subtypes and mutations, the immune response to distinct antigens and the unique development of an individual's immune response, makes the application of standardization difficult. In contrast, for serological assays that detect and quantify viral antigens, such as HIV p24, conventional approaches to standardization are more applicable.

Physical Standards (Reference Materials)

Because of the complex, biological nature of diagnostic specimens tested in clinical virology laboratories, they cannot be evaluated by physicochemical means. Instead bioassays, measuring a functional biological activity are necessary. Reference materials, also termed standards, are essential for the control of such bioassays. These reference materials may be measurement standards, applied to quantitative assays. They can also be controls used qualitatively or quantitatively to monitor day-to-day performance of a test. The most important measurement standards used in virology laboratories are World Health Organization (WHO) International Standards (ISs) which have defined concentrations of specific analytes. The WHO ISs are considered "higher order standards" for biological assays and are critical for calibration of different assays using a common material and for ensuring calibration traceability. Concentrations of ISs are expressed in International Units (IUs) per ml. Because of the biological nature of WHO ISs results cannot simply be reported in International System of Units (SI)-related units such as moles, hence the adoption of the IU.

The ISs are used to directly calibrate secondary standards, including ones that used at a regional or national level, calibrators used for commercially available assays, as well as control materials (e.g., working standards/reagents and run controls, independent of controls supplied by manufacturers of diagnostic kits) used to monitor assay performance. In turn, tertiary standards are directly traceable to secondary standards ([Fig. 1](#)). Collectively, these standards enable the comparison of results among different assays and different laboratories.

Uncertainty values are not assigned to WHO ISs, since IU are arbitrary units and variance is associated the contents in the vial of standard. For secondary and tertiary standards there will be a measurement uncertainty when calibration is performed ([Fig. 1](#)).

The WHO also produces reference materials termed International Reference Panels (IRPs) and no unitages are assigned to these materials. IRPs designed for NAT assays or antigen assays include different genotypes or strains of a virus that might be encountered globally and may challenge current assays. By analogy, IRPs designed for antibody assays reflect sera of patients who developed antibodies against different virus genotypes or strains or a different times post-infection. The WHO reference reagents (RRs), are usually interim standards with a unitage defined in units rather than IU. The types of reference material and their role in the clinical virology laboratory are summarized in [Table 1](#).

Fig. 1 Hierarchy of standards. The relationship between ISs and secondary and tertiary standards is shown, together with their uses. Reproduced, in modified form, with the permission of the Journal of Clinical Microbiology.

Table 1 Types of standard and their role in the clinical virology laboratory

Type of standard	Role
WHO IS	Highest order reference material. Used for calibration of secondary standards and evaluation of critical assay parameters such as limits of detection.
WHO IRP	Ensuring adequate detection of genetically and antigenically distinct strains of important viral pathogens and associated antibodies.
Secondary standards	National and regional standards traceable to the WHO IS with value assigned in IU. Manufacturer's calibrators used for control of commercial assays with value assigned in IU. Working standards/working reagents used as routine external run controls for assays, assigned a value or range in IU.
Tertiary standards	Calibrators traceable to a secondary standard calibrated in IU. Working standards/working reagents used as routine external run controls for assays, assigned a value or range in IU traceable to a secondary standard.
Working standards/working reagents	Used as routine external run controls for assays, no unitage assigned or given an arbitrary value if no WHO IS exists.

Preparation and Evaluation of Standards

The decision to develop a specific standard is based upon public health need and the prioritization of WHO standards is determined through discussion with the medical scientific communities worldwide and in consultation with the WHO Expert Committee on Biological Standardization (ECBS). The process for the preparation and evaluation of WHO standards, including their replacement is shown in [Fig. 2](#).

The starting materials for the preparation of any kind of standard are carefully pre-qualified to ensure they are fit for purpose. In the case of ISs used for NAT, they should contain the specific virus in sufficiently high titer, the strain should be detected in commonly used assays and the final formulation should not affect NAT assay performance. Similarly, starting materials for viral antigens or antibodies for IS are prepared at a titer that will enable the calibration of secondary standards.

The ISs are usually lyophilized in order to maintain stability of the reference material, allowing worldwide distribution at ambient temperatures therefore avoiding cold chain difficulties. Batches of IS are tested to ensure that volume dispensed during filling is consistent and that the homogeneity and potency of the analyte after filling and lyophilization is adequate. After lyophilization, vials are filled with nitrogen and residual moisture in the freeze-dried residue (cake) is determined together with

Fig. 2 Process for the development of WHO ISs, RRs and IRPs. The procedure is shown from the identification of a scientific need to develop a standard to the establishment of the standard and ultimately to its replacement. cIS, candidate IS. Reproduced, in modified form, with the permission of the Journal of Clinical Microbiology.

the levels of oxygen present in the final vial to ensure that levels do not exceed predefined specifications that may impact on the stability. Stability of IS must be evaluated to ensure that there is no degradation of the material during storage and shipment that would affect the unitage assigned to the analyte and, in turn, the value assigned to any secondary or tertiary standards. Occasionally, it has been necessary to add stabilizing agents to certain NAT standard preparations, especially for some RNA viruses that are more susceptible to degradation by nucleases. Long-term stability is predicted by accelerated degradation studies with incubation of the candidate material at higher temperatures, for defined time periods, together with continuous monitoring by testing of the IS after its establishment at defined time intervals.

Details of the specifications are described in the WHO Recommendations for the preparation, characterization and establishment of international and other biological reference standards (2004).

The WHO ISs are prepared using material that reflects the sample type being tested in an assay, and materials must be assessed for their “commutability” to ensure that their performance in different assays is equivalent to the usual test samples such as patient specimens tested routinely. The property of commutability is particularly affected by the composition of the sample matrix which may vary between the reference material and the routine specimens. The source materials for ISs for NAT are from viraemic plasma from infected donors or patients or by using virus stocks produced in cell culture, which may be heat-inactivated, and spiked into human plasma. For NAT standards, the use of intact virus particles is important because such preparations undergo nucleic acid extraction as well as the amplification and detection steps in a NAT assay. Materials made from *in vitro* RNA transcripts or plasmids do not control for the extraction step or reflect the complexities of viral genome structures and have not proved to be helpful in assay harmonization. Antigen standards have also been prepared from plasma from infected patients or from virus propagated in cell culture or from recombinant sources.

Developing ISs for antibody detection, is more complex as a single reference preparation is not necessarily suitable for all purposes. An infected individual's antibody response develops over time, with low avidity antibodies being replaced by higher avidity antibodies during the infection course. Furthermore, antibody features (antibody classes; epitopes and antigens targeted by antibodies) depend not only on strain or genotype of the pathogen, but also on parameters like the site and route of infection, inoculum size or infectious dose. Last but not least, the individual antibody response is unpredictable and often highly variable between infected individuals, dependent on different components of the individual immune system. Diagnostic assays may have different designs, e.g., in respect to detect "functional" antibodies (e.g., neutralizing antibodies) or "binding" antibodies, often with different antigens and epitopes used in the individual tests. With all these different aspects to consider, standardization of antibody tests is more difficult. Standardization of antibody assays restricted to a specific viral antigen, for example in the case of hepatitis B virus (HBV), anti-HBV core (anti-HBc), appears more feasible compared to assays detecting total antibodies to HBV: the designs of different anti-HBV assays may differ in the HBV antigens used with the consequence that each measures different subsets of anti-HBV antibodies. The IRPs for antibodies are often comprised of different specimens to reflect the diversity of antibody responses between individuals. Some reference materials have been prepared from therapeutic immunoglobulins, raising potential matrix (commutability) issues.

The WHO reference materials i.e., ISs, IRPs and RRs are evaluated in international studies typically involving reference laboratories, clinical laboratories, regulatory organizations as well as manufacturers of diagnostic kits and reflecting different globally available assays. Such studies allow the head-to-head comparison of different assays used globally, including both commercially available tests as well as laboratory-developed tests (LDTs) or in-house assays. Potencies of the candidate reference materials are determined by the participants. [Fig. 3](#) shows an example of the range of potencies reported by laboratories for the IS for hepatitis E virus (HEV) RNA. Potencies were determined by a mixture of qualitative and quantitative assays with a wide range of reported values. However, expressing results of other study samples against the candidate IS greatly reduced the variation in the measured potencies reported by participants. This reduction in variation is one of the main aims of the collaborative study because it demonstrates that the use of a reference material can improve harmonization of the results of diagnostic assays. The outcome of the studies are published on the WHO website to allow time for comments before it is presented to the WHO ECBS which endorses the proposed unitage and confirms whether materials are established as ISs, IRPs etc.

Several thousand vials of each IS are prepared, once the stocks near exhaustion the IS must be replaced. The continuity of the IU assignment is important and replacement material must be carefully selected to ensure they are similar to the previous IS or have been demonstrated to perform in a similar way. In some cases, where large volumes of the original source material are available this process is easier. Preparation of the replacement IS follows the same manufacturing procedures as the establishment of a new IS. In the collaborative study the replacement material is evaluated alongside the existing IS in order to determine the potency of the new standard.

Written Standards and Guidelines

In order to standardize diagnostic testing, the availability and correct implementation of reference materials is essential; underpinning this are documentary, written standards and guidelines relating to development of tests and their routine use in the diagnostic laboratory.

With respect to the reference materials themselves, the WHO ECBS publishes a Technical Report Series (see "Relevant Websites section") which records opinions of the committee with respect to the establishment of new reference materials and reviews strategic matters in the field of standardization including guidelines outlining the procedures used for the development and establishment of WHO ISs and IRPs together with guidance on the calibration of secondary and tertiary standards. The WHO also publishes biological standardization study reports (BS documents) which document each standardization project, including an analysis of the data generated during the collaborative study, and serve as a basis for the decision of the WHO ECBS to establish new and replacement standards.

The International Organization for Standardization (ISO) is a non-governmental, independent standard setting body that aims to improve quality, reliability and safety of products and services by providing common standards around the world. Several ISO standards are important in the standardization of diagnostics. In particular, ISO 17511:2003 which comprehensively deals with metrological traceability of values assigned to calibrators and control materials. Supporting standardization is ISO 15189:2012 which sets out the requirements for quality management and competence in medical laboratories and is now mandatory in many countries. External quality assurance (EQA) schemes are important in independently demonstrating adequate quality of testing in laboratories. The materials used in EQA samples should be commutable and traceable to established standards and reference materials as defined in ISO 17043:2010 which provides guidance on the development and operation of EQA programmes. The Clinical and Laboratory Standards Institute (CLSI) is a voluntary organization developing clinical and laboratory practices globally, including, for example, guidance concerning commutability of reference materials. The International Laboratory Accreditation Cooperation (ILAC) is an international organization for accreditation bodies for testing and calibration laboratories and produces documents on measurement traceability and selection of reference materials. There are other guidelines and regulations relating to *in vitro* diagnostics either at a national or a regional level worldwide.

The guidelines described above are not an exhaustive list of written standards, but provide some of the most important sources of information and are summarized in [Table 2](#).

Fig. 3 Harmonization of data by expressing potencies of a sample against a WHO IS. The top two panels show absolute mean values of the WHO IS for HEV RNA (left) and a blinded replicate sample S2 (right). By expressing the potency of S2 against the IS, the agreement is much improved between laboratories (bottom left). White indicates data reported from quantitative assays and orange indicates qualitative assays. The number of laboratories is indicated on the vertical axis. Laboratory code numbers are indicated in the respective boxes. Reproduced, in modified form, with the permission of Emerging Infectious Diseases.

Quality Assurance

In the diagnostic virology laboratory, quality assurance (QA) is a planned and systematic set of activities designed to ensure confidence in the results of different diagnostic assays. The QA process includes the establishment of a quality management system (QMS) setting out the scope of activities, policies, procedures, documented information and resources needed for implementation

and maintenance of the testing service. QA measures should include the use of standard operating procedures (SOPs) and associated documentation; correct handling of samples to ensure their appropriate storage and traceability, calibration and preventive maintenance of equipment, the use of designated laboratories, and the use of pre-qualified and in-date reagents. Operators should be suitably trained in technical procedures as well as specific assays, be competent in data interpretation, and able to undertake remedial/corrective actions where necessary. Audits and reviews are performed to ensure adequate performance and identify any issues and areas for improvement.

The Use of Controls

Assessing an assay's performance over time is achieved by testing of run controls and monitoring the test results. Controls for monitoring assays include ones provided in diagnostics kits supplied by the kit manufacturers – these typically include positive and negative controls or controls for quantification. Other controls, termed external run controls are provided by other organizations and represent an independent means of monitoring performance. All assays experience variation. The sources of variation are derived from the equipment and consumables used, operators, changes in calibration of instruments, transport and storage of reagents and general environmental conditions such as temperature and humidity. For serological assays, changes in reagent lot numbers are the greatest source of normal variation.

The run controls are tested frequently, usually on a daily or per test run basis, and the results plotted on a Levey-Jennings (LJ) chart (Fig. 4). In a well-designed run control program, samples known to be reactive at medical decision points are used. Preferably they are of known homogeneity and stability, as are controls registered as *in vitro* diagnostic devices. Ideally, QC samples are calibrated against an IS (where one is available). This is usually the case in nucleic acid testing QCs. If this is not possible, the manufacturer should ideally reserve sufficient stock material to allow minimal QC lot-to-lot variation, releasing each new batch against in-house QC reference materials. By achieving consistency of QC reactivity from lot-to-lot, it is possible to monitor the performance of the assay over a long period of time.

If the QC sample is calibrated against the corresponding IS and is proven to be commutable with patients samples, the results of QC testing can measure not only the imprecision of the test system (i.e., the standard deviation (SD) or coefficient of variation) but it can also measure the bias of the assay (i.e., how far removed the mean of the QC results are from the QC assigned value). These metrics are valuable in estimating the measurement of uncertainty of the assay.

Critical to a run control program is determining the acceptance range of test QC test result. Acceptance limits set too tight will falsely reject test runs leading to unnecessary investigations, whereas limits set too broadly may result in incorrect results being reported and defects in the test systems not being identified. Traditionally, the mean and SD of QC results are used to determine acceptance limits. International guidelines suggest using 20 QC test results and set the acceptance limits at mean $\pm$ 2 SDs; and they apply a set of QC "rules", called Westgard Rules, to detect "out-of-control" results. Although this approach works well for clinical chemistry, it is not applicable to infectious disease testing, especially serology, due to changes in reactivity of the QC sample due to reagent lots (Figs. 5 and 6). An alternative method for calculating acceptance limits has been published. QConnect Limits (see "Relevant Websites section") use historical data from many laboratories using the same QC sample and assay

Fig. 4 Results of a QC sample tested repeatedly over time plotted on a LJ chart. The vertical axis represents the signal to cut-off values of the QC sample. The horizontal axis represents the date of testing. The results reported over the period are all within the mean $\pm$ 2 standard deviations (indicated by upper and lower horizontal lines) of the QC test results displayed. The mean value is represented by the horizontal line in the middle of the plot.

combination (i.e., peer group). By using data from multiple laboratories over a long period of time, all sources of “normal” variation can be accounted for and more robust acceptance criteria established.

Batch Testing

Commercial assays undergo testing by manufacturers to ensure adequate performance before they are released onto the market. In some regions of the world, regulatory authorities perform independent testing of assays before they are marketed as well as evaluating different batches during the lifetime of a particular product. In Europe, IVDs deemed to be high risk i.e., those where the consequences of a false diagnosis could cause serious harm both to the patient and to the community include tests for HIV and hepatitis B and hepatitis C. Independent batch testing is done for these high risk IVDs in some European countries using panels of well-characterized samples from patients or blood donors. Assays must show consistent performance, for example adequate sensitivity should be maintained, before new batches are released on the common market. In addition, technical files documenting the design, development, performance and manufacture of these high risk IVDs are independently reviewed by Notified Bodies who are involved in the conformity assessment of IVDs. With the introduction of new regulations (laws) concerning IVDs in Europe, verification of the performance of high risk IVDs by specialised reference laboratories will be a legal requirement before kits receive a EC declaration of conformity (i.e., CE-mark). Similar procedures are in place in the USA (see “Relevant Websites section”) and elsewhere.

External Quality Assessment/Proficiency Testing

EQA schemes, also referred to as proficiency testing (PT) or ring trials, are an important part of the overall standardization process. The EQA organizers distribute the same materials (which are usually blinded) to participating laboratories. The laboratories test

Fig. 5 Results of an anti-hepatitis C virus antibody QC sample tested repeatedly over time. A significant decrease in reactivity of the QC sample was associated with the introduction of a specific reagent lot (orange arrow). The results (signal to cut-off value on the vertical axis) of the QC sample tested on the affected reagent lot were outside the mean $\pm$ 2 SDs (upper and lower bold lines) of the QC test results displayed. Reagent lots are indicated at the top of the figure. The horizontal axis represents the date of testing.

the samples using routine methods and return results to the organizer. In some schemes associated metadata, such as reagent lot numbers and expiry dates are also collected by the organizer for analysis. The participation in EQA schemes provides laboratories with an objective means of assessing and demonstrating the reliability of the results they are producing. The EQA scheme covers the overall performance of a laboratory, including the entire process from receipt and storage of the samples, the laboratory testing, the interpretation and transcription of the data generated, to the reporting of results. Failure at any stage of this process affects the proficiency of the laboratory. Participation in EQA schemes is mandatory for laboratories accredited to ISO 15189:2012 and is important for laboratories seeking accreditation.

Laboratory Accreditation

Accreditation of laboratories to ISO 15189:2012 or ISO/IEC 17025:2017 provides objective and internationally recognized evidence of a level of quality. ISO accreditation ensures that the laboratories have robust and well-documented procedures and that test systems employed are fit for purpose, validated and under control. When a previously validated assay (including commercial assays used in strict accordance with the manufacturer's instructions for use) is introduced into use, verification is required before bringing the assay into routine use to demonstrate their utility. Validation protocols should be prospective i.e., they should set acceptance limits for assay performance which should be verified by the validation experiments and demonstrate that a particular procedure is suitable for its intended purpose. Once an analytical method has been established, a protocol for validation of the analytical procedure can be prepared. The analytical method should yield consistent results under standard operating conditions, critical points should be known, and robustness studies should be performed as part of the validation exercise. Upon completion of the validation experiments, the results are formally documented. Only if an analytical procedure meets the acceptance criteria set out in the validation protocol is the

Fig. 6 Changes in QC sample reactivity for a combined serological assay detecting both anti-HIV antibodies and HIV p24 antigen. The changes are a consequence of changes in reagent lots. Reagent lots are indicated at the top of the figure. The vertical axis represents the signal to cut-off values of the QC sample. The horizontal axis represents the date of testing.

method considered validated. Validation includes analysis of performance characteristics such as analytical sensitivities (e.g., limit of detection, limit and range of quantification determined using reference materials where available), specificities as well as accuracy (closeness to an accepted value) and precision (how repeatable/reproducible a measurement is). Examples of accuracy and precision of measurements are shown in [Fig. 7](#) demonstrating good to more variable and poor performance.

Documented evidence of staff training and competence, instrumentation commissioning, maintenance and monitoring, and standardised procedures need to be in place. Accredited laboratories are required to identify, record and investigate any deficiencies detected and undertake a root cause analysis of the issues and implement corrective actions, and demonstrate the effectiveness of the action taken. All suppliers and subcontractors are managed under the QMS. All accredited laboratories undertake self-assessment in the form of internal audits and are subjected to external audits by their accrediting body and other stakeholders periodically.

Similar regulatory requirements are in place in other jurisdictions such as the USA Clinical Laboratory Improvement Amendments (CLIA) regulations or local State-based regulations. In some parts of the world, for example Africa, there are frameworks in place to enable laboratories to work towards accreditation, these include Strengthening Laboratory Management Toward Accreditation (SLMTA) and Stepwise Laboratory Improvement Process Towards Accreditation (SLIPTA).

Commercial and Laboratory-Developed tests

The availability of commercial assays which have been granted regulatory approval, such as clearance by the US Food and Drug Administration or EC declaration of conformity (i.e., have a CE-mark) in Europe, attesting to a certain level of quality have helped improve standardization in the diagnostic virology laboratory. This can be seen in the results from EQA studies where more

Fig. 7 Precision and accuracy of measurement procedures. The upper left panel demonstrates the ideal situation where a measurement is both accurate and precise – hitting the target directly in the middle. In the case of the upper right panel, although the measurements are very precise they are off target i.e., they are not accurate. In the bottom left panel, the measurements are accurate, but they are not precise. Finally, in the lower right panel, the measurements are scattered being neither precise nor accurate.

consistent results are reported following the introduction of commercial assays over time. This is especially true once assays are calibrated in IU. Laboratory developed tests (LDTs) need to undergo extensive verification and validation before they are brought into routine use. IS are important for the calibration of LDTs and in the preparation of calibrated run controls, traceable to the IS, used to ensure consistent assay performance.

Fig. 8 illustrates the steps involved in the introduction of an assay from initial evaluation and verification, through validation and routine clinical testing. The interplay between QC and EQA procedures ensure adequate test performance and identify out of specification test results which lead to quality improvements.

Virus Isolation

Although used less frequently nowadays, virus isolation or culture is still in use in some diagnostic virology laboratories. The origins of the cell lines and tissue cultures used in isolation procedures should be defined to ensure identity and traceability as well as passage number. For example, continuous cell lines can be obtained from organizations such as the American Type Culture Collection and the European Collection of Authenticated Cell Cultures. The virus detection limit is an important validation parameter; however, this is likely to be specific for each indicator cell line and virus and may well vary for different strains. It is important to verify that the test matrix does not interfere with virus detection, and pre-dilution of samples may be necessary e.g., for stool or urine specimens; appropriate interference and negative controls should be included during isolation procedures. Virus isolation exercises may be offered by some EQA providers.

The Use of International Standards in Clinical Practice

The standardization of NAT testing is important in clinical practice, not only for disease diagnosis, but also in decisions concerning when to implement treatment with antiviral drugs and how long treatment should continue.

The first WHO IS developed for NAT testing was for hepatitis C virus (HCV). While this standard was established in 1997 to enable harmonized regulations for screening of plasma donations for blood product manufacturing, it soon found utility in clinical virology laboratories. In the European Association for the Study of the Liver (EASL) Recommendations on Treatment of Hepatitis C 2018, it is stated that HCV RNA assessment (in both acute and chronic cases) should be made by reliable, sensitive assays, and HCV RNA levels should be expressed in IU/ml using assays with a lower limit of detection ≤ 15 IU/ml. However, the vast majority of patients with an indication for anti-HCV therapy have an HCV RNA level above 50,000 IU/ml. For the treatment of acute hepatitis C in low- or middle-income countries and in specific settings in high-income countries, a qualitative HCV RNA assay with a lower limit of detection $\leq 1,000$ IU/ml can be used to provide broad affordable access to HCV diagnosis and care. The

Fig. 8 Assay implementation in a diagnostic laboratory, from initial evaluation and verification, through validation and routine clinical testing. QC and EQA procedures ensure adequate test performance and identify out of specification test results which lead to quality improvements. Reproduced in modified form with permission by Professor H. Niesters.

EASL recommendations include further parameters including lower detection limits (≤ 15 IU/ml) indicating patient recovery following antiviral therapy, for example.

Patients with chronic HBV infection are at increased risk of progression to cirrhosis and hepatocellular carcinoma (HCC). In the EASL 2017 Clinical Practice Guidelines on the management of HBV infection, HBV DNA levels exceeding 2,000 IU/ml, elevated alanine transaminase (ALT) and/or at least moderate histological lesions are an indication for treatment together with all cirrhotic patients with detectable HBV DNA. In patients where the levels of HBV DNA exceed 20,000 IU/ml, and ALT levels exceed $2 \times$ the upper limit of normal, treatment should commence regardless of the degree of fibrosis.

Human cytomegalovirus (HCMV) is a major pathogen for immunocompromised patients, particular transplant recipients. The use of HCMV NAT is important for surveillance to guide antiviral treatment, and for therapeutic monitoring. In the "Third International Consensus Guidelines on the Management of Cytomegalovirus in Solid-organ Transplantation", reporting levels of HCMV DNA by NAT testing in IU/ml is recommended. In the future, it is hoped that it will be possible to define agreed thresholds to initiate pre-emptive therapy.

There are several ISs for infectious disease antigens, such as HBV surface antigen (HBsAg), HIV-1 p24 as well as HCV core antigen. These have been used to calibrate immunoassays and they represent a cost-effective way of monitoring in infected patients undergoing therapy compared to NAT. However, quantitative results of antigen tests are used less frequently nowadays in clinical decision making, having been superseded by viral load testing by NAT. However, HBsAg testing is very widely used in screening blood donors to test and exclude donors with HBV infection.

The level of antibody in a patient is not often used in the clinical setting. Qualitative testing for antibodies uses various processes to detect the presence of the immune reaction; however, a rise in the concentration of antibodies may be useful in confirming a recent infection. Furthermore, detection of antibody classes may provide insight into infection course (e.g., IgM in recent infection). Determination of antibody function may provide relevant information on immunity (e.g., neutralisation assays and protection against potential re-infection). Sometimes levels of immunity in patients are determined by assays calibrated with a WHO IS and the immunity threshold defined in IU/ml. However, this approach is sometimes questionable and standardization using a single reference material has proved challenging in certain circumstances, for example, with assays designed to measure antibodies against a single antigen or neutralization of virus infectivity. Several of the antibody standards that are available have been prepared to set a specification for therapeutic immunoglobulins and may not be the most suitable materials for standardization in the clinical laboratory setting.

Conclusions

The standardization of diagnostics in the clinical virology laboratory is driven by a combined approach using physical reference materials as well as written standards and adherence to quality assurance procedures. The WHO ECBS ensures that standards suitable for their purpose and will be replaced in a timely manner with the assurance of the continuity of the unitage. Discussions with the clinical virology community are essential to identify where there is a diagnostic need for new standards.

The Principles of Quality Assurance and Quality Management

The principles of quality assurance (QA) and quality management (QM) have their origins in manufacturing and in particular the automotive industry. They were primarily used to support the stream-lining of processes and procedures, with the aim of increasing productivity, while reducing costs but maintaining the quality of the product delivered to the customer. Within the clinical laboratory, the concepts of QA and QM were first introduced in hematology and clinical chemistry by Belk and Sunderman in the late 1940s/early 1950s in an effort help reduce the high number of diagnostic errors observed in relation to the handling and testing of patient specimens which ultimately could have an impact on patient care. These concepts and general principles formed the QA and QM foundation commonly used within the clinical virology laboratory which continue to evolve in order to meet present regulatory demands and assure the safety and effectiveness of the virology testing service.

The key components of quality assurance within a laboratory's quality management system (QMS) are shown diagrammatically in [Fig. 1](#).

As well as supporting the whole diagnostic process (pre- analytical to post analytical) to delivery of patient result, the QMS also support the verification, validation and implementation phases of the diagnostic assays used within the virology laboratory.

With the implementation of quality principles from other industry sectors comes the adoption of the associated terms and definitions used and one such quality term which has found its way into clinical virology in recent years is Total Quality Management (TQM). In the context of the clinical virology laboratory, TQM provides an alternative description for the integration of all quality parameters and the nurturing of a quality culture followed by all laboratory staff. So that the aim of the laboratory is not only to provide correct results, they also aim to ensure that the correct test is performed on the appropriate specimen, the correct result is obtained and interpreted, and provided to the right patient within a meaningful time frame and using the correct procedures. The goal of the laboratory is, to ensure confidentiality, the safety of the patient, as well as provide a mechanism for continuously monitoring and improving of the diagnostic service.

In many countries, clinical virology laboratories and the testing services they provide are required to be accredited and in some regions accreditation is a pre-requisite to regional reimbursement policy. Accreditation also helps the clinical laboratory demonstrate the competence and reliability of its services to its immediate peers within the healthcare environment, the Clinicians who routinely utilize the testing service, and those external to the healthcare environment such as the legal profession. Increasingly, clinical virology laboratories are gaining accreditation to the internationally recognized standard ISO15189 which was developed specifically for the medical laboratories involved in laboratory testing and examination, although in some country's laboratories are accredited to the national regulatory framework. The quality management requirements of ISO15189 are also aligned to those in ISO 9001 which provides a basic standard and quality language across diverse industry sectors.

Quality Management System (QMS)

In the context of the clinical virology laboratory, the QMS covers all the policies, documented processes, procedures, and records used in order to deliver the diagnostic testing service to the patient under its defined scope of accreditation. This also incorporates the operational environment in which the testing is performed, the equipment, specialist reagents and essential supplies required, as well as the qualification and competence of the staff tasked with conducting the testing service. The complexity of the quality management system depends on the scope of the service and in many larger Hospitals the QMS is managed centrally and covers the whole of the pathology services, Hematology, Blood Transfusion, Biochemistry, Microbiology including virology.

Quality Management Documentation

The documentation used within the QMS is usually organized and managed through a clear document hierarchy. The top-level documents include the Quality Manual or Services Manual which stipulate the laboratory's quality policy and objectives. These are monitored against defined quality performance indicators, such as the monitoring of the time taken to report a test result from receipt of specimen, and ensure that the service is achieving its stated quality intentions. The Quality Manual also sets out the

Fig. 1 QMS/QA component.

laboratory organization, management roles and responsibilities in relation to the scope of the services provided. This will include the range and type of tests performed, the specimen types handled, the quality control measures and internal quality assurance procedures the laboratory undertakes, as well as the external quality assessment (EQA) schemes it subscribes to. Practical information on how to order the test, referral of tests and contact details for additional clinical and technical advice are also included within the quality manual or service manual.

The procedural documents including standard operating procedures (SOPs), equipment operating procedures (EOPs), describe in detail how a specific laboratory activity is to be conducted or how a piece of equipment is to be used, who is authorized to do so, as well as when and where that activity is to be performed or equipment used. The procedural documents also describe the inputs and outputs of the procedure and where this information should be recorded. In addition to operating procedures some laboratories may also have separate specific work instruction documents. These detail the exact steps and methods to be employed when conducting a laboratory activity such as the consecutive tasks required in order to set up for the detection of a particular viral pathogen or the operation of a specific piece of equipment, for example the calibration and maintenance of a real-time Thermal Cycler. In some clinical virology laboratories, having separate work instructions means that they can be held directly within the laboratory for easy access and reference where the activity is taking place.

The inputs and outputs of a procedure or specific work instruction are recorded within a Standard Operation Record (SOR). These include paper-based records as well as electronic outputs from equipment or devices within the laboratory such as a thermal cycler or serological autoanalyzer. In these cases, the devices are interfaced with the laboratory and the records are managed through a middleware software such as FlowG (See Relevant Websites section) which collects, collates, and stores the data which can include calibration and control performance data across a range of laboratory platforms. The middleware is also linked to the general Laboratory Information Management System (LIMS) which provides secure storage and management of all the laboratory data and patient results.

Document Control

All documents within the clinical virology laboratory QMS need to undergo regular review at the specified intervals on when a particular policy, process, or procedure is changed in order to ensure that they remain fit for purpose and compliant. This is managed through a document control policy which also includes an index of all the documents within the laboratories QMS, who is responsible for each one, and when it is scheduled for review.

Many clinical laboratories have moved away from a paper-based Quality Management and document control systems towards having a commercially available QMS software management solution such as Q-pulse (See Relevant Websites section) which is able to integrate directly into LIMS and makes the management of laboratory quality assurance information more efficient and compliant with regulatory standards such as ISO15189.

Specimen Management

The ability of the clinical virology laboratory to carry out a test and to support a diagnosis depends extensively on the quality of the specimen the laboratory receives and the time it takes to get to the laboratory. Pre-analytical errors such as wrong labeling of the specimen, the incorrect specimen collection device, incorrect specimen type are the most frequently reported sources of error (between 48% and 62%) within the clinical laboratory.

In some hospitals or institutes, it is the responsibility of specific clinical virology laboratory staff to provide training on appropriate sample collection, handling, transportation and storage of the clinical specimens to be used. As a result, the clinical virology laboratory details the quality requirements of the specimen types (i.e., serum, plasma, urine, stool, etc) the laboratory is capable of processing in relation to the test repertoire offered under the services it provides. This includes specific instructions to clinicians, general practitioners, and nursing staff on how and when to take the patient specimen as well as the collection device to be used and the minimum volumes required for the test requested.

For example, most common serological tests are performed on either serum or plasma and are best tested within 48–72 h after collection in order to prevent degradation of the analytes, unless they are stored and shipped to the laboratory at between 2–8°C. In comparison, for the molecular viral load determination of blood borne viruses such as HIV, HCV, and HBV, either EDTA plasma or sodium citrated plasma is preferable to serum as the degradation of nucleic acids has been observed within serum/clotted specimens and may result in the under-reporting of the viral load result. Heparinised specimens are also not recommended for molecular testing as the heparin has been shown to inhibit techniques such as PCR, although in most modern molecular technologies this does not appear to be a problem.

Although all clinical specimens must be regarded as potentially infectious, most laboratories will also have a separate policy for the handling of potentially high-risk samples, such as those suspected of having a viral hemorrhagic fever (VHF). The policy covers the way that these specimens are handled and the labeling to be used. This will depend on risk factors identified and any regional regulatory and health and safety requirements the laboratory must adhere to.

However, the sample selection process has been improved significantly through the implementation of electronic test requisitions which allow authorized healthcare professionals such as general practitioners to request a test directly through an internet-based portal. This has helped make the process more efficient and standardized, as well as reduces both transcription and translation errors associated with manual processing. Many of the electronic test requisition systems also enable the generation of unique specimen-Patient barcodes which also help reduce the incidences of under labeling (i.e., not providing sufficient patient information in order to support a test requisition) or mislabelling as the additional information is a required field when completing the 'on-line' form and in many cases is incorporated within the barcode generated.

Transportation and Storage of Specimens

Transportation and storage can have a significant impact on the quality of the clinical specimen and hence the accuracy and outcome of the laboratory result. For example, sputum specimens should ideally be tested within 2 h of collection and stool samples within 12 h in order to prevent background bacterial flora growth masking the virologic examination. If this is not possible then the specimens can be stored at 4–8°C but only for 48 h. So, it is essential that staff are appropriately trained and follow the correct procedures which are usually defined within the laboratory's policy on the handling and delivery of laboratory specimens and in line with the requirements of any national Health and Safety at work legislation.

The transportation of samples within the hospital or institute where the clinical virology laboratory is located is usually conducted through a trained internal porter service using containers dedicated to the movement of potentially biohazardous specimens. An approved specialist courier service will usually be contracted in order to transport specimens from external sites such as clinics, General Practitioner sites to the clinical virology laboratory. Transportation of specimens by road must comply with the carriage of dangerous goods regulations within that region (See Relevant Websites section), which state the specific packaging conditions that need to be followed dependant on the risk the viral pathogen poses. In general, most specimens such as blood, excreta, secreta, for diagnostic purposes will be transported under the category B classification unless they contain live virus cultures that are known to be life threatening to humans, under these circumstances the specimens should be transported under category A. Exempt patient specimens are those with a minimal likelihood that a viral pathogen is present and include blood transfusion products, and most dried blood spot applications.

Where specimens need to be transported by air, the regulations of the International Air Transport Association (IATA) regulations are followed. In addition, where viral specimens are being transported from one country to another for reference testing, assay verification, or quality assurance purposes, etc it is important to verify whether the pathogen is regulated under any regional Human Pathogens and Toxins Regulations which could restrict its exportation and importation. Regulations vary from

country to country dependant the apparent risk associated with the activities performed and also take into consideration whether the virus is a security sensitive biological agent.

Laboratory Specimen Retention Times

Specimen retention defines the length of time clinical specimens will be retained by a clinical virology laboratory. Retained specimens are extremely important to the laboratory for confirmatory testing where required, infection control, and public health investigations, as well as for quality control and new assay evaluation. The specimen retention time will depend on the type and origin of the specimen, the needs of the patient, and also the storage capacity and capability of the laboratory. Monitoring retained specimens with regards to events such as the number of freeze/thaw cycles, viral load over time in storage, is important in assuring the quality of the specimens, particularly if they are going to be used for quality control purposes. Many clinical virology laboratories will utilize software options in order to create an inventory to track the use of important retained clinical specimens.

Personnel Training, Competency, and Continuous Professional Development (CPD)

The clinical virology laboratory operates within a highly regulated environment and in many countries the laboratories can only perform their testing service under the appropriate legal licenses.

An important aspect of human resource management particularly within the clinical virology laboratory is to ensure that all staff have defined roles and responsibilities, and they are clear on what is expected of them within the daily operation of the clinical laboratory. The structure and organization of the clinical virology human resource is dependant on the size of the laboratory, the range and complexity of the testing service provided, the volume of annual clinical specimens, and whether it is a separate independent entity or it is affiliated to a hospital or institute as part of the total pathology services provided. An organogram for the clinical virology laboratory with supporting narrative outlining the structure and reporting relationships is usually detailed within the Quality Manual and is an essential quality assurance requirement.

The head of the laboratory (laboratory Director) will usually be a licensed Medical Virologist either with a Medical Doctorate (MD) or a Senior Clinical Scientist with a MSc, PhD, or equivalent professional qualification specialising in virology. They must ensure that the laboratory has sufficiently trained and competent staff in order to provide the scope of virology testing services specified to the appropriate regulatory standards within their jurisdiction, and where required, in line with their accreditation for example to ISO15189. The laboratory director is usually supported by a consultant clinical medical microbiologist and/or virologist responsible for the overall clinical practice and decision-making process. In line with the requirements of International Standards for Laboratory Accreditation, most laboratories will have a dedicated quality manager and nominated deputy this helps avoid potential conflicts of interest between roles as the quality manager does not have any laboratory operational responsibilities and can therefore assess and monitor the quality aspects of the laboratory impartially. Larger organizations may have a separate quality manager responsible for the whole of the pathology services provided by the hospital. The advantage of this is that they are independent of the clinical virology laboratory and can inspect and advise on quality issues. The disadvantage is they may not be familiar with the technicalities of the virology testing service offered which can potentially lead to misunderstandings.

Under the direction of the laboratory director, the clinical virology laboratory will consist of technical supervisors (or technical section leaders) who lead specific laboratory sections such as the molecular, serology, or viral isolation & culture section and are responsible for the daily management of scientific and technical staff within their respective sections. The scientific and technical staff will be responsible for specimen processing, carry out the various testing procedures and other laboratory activities such as equipment maintenance and calibration. The laboratory will also have general non-laboratory based clerical support staff performing administrative tasks including medical record keeping. Other laboratory support activities such as stock management, the procurement of laboratory supplies, and diagnostic kits would may be the responsibility of a dedicated laboratory manager or may be shared responsibilities in smaller organizations or hospitals.

The human resource (HR) files for each staff member usually contains the most up to date job description, curriculum vitae, qualifications including copies of any certificates/diplomas, and laboratory licenses in regions where this is required. In addition to this training records, and details of any continuous education programs/events the staff member has undertaken are also included within the HR or personnel file, along with any relevant publications.

Each laboratory employee should be provided with a clear training plan. This should cover the preliminary laboratory training requirements, initial duties, and responsibilities, for when the individual joins the laboratory. This should be assessed regularly and if necessary, amended in order to accurately reflect the current status of the individual followed by a further personal training and development plan which supports the employee's continued professional development (CPD) requirements in line with the objectives of the clinical virology laboratory.

The effectiveness of training and the competency of employees must also be reviewed regularly in accordance with the duties the employee is expected to perform. This can be achieved through practical laboratory assessments where the test results obtained by the employee on known QC samples or residual material from an external quality assessment cycle, are introduced into the routine workload and used as a way of checking and monitoring the employee's ability over a defined period of time. Other aspects include monitoring the adherence to laboratory policies and procedures, observing performance when carrying out instrument maintenance and calibration checks, as well as the evaluation of problem-solving and data analysis skills through set

technical questionnaires. The outcome of any competency assessment exercises are recorded within the employees training matrix and competency assessment records. If a performance issue is identified further training may be required followed by a reassessment of the employees' competency. Staff training and competency assessment are key elements within a laboratory's accreditation and some regulatory organizations such as the College of American Pathologists (CAP) in the United States specify the frequency that competency assessments must take place in relation to retraining requirements and test complexity. For example, for employees within the first year of their laboratory duties, competency must be assessed at least twice a year when engaged in moderate to high complexity testing (i.e., molecular testing).

Most clinical laboratories will also have an employee handbook which is provided to each staff member when they commence work within the clinical laboratory, this usually includes guidance to the employee on human resource policies such as performance reviews, absence and holiday policies, information technology and security, as well as health and safety aspects related to the clinical virology laboratory working environment.

Laboratory Facilities and Equipment

The quality of the test results a clinical virology laboratory provides are largely dependant on its facilities, organizational set-up, and equipment used. In general, the laboratory will be organized into functional areas designed to provide a safe and effective environment that ensures the delivery of the testing services to the appropriate quality and regulatory standards.

For example, most clinical virology laboratories will have separate functional areas along the following lines:

- specimen collection and preparation area,
- general laboratory area, stores, plant room, etc.,
- molecular virology,
- serology,
- virus culture and isolation unit (Note: in some specialist virology laboratories this could be further split dependant on the type and risk level of the viral pathogen),
- non-laboratory office area.

Each area will have its own set of operational specifications which may include temperature and cleanroom air-handling conditions. These are monitored as part of the laboratories QA measures against the specifications and defined control limits. In many laboratories the monitoring is 24/7 by way of an integrated electronic system which raises an alarm directly to laboratory management 24/7 in "real-time" should a control limit be broken, who can then take immediate action. In addition, the separation of functional activities and equipment helps prevent cross-contamination which could eventually lead to erroneous test results.

Particular attention is paid to the set-up and management of the molecular virology area as molecular amplification techniques such as PCR are extremely sensitive as well as pose a significant risk of introducing amplicon-based contamination if they are not properly controlled. In order to minimize the risk, most clinical virology laboratories will use rooms with a unidirectional workflow with relative air pressures with which to separate and manage the Pre-molecular amplification activities from the Post-molecular amplification activities. The number of separate rooms or areas the laboratory implement largely depends on the facilities and space available.

Four designated areas or rooms provide the laboratory with the ability to separate the molecular activities into the reagent preparation area, the specimen extraction/processing area, the assay set-up room (template addition stage), and the molecular amplification room.

Each room has its own equipment such as biological safety hoods, pipettes, centrifuges, fridge and freezers, etc as well as a dedicated consumable/reagent store which is restricted for use within that room. Staff movement follows the direction of the workflow, and returning to previous rooms in the workflow is not allowed. Personal protective equipment (PPE) such as glove and laboratory coats are required for different rooms and is often color coded for easier visual awareness. The management of waste from the molecular facilities should be properly segregated and disposed according to the institute's disposal and infection control procedures. Amplicon contamination has been a serious problem in the past and has resulted in the shutdown of some laboratory facilities. The use of periodic wipe tests helps to monitor the laboratory environment for potential amplicon contamination. The frequency can be adjusted if any contamination is identified and thorough decontamination measures can then be put in place to rapidly address any issues found. It is also standard practice to include no template control (NTC)/negative controls in order check for potential contamination in the reagents, consumables, and general laboratory environment. Monitoring the positivity rate of the NTC over time can act as an indicator of potential contamination issues.

Equipment Qualification, Calibration, Maintenance and Monitoring

From a quality assurance perspective equipment covers instruments and software including laboratory information management systems (LIMS). Regulatory agencies (ISO15189 or equivalent) place a great deal of emphasis on the quality assurance of

equipment from initial purchase through qualification, calibration, maintenance and monitoring, to its eventual disposal at the end of its intended use and life cycle. Not only is equipment QA an important regulatory requirement, as specialist laboratory equipment is expensive the QA procedures employed can also help to increase the equipment lifespan and therefore provide an additional cost benefit to the laboratory.

Equipment Qualification

The clinical virology laboratory will have an equipment validation and/or verification plan and the initial phase of this will be equipment qualification. The laboratory will evaluate the item of equipment in consultation with the equipment manufacturer in order to define both the functional and operational specifications of the equipment as well as the cost and any preliminary installation, calibration, and training requirements. This step is often called design qualification (DQ) and is followed by installation qualification (IQ) in which the laboratory establishes that the equipment is suitable for operation and meets the manufacturers specifications as well as any regulatory claims. Operational qualification (OQ) is the third step in equipment qualification and it involves proving the equipment's performance within the clinical setting usually against a "gold standard" or predicate device. The final phase is performance qualification (PQ) where the performance of the equipment is monitored over time in the clinical setting against a defined set of performance criteria. Within industry this four-step approach has become known as the 4Qs and within clinical virology the steps are generally covered through assay verification and validation.

For the most generic equipment used within the virology laboratory such as pipettes, vortex's and microfuges the recommendations provided by the equipment manufacturer are usually sufficient for qualification for routine use. However, specialist virology equipment used for molecular and serological testing (e.g., thermal cyclers and autoanalyzer's) will require specific qualification for the equipment's intended use within the clinical context. These instruments can be fully integrated platform or cartridge based commercial assay systems which are essentially 'sample in and result out'. Alternatively, they can be component-based workflows where a combination of equipment is required to create a virology workflow which can be used to generate a test result.

This is largely the case in molecular virology, particularly for laboratory developed assays, where the extraction platform, kit, molecular amplification platform, and detection kit are combined in a molecular workflow. The virology laboratory will define the equipment qualification criterion in accordance with the manufacturers' equipment recommendations and the laboratories intended clinical use. The aim being at qualifying the laboratory equipment and monitoring performance to ensure the validity of data/result generated for the individual items of equipment as well as the whole test workflow.

Equipment Calibration

When using laboratory equipment for measurement purposes whether monitoring viral load or the temperature of the laboratory environment maintaining the quality assurance of the equipment through calibration is essential. Calibration minimizes measurement uncertainty. It also helps establish operational performance criteria which is used to monitor and control errors by ensuring that measurements remain both appropriate and acceptable.

Within the clinical virology laboratory, equipment calibration covers both the fixed plant and machinery used to control the different working environments within the clinical virology laboratory as well as the specialist instrumentation used within each of the designated laboratory areas.

Fixed plant and machinery includes the laboratory's heating, ventilation, and air conditioning (HVAC) systems which are designed to contain any potentially infectious material dependant on the biosafety classification level (1–4, with 4 being the highest risk based on the type of virus and work to be undertaken) as well as any fitted walk-in cold-rooms and specialist culture facilities. The calibration of specialist instrumentation including biosafety hoods, – 80°C freezers, thermal cyclers, autopipettes, etc. assures the user that the instrument is working within the manufacturers defined specifications. The calibration of pipettes can readily be performed by the laboratory themselves using gravimetric calibration which is an accepted standard for pipette calibration. However, for most accredited laboratories the calibration of fixed plant and machinery and some specialist instruments (such as thermal cyclers) is usually conducted by the equipment manufacturer or an approved external contractor to an international standard such as ISO17025 or equivalent. If a laboratory decides to change the manufacturers calibration requirements this could result in the manufacturer's warrant for use being invalidated. It is therefore important that the laboratory discusses and agrees any proposed changes with the manufacturer before implementing them.

The frequency of calibration depends on the specific requirements of the equipment, maintenance and safety record, annual service plan, as well as the extent of its use. Calibration events are recorded within a "equipment/calibration log" which identifies the equipment by its assigned asset number.

Equipment Maintenance and Monitoring

The ongoing calibration, service, and preventive maintenance of laboratory equipment throughout its lifespan supports reliability and confidence in the performance of the equipment. Maintenance and monitoring should include a register of all equipment indicating serial numbers, assigned asset numbers as well a location within the laboratory. This is particularly important for

equipment that is designated for use within a single laboratory location. Within the equipment log, details of the validation and outcome of any safety inspections are recorded along with any equipment failures and servicing events.

Most laboratories will assign the responsibility for specific laboratory equipment to an operator or group of operators. It is their job to keep the equipment in good working order and to ensure that calibration and maintenance events are up to date as well as report any reoccurring problems to laboratory management.

Routine preventive maintenance ensures the equipment warranty in line with the manufacturer's recommendations and specified annual schedule. For example, the air filters within the HVAC system should be monitored and cleaned regularly and failure to do this could lead to potential laboratory contamination issues or safety issues if the filters become blocked and cause overheating. In addition, this can also lead to mechanical issues which shortened the equipment life span and become an additional cost burden to the laboratory.

Most of the environmental monitoring within the laboratory (such as temperature and pressure) is managed through wireless monitoring systems. These systems consist of operating software, specific probes/sensors, and receivers/transmitters for picking up the data and enable real-time performance monitoring throughout the different laboratory environments. If the central power fails, the equipment is covered by a back-up power system which ensures the integrity of the laboratory environments is maintained and monitored 24/7. The metrics from the wireless monitoring system usually have operational tolerances set which provide an automatic alarm which is set electronically to the designated operator when the metric is broken. This enables the laboratory to take immediate action as well as helps with the identification of trends over time.

Internal and External Audits

Internal and external audits are an essential part of the clinical virology laboratory's quality assurance armory. The purpose of the internal audit is to provide an objective overview of the laboratory's control and functional effectiveness over its policies, processes, and procedures in relation to the testing service it provides and the regulatory standard and environment it operates within. The quality manager in consultation with the laboratory management team will prepare an annual internal audit plan which sets out the areas to be audited throughout the year in relation to the relevant clauses of the standard to which the laboratory is accredited, the date and time of the audit, and those responsible for each audit area. The depth, breadth and scope of each internal audit will vary depending on the technical complexity of the area, any findings from previous audit reports, as well as any open quality activities such as corrective actions and preventative actions (CAPA). Internal audits should only be conducted by those staff members who are trained and shown to be competent auditors. In addition, those staff members being audited need to ensure that they are fully prepared prior to the audit with a full understanding of the policies and procedures they are responsible for and a list of items that could be reviewed during the audit. This helps improve the efficiency of the audit and helps ensure that internal audits are completed within the allotted timeframe. The audit should be non-directive and allow the auditees responsible for their designated areas within the laboratory to explain their processes and procedures. The auditor is then able to gain an understanding of the staff competence, identify areas that may require improvements such as additional training, as well as potential risks or non-conformances within the written policy and procedures that could ultimately lead to a non-compliance with the regulatory standard. A documented plan can then be agreed with management outlining how any findings are to be addressed before any scheduled external regulatory audit takes place.

The external audit is an independently conducted inspection usually by a national accreditation body (NAB) which assesses the laboratory's technical competence and conformity to applicable international standard such as ISO15189 or ISO17025. The audits typically follow a four-year cycle with an annual surveillance audit over a three-year period and a re-accreditation audit every fourth year. Many countries have officially appointed National Accreditation Bodies that carry out conformity assessment and accreditation activities in particular for calibration and testing. The NAB's are subject to oversight through regional co-operative bodies such as the EA in Europe, APAC in the Asia-Pacific, IAAC in the Americas, AFRAC in Africa, SADCA in Southern Africa, and ARAC in the Arabian region, all under the umbrella of the International Accreditation Forum (IAF) which aims to promote multilateral recognition arrangements (MLA) and common recognition and harmonization of the accreditation standards and practice across geographical regions. The International Laboratory Accreditation Cooperation (ILAC) supports the interests of those accreditation bodies that deal specifically with laboratory testing (ISO17025, ISO15189), measurement and calibration (ISO17511) as well as EQA or PT provider accreditation (ISO17043).

Assay Verification and Validation

The implementation of a new assay method or the amendment of an existing assay method needs to be supported by an appropriate verification and/or validation study prior to routine use within the clinical virology laboratory. Assay verification is the process of testing and reviewing an assay's performance in relation to its known or reported performance such as against the assay manufacturers' defined performance specifications as they are stated within the package insert provided. Whereas, assay validation is the process of evaluating the assay method, establishing its performance characteristics and determining its fitness for use within the clinical virology laboratory. The verification and validation requirements depend on the type of assay, its intended use, and the amount of performance data available such as from previous clinical studies. There are numerous national and International regulatory guidelines which outline the verification, validation process as in many countries this is governed by the regulatory

Table 1 Key verification and validation parameters

Assay parameter	Description/Definition	EQA monitoring	IQC monitoring
Accuracy	The closeness between values obtained from a series of test results. Where possible within the assay verification phase the test results are compared to “known” and/or an accepted reference value	+	+
		Based on consensus	“run to run”
Precision/imprecision	The ability to consistently produce the same result for a given test sample	+	+
	<i>Repeatability:</i> Repeat testing under unchanged conditions for example within a single assay run (inter-assay) <i>Reproducibility:</i> Repeat testing of the same test sample in different runs across a time period, possibly using different operators (intra-assay)	Duplicate sample/lab peer review	Inter-assay (Intra-assay)
Linear/ Reportable range	This is the ability of the assay to obtain test results which are directly proportional to the concentration of the analyte within a given range	+	+
	The reportable range (also <i>Analytical Measurement Range – AMR</i>) is the interval between the upper and lower concentrations of an analyte for which the assay has acceptable levels of <i>precision</i> , <i>accuracy</i> and <i>linearity</i>	Paired/samples	Only if more than 1 control used
The limit of detection (LOD)	The lowest quantity of a substance that can be distinguished from the absence of that substance (a blank value) within a stated confidence limit. The limit of detection can also be determined using a serial dilution of prequalified standard or reference material spiked into an appropriate clinical matrix. The dilutions are replicate tested and the results analyzed using PROBIT analysis	+	+
		“Educational” samples	
Limit of quantification (LOQ)	The lowest concentration at which the analyte can be reliably detected within established imprecision (and where appropriate bias) criterion	+	+
		“Educational” samples	95% CI of + ve result
Sensitivity (analytical and clinical)	The lowest amount of target nucleic acid that still returns a true positive result.	+	+
	<i>Qualitative assays:</i> The number of true positive samples correctly identified by the assay divided by the total number of true positive samples <i>Quantitative assays:</i> Defined from the limit of detection and where appropriate confidence interval (CI) can be calculated in order to support the chance of obtaining a true positive result	Clinically relevant/ educational samples	
Specificity (analytical and clinical)	The ability to return a “true negative” result when the target nucleic acid is not present	+	+
	Consider any potential interfering or cross-reacting substances that may be present in the specimen or matrix	Clinically relevant/ educational samples	If applicable

requirement within that country and the regulatory category of the assay method. However, the general parameters covered are the same and include accuracy, precision, reportable range, linearity (for quantitative assays), reference interval, analytical sensitivity, and analytical specificity as outlined in [Table 1](#).

Where a clinical virology laboratory uses a commercially developed assay such as one regulated and approved by the Food Drug Administration (FDA) in the US or a CE marked assay in Europe, the manufacturer is responsible for providing the clinical laboratory with the analytical performance characteristics as well as its expected clinical performance and supporting clinical data. The clinical laboratory verifies the assay performance against the manufacturer's performance claims for the its intended use as defined within the instruction manual provided with the assay. Importantly, if the laboratory modifies the commercial assay and/or instructions for intended use, the assay is no longer considered a regulatory approved assay and the laboratory would be expected to fully validate the impact of these changes on the assay's performance. It is important to remember that any changes to the manufacturer's assay or protocol without prior approval could result in the manufacturer withdrawing its support for the assay. In comparison, where the assay has been developed in house by the clinical virology laboratory often referred to as a Laboratory Developed Test (LDT), the process of validating and establishing the performance of a laboratory developed assay would be more extensive and will also include comparative testing of the new test against a previous assay for the same targets as well as reference to clinical performance within the current literature if available.

In both cases, commercial assay or LDT there is a requirement for well characterized reference material and, where available, International standards in order to support the verification and validation process as well as on-going Quality Control (see also section on Internal Quality Control Procedures and Monitoring Assay Performance Over Time). The patient samples, controls, or reference material used for verification and validation should be in the appropriate matrix and at clinically appropriate levels (if known). Where there is limited reference material available or a lack of suitably characterized patient material, the laboratory can use residual material from proficiency testing (PT) or external quality assessment (EQA) schemes. The EQA materials are generally highly characterized as well as have the advantage of comparative peer group data which can help facilitate the verification and validation process. It is also good practice to use the same assay reagent lots when conducting the verification and validation exercise in order to reduce the potential impact of variation introduced through different lots/batches of assay reagents. Finally, before undertaking any verification or validation study it is important that the laboratory ensures that the assay method is calibrated to the manufacturers requirements and there are no recalibration/maintenance events scheduled for the duration of the study.

For the verification of a regulatory approved qualitative assay, the following approach and principles would apply.

Accuracy

In order to verify accuracy a comparison of methods study can be carried out. Known patient samples which cover the assay range, and have previously been tested on the current assay method the clinical virology laboratory uses, are tested on the proposed new method over a defined period of time and the results compared. If insufficient in-house patient samples are available, the laboratory may obtain specimens from other laboratories. However, when using patient samples, it is important to ensure that the specimens have been treated the same prior to testing (i.e., storage conditions, number of freeze-thaw cycles etc). An alternative is to use commercially available control or characterized reference material containing the target of interest across the assay range. The number of samples to be tested and the frequency of testing depends on the type, complexity, and intended use of the assay method. Although some regulatory authorities do provide minimum requirements or recommendations. For example, 20 patient specimens over 2–5 testing events. The qualitative data (positive, negative) obtained is analyzed statistically using Cohen's κ analysis.

Precision

The precision of the assay method would be determined by testing one or two controls at clinically relevant levels (if known) repeatedly over a specified period of time in order to establish the between run precision. The recommended minimum time period for testing is 20 days in many guidelines. However, the testing interval should be sufficient to cover the routine operation within the laboratory, such as rotation of operators. The within-run precision can also be established by running duplicate control samples over a specified time period, usually 10 days. The results are analyzed using standard deviation and coefficient of variance and compared to the claims of the assay manufacturer or the results obtained for the current laboratory method being used.

Reportable range and limit of detection (LoD)

The Reportable range of the assay is verified using known characterized positive clinical samples at clinically relevant levels or by using dilutions of commercially available standards or reference materials tested over a period of time in comparison to the current laboratory method. The LoD of the assay is verified by testing replicate samples at known levels above, at and below the determined LoD (e.g., $\text{LoD} \pm 20\%$) or as specified within the manufacturers Instruction manual in duplicate over a defined period of time (usually 20 days). The percentage detected at each level is then calculated and Probit analysis used to estimate the LoD, which can then be defined as a titer of the target analyte detected at a 95% Confidence Interval (CI).

For the verification of a regulatory approved quantitative assay, such as a molecular assay used for the determination of viral load, the same basic principles used for verifying a qualitative assay apply for accuracy and precision although they need to be verified across the analytical measurement range (AMR) of the assay and in particular at known clinically relevant or clinical decision making concentrations.

Linearity/analytical measurement range (AMR)

In the context of a molecular viral load assay, the AMR or reportable range can be defined as the linear range of test values over which the laboratory can accurately detect the target viral nucleic acid within acceptable degrees of variation. Beyond the manufacturers stated limit of

Fig. 2 Graph showing the linear relationship of test results across multiple clinical laboratories for a dilution series of SARS-CoV2.

quantitation (LoQ) the relationship between the measured and actual viral load concentration may not be linear and test results become unreliable. It is therefore important that the laboratory verify the AMR in the clinical setting they intend to use the assay method and in line with the manufacturer's instructions and claims. In some cases, the manufacturer may only have performed an analytical assessment of AMR on contrived or synthesized control materials such as target viral nucleic acid in a plasmid construct and not true clinical samples at relevant titers. As a result, it may not be possible to establish the full analytical AMR equivalence with the manufacturer's specifications. In these circumstances the laboratory should ensure that they assess the AMR within the known clinical context and in line with the laboratory's pre-defined AMR acceptance criteria. At a minimum this should include samples at the low, medium, and high points of the AMR. Polynomial Regression analysis is used to assess the linearity of the assay across all relevant concentrations and if the relationship is found to be non-linear (not first order) those concentrations are removed from the analysis at the high and/or low end and the regression analysis repeated. The testing is usually performed in replicates (2 – 4) at each concentration and precision assessed across the linear range. The highest and lowest concentrations that produce a linear relationship are defined as the upper and lower limits of quantification. (Fig. 2) Where the AMR results are compared against the manufacturer's claims or against the AMR of the comparative method the laboratory is currently using the proportional bias, as measured by the slope of the regression curve, and the constant or systemic bias, as measured by the y-intercept, are determined. A Bland-Altman difference plot is used to measure bias between assays.

Most regulatory standards (such as ISO15189) require the laboratory to have a written policy on verification and validation. This defined the methods, frequency and limits of verification for an assay method. In general, the AMR should be verified in line with the following criteria:

- at changes of reagent lots, unless the laboratory can demonstrate that the use of different lots does not affect the accuracy of patient test results and the range used to report patient test data,
- if QC materials reflect an unusual trend or shift or are outside of the laboratory's acceptable limits, and other means of assessing and correcting unacceptable control values fail to identify and correct the problem,
- after major equipment maintenance or service,
- when recommended by the assay manufacturer.

In addition to this, some regulatory organizations may also specify the frequency of AMR verification, such as every 6 months (e.g., CAP). In most cases the laboratory will only test a smaller sub-set of linearity samples (3 – 4) at the low, mid, and high points within the AMR and only conduct further more extensive testing if these samples fall outside the acceptable criteria.

Sensitivity, Specificity, and Clinical Utility

Key factors that can impact on the accuracy of a test to deliver a result are sensitivity and specificity as well as the prevalence of the disease in the population targeted by the assay method. In the context of a serology assay either targeted at detecting the viral antigen directly or through the indirect detection of antibodies to the viral pathogen, the diagnostic sensitivity and specificity are derived from test results on clinical samples obtained from selected reference patient groups within the population. The degree to

which the reference groups represent all of the host and environmental factors within the total population targeted by the assay method can have a major impact on the accuracy of test result and its interpretation in the clinical setting. Therefore, the clinical virology laboratory also needs to consider this during the verification and validation phase, which is an ongoing process which continues for as long as the assay method is being used within the laboratory and requires constant vigilance, review, and where required reassessment. Specificity also includes any potential interfering or cross-reacting substances that may be present in the specimen or matrix. Interference is basically any non-target organism or substance that can cause a false negative result. Whereas, cross reactivity is a non-target organism or substance that can cause a false positive result. With molecular based assays this can be a problem, particularly when the assays are aimed at differentiating related viral strains. The assay manufacturer or laboratory who developed the assay should have chosen their primers and probes cautiously as well as made an initial "in silico" assessment of the available databases before testing in practice with known samples that are related taxonomically and also epidemiologically. The list of potential cross-reacting and interfering substances is usually documented within the manufacturer's instruction manual. An assessment of analytical specificity should include testing the potential cross-reacting or interfering substance at the known highest concentration that could be expected to be observed within the patient sample. A common approach, in the absence of sufficiently available clinical samples, is to use spike samples in negative matrix and also weakly positive samples (e.g., LoD + 10%) for each of the analytes of interest. From this the minimum inhibitory concentrations can be determined. For quantitative assays any potential cross-reacting targets should be assessed near the Lower Limit of Quantitation (LLOQ) and the quantified target values from spiked and unspiked samples compared and determined to be within the defined precision limits of assay.

Many variables can influence the performance of the assay method, such as the prevalence of the viral disease, the clinical setting, and type of test being performed. Therefore during the clinical evaluation of the assay it is important to consider the testing purpose such as whether it is for diagnosis, screening, or therapeutic monitoring purposes; the environment the testing is likely to take place in such as the central clinical laboratory, out-reach clinic, or point of care setting; the specimen type (e.g., whole blood, plasma, sputum etc); type of result such as quantitative or qualitative result. Two other important measures of assay performance are positive predictive value (PPV), the probability that those testing positive by the test have the viral disease, and the negative predictive value (NPV), the probability that those tested negative by the test are do not have the viral disease. Both PPV and NPV depend on the sensitivity and specificity of the test and also the prevalence of the viral disease within the population which in turn gives the assay its clinical utility. In terms of the number of specimens that should be tested during clinical evaluation in order to assess PPV and NPV, some guidelines recommend 100 negative clinical samples for the evaluation of false positive rates, and 50 clinical samples known to be positive for the target viral pathogen are considered appropriate for determining the false positive rates. The CLSI guidelines (CLSI EP12-A2) recommend a minimum 50 positive and 50 negative clinical specimens. In low prevalent diseases, it can be difficult to obtain sufficient clinical samples to conduct a full clinical evaluation. In these circumstances the clinical laboratory has to consider alternative approaches such as including materials used in previous proficiency testing/EQA scheme challenges.

Internal Quality Assessment (IQA)

"Split sampling" is an effective additional IQA measure for monitoring the whole laboratory testing process. This is where between 0.5%–1.0% of a laboratories clinical patient sample workload are subjected to internal quality assessment. The randomly selected patient samples are split and a new internal testing request generated with a unique laboratory IQA code. This IQA sample is processed through the laboratory in parallel to the original clinical patient sample. At the end of the testing process, results are generated for both original clinical patient sample as well as the IQA sample. These can then be compared internally by the laboratory quality team and any inconsistencies within the results and the report are investigated and corrective action taken through the laboratories quality system. The split sample approach is not always practice or appropriate particularly when the volume of the patient sample is small.

Internal Quality Control Procedures and Monitoring Assay Performance Over Time

Assay variation is the result of systematic and random error which is inherent to the assay method. Common sources of error or variation can be attributed to operator, instrument, reagent lot, calibrator and calibration cycle. The amount and type of variation associated with an assay method is determined during assay verification and/or validation. Having established the extent and where known the clinical relevance of the variation it is important that the laboratory continues to monitor the variation to ensure that it remains within acceptable levels. This is done through Internal Quality Control on a daily run to run basis and is often a requirement of many regulatory bodies (including CLIA and ISO). In general, a commercial assay will be supplied with a set of controls. The intended use of these controls is to monitor the assay in line with the manufacturers defined performance criteria. As such, the manufacturers kit controls are intended for use only with the manufacturers assay and in addition are often specific to a particular kit batch or reagent lot. This can mean that the manufacturers kit controls do not support the monitoring of different reagent lots over time and would not necessarily identify a drift in the overall assay performance over time (assay drift). So, it is important that the operator is aware of the potential limitation of the manufacturers kit controls. For example, many of the controls provided with the manufacturers kit controls only monitor as specific part of the process such as with molecular tests where the manufacturers kit controls may just be free nucleic acid and would therefore only be suitable for controlling the

amplification/detection steps of the assay and not the whole testing process from sample pre-treatment through the extraction phase, amplification and detection, to end result.

Consequently, many regulatory and standards organizations either recommend as “best practice” or in some cases insist on the use of independent third-party controls either instead of, or in addition to those supplied by the assay manufacturer in order to demonstrate compliance. Such recommendations are made at the International level (ISO15189, CLSI) as well as the national level (e.g., RiliBak in Germany). Independent third-party controls are also often referred to as external quality controls or run controls. They aim to monitor the complete testing process and provide an accurate, unbiased measure of quality performance independent of the manufacturers specific control or calibrator.

In general, for qualitative tests a minimum of a positive and negative control is included in each assay as specified in the laboratory procedure. This should also take into consideration the assay manufacturer’s instructions. For multiplex assays covering several different viral targets in a single assay, the laboratory may choose to rotate different positive controls for different targets within the multiplex assay over a given time period at a frequency defined within their laboratory procedure.

For quantitative tests including molecular viral load assays, the laboratory should ensure that the controls it uses are at or near clinically relevant decision levels, where known and/or as specified within the current clinical guidelines. For viral load assays it is common practice to determine performance characteristics for the control under routine laboratory conditions by testing the control over a period of time (usually a minimum of 20 times) in order to obtain sufficient data points to determine the mean and standard deviation from which suitable control limits can be established. Some laboratories calculate a rolling mean based on the last set of observations reported in order to reduce the initial amount of testing and re-evaluate the mean and control limits after sufficient datasets are obtained. Where a Laboratory is using more than one of the same instruments/platforms, they would generally perform the study on one instrument and then perform a comparison testing to confirm performance on the other instruments. Alternatively, the laboratory could opt to run alternate QC runs across platform instruments. Alternative approaches have also been suggested for establishing and monitoring the performance of serology assays based on extended historical data and peer group assessment. This is covered within article by Sally Baylis *et al.*

The most frequently used control rules applied within the clinical laboratory are those defined by Westgard (See Relevant Websites section). The performance can be monitored graphically by plotting the measurements in Levey-Jennings control charts and any deviations from the expected performance can be investigated and the appropriate corrective action taken if required. There are numerous web-based software packages available for the reporting and monitoring quality control data. Some such as Acusera 24.7 (See Relevant Websites section) offer LIMS connectivity, interlaboratory peer group assessment, as well as the ability for the laboratory to further interrogate parameters such as specific operator, and instrument associated with a particular set of QC data. This enables the laboratory to proactively monitor QC performance and identify important trends or shifts in expected results over time which may impact on the assay performance and ultimately the patient test results.

Suitable Standards, Reference Materials and Controls to Support Quality Assurance in Virology

International standards are essential to quality assurance in virology as they provide the means for the calibration of quality control and EQA materials which in turn help support the comparability of results across assay methods and provide confidence in the ability of the laboratory to deliver accurate and reproducible patient test results. In particular, the utility of viral load assays has improved significantly through the calibration of assays to the available International Standards particularly where patient management depends on the ability to relate patient results to prior results or to defined viral load values which support clinical decision making in line clinical practice, such as in the monitoring of post-transplant CMV infections.

The development of WHO International standards is covered in chapter (Sally Baylis), however in the context of clinical virology, and in particular the quantitation of viral nucleic acid, the concepts of metrological traceability as defined in ISO17511 (In vitro diagnostic medical devices – Requirements for establishing metrological traceability of values assigned to calibrators, trueness control materials and human samples) which are widely used in other areas of laboratory medicine such as clinical chemistry can generally be applied to molecular viral load assays. Metrological traceability describes the steps through which a patient test result can be traced back to a relevant higher order standard and the uncertainty of measurement in relation to each step estimated in a common unit of measurement. The highest order of standard would be one which is ultimately traceable to the metric system/international system of units (SI). WHO International standards are derived by consensus and are not ultimately traceable back to an SI based value and do not have an assigned uncertainty of measurement nevertheless their utility and importance in driving standardization in molecular virology continues to be demonstrated.

Additional to the WHO initiatives, other international organization such as NIST (National Institute of Standards and Technologies) and LGC (Laboratory of the Government Chemist) have supported the development of methods such as Digital PCR (dPCR) which enables the counting of individual target viral nucleic acid molecules. Recent interlaboratory studies have demonstrated the accuracy and reproducibility of dPCR for the absolute quantification of DNA copy number concentration in comparison to techniques such as flow cytometry and isotope dilution-mass spectrometry. Thus, the inclusion of dPCR within the latest version of ISO17511 means it has the potential to become a recognized SI-traceable primary reference measurement procedure. However, dPCR still has limitation in the same context as any other PCR based methodology such as assay bias. Therefore, understanding the relationship between International Units (IU) and digital copies in a clinical context and across different non-PCR based molecular technologies such as Transcription Mediated Activation (TMA) used by Hologic, Strand

Fig. 3 Schematic of the EQA cycle.

Displacement Amplification (SDA) employed by BD ProbeTec, etc is essential in further supporting standardization. In addition, the commutability of quality control or reference materials needs to be demonstrated relative to the patient specimen and assay technology it is tested on in order to further support comparability of results.

The development of an International standard is primarily based on public health need. However relative to the number of viral pathogens routinely tested in the clinical laboratory there are very few International standards and certified reference materials (CRM) available with which to calibrate secondary standards and commercially available controls. Therefore, technologies such as dPCR and Next Generation Sequencing (NGS) enable commercial control manufacturers to molecularly characterized the materials in the absence of an International standard. When an International standard becomes available these materials can then be back calibrated to the standard to achieve further traceability.

External Quality Assessment and Performance Criteria

External quality assessment (EQA) or proficiency testing (PT) is integral to quality assurance within the clinical virology laboratory. It provides assurance and confidence in the laboratory's procedures and service provision. It also enables the laboratory to compare its performance to other laboratories carrying out similar tests, as well as provides an indication of areas for quality improvements. The participation in EQA is often an accreditation requirement as defined in ISO15189 and more recently ISO22870 which covers the specific use of point of care testing within the clinical laboratory setting. In many countries it can be a mandatory requirement with laboratories required to report their EQA performance to the national body within that region. In these circumstances, EQA is often linked to the test reimbursement policy within specific countries. The EQA provider, is also required to ensure that the EQA schemes it provides fulfill the requirements of ISO17043 (Conformity assessment – General requirements for proficiency testing) (Fig. 3).

The EQA cycle starts with the EQA provider, supplying registered laboratories with "blinded" clinically represented samples at predetermined intervals throughout the year. The laboratory is required to test the EQA samples using its routine laboratory method and return their results through a web-based portal to the EQA provider within a defined period of time. Data analysis is carried out by the EQA provider and an EQA report which details the laboratories individual results and peer group performance is provided to the clinical laboratory along with a certificate of participation. In regions where there are defined national EQA performance criteria for specific target analytes, such as in Germany for the viral load determination of HIV, HBV, and HCV, the EQA provider will also report whether the laboratory has achieved the required level of proficiency.

EQA Design and Objectives

As molecular diagnostics account for the majority of the test output of the clinical virology laboratory, EQA design has progressed in order to meet increasing demand. Specialist EQA providers such as QCMD (See “Relevant Websites section”) which focus specifically on the provision of EQA within the area of molecular infectious disease offer a growing range of schemes covering viral quantitation, as well as the genotypic analysis for the detection and typing of drug resistance variants based on nucleic acid sequencing using techniques such as NGS.

The design and objectives of a clinical virology EQA scheme is dependant on many factors such as the type of method (e.g., qualitative, quantitative, sequencing, typing), its intended use, the matrix. In addition to this, in some countries where there are mandatory EQA schemes the regional regulatory bodies will often define the number and type of EQA samples that can be included within the EQA panel as well as the frequency of distribution to the laboratory (e.g., once every 6 months in the US and in Germany).

Within the example shown in [Fig. 4](#), the EQA panel consisted of two different viral strains of HIV, at a range of different clinically appropriate viral loads with the lower titer sample included to assess the sensitivity of the participating laboratory tests. In addition to this the panel also contained a negative matrix only sample in order to assess absolute specificity/false positivity. The inclusion of duplicate samples within an EQA challenge and across EQA distributions also supports the evaluation of homogeneity and reproducibility of the EQA panel members.

For many quantitative EQA schemes, the assessment of performance is based on the consensus mean of results returned by all laboratories which tested the EQA sample, once any outlying values have been identified statistically and removed from the initial analysis. Alternatively, the consensus mean of the assigned method or technology peer group can also be used, such as in the example in [Fig. 5\(a\)](#) and [\(b\)](#).

In both approaches the mean and standard deviation are calculated accordingly and a sample performance score based on the distance the laboratories result is from the consensus mean is established. In the example provided, zero points if the result is within one standard deviation from the mean. One penalty point if the result is between one and two standard deviations, two penalty points within two and three standard deviations, and three penalty points if the result is more than three standard deviations from the mean.

The regional regulatory bodies have oversight of viral diagnostic testing for regulated analytes such as the blood borne viruses HIV, HBV, and HCV in some countries and define the minimum performance criteria for laboratories participating in these EQA schemes. For qualitative tests, failure of the laboratory to obtain results within 80% of the overall consensus is considered unsatisfactory and laboratories which fall outside this range require investigation, the outcome of which may involve escalation to the regulatory body.

Fig. 5 Example of performance scoring within the HIV viral load EQA scheme. (a) Qualitative and quantitative panel score. (b) Individual sample analysis (quantitative).

It is important that clinical virology laboratory management and operational staff evaluate the outcome of the EQA schemes through regular quality meetings. A preliminary step is ensuring there are no administrative transcription errors which could inadvertently affect performance. The laboratory should also compare their results to previous EQA distributions and in line with known performance characteristics for the assay as defined through verification/validation and IQC monitoring. Where the IQC indicates that the performance of the assay is acceptable but the EQA indicates a possible quality issue, the laboratory should investigate further and if required obtain further information from the EQA provider as well as the assay manufacturer (if the assay used is commercially available).

As well as meeting regional regulatory requirements, EQA schemes also provide the laboratory with educational feedback in relation to the test coverage for current clinically relevant viral strains, the incidence of false positive results, and differences in laboratory performance with a specific assay or technology. This also includes the monitoring of observed trends in laboratory EQA reporting over time, such as the move from reporting results in copies/ml and the gradual increase in the reporting of EQA results in IU/ml following the introduction of the first WHO International Standard for CMV viral quantitation and more recently the range of gene targets in assays targeting SARS-CoV-2 (Fig. 6(a) and (b)).

The aim is to ensure optimal quality performance and compliance with the accreditation standard and regulatory authority. In addition, participation in EQA schemes also helps identify possible areas for improvement and ensure that the assay is clinically fit for purpose.

Summary and Future Aspects of QA to Virology Laboratory

Viral tests are fundamental for patient management in diagnosis, infection control, and disease outbreaks where the rapid assessments of disease burden and progression is essential for evaluating the effectiveness of interventions and the verification of disease status. Technologies such as Next Generation Sequencing (NGS) and metagenomics allow the whole genome characterization at the nucleotide

level which as well as enhancing diagnostics also aids rapid epidemiology and infection control which is particularly important in relation to the recent Coronavirus pandemic. These technologies require advanced analytical and artificial intelligence software algorithms which support the extraction of diagnostic information. This poses additional challenges in quality assurance which will need to be addressed before such technologies can reach full routine potential and further drive diagnostic improvements as they become more accurate, simple, and affordable for use across a wide range of intended clinical settings.

Biosafety and Biosecurity in Diagnostic Laboratories

Hannimari Kallio-Kokko, University of Helsinki and Helsinki University Hospital, Helsinki, Finland

Susanna Sissonen, Finnish Institute for Health and Welfare, Helsinki, Finland

Introduction

Biosafety and Biosecurity

Biosafety and biosecurity are not unambiguous concepts but have different meanings in different contexts.

In laboratory context, biosafety usually refers to “the containment principles, technologies and practices that are implemented to prevent unintentional exposure to pathogens and toxins, or their accidental release” (WHO Laboratory Biosafety Manual, 3rd edition). Biosafety aims to protect the workers, the community and environment. Many common laboratory practices such as good microbiological practices and procedures, use of personal protective equipment (PPE), decontamination and disinfection procedures or the use of safety equipment such as biosafety cabinets are part of laboratory biosafety.

Laboratory biosecurity refers to “institutional and personal security measures designed to prevent the loss, theft, misuse, diversion or intentional release of pathogens and toxins” (WHO Laboratory Biosafety Manual, 3rd ed.). Laboratory biosecurity involves responsibility for the protection, control and accountability of biological materials. Measures that prevent the malicious use of pathogens and toxins such as permits and licenses for the handling, import and export of biological materials, physical structure of the laboratory facilities, restricted access or even ethical codes for life scientists can be regarded as biosecurity measures.

Diagnostic Laboratories

Diagnostic laboratories handle human/animal samples that potentially contain hazardous microbes, and to ensure safe working environment to all personnel, the working practices maintained should follow thorough risk assessment at all stages. The safe working practices in any laboratory contain codes of conduct, competent and appropriately trained staff, good microbial practices and procedures at all stages of handling potentially infective material. In addition, laboratory facility and equipment in use should be appropriate. Regardless of the focus of a laboratory, the possibility of highly contagious viruses, bacteria, fungi, parasites or prions being present in same sample should be taken into consideration, and be included in the risk evaluation to cover safe handling of samples and to ensure choice of proper and effective disinfectants.

The selection and types of diagnostic assays performed in a laboratory affect the probability of risks as do e.g., the level of need for manual handling of samples. Working procedures that contain vigorous shaking (vortexing) or centrifugation of patient samples demand special biosafety precautions. Also assays that aim to concentration or multiplication of infectious agents (e.g., virus cultivation) cause special requirements for both the biosafety level of the facilities and utilization of other safety measures including PPE. The use of automated laboratory assay systems reduce the risk caused by manual sample handling, but problems in the function of machines rise another type of challenges, and handling and cleaning of possibly contaminated laboratory equipment is an important part of risk evaluation, the suitability of effective disinfectants should be ensured also with the equipment manufacturer.

Even though potential to the presence of hazardous microbes is a reality in all diagnostic laboratories, and good basic laboratory practices, e.g., no eating or drinking in the laboratory are the ground for assuring laboratory biosafety, differences in the probability of highly contagious pathogens do exist. The epidemiological situations vary in different countries, leading also to differences in the level of immunity and susceptibility of individuals in the community. The type of a laboratory affect the sample material handled and assays performed, and laboratories providing advanced diagnostics and diagnostics for high threat pathogens need more control measures and enhanced biosafety precautions to be obtained.

Laboratory Biosafety

Biological Agents

Microorganisms are classified into four risk groups (1 – 4) based on the severity of the risk caused by the microbe to both an individual and the community. The severity of the disease, the transmissibility to other individuals as well as the availability of effective treatment and preventive measures affect the classification.

Risk group 1 contains microbes that are unlikely to cause a disease in healthy humans.

Risk group 2 contains microbes that are able to cause disease in humans, but are unlikely to cause serious threat to the environment or community. In case of an infection, effective treatment and preventive measures are available.

Risk group 3 contains microbes that usually cause serious disease in humans, but pose a limited risk of spreading to the community, and effective treatment and preventive measures do exist.

Risk group 4 contains microbes that usually cause serious disease in humans, and can easily be transmitted from one individual to another with no effective treatment or preventive measures usually available.

For a single microbe, the classification may vary between different countries due to e.g., epidemiological situations or existing levels of immunity. Risk groups 2–3 contain viruses, bacteria, fungi and prions whereas all agents belonging to risk group 4 are viruses.

For occupational evaluation of risks caused by handling microorganisms, it should be noted that the list of classified agents is based on the effect of those agents on healthy individuals only. Pre-existing disease, ongoing medication, compromised immunity, pregnancy or breast-feeding may affect the susceptibility to a pathogen. Therefore, special care should be taken when evaluating the risks of even microbes with lower classification for personnel on whose susceptibility may be affected for one or other reason.

Laboratory Biosafety Levels

To ensure the safe working environment in laboratories, there are traditionally also four laboratory biosafety levels, which describe the level of the biocontainment structures and precautions required to handle biological agents in an enclosed facility. The classification is designed to provide protection to personnel, the environment, and the community. Biosafety level designations are a composite of the laboratory facilities, equipment, practices, operational procedures and PPE required for working with biological agents from the various risk groups (1 – 4). Differences between laboratory biosafety levels include requirements for ventilation systems, waste management, access control and safety practices such as work practices and the use of PPE. The lowest biosafety level with least specific requirements is level 1 (BSL1) precautions getting stricter step by step to the highest level 4 (BSL4). In BSL3 and BSL4 laboratories, special engineering and design features are required to prevent the accidental release of the pathogens from the laboratory. Also special training in handling the pathogens is required for the workers in high containment level laboratories.

The risk groups of biological agents relate but do not equate to the biosafety level of laboratories. The assignment of handling an agent to a biosafety level for laboratory work must be based on a risk assessment covering all working procedures. Currently not only the classifications of agents and facilities but especially the risk based and the evidence-based approach to biosafety are emphasized more and more. WHO is updating the Laboratory Biosafety Manual, and when evaluating the risks, the main principles will be the same with the consequence of exposure and release, and likelihood of exposure varying from low to high. The response to the likelihood of the risks will contain core requirements (equivalent to BSL2 without BSC) for handling lower levels of risks, and as the risks elevate, heightened control measures are needed (equivalent to BSL2+ and BSL3), ending to maximum containment procedures (equivalent to BSL4) if the highest risks are being present.

Types of samples handled and diagnostic assays performed affect the needs for biosafety precautions, e.g., the propagation of risk group 4 viruses demand the highest level of biosafety practices. Procedures on samples that might contain agents with potentially severe consequences or on samples with known pathogens of high consequences need the highest level of biosafety practices obtained.

Risk Assessment

Risk assessment is the process in which the risk(s) of working with hazards are assessed and evaluated. Based on the risk assessment the necessary control measures are determined to reduce the risk to an acceptable level. A hazard is something that can cause harm. A risk is the combination of the probability of the hazard to occur and the severity of the harm. Strategies for risk reduction in microbiological work include also the possible elimination of the work, substitution with an alternative organism/activity, isolation of the hazard, use of engineering controls, use of administrative controls and use of PPE. As the risk assessment is the basis for the work safety, laboratories should have a routine for assessing risks, laboratory directors and principal investigators having the responsibility for follow up of proper evaluation and optimal practices.

Risk assessment should take into account the pathogenicity of biological agents handled, mode of transmission of these agents, volume and concentration of infectious material handled. The presence of other risks such as use of needles and sharp items, high risk of creation of aerosols during working procedures, or use of hazardous chemicals and inflammables are included into evaluation. Also the availability of effective treatment or prophylaxis in case of accidental exposure is to be considered. The types of patient samples handled in the laboratory, the types of analyzes performed on the samples (e.g., the potential of aerosol formation), and the facilities available affect whether the risk can be safely handled. The route of transmission and the transmissibility of the agents affect the safety procedures selected for each work stage.

The risk assessment should also cover the evaluation of effective decontamination methods and safe waste handling procedures as well as biosafety precautions. Training of the personnel is a key factor for ensuring the proper biosafety cultures in all laboratories, and the role of maintenance personnel (e.g., cleaners, technical personnel, maintenance personnel of laboratory equipment) should be included.

Routes of Transmission and Infective Dose

In laboratory setting, the route of transmission may be different as compared to naturally acquired infections. Intact skin protects well against most microbes, but e.g., wounds or atopic eczema can break down this barrier. Mucous membranes and eyes are

vulnerable, and serve a possible infection route for several microbes. In laboratory settings the most probable transmission routes for infective agents are through blood (needle stick accidents or cuts with sharp objects), mucosa and airways (spills or splashes into mouth, nose or eyes, through generation of aerosols), or gastrointestinal route (spills, by touching mouth with contaminated fingers or while consuming food in laboratory).

All patient samples are considered potential to transmit infection to a laboratory worker. High risk of transmission is associated with contagious blood (blood borne pathogens e.g. HIV), nasopharyngeal specimens and other respiratory samples (air borne pathogens e.g., influenza viruses), feces (e.g., norovirus), brain biopsies and central nervous system specimens including cerebrospinal fluid (e.g. rabies virus, prions), tissue specimens, and skin biopsies and blisters (e.g., poxviruses and herpes simplex viruses). The most often reported ways of acquiring laboratory associated infections include splashes or sprays of infective material, needle stick injuries, accidents with sharp objects, and earlier also mouth pipetting. Working procedures such as pipetting and pipette spills on surface, taking blood samples or handling blood tubes as well as the usage of centrifuges, blenders, shakers, mixing instruments, and sonicators pose elevated risk for aerosol generation.

The infective dose is the number of microbial particles needed to cause an infection, and it has an important role while evaluating the level of risk caused by handling the patient samples or enriched cultivations. For e.g., norovirus the infective dose is estimated to be as low as only 10–20 virus particles.

Personal Protective Equipment (PPE)

PPE is meant to block the direct transmission of an infective agent to a worker, and should be worn in circumstances where a risk assessment has shown the continuing needs for personal protection. PPE is usually regarded as the last measure to prevent the exposure to infectious agents; all other control measures such as the use of engineering controls should be applied before using PPE. PPE must be suitable for the purpose, suitable for the person and used correctly.

The selection on the PPE is based on the risk assessment. Protective clothing, gloves for hand protection, facial masks for respiratory protection, and goggles and/or face shield for eye protection are examples of personal protective equipment available. It is recommended to avoid wearing protective laboratory clothing outside the laboratory, e.g., in canteens, coffee rooms, offices, libraries, staff rooms and toilets. While working in higher containment facilities, selected PPE is always put on prior to enter to, and removed before exit from the facilities.

Protective clothing is considered the basic PPE used in all clinical laboratory settings. The selection of the material of protective clothing is based on the type of work performed. In case of a constant risk for heavy spills, the material should be water resistant, if no risk for heavy spills also water repellent material can be a choice. In case of contamination of the clothing during work, the decontamination of material by e.g., autoclaving before sending to laundry unit is obligatory. Especially in higher containment facilities, also disposable clothes, or positive pressure suits ventilated with motor unit are used.

As the material of protective gloves vary, the selection is on the potential hazard (microbial and/or chemical). Nitrile has good shield against viruses and high or medium protection against some chemicals (high against e.g., glutaraldehyde, sodium hydroxide and hydrogen peroxide, medium against e.g., 70% ethanol, but not recommended against e.g. acetone or methanol). Latex is good against microbes, but pose a risk of allergies and does not protect against organic solvents. Vinyl is not suitable for work with highly infectious material. Standards, such as EU standard EN374-5:2016 “Protective gloves against dangerous chemicals and micro-organisms” help in selecting the proper material for intended use. Glove packages should be marked with pictograms, which indicate the suitability of the glove against chemical and biological risks. After selecting the correct material, also proper way of using gloves is important. Appropriate gloves are to be worn for all procedures that may involve direct or accidental contact with potentially infective patient samples such as blood or body fluids, other potentially infectious materials or infected animals. Regular change of gloves while working, especially in case of a potential spill to hands, and removing the gloves aseptically is crucial to prevent contamination. Also cleaning the hands after removal of gloves ensure transmission prevention.

For respiratory protection, several different types of masks are available, mask types varying in the level of protection provided. When working with material posing a high risk for airborne transmission, surgical masks offer the lowest protection for the worker, and FFP3/N-95 masks provide a better protection, assuming the person have passed the fit test with the FFP3/N-95 mask selected. Respirator with motor unit using filters against chemicals and/or microbes are a good choice when needed.

To ensure best practices, the training of personnel should include the correct selection and use of PPE as well as the correct dressing and undressing procedures, keeping in mind that after each working period the outside of the PPE is considered potentially contaminated.

Biosafety Cabinets

In diagnostic laboratories, biosafety cabinets are in use to protect the worker as well as to protect the sample from contamination. Biosafety cabinets use laminar airflow for cabinet air, and e.g., High-Efficiency particulate air (HEPA)-filters for incoming and/or exhaust air to capture potentially hazardous particles. Class I cabinet does not filter the incoming air, so while working in these only the worker is protected from contaminating agents. Class II cabinets drive both incoming and exhaust air through filters, and thus protect both the worker and the sample (Figs. 1 and 2). Class III cabinets completely isolate the sample from the worker and are the safest choice for work with highest threat pathogens (Fig. 3). In class III cabinets both incoming and exhaust air is filtered, and the cabinet connect to ventilation system through hard duct connection.

Fig. 1 The air flow system in biosafety class II cabinet. Green arrows = Room air or filtered air to exhaust; blue arrows = Filtered air inside the cabinet; red arrows = Contaminated air before filtering.

With class I and II cabinets, working practices affect the safety of the cabinet, vigorous moving of hands or blocking of the cabinet's air circulation system by paper or material causing loss of safety. After each working session the cabinets are cleaned and treated with disinfectants chosen according to risk assessment, special care is taken when handling samples for nucleic acid detection assays to reduce the possibility of nucleic acid contamination, e.g., by using disinfectants that also break down nucleic acid chain residues. Proper training of personnel is crucial to ensure the optimal protection provided by biosafety cabinets.

Decontamination and Waste Management

Very important is to carefully plan and instruct the disinfection practices of all laboratory work spaces as well as laboratory equipment, which have been in contact with potentially infectious agents. Selection of decontamination method is based on the evaluation of the properties of microbial agents handled in the laboratory. Use of disinfectants should follow the instructions provided by the manufacturer, and the suitability on special laboratory equipment confirmed from the equipment manufacturer. To ensure proper effect, the concentration of disinfectants used, the contact time of disinfectant on table surfaces or equipment, and the storage of the disinfectant should always be as instructed by the manufacturer.

Several disinfecting chemical agents are available: aldehydes (e.g., glutaraldehyde and formaldehyde), alcohols (e.g., ethanol and propanol), biguanides (e.g., chlorhexidine), phenol compounds, halogens (e.g., chlorine compounds and iodine), quaternary ammonium compounds, and peroxygens (e.g., hydrogen peroxide and peracetic acids). Of these, peroxygens have the widest effective range against viruses covering both non-enveloped and enveloped virus groups. In some facilities, also UV-light (germicidal UV-light, 254 nm radiation) and ozone are in use for decontamination. Special attention to selecting the decontamination method is crucial when specimens handled in a laboratory have potential to contain highly resistant agents such as bacterial spores or prions.

Fig. 2 An example of a class II biosafety cabinet.

Safe collection of all waste including sharp material (e.g., needles and pipette tips) prevent the risk of laboratory accidents and assure safe waste management at all stages. All waste is to be collected to specific waste buckets, and the content marked to assure safe disposal of the buckets. Special attention is required on the selection of waste buckets used for highly contagious waste, these should be leakage proof and sealed for safe transportation.

When found necessary waste management should include decontamination of waste before disposal by chemical ways, heat inactivation or autoclaving depending on the potential infectivity of the waste (e.g., primary samples or virus cultivations). Incineration of special waste and safe transportation to disposal unit are also important. In higher containment laboratories, decontamination of sewage water is also required either by heating or by chemical ways before release to sewage system. In higher containment laboratories, fumigation of the facilities with e.g., hydrogen peroxide or formaldehyde is required on regular basis to ensure the safe maintenance of the facilities and laboratory equipment.

Emergency plan including the choice of methods and disinfectants is important to ensure the quick and effective response in case of unexpected events.

Laboratory Accidents

Exhaustive reports on laboratory-acquired infections are scanty. According to the studies, many laboratory accidents and laboratory-acquired infections originate from human factors such as insufficient training, lack of PPE, lack of risk assessments or inadequate risk assessments, lack of standard operating procedures or negligence of following the existing instructions. The best way to prevent laboratory accidents is by thorough education of the staff and maintenance of good laboratory practices on daily basis. Programmed action points and emergency plans in case of an accident prevent/mitigate effectively serious consequences.

In laboratory settings, accidental routes of pathogen transmission include ingestion, injection, cuts and abrasions, and inhalation of infectious aerosols. According to published studies, in many cases the route of exposure remains unknown. Of the identified cases, it is usually by inhaling infectious aerosols. An aerosol is a colloid of fine solid particles or liquid droplets, in air or another gas. An aerosol with a diameter of 5 μm or less can remain airborne for a long period of time, spread wide distances, and is easily inhaled. Proper PPE such as masks or respirators are to prevent primary contact. To mitigate the risks connected to aerosol generating procedures also the use of sealable buckets for centrifugation and opening the buckets only in biosafety cabinet offer best protection in case of e.g., broken tubes during centrifugation.

Fig. 3 An example of a Class III biosafety cabinet.

In case of a spill of infectious material to mucosa or eye, thorough rinsing with clean water is usable first aid, and proper first aid, e.g., eye shower, should be available. In case of wounds to skin gentle cleaning with soap and water, and thorough rinsing with clean water are usable first aid. To prevent the serious consequences of accidents with certain known and preventable microbes, also post exposure prophylaxis is available (e.g., HIV drug administration after a needle accident while handling HIV-positive patient blood sample or rabies-immunoglobulin administration and/or vaccination after exposure to potentially infective sample from a rabies patient or animal). Prophylactic possibilities are included in the risk assessment.

Occupational Health and Special Groups

Occupational health has an important role in providing guidance and in evaluating the workers ability to work in laboratory settings. Management of the facilities assure that both physical and mental health requirements are covered. Vaccines offered by occupational health for vaccine-preventable infectious diseases, such as influenza and hepatitis B are widely used for additional preventive measures, and can offer a protective method in addition to following good laboratory practices and using PPE. Use of vaccinations should be included in risk assessment especially if work contains virus cultivation or handling high virus concentrations of certain pathogens, e.g., rabies virus and TBE virus.

Planning of working profile is important especially with special groups, which are more vulnerable to infections due to their health status or ongoing medication. Special planning is important e.g., with pregnant women, immunocompromised workers, or workers suffering from atopic eczema or allergies against e.g., disinfectants or other material used in PPE (e.g., chlorine or rubber). The need for regular, medical examinations should be included in the risk assessment.

Shipment of Clinical Specimens

As samples often need to be transported from the medical unit taking the samples to diagnostic laboratory doing the microbiological analysis, laboratory has an important role also in instructing the clients to send the specimens. Instructing covers the selection of appropriate tubes for different specimens and assays, proper ways of packaging including the usage of

Fig. 4 An example of a package for transportation of Category B substances.

leakage proof tubes, adsorbent and secondary package, and transportation systems available. International and local regulations guide the transportation of potentially infective samples. International Air Transport Association (IATA) supports aviation with global standards for e.g., airline safety and security, and offers instructions and guidelines for air transportation of highly infectious material. Category A samples listed by IATA demand more extensive safety procedures than Category B samples with lower infective potential (Figs. 4 and 5). Shipment of samples containing potentially highly infectious material demands careful planning and instructions in laboratories, special training in packaging and shipment, and well-organized contacts to couriers.

Laboratory Biosecurity

During the last decades, the concerns for the deliberate malicious use of pathogens and toxins have arisen. Many pathogens and toxins can be used intentionally to cause harm for humans, animals or the environment. Laboratory biosecurity measures prevent the malicious use of micro-organisms. Also the information and knowledge related to pathogens as well as materials like laboratory equipment can be controlled by biosecurity measures.

Microbial agents have a dual use nature: they can be used in benign diagnostics, research or commercial purposes but they can be also used in malicious purposes. It can be difficult to prevent the unauthorized use of biological agents since the same agents can be found in nature. Even the diagnostic laboratories should take the possibility of malicious use of micro-organism into account, even though the probability of malicious use is limited.

Biosafety and biosecurity practices usually comply, and often biosafety and biosecurity measures must be integrated to have an effective biosecurity system. In some cases, biosafety procedures and biosecurity procedures may be in conflict. For example, the list of biological agents handled in the laboratory can be available for safety purposes but at the same time this information should be limited for security purposes.

The key components of laboratory biosecurity are physical security and access control, personnel reliability, information security, transport security and accountability for materials. In addition, biosecurity awareness and emergency response planning are integral parts of an effective biosecurity system. Physical security control measures are used to prevent unauthorized access to sensitive biological materials or information. Physical security measures also improve laboratory biosafety since they restrict the access to the laboratory to only those personnel who are trained to work with the pathogens. Also personnel reliability measures prevent the pathogens and toxins out of the hands of individuals who might have malicious purposes. Personnel who handle or transport dangerous pathogens should be trustworthy, reliable and competent to perform their duties.

Fig. 5 An example of a package for transportation of Category A substances.

Some information related to the working with biological agents can be sensitive and must be kept secure. Sensitive information can include, for example, the list of infectious agents and samples handled and stored in the laboratory, list of key personnel or laboratory security plans. Accountability for materials and inventory control mean that the laboratory should have an up-to-date overview of high-risk materials that they are handling and storing. Transport control ensures that the national and international rules for packaging, transport, import and export are being followed when biological agents are being transported. The biological material should only be sent to trustworthy and legitimate receivers, and the transport should be performed by approved couriers.

The biosecurity measures needed are defined in the risk assessment. Basis of biosecurity in diagnostic laboratory consists of proper training of the personnel including also keeping up the knowledge of restricted sharing of information with third parties and restricted access to classified information. Restricted access to the facilities, including access control and follow up are also crucial. Thorough records and documentation of storages are also important to facilitate good follow up of all material that can potentially cause risk to the environment or that could be misused. Restricted access to delicate information of the facilities and the security systems ensure biosecurity.

Biorisk Management System and Legislation

Biorisk management system describes the management of both biosafety and biosecurity risks. National legislation, regulation and policies as well as international regulation, policies and guidelines often set requirements that are related to laboratory biosafety and biosecurity. Some countries have strictly regulated biosafety and biosecurity systems.

There are several international guidances and standards that are related to biosafety and biosecurity, such as WHO Laboratory Biosafety Manual, Biosafety in Microbiological and Biomedical Laboratories (BMBL) or the ISO 35001 Biorisk Management for Laboratories standard. Laboratory quality standards such as ISO 17025 General requirements for the competence of testing and calibration laboratories and ISO 15189 Medical laboratories – particular requirements for quality and competence comply with the implementation of laboratory biosafety and biosecurity.

National and international Biosafety Networks aim to promote biosecurity and biosafety aspect in different laboratories by e.g., sharing best practices and by organizing training on biosafety and biosecurity for laboratory professionals. In many organizations, Biosafety Officer or Biorisk management advisor is the professional with expertise on biosafety and biosecurity regulations and safe practices, and responsible to supervise and guide personnel in matters connected to biosafety and biosecurity, e.g., in evaluating the risk assessments.

Screening for Viral Infections

Walter Ian Lipkin, Nischay Mishra, and Thomas Brieese, Columbia University, New York, NY, United States

© 2021 Elsevier Ltd. All rights reserved.

Introduction

Viral diagnostics are increasingly significant for public health and clinical medicine. Recognition of an infectious disease as viral was once important only as an insight that allowed practitioners to exclude the need for antibiotics. Tools for virus diagnosis, surveillance and discovery have become more urgent with the expansion of the inventory of effective and specific antiviral drugs, and of the emergence of new zoonotic agents that require assays to facilitate containment and to direct investments in vaccines. An additional incentive is the evidence to support new models of diseases wherein viral infections result in autoimmunity, neurodevelopmental damage, or neoplasia, that manifest months to years after the infection has resolved.

In this article we will review the status of histopathology, culture, and molecular and serological assays in clinical and environmental microbiology.

Pathology

Before the advent of high throughput genetic methods for detection and characterization of viral sequences the majority of viruses were detected using electron microscopy. Prominent examples of viral discovery enabled by electron microscopy include tobacco mosaic virus, ebolavirus, variola major virus, norovirus, polyomavirus, and SARS coronavirus (Kausche *et al.*, 1939; Breman *et al.*, 2016; Van Rooyen and Illingworth, 1944; Long *et al.*, 1970; Kapikian *et al.*, 1972; Haycox *et al.*, 1999; Nicholls *et al.*, 2003). Electron microscopy continues to be an important tool in virology where it is increasingly employed for confirmation of a molecular finding rather than as the first step in investigating outbreaks of infectious disease. Readers may wish to see Goldsmith and Miller for an excellent review of the history and use of electron microscopy in virology (Goldsmith and Miller, 2009). Histopathology and immunohistochemistry, too, have shifted from primary roles in viral identification to applications for viral biology and pathogenesis. In the earliest applications of polymerase chain reaction (PCR) in viral discovery, primer selection was guided by findings in analyses of clinical materials using panels of antisera to a wide range of viruses or hyperimmune sera from patients with specific diseases. In our own work with Sherif Zaki for example, immunological cross reactivity facilitated the discovery of West Nile virus NY99 (Brieese *et al.*, 1999). The finding of a viral nucleic acid sequence in an extract from an individual with disease is insufficient to demonstrate a causal relationship. An argument for a causal relationship is strengthened if footprints of the agent in an affected organ can be demonstrated through immunohistochemistry or in situ hybridization for viral proteins or nucleic acids, respectively (Lipkin, 2010).

Culture

The focus of clinical diagnostic virology has shifted from culture to molecular methods. This largely reflects the introduction of commercial assays that allow rapid, inexpensive detection of viral pathogens using multiplex PCR panels, and quantitative PCR assays that can be used to monitor the efficiency of interventions by tracking viral burden. Culture nonetheless remains critical to viral discovery, and basic and translational viral research. Virus amplification through culture enhances the efficiency of detection through molecular methods. SARS coronavirus, for example, was readily characterized using sequencing, microarrays decorated with oligonucleotide probes representing viral sequences, and consensus PCR. Proof-of-causation through fulfillment of Koch's Postulate requires propagation of an agent isolated from an individual with a disease, and recapitulation of the disease following introduction of the agent into a naïve host. Although alternative strategies for proving a causative relationship have been established, Koch's Postulate remains the most persuasive. Virus isolation is also essential for understanding how it enters a cell, replicates itself, evades innate immune responses, and causes disease in animal models. Finally, virus isolation is imperative for developing and testing the efficacy of antiviral drugs and vaccines.

Viruses can be isolated and propagated in cell culture systems or in live animals. The choice of an in vitro versus an in vivo strategy can have a substantive impact even for closely related viruses. Whereas inoculation of suckling mice is useful in detecting human enterovirus A, tissue culture is better for detection of human enterovirus B. Success depends on the presence of cell surface receptors that enable entry; intracellular factors required for trafficking of viral nucleic acids and proteins to appropriate sites for transcription, replication, translation, assembly and egress; and the ability of the virus to evade innate immune responses that inhibit viral replication. Accordingly, many clinical microbiology laboratories maintain multiple continuous cell lines for virus isolation. Some viruses cannot be propagated in continuous cell lines. Cytomegaloviruses, for example, require immature cells and are typically grown in primary fibroblast cultures. Other viruses require specific receptors that can be introduced through transfection, or more complex systems comprising multiple cell types that resemble organs (organotypic cultures). Still others are even more fastidious and require live animals such as suckling or transgenic mice. Culture in primary cells, transfected cells, organotypic cultures, and live animal systems is typically restricted to public health reference and research laboratories due to the need for substantial investment in resources and expertise.

Nucleic Acid Tests

Polymerase Chain Reaction Assays

The discovery of PCR by Mullis in 1983 transformed clinical microbiology and public health (Saiki *et al.*, 1985) by enabling rapid, inexpensive, tools for microbial differential diagnosis, surveillance, and discovery, as well cDNA cloning. In viral diagnostics, PCR can be broadly divided into assays that target single agents versus those that target more than one agent (multiplex PCR assays), assays that are designed to detect only specific viral species versus those that also detect related viruses (consensus PCR assays), and assays that are quantitative (qPCR assays). The amplification products of single agent PCR can be visualized after size fractionation through gel electrophoresis using dyes like ethidium bromide or the newer and safer stains (e.g., SYBRsafe or GelGreen among others) that also intercalate with nucleic acids. Alternatively, products can be quantitated using complementary oligonucleotide probes that contain both a fluorescent reporter dye and quenching molecule. In Taqman assays, probe bound to the template is degraded by the 5' to 3' exonuclease activity of the polymerase, thereby freeing the reporter molecules for detection. In molecular beacon assays, the quencher and reporter molecule are in close proximity to one another in a hairpin probe structure and become separated when PCR results in a product that is complementary to the hairpin loop sequence between them. Through use of a standard curve and known concentrations of template one can measure the amount of target in an experimental sample. Taqman and molecular beacon assays are exquisitely sensitive and typically can detect as few as 10 target molecules per reaction.

Multiplex PCR

The majority of multiplex PCR assays are based on the Taqman system; however, gel based, mass spectrometric, and Luminex-bead based assays have also been established. At the time of writing, only five fluorescence reporter dyes can be unequivocally separated; thus, multiplex Taqman assays are limited to five targets (typically four viral and 1 host gene target control). The sensitivity is similar to single agent Taqman PCR. Two platforms combine PCR with mass spectroscopy to detect either the product itself or tags attached to the primers. The Ibis system, adopted by Abbott, uses matrix-assisted laser desorption–ionization (MALDI) MS to directly measure the molecular weights of PCR products in a sample and to compare them with a database of known or predicted product weights (Van Ert *et al.*, 2004; Ecker *et al.*, 2005; Sampath *et al.*, 2007; Ecker *et al.*, 2008). The Ibis system discriminates products of PCR amplification using universal bacterial 16S rRNA primers. There is no correlate universal viral primer set; thus, the platform is better suited to bacteriology than virology. MassTag PCR can accommodate up to 50 different primer sets. It uses atmospheric pressure chemical ionization (APCI) MS to detect small molecular weight reporter tags attached to PCR primers (Briese *et al.*, 2005). Syndrome-specific MassTag PCR panels have been established for the detection of viruses, bacteria, fungi, and parasites associated with acute respiratory diseases, diarrheas, encephalitides/meningitides, and hemorrhagic fevers (Briese *et al.*, 2005; Lamson *et al.*, 2006; Palacios *et al.*, 2006; Renwick *et al.*, 2007; Dominguez *et al.*, 2008; Tokarz *et al.*, 2009; Palacios *et al.*, 2009; Tokarz *et al.*, 2010; Tokarz *et al.*, 2011; Tokarz *et al.*, 2012; Al-Samarrai *et al.*, 2013; Hsu *et al.*, 2013). Another highly multiplexed platform, established by Luminex Corporation uses flow cytometry to detect PCR amplification products bound to matching oligonucleotides on fluorescent beads (Brunstein and Thomas, 2006; Han *et al.*, 2006; Li *et al.*, 2007). Signal in multiplex PCR and Luminex assays requires the presence of three independent genetic targets (the forward primer, the reverse primer, and the probe). This provides high confidence in the fidelity of a finding. In contrast, mass spectrometric assays require the presence of only two genetic targets. Accordingly, we use them as screening tools and follow-up presumptive findings with single agent PCR or Sanger sequencing.

DNA Microarrays

Microarrays are typically 750 × 250 × 1 mm glass slides that have been modified to bind oligonucleotides or peptides for detection of host or microbial nucleic acids or antibodies, respectively. This section of the article will focus on nucleic acid detection. Arrays for serology will be discussed below. Arrays comprise hundreds to millions of probes and can be designed to detect virtually any DNA or RNA target sequence. By varying the length of probes one can differentiate between truly complementary or less closely related sequences. Whereas probes less than 25 nt are specific, those more than 60 nt in length tend to be more promiscuous. Two longer probe array platforms were established for viral surveillance and discovery: the GreeneChip and the Virochip (Wang *et al.*, 2002; Wang *et al.*, 2003; Palacios *et al.*, 2007; Quan *et al.*, 2007). Both employ random amplification strategies prior to hybridization. Because host and viral sequences are amplified with similar efficiencies, the sensitivity for viral detection in tissues is lower than for targeted PCR assays. Host nucleic acid can be reduced by enzymatic digestion (DNA) or ribosomal RNA (rRNA) subtraction; nonetheless, these platforms are most successful with acellular template sources, such as virus cell culture supernatant, serum, plasma, cerebrospinal fluid, or urine. Viral nucleic acid that is hybridized to oligonucleotides on arrays can also be eluted from microarrays to enrich for relevant template prior to sequencing (SARS) (Wang *et al.*, 2003).

High Throughput Sequencing

The introduction in 2005 of automated pyrosequencing by 454 Corporation provided the first insights in the potential power of what has become known as 'Next Generation Sequencing' (NGS). Before the platform was replaced in 2013 by the more efficient Illumina system, pyrosequencing resulted in the discovery and implication of novel viruses in outbreaks of disease in humans,

domestic animals and wildlife including an astrovirus associated with fatal encephalitis in X-linked agammaglobulinemia, disseminated arenavirus infection after organ transplantation, a polyomavirus causing vasculitis with myositis and retinal blindness, LuJo and Bundigbuyo virus associated hemorrhagic fever, and a reovirus that decimated wild and domestic salmon worldwide (Palacios *et al.*, 2010). Whereas 454 pyrosequencing required three days to yield 50,000 sequence reads, hundreds of millions of reads can now be obtained in less than 24 h. The pace of viral discovery has accelerated accordingly, and sequencers are moving into clinical microbiology and public health laboratories worldwide.

In the past several years, improvements in single molecule sequencing platforms have begun to address the potential drawback of the Illumina sequencing system concerning its limited read length (~350–700 bp). Recent sequencing technologies aim at fewer but longer reads, such as the single molecule real-time (SMRT) sequencing from PacBio (Eid *et al.*, 2009), or the MinION from Oxford Nanopore (Lu *et al.*, 2016). The latest Sequel sequencer by PacBio generates ~2 million reads in a mean length range of 15–50 kb (up to ~200 kb). However, it is quite a sizable instrument and takes ~30 h to run. In contrast is the MinION by Oxford Nanopore, a tiny device of ~100 g that is connected to a common USB port of a laptop computer. Data can be assessed in real time after a few minutes of run-time and downloaded once sufficient data for the application purpose are collected, commonly after 12–20 h. The device generates ~10 million reads ranging in length from approx. 10 kb to several hundred kb. The long-read platforms are currently used mostly in combination with short read data to generate the most accurate assemblies with regard to sequence duplications or repetitive elements (Wick *et al.*, 2017; Giddins *et al.*, 2018).

VirCapSeq-VERT

Host and viral nucleic acids compete as template in unbiased high throughput sequencing. In complex samples, such as tissue, blood, nasopharyngeal secretions, and feces, host sequences outnumber viral sequences by orders of magnitude. The relative sparsity of viral sequences in complex samples can lead to detection failure where the number of sequence reads is insufficient to include rarer templates. Thus, to enhance the probability for recovery of viral sequences, investigators typically obtain a minimum of 200 million reads per sample. This approach is resource intensive. It requires not only a substantial investment in sequencing but also in bioinformatic analysis. One strategy to focus and increase sensitivity for viral diagnosis and discovery has focused on enrichment of viral template through subtraction of host nucleic acid via nuclease digestion and depletion of rRNA. Another strategy is positive selection. VirCapSeq-VERT is a positive selection system designed to increase the sensitivity of NGS for detection of vertebrate viral sequences based on viral sequence capture (Briese *et al.*, 2015). The platform comprises a library of biotinylated oligonucleotide probes that tile the coding sequences of all known vertebrate viruses with an inter-oligonucleotide distance of 100–150 nucleotides. cDNA libraries prepared from samples containing viral genetic material are hybridized with the oligonucleotides. The resulting viral nucleic acid/viral probe hybrids are collected using avidin coated magnetic beads and taken forward for sequencing. When compared with unbiased NGS, VirCapSeq-VERT enables a 100 to 1000-fold increase in sensitivity and improved depth of coverage. We find that 2.5 million reads with VirCapSeq-VERT provides similar sensitivity and genome coverage to that obtained with 200 million reads after subtraction (Williams *et al.*, 2018). Bioinformatic complexity and computational resources are reduced accordingly.

Clustered Regularly Interspaced Short Palindromic Repeats (CRISPR) Platforms

Bacteria and archaeobacteria have evolved a response to invading bacteriophages that entails specific degradation of viral nucleic acid. Infection results in the integration of DNA fragments of bacteriophages into the bacterial genome as clustered repeats known as CRISPR arrays. Genes encoding CRISPR-associated (Cas) proteins with endonuclease (and in some instances integrase) activity are located in close proximity to CRISPR arrays. Subsequent infection with a similar bacteriophage results in expression from CRISPR arrays and Cas genes of RNA transcripts that target and degrade viral nucleic acid. CRISPR arrays can be genetically engineered to represent virtually any sequence. Thus, when joined with the appropriate Cas enzyme the system can be used to degrade vertebrate viral sequences in addition to bacteriophage sequences. CRISPR Cas systems can also facilitate gene editing by including Cas proteins with both endonuclease and integrase activities. For diagnostic purposes CRISPR Cas systems have been employed in conjunction with isothermal amplification in lateral flow assays and in CMOS arrays for multiplex detection of viruses in environmental and clinical samples (Gootenberg *et al.*, 2018; Freije *et al.*, 2019).

Serology

Serology complements direct detection methods by providing a history of exposure to a viral agent. To date most serology assays have been performed using single agent enzyme-linked immunosorbent assays (ELISA), neutralization assays (NT), western blots (WB), immunofluorescence assays (IFA), haemagglutination assay (HA), or hemagglutination inhibition assay (HAI).

Hemagglutination Inhibition Assays

Serum agglutination, perhaps the first routine diagnostic test, was introduced in the 1800s for diagnosis of typhoid fever (Widal, 1896). Later, agglutination of blood cells was introduced by Landsteiner to determine ABO blood groups (Landsteiner, 1901).

In virology, the hemagglutination (HA) assay is based on the capacity of some viruses responsible for prominent human and animal diseases to bind and cross-link red blood cell surface receptors. The resulting lattice formation deposits as a diffuse reddish layer on the surface of the reaction container. The presence of virus-specific antibodies (Abs) bind the virus and thus inhibit agglutination of red blood cells. Antibodies are quantitated by incubating fixed numbers of red blood cells and virus stock with dilutions of a test serum. Hemagglutination inhibition (HAI) assay are commonly used in typing and subtyping of influenza viruses (Hirst, 1942). Other agglutination assays include latex agglutination (LA) systems where microbeads are coated with Abs or viral antigens.

Plaque Reduction Neutralization (PRNT) Assays

Antibodies can be detected and quantitated based on their capacity to prevent viruses from binding to and infecting their target cells (Pedersen and Spackman, 2014). The readout is a reduction in the number of lytic plaques in a culture of susceptible cells inoculated with the virus of interest. In PRNT as in hemagglutination assays, the requirement for infectious virus poses challenges for many clinical microbiology laboratories, particularly with assays for highly pathogenic viruses. Accordingly, in some instances investigators used less pathogenic viruses such as vesicular stomatitis virus (VSV) where the VSV glycoprotein gene has been exchanged for the glycoprotein of a more pathogenic virus such as ebola (Lee *et al.*, 2017). Because of its native Ag presentation and biological signal readout PRNT is the still the method of choice for measuring functional (protective) immunity. Since even minor variation in protein structure result in changed neutralization behavior, it is also superior to the other methods in distinguishing closely related viruses via cross-neutralization studies. The specificity of PRNT assays is frequently exploited in differentiating immunological reactivity to related viruses. For example, PRNT is considered the gold standard in the differential serodiagnosis of infection with flaviviruses including Zika and dengue viruses (Kuno, 2003; Musso and Gubler, 2016). Only recently, Serochip analyses enabled the characterization of specific peptides that include distinguishing epitopes that now can be transferred other platforms such a peptide ELISA or lateral flow format with the promise of specific identification (Mishra *et al.*, 2018). PRNT assays can also be employed to identify virus isolates through use of panels of hyperimmune sera generated in experimentally infected animals, and to group viruses taxonomically (Casals, 1957; The Enteroviruses, 1957; Schmidt *et al.*, 1961; Muir *et al.*, 1998).

Immunofluorescent Assays (IFA), Enzyme-Linked Immunosorbent Assays (ELISA) and Immunoblot Assays

Each of these methods build on the specific binding between Ab and its matching Ag. In IFA, cultured cells are infected with virus, fixed on glass slides or in multi-well plates with acetone or formaldehyde, and incubated with the test serum, plasma or CSF. A reporter dye linked to a secondary Ab directed against the primary (test) Ab is then introduced prior to fluorescence microscopy. Secondary antibodies can also be conjugated to enzymes that yield products that can be visualized by light microscopy.

Enzyme-based dye formation is also the basis for the ELISA (Engvall and Perlmann, 1971; Van Weemen and Schuurs, 1971), the most common assays used for antibody detection. Amongst the various platforms, the ELISA is the most versatile and popular. This is in part because of the multitude of ways to present Ags or Abs and the comparatively high throughput in 96-well format. Another advantage is the ability to present targets in native form supporting the detection of a wide variety of epitopes. The ELISA is typically performed in 96-well plates wherein wells coated with a viral antigen are incubated with serially diluted patient body fluid, a reporter enzyme (usually peroxidase or alkaline phosphatase) directly conjugated to the serum immunoglobulins (direct ELISA) or a secondary antibody (indirect ELISA), and finally a dye system that generates upon enzymatic catalysis a soluble colored product that can be read spectrophotometrically. A common variation is the sandwich ELISA wherein the well-surface is first coated with Abs specific for the Ag (capture Ab) before the antigen is applied. Next, the detection Ab is applied, either in direct or in indirect format. The advantage of the sandwich ELISA is that it increases the sensitivity and specificity of the assay.

Western blot assays (also known and immunoblots) are typically performed including complex Ag preparations such as crude infected cell extracts that are size fractionated by electrophoresis in sodium dodecyl sulfate polyacrylamide (SDS-PAGE) gels, transferred onto nitrocellulose or polyvinylidene difluoride membranes, and then incubated with sera. Immunoreactivity of antibodies in sera are detected using a species-specific secondary antibody that is linked to an enzyme that results in either a dye or chemiluminescence signal. Proteins subjected to SDS-PAGE are denatured. Thus, they are not designed to detect conformational epitopes that may be critical in viral neutralization.

Lateral Flow Assays (LFA)

These assays are designed for point of care serodiagnosis and field applications. In LFAs, the liquid sample (plasma, serum, urine or CSF) flows by capillary action through a membrane where the antigen or antibody in the sample binds to a dye-labeled cognate marker (antigen or antibody). The antigen-antibody-dye marker complex continues to migrate through the membrane until further migration is blocked by binding of the complex to an antibody to a component of the complex that is fixed in position, the appearance of a line of dye indicates that the antigen or antibody was present in the sample.

Multiplex Platforms for High Throughput Serology

In contrast to molecular diagnostics where advances in technology such as PCR and HTS have dramatically improved sensitivity, specificity, and capacity for multiplex analyses, serologic methods remained largely unchanged. This lag is important given the role of serology in establishing the distribution and frequency of infection, testing the significance of association between the finding of an agent and disease, focusing efforts in pathogen discovery and surveillance, and for monitoring humoral responses to vaccines and immunomodulatory drugs. Most serological tests target only one agent; however, Luminex-based systems have been employed that can address up to 100 targets simultaneously.

Phage display systems and arrays that comprise spotted recombinant proteins expressed *in vitro* in *E. coli*, *S. cerevisiae*, baculoviruses, and cell-free, coupled transcription-translation, have also been established. The VirScan platform comprehensively tests for the presence of antiviral antibodies through immunoprecipitation of viral peptides in bacteriophage followed by DNA sequencing. The current version screens 93,904 200-mer oligonucleotides, encoding 56-residue peptide that tile the proteome of 206 viral species with 28 residue overlap (Xu *et al.*, 2015). The phage library is incubated with serum, plasma, or CSF. Bound antibodies are recovered by using a mixture of protein A and G coated magnetic beads. The bound phage DNA is sequenced and quantitated to identify immunoreactive epitopes. These assays are powerful but require expertise and resources for cDNA cloning, expression, sequencing, and bioinformatic analysis. An additional challenge is that VirScan may not have the resolution required to differentiate immune responses to closely related viruses. Peptide arrays (Serochips) are an alternative high throughput platform for unbiased serology. Serochips comprise up to 6 million distinct linear peptide sequences attached to a solid support. Like the VirScan platform, Serochips display only linear peptides; thus, neither platform will detect conformational or glycosylated epitopes. To ensure our ability to detect immune responses to discriminant as well as common viral epitopes we tile the entire proteome of the relevant viruses using 12 aa peptides with 11 aa overlap. After incubation with serum, plasma or CSF, arrays are incubated with fluorescence-labeled secondary antibodies (IgG or IgM). Finally, high-resolution image scans are obtained and relative fluorescence signal intensity is used to map immunoreactivity to specific viruses and identify peptides that can be transferred to less expensive and simpler methods for serodiagnosis such as ELISA, western blot, Luminex assays, or smaller peptide arrays.

The detection of an IgM versus an IgG response is important to certain aspects of functional serology. During the challenge of the immune system with a new Ag, stimulated B-cells produce their membrane-presented Ab first as pentameric immunoglobulin class M (IgM) isotype antibodies, that usually exhibit limited specificity. During the next 2–4 weeks plasma B-cells transition after isotype switching and hypermutation to the production of highly specific monomeric immunoglobulin G (IgG) isotype antibodies (Nossal, 2007; Tonegawa, 1983). The ratio of IgM to IgG response may therefore be helpful in determining the timing of the infection. IgM vs IgG determination is easily achieved in all indirect assay systems through the choice of the secondary Ab, applying either an anti-human IgM or an anti-human IgG-specific Ab. There are many other considerations directing the choice of a particular serologic platform. This often includes the classical paradigm of confirming a positive result in one assay in a second technically independent assay, as it is still common practice in Lyme diagnosis; after initial screening by ELISA positive results are confirmed by immunoblot reaction patterns (Centers for Disease Control and Prevention, 1995; Tokarz *et al.*, 2018).

Discussion/Summary

Viral diagnostics is no longer a discipline that requires resources and expertise available only in reference laboratories. Although culture and electron microscopy remain important tools for basic and translational research, molecular methods have moved to the forefront of diagnostics in clinical microbiology and public health. This reflects not only lower costs and ease of use but also the capacity of molecular methods to yield actionable information in hours rather than days. Serology too is becoming more robust and convenient with the advent of multiplexed assays that provide specific information without virus cultivation and neutralization assays. Advances in molecular and serological methods allow clinicians and public health practitioners to simultaneously consider a wide range of probable candidate viral pathogens, and to detect the presence of pathogens that are not typically anticipated in a differential diagnosis. These include viruses known to cause disease in other geographic regions or in other species, or viruses not previously known to medicine or science. We have not addressed in this article the potential for host genetic, proteomic, metabolomic or microbiome analyses to provide diagnostic and prognostic information independent of virus identification that will impact interventions. This is an area of active research that we anticipate will be featured in future editions of this encyclopedia. We also anticipate that insights from wider application of molecular and serological tools will encourage the development of drugs and vaccines that reduce the burden of viral infections in both acute and chronic disease.

Glossary

DNA Deoxyribonucleic acid.

Evidenced based medicine Uses the currently available best evidence in making decisions about the clinical management of individual patients.

Multiplex PCR An assay to detect different pathogens/targets simultaneously in a single or limited number of reaction tubes.

Nucleic acid testing (NAT) The direct amplification and detection of DNA or RNA (after reverse transcription prior to PCR).

Point-of-Care-tests Rapid tests that can be performed close the patient with minimal hands-on time and ease of use.

Polymerase chain reaction (PCR) Enzymatic thermocyclic amplification procedure for DNA.

Randomized controlled trial A study that allocates enrolled patients randomly to either one of two arms: one intervention arm and one control arm. It thus eliminates bias.

Reverse-transcription PCR For RNA, nucleic acids are transcribed into DNA using reverse transcriptase enzymes.

RNA Ribonucleic acid.

Introduction

Traditionally, clinical diagnostic virology methods included virus isolation using cell culture, antigen detection, and antibody detection methods. Until recently, these conventional methods were rather slow, labor-intensive and only available for a limited number of viral infections. In most instances diagnosis was retrospective. Thus, clinical diagnostic virology had little impact on patient management and clinical decision-making. However, clinical diagnostic virology has been revolutionized with the advent of nucleic acid testing (NAT) more than three decades ago. Molecular methods allow the detection of minute amounts of viral genomes and rapidly became indispensable tools for the clinical diagnostic laboratory. Target-specific amplification of (parts) of the viral DNA or RNA genome using polymerase chain reaction (PCR or reverse-transcription PCR for RNA viruses) is the most common technique used for NAT, but other technologies such as nucleic acid sequence-based amplification (NASBA), transcription-mediated amplification (TMA), or loop-mediated isothermal amplification (LAMP) have also found their niche. Beyond the pure detection of viral pathogens, NAT also provides a means to quantitate the amount of viral DNA/RNA ("viral load"). This was primarily made possible with the introduction of real-time quantitative PCR. Moreover, PCR combined with sequencing capabilities provides a tool to genotype and characterize a virus, i.e., to look for resistance-associated mutations in the viral genome. Technically, next-generation sequencing technologies are rapidly evolving and characterize viral genomes with unprecedented depth and accuracy. In combination with the increasing availability of antiviral therapeutics clinical diagnostic virology thus became essential for optimized patient care, e.g., in the context of viral load monitoring of HIV-, HBV- or HCV-infected patients or monitoring of CMV, EBV and other relevant viruses in immunosuppressed patients as well as for resistance testing. Consequently, with the advent of NAT many traditional "reference" methods became obsolete. It should be noted, however, that even in the era of NAT a mix of different techniques remains essential for the clinical virology laboratory to come to a valid and reliable diagnosis.

Compared to conventional virological techniques NAT is faster, more sensitive and available for a wider range of pathogens. However, the first NAT assays were laboratory-based and still had turn-around times of up to 48 h. If testing for multiple viruses was required, this was mainly done in a sequential and time-consuming manner. In the next step, laboratories developed in-house assays that used the same PCR reaction components and the same thermal cycling profile. This allowed parallel testing for multiple targets but still required separate nucleic acid extraction and PCR set-up steps (Bonzel *et al.*, 2008; Gunson *et al.*, 2008). With constant technical improvement, multiplex panels for the simultaneous detection of a variety of pathogens in a single reaction have been introduced into routine diagnostics recently. This approach is also called "syndromic testing approach" and is evolving rapidly. Here, a simultaneous search for multiple pathogens causing a similar clinical picture is performed. Some of these assays require minimal hands-on time by using single-use cartridges and allow for near-patient testing (also termed "point-of-care testing" = POCT). Time to result may be as low as <2 h on these integrated platforms. A number of different syndromic panels are now commercially available, e.g., for respiratory tract infections, gastrointestinal infections, and meningitis/encephalitis. Complementary to this, fully automated random-access platforms combining nucleic acid extraction and amplification/detection are now on the horizon for numerous pathogens, e.g., CMV, EBV, HIV, HCV, HBV and will certainly impact clinical diagnostic virology. Therefore, it is anticipated that rapid and near-patient testing will again constitute a dramatic change for the field of clinical diagnostic virology and may directly impact patient management. This includes but is not limited to the administration of (new) antiviral drugs (if available), appropriate use of antibiotics, and rapid implementation of infection control measures. This is accompanied by a variety of novel next-generation sequencing approaches entering diagnostic laboratories allowing "personalized medicine". However, although many of these novel

Fig. 1 Interdisciplinary network of clinical diagnostic virology.

techniques demonstrated very good diagnostic performance and accuracy the clinical impact remains unclear to date. It is mandatory that beyond many already published studies high-quality and randomized controlled trials will shed more light on the question if these new technologies will provide a benefit for the patient and will improve outcomes without doing harm. Another challenge remains the currently high costs of these novel assays, the optimal ordering strategy, rapid communication and interpretation of test results in the context of clinical disease and lastly quality control issues.

Clinical diagnostic virology is truly interdisciplinary and requires a close partnership of infectious diseases clinicians, clinical virologists, microbiologists, laboratory/bioinformatics specialists, epidemiologists, infection control specialists, and public health members (**Fig. 1**). Foremost, close interaction with clinicians is essential to serve their needs and in turn for clinicians to understand test characteristics, result in interpretations and their utilization. This is especially true when new test panels will be introduced, which should be accompanied by performance evaluation and ideally cost-effectiveness calculation by the laboratory. Thus, clinical diagnostic virology should be an integrated part of antimicrobial and diagnostic stewardship programs ([Dik et al., 2017](#)). In this respect, clinical diagnostic virology should interact with all stakeholders, e.g., administration and purchasing department and develop solutions to the best of our patients. This may differ from country to country and even within countries with a very dynamic landscape of university-affiliated laboratories, large non-academic laboratories and those serving for basic and regular care. It is obvious that laboratories may serve different patient populations (e.g., number of immunosuppressed and immunocompetent patients, intensive care units, high or low throughput) and have different requirements (e.g., proximity to a hospital). In addition, large healthcare group laboratories may have their own needs and develop different approaches.

Beyond primary patient care, clinical diagnostic virology also contributes to translational research and the implementation/evaluation of emerging technologies and their transition into clinical care. Having this in mind data sharing to assess the burden of diseases and to better appreciate the epidemiology of viral infections seems mandatory on a national as well as international level.

This article will briefly describe examples of syndromic testing approaches currently used in clinical diagnostic virology and how they might impact clinical decision making and the currently available evidence supporting this. Further, the impact of clinical diagnostic virology on current knowledge of hepatitis E virus infection will be briefly discussed as an example of an emerging infection and translational research.

Respiratory Tract Infections

Background

Acute respiratory tract infections (RTI) have a high disease burden worldwide and contribute significantly to mortality. In general, these acute RTI have a viral etiology and less common a bacterial one. Of note, acute RTI can be caused by a variety of respiratory viruses from different virus families including, e.g., influenza virus, respiratory syncytial virus (RSV) A/B, coronavirus, human metapneumovirus, and rhino-/enterovirus. Seasonal influenza alone causes up to 650,000 deaths worldwide and enormous socioeconomic losses each year. Clinical presentation can range from mild upper RTI to severe lower RTI and pneumonia. Of note, specific populations are at increased risk for severe clinical courses, e.g., immunosuppressed patients, HIV-infected patients, pregnant women, and the elderly. Except for viruses, atypical bacteria like *Bordetella pertussis*, *Mycoplasma pneumonia* and *Legionella*

^aNon-cartridge/pouch-based systems.

pneumophila can also cause acute lower RTI/pneumonia. These bacteria are not very well detected by standard culture-based microbiological techniques and are therefore frequently included in modern molecular panels. Thus, testing for atypical bacteria should complement the diagnosis of acute RTI. Suitable clinical samples include nasopharyngeal swabs and aspirates/washings, pharyngeal swabs, high-quality sputum, and bronchoalveolar lavage. Limitations apply as per the recommendation of the manufacturer of commercial assays as some assays have been only validated for a specific specimen type.

The vast majority of (pediatric) RTI cases are seen by primary care physicians. However, it is currently impossible for primary care physicians to distinguish viral etiologies of an acute RTI and even more important to distinguish a viral from a bacterial etiology on clinical grounds only. This makes a laboratory-based diagnosis mandatory for a definite diagnosis. Critically, antibiotics are prescribed in >65% of consultations due to RTI although viruses cause the vast majority of RTI. Rapid identification of the etiology may lead to optimized patient care and treatment and may also reduce overall costs. From a public health perspective antibiotic resistance is an emerging problem worldwide and overuse/not appropriate use of antibiotics is therefore of great concern. In addition, viral infections like influenza can be treated with specific antiviral drugs, e.g., oseltamivir, but these drugs need to be given quite early in the course of the disease. Interestingly, the use of broadly reactive multiplex panels already allowed new insights into the epidemiology of previously underestimated viral infections like coronaviruses. Finally, a rapid diagnosis may also prove useful for better infection control and prevention within the hospital setting.

Assays

In recent years, a paradigm shift has been observed for the detection of pathogens causing acute RTI. The first multiplex PCR assays were mostly laboratory-developed tests (LDT) and were mainly based on real-time PCR technology. One of the first commercial assays for the comprehensive detection of RTI pathogens was developed by Luminex Corporation. However, these assays still required separate nucleic acid extraction steps and the time to result was somehow in the range of around 8 h. Technological advancements led to the development of cartridge-based systems which combined nucleic acid extraction and PCR amplification/detection allowing to test for a battery of different pathogens with minimal hands-on time within less than two hours. Different systems are now on the market and commercially available, e.g., FilmArray, ePlex or Verigene (Table 1). Popowitch *et al.* compared four different multiplex panels and determined overall sensitivity and specificity, ranging between 84.5% and 100%, respectively (Popowitch *et al.*, 2013). It is important to note that sensitivity for different targets can vary and that laboratories are aware of the performance data and possible limitations of the assays they perform. Of note, selected pathogens yielded considerably lower sensitivities e.g., adenovirus and influenza virus in some studies, which is an issue of concern (Popowitch *et al.*, 2013). Another study compared the Genmark ePlex RPP assay with LDT and showed a high overall agreement of 97.4% rendering them suitable for routine diagnostics (Nijhuis *et al.*, 2017). Some of these assays already received FDA/CE marks and a recent study showed a high diagnostic accuracy of these multiplex panels (Huang *et al.*, CMI 2018).

Limiting their widespread implementation are considerable higher costs and presently limited availability of different panels on these platforms. However, recent experience has shown that the costs of multiplex panels are declining as more and more companies enter the market with newly developed panels. In addition, pending issues concerning quality control, reimbursement, and notifiable diseases have to be discussed in some countries.

Critically, molecular assays need constant re-evaluation and close monitoring of new or mutated viral strains, which might affect assay performance. In 2009, a new influenza A virus emerged and challenged many established detection systems. In addition, e.g., influenza drift variants may go undetected if primer and/or probe binding regions are affected. It is a well-known phenomenon that especially RNA viruses are prone to genetic changes. Similarly, for enteroviruses and adenoviruses, a diversity of different types/genotypes is known, and comprehensive detection of all members is challenging. It should also be noted that these panels include fixed combinations of pathogens and usually do not allow them to be customized. Prevalence of RTI pathogens vary in time and

geographically and thus affect positive and negative predictive values. It is mandatory to record positivity rates for all detected pathogens for quality control purposes. The likelihood of false-positive results must be taken into account and might require alternative testing with individual assays. Thus, the laboratory must be aware of possible pitfalls of the assays in use (van Zyl *et al.*, 2019). Strict operating procedures must be followed to minimize the risk of contamination. This holds especially true when near-patient testing is done by non-laboratory personnel outside dedicated molecular diagnostic facilities. Further, NAT detects nucleic acids only and at present, it is impossible to assess infectivity/viability. Prolonged shedding of viral RNA has been described especially for entero-/rhinoviruses in the immunocompromised host. Finally, the role of co-detections is unclear to date. Some studies suggest that co-detections might be more severe compared to mono-infections whereas other studies did not show any differences.

Clinical Impact

Although multiplex panels have been introduced by many laboratories worldwide within the last years the clinical impact of these rapid multiplex panels remains to some extent unclear to date. The first studies mostly used a before/after approach to analyze the impact after the introduction of multiplex testing approaches. Not surprisingly, these studies demonstrated a significant decrease in time to diagnosis (Rappo *et al.*, 2016). Another study reported a significant increase in the number of detected pathogens. However, limitations apply as viral culture or other rather slow conventional methods were used in the prior season. Proper administration of antiviral therapies is another important issue in acute RTI. Vos *et al.* analyzed the impact of rapid viral testing in adult immunosuppressed patients and were able to show a more adequate use of oseltamivir (Vos *et al.*, 2019b).

Another recent systematic review and meta-analysis also yielded inconclusive results due to a very heterogenous study landscape (Vos *et al.*, 2019a). In theory, the rapid identification of a viral etiology may help reduce unnecessary antibiotic treatment and initiate specific antiviral therapy, e.g., in influenza. Moreover, new antiviral therapies are in the pipeline of pharmaceutical companies, e.g., for RSV. The implementation of rapid molecular testing in the emergency department resulted in a more targeted approach to use oseltamivir treatment in immunocompromised patients. However, in the same study, no reduction in antibiotic prescriptions or its duration, admission and length of stay was seen. It is anticipated that new studies will shed more light on the clinical impact of rapid near-patient testing and will help to better appreciate their usefulness for patient care. Ideally, randomized controlled trials will be initiated to answer these urgent questions. It may also influence the decision to admit patients, reduce the length of stay, and avoid antimicrobials.

Costs are also an important factor requiring careful consideration. As an example, multiplex panels showed to be cost-effective in the pediatric setting when children with influenza-like illness in the emergency department were analyzed. However, the estimation of costs and possible savings remains complex and varies from country to country. Beyond laboratory costs (which might increase due to higher test costs and extended availability of personnel) costs might decrease overall for the hospital. Recently, the €hr concept was introduced to analyze this in more detail (Dik *et al.*, 2016).

To summarize, the clinical benefit of rapid syndromic testing for the patient is to some extent unclear to date. A differentiated approach might be necessary taking into account e.g., the severity of the disease and the immune status of the patient. Syndromic testing might be beneficial for the immunocompromised host, but a more targeted approach might be necessary for the otherwise healthy outpatient and for children. It might be necessary to establish local testing algorithms for specific patient groups to use these promising new technologies properly. This may also include different testing approaches over the year to account for seasonal variations in the prevalence of RTI pathogens.

Gastrointestinal Infections

Background

Similar to the situation with acute RTI, gastrointestinal infections (GI) are also associated with a high disease burden worldwide. An estimated 2 billion cases occur each year and they constitute a major cause of emergency department visits and hospitalizations worldwide (Farthing *et al.*, 2013). In particular children in resource-limited countries are affected and mortality in these settings can be very high. It is estimated that around 2 million deaths each year occur in developing countries. On the contrary, in industrialized countries, GI infections also have a great impact on individual and public health but to a lesser extent on mortality. However, although most infections are usually mild and self-limited in industrialized settings, severe courses and sometimes fatal outcomes are seen in vulnerable populations like the elderly and immunocompromised persons. Of note, outbreaks have been described, e.g., in the hospital setting, in nursing homes or on cruise ships. Transmission occurs via contaminated food or water or close contact with an acutely infected person. In addition, an aerosol transmission has been described for noroviruses. Relevant pathogens for GI are of viral, bacterial or parasitic origin. Traditional methods for the detection of GI pathogens include laborious and time-consuming microscopy, culture and antigen detection methods. The time to final diagnosis can take days. In addition, all of these techniques are less sensitive and specific compared to NAT. Timely diagnosis may prevent further spread and adverse patient outcomes and selected patients

may benefit from rapid and appropriate antibiotic treatment. Isolation and/or cohorting of patients with norovirus associated GI is important in the health care setting.

Assays

Numerous LDT, as well as commercial assays, are available for single pathogens but similar to RTI multiplex panels are now entering the market. Some of these platforms allow for rapid and near-patient testing using single-use cartridges or pouches (Table 1). In analogy to RTI panels different viral, bacterial and parasitic targets are included and allow for a “syndromic” testing approach. Most assays include more bacterial/parasitic targets than viral targets. Comparison studies have demonstrated equivalent or even superior performance to reference assays. In these studies, ≥ 2 pathogens were detected significantly more frequently throughout different studies compared to conventional methods. Major viral targets included in these multiplex panels are adenovirus 40/41, astrovirus, norovirus genotype 1/2, rotavirus A, and in some assays sapovirus.

Clinical Impact

The Luminex GPP assay was one of the first syndromic assays for GI pathogens on the market. However, it still required separate nucleic acid extraction procedures and multiple (post-PCR) processing steps. It was shown that costs for the clinical laboratory increased but overall, there were savings for the hospital (Goldenberg *et al.*, 2015). Another study evaluated the impact of the FilmArray GIP on length of stay and patient isolation and concluded that patients spent considerable time without appropriate isolation methods in the hospital whereas others were placed under contact precautions without cause (Rand *et al.*, 2015). One important observation was reported by Claas *et al.* in that 65% of positive results were from pathogens not specifically ordered by the treating physician (Claas *et al.*, 2013). The clinical impact is much harder to assess in resource-limited settings where it became apparent that in children numerous pathogens can be detected in cases with diarrhea as well as in asymptomatic controls (Leva *et al.*, 2016). This requires careful analysis of the local setting (i.e., patient population: adult versus pediatric, ambulatory versus in-hospital, immune status/previous antibiotic treatment, travel associated) and to evaluate the implementation of new methods in the respective laboratory. For some patients, a more tailored approach would be more effective but not possible with the fixed combinations delivered by the manufacturers. It seems advisable to develop algorithms, which patient should be tested with which method. This apparently needs a cross-sectional and collaborative effort of all involved partners within a hospital (Fig. 1). However, there is still limited evidence based data available to show a clear benefit for the patient without doing harm in industrialized settings. Of note, for bacterial pathogens culture and susceptibility testing is usually not recommended by many current guidelines but may prove useful in the context of outbreak investigations. It is also vital for public health surveillance and epidemiological purposes.

Central Nervous System Infections

Background

Infections of the central nervous system are usually caused by viruses or bacteria or to a lesser extent fungi. They can lead to encephalitis, which is an inflammation of the brain. It is frequently accompanied by meningitis, which is an inflammation of the meninges. Meningitis/encephalitis (ME) is associated with significant morbidity and mortality worldwide. Clinically, signs and symptoms of ME are often unspecific. Headaches and altered mental status are frequently reported. For diagnosis of microbial pathogens, Gram staining, microscopy and bacterial culture are standard laboratory methods. This is complemented by analysis of cerebrospinal fluid (CSF) for protein levels, white blood cell count and other clinical chemistry parameters. Molecular testing for viruses, which include herpes simplex viruses 1 and 2, varicella-zoster virus, and enterovirus as the most common viral pathogens causing ME has been well established by many laboratories for a long time. In addition, serological testing for flaviviruses (tick-borne encephalitis virus, West Nile virus) can be performed depending on the local epidemiology.

Assays

Compared to the situation for respiratory and gastrointestinal infections the availability of multiplex panels is rather limited. However, a number of different assays are in the pipeline of commercial companies and it is expected that they will soon enter the market. However, their performance has to be evaluated in comparison studies first. One of the first assays on the market was the Biofire FilmArray Meningitis/Encephalitis panel, which includes 14 targets including viral as well as bacterial/parasitic pathogens. Analytical performance studies showed somehow contrasting results when the assay was compared to culture and molecular methods (Leber *et al.*, 2016). Of importance, false-positive results have been reported and the results of the FilmArray need to be interpreted cautiously and in combination with clinical signs and other laboratory markers. This again highlights the importance of strict contamination precautions, dedicated laboratory space and trained personnel for molecular testing. In addition, the pretest probability for ME has to be taken into account. Critical points of the multiplex panels for ME include e.g., the above-mentioned sensitivity/specificity issues, the composition of the panels and the relevance of detecting bacteria in populations with

successful immunization programs.

Clinical Impact

Similar to the presently limited number of assays information on the clinical impact remains scarce. With respect to the FilmArray, no reduction in antimicrobial use or length of stay was reported in a study with rather small sample size. Thus, as soon as more assays are available and have proven their analytical performance ideally randomized controlled trials are necessary to assess the clinical impact of these assays. Ultimately, evidence based guidelines should provide reliable information on the use of these ME panels.

Hepatitis E Virus Infection

Hepatitis E virus (HEV) infection is another example of clinical diagnostic virology leading to a fundamental change in current knowledge and clinical practice. Until recently, HEV was thought to be restricted to countries in Africa and Asia. In these countries, HEV genotypes 1 and 2 are causing HEV infections and transmission occurs through fecally contaminated water. Illness is usually short-lived mild hepatitis only. Exceptions are severe courses with a high fatality rate in pregnant women. Sporadically, outbreaks can occur with thousands of cases. In industrialized countries, HEV infections were occasionally seen in travelers who acquired infections abroad. Due to imperfect serological methods, this led to a gross underestimation of HEV seroprevalence rates (Kmush *et al.*, 2015). However, interest and progress in HEV understanding dramatically changed when it became clear that HEV genotypes 3 and 4 are prevalent in industrialized countries and are transmitted zoonotically from infected animals (mostly swine, deer and others). Importantly, clinical diagnostic virology could demonstrate locally acquired HEV infection in chronic liver disease (Dalton *et al.*, 2007).

In brief, diagnosis is based on the detection of HEV-specific antibodies and more recently quantitative real-time PCR became available to detect HEV RNA in serum and stool samples. Of note, serological assays differ in their performance partially questioning the results of older seroepidemiological studies (Hartl *et al.*, 2016). The first comparison studies were conducted showing significant differences among assays. However, in the absence of a true gold standard assay performance is still under evaluation. At the same time, the industry developed new test kits with improved performance characteristics. In addition, quantitative real-time PCR and newly established WHO standards for quantitation of viral HEV RNA were introduced. These are now widely used to monitor patients with chronic HEV infection and to control the success of antiviral treatment (Kamar *et al.*, 2014). Using these novel tools, clinical diagnostic virology provided new data on seroprevalence in many European regions and elsewhere. Interestingly, using state-of-the-art diagnostic tools it soon became clear that beyond hepatitis other extrahepatic manifestations are associated with acute HEV infection including various neurological injuries (Dalton *et al.*, 2016). Thus, clinical diagnostic virology led to new knowledge and changed what was previously thought to be accepted knowledge.

To summarize, clinical diagnostic virology is an interdisciplinary subject requiring close collaboration foremost with clinicians and other related disciplines. Recently, multiplex panels proved to be valuable and powerful tools and are anticipated that fully automated random-access machines for almost all relevant viral targets will enter the market soon. However, critical issues remain, and we need evidenced-based data from high-quality trials on whether to implement these multiplex panels into routine diagnostics. Beyond technical issues, this also requires cost-effectiveness analysis and the development of locally adopted diagnostic testing algorithms to benefit the patient.

Introduction

The rapid and sensitive diagnosis of virus infections in the immunocompromised human host is of utmost importance to avoid the development of severe and possibly lethal virus diseases. In contrast to the immunocompetent host, the main virus infections leading to life-threatening infections in immunocompromised patients are often caused by viruses of overall low pathogenicity, such as herpesviruses, polyomaviruses and adenoviruses. Primary infection with these viruses may cause only mild disease or even asymptomatic infections in healthy individuals. However, they become dangerous pathogens in the absence of appropriate development of antiviral immune responses and may proceed to a high level or even unlimited virus replication, leading to highly increased morbidity and mortality. Most of these viruses are often latently present in the patients already before immunosuppression starts due to past infections and frequently reactivate and start extensive replication after the onset of immunosuppression.

The major group of immunosuppressed patients, in whom an intensive and rapid virological diagnosis is required and close virological follow-up is needed, are recipients of solid organ transplantation (SOT) or hematopoietic stem cell transplantation (HSCT) recipients. These patients receive severe artificially induced immune suppression, mostly over their lifetime. The administration of immunosuppressive medication is urgently needed to protect the transplanted organs from the recipient's immune response, directed against foreign antigens. A decrease of the host's immune response can be caused by a number of drugs that influence different immune defense mechanisms, and thereby may avoid acute or chronic rejection of the transplant by the recipient. However, as a problematic and potentially dangerous side effect, this impairment of distinct immune mechanisms also leads to a decreased ability of the host to defend against viral infections and against infections with bacterial and fungal pathogens.

Also, patients with genetic defects that impair different parts of the immune response are at high risk for virus infections. Individuals with Human immunodeficiency virus (HIV)-associated immunosuppression and AIDS may also suffer from severe virus infections, and rapid virological diagnosis is needed. Since the successful introduction and application of highly active antiretroviral therapy (HAART), severe virus infections have become quite rare in numerous HIV positive populations. However, especially patients diagnosed at a late time point after infection with HIV and those with limited access to antiretroviral drugs are still at high risk of developing opportunistic infections with other viruses.

Viral Diagnostic Tests

Diagnosis of virus infections in immunosuppressed persons, especially in transplant recipients, encounters a number of specific problems. One main challenge is that virus screening must be performed preemptively in most cases, which means that virus replication must be detected already before the viruses start to cause clinical disease. This means a routine diagnostic follow-up schedule after transplantation is required. Patients must be screened for defined viral parameters at regular intervals and for a long time. Another aspect complicating the routine diagnosis of viruses with latency phases is that the presence of these viruses does not "per se" prove the patient's risk to develop a virus-associated disease on follow-up.

Indeed, a deep understanding of viral pathogenesis is required to select a better indicator of whether a specific virus disease is to be expected or not. In some cases, low-level virus replication is a physiological state and may be also observed in the immunocompetent host, while increasing to a certain level of virus replication may indicate a high risk for the development of virus diseases and may require immediate intervention. This level, deciding whether antiviral interventions are required, needs to be defined for each cohort and each virus separately. It must be confirmed that antiviral interventions are started at the optimal time point, avoiding unnecessary antiviral treatment, but starting early enough to avoid high-level virus replication and disease. Also, the virus emerging after transplantation may have been derived from the virus population of the transplant recipient as well as from the donor virus population transmitted by the transplant. The main analysis applied in the virological follow-up of transplant recipients is the quantitative analysis of the nucleic acid-load of different viruses as Cytomegalovirus (CMV), Epstein-Barr Virus (EBV), BK-Polyomavirus (BKPyV) or Adenovirus (ADV). This may be performed in blood but also in other compartments, as bronchoalveolar lavage (BAL), urine or stool, depending on the specific virus infection and transplant population.

The extent of the recipient's preexisting immune response against different viruses has a substantial impact on the course of the disease. Transplant recipients, who have no prior immunity for these viruses, show a particularly high risk of developing a severe primary infection by the donor virus after transplantation. To assess the individual risk of a patient developing severe virus infections, testing for the presence of virus-specific antibodies (ABs) in the donor and recipient prior to transplantation is routine. Blood samples collected from the patients are tested by Enzyme-linked immunosorbent assay (ELISA) test systems, determining in particular virus-specific IgG. The absence of virus-specific IgG in the recipient indicates that the patient is susceptible and could

Table 1 Clinical manifestations and virus diagnostics of the most important virus infections in the immunocompromised patient after transplantation

<i>Virus</i>	<i>Clinical manifestation</i>	<i>Diagnosis</i>	<i>Pre Tx serology tested</i>	<i>Preemptive testing by quantitative PCR</i>
Cytomegalovirus	End-organ diseases (Pneumonitis, Colitis, encephalitis etc.) disseminated CMV syndrome	Quantitative PCR from blood (also BAL, CSF other body fluids)	Always, from donor and recipient	In all transplant recipients
Epstein-Barr Virus	Posttransplant lymphoproliferative disease	Quantitative PCR from blood	Sometimes especially in children	In high-risk groups
BK Polyoma Virus	Polyomavirus associated nephritis, loss of kidney transplant Hemorrhagic cystitis after HSCT	Quantitative PCR from urine and blood	Not routinely done	Especially in kidney transplant recipients, eventually in HSCT
Adenoviruses	Generalized infection, especially in children after HSCT	Quantitative PCR from blood and stool	No	Especially in pediatric HSCT
Herpes simplex virus	Extended cutaneous lesions, rare generalized infections	PCR from vesicles, ev blood, CSF	No	No
Varicella-Zoster Virus	Extended cutaneous lesions, rare generalized infections	PCR from vesicles, ev blood, CSF	Yes, vaccination possible	No

develop a primary virus infection. If the transplant derives from an IgG seropositive donor, this is a particularly high-risk situation, as it is most likely that a primary infection from the donor will occur.

The determination of the recipient's antiviral T-cell response is gaining growing interest to assess the individual risk for severe infections. In particular, the reconstitution kinetics of neutrophils, CD4⁺, CD8⁺ T-cells and NK cells are of paramount importance in the HSCT setting to determine transplant success but are also actively investigated in SOT to determine the recovery of immune function following induction treatments. CD4⁺ and CD8⁺ T-cell responses to individual viruses can be investigated to determine the risk of specific virus-related diseases. However, this approach is so far not widespread and no consensus on protective responses has been reached yet.

It was also shown that the level of Torque Teno Virus (TTV), a small commensal and non-pathogenic DNA virus present in the majority of the human population in blood, is associated with the level of drug-induced immunosuppression after SOT. TTV-DNA loads are also affected by the patient's immune response and have been proposed as a potential indicator of overall immune impairment in SOT. This was reported in lung transplant and also kidney transplant recipients. An association was established between high immunosuppression, a high TTV load exceeding a specific cut off level and the occurrence of opportunistic infections. In contrast, low TTV-load was reflected low immunosuppression decreasing under a defined lower cut off level and was significantly associated with organ rejection processes after lung and kidney transplantation.

The virus diagnosis procedures and follow-up recommendations are different and specific for each virus, which potentially causes a high risk to the immunocompromised host. Therefore, the most important virus pathogens and their follow-up will be separately reviewed in the following and are summarized in [Table 1](#).

Human Cytomegalovirus (HCMV)

Human Cytomegalovirus is a member of the herpesvirus family and belongs to the beta-herpesvirus subfamily. HCMV proved to be the major opportunistic agent in immunocompromised patients. Before the HAART era, HCMV was associated with most morbidity and mortality in HIV- infected individuals. Indeed, HCMV end-organ diseases were primary AIDS-defining clinical conditions, typically appearing in the presence of CD4⁺ T-cell counts <200. Similarly, HCMV represents the main opportunistic pathogen in both HSCT and SOT recipients. Like all herpesviruses, HCMV is a widespread agent acquired early in life. In immunocompetent individuals, the majority of primary HCMV infections are asymptomatic, while in a minority of cases is a self-resolving mononucleosis syndrome.

Following primary infection HCMV can establish lifelong latency in many cell types (myeloid cells precursors, endothelial cells, kidney and salivary glands epithelial cells). In immunocompetent individuals, reactivations are asymptomatic. The peculiar ability of HCMV to infect and become latent in many cell types may explain why this virus is so aggressive in immunocompromised patients. Indeed, in patients with impaired T-cell and NK immunity primary and reactivated infection can present as disseminated infections associated with end-organ diseases (retinitis, gastritis, small and large bowel ulcers, pneumonia, encephalitis, hepatitis). This wide range of end-organ diseases is due to HCMV establishing latency in endothelial cells, thus reactivation(s) can potentially involve any organ.

From a diagnostic standpoint, it is then important to: (1) determine the donor (D)/recipient (R) serostatus and (2) periodically monitor the presence and the level of HCMV DNA in blood as a marker of reactivation and dissemination. The highest risk for HCMV disease in HSCT is in D⁻/R⁺ combination, while in SOT is in the D⁺/R⁻ group. In both cases, an HCMV infection could develop in the absence of specific memory B- and T-cell responses, with a high risk of dissemination and organ involvement. For

this reason, high-risk transplant populations are often given antiviral prophylaxis. On the other hand, patients already HCMV experienced are at risk of symptomatic HCMV reactivations due to impaired immunity consequent to immunosuppressive anti-rejection treatments. To minimize the toxic effects of current antivirals, medium to low-risk patients are given pre-emptive treatment protocols based on the administration of antiviral treatment in the presence of documented HCMV replication when still asymptomatic.

Periodic HCMV DNA quantitative determination in the blood is then required in the post-transplant period to detect the presence and the extent of virus replication (reactivation). A typical monitoring schedule involves HCMV DNA quantification once a week in the first 3 months (when immunosuppression is greater in SOT and engraftment is ongoing in HSCT) followed by once every 2 weeks in the second 3-month period and once a month in the following 6 months. Detection followed by the rising of HCMV DNA levels in the blood is indicative of asymptomatic HCMV replication and the potential for dissemination. For pre-emptive treatment initiation, different centers use different HCMV DNA cut-off levels due to a lack of standardization between real-time techniques. Recently, a national consensus conference indicated HCMV DNA cut-off levels for high, medium and low-risk SOT as well as HSCT recipients. The diagnosis of HCMV end-organ diseases requires the identification of viable virus (isolation) and virus antigens (immunohistochemistry) in organ tissues or a high level of CMV DNA in relevant fluids.

Sequential determination of HCMV DNAemia is essential to identify treatment failures. Indeed, unchanged or increasing HCMV DNA levels following several days of treatment may indicate the “in vivo” selection of a mutant and drug-resistant HCMV strain. A number of drug-resistant mutants have been described and occur especially in the UL97 and UL54 genes. UL97 codes for a kinase required for the phosphorylation of ganciclovir and different mutations at this gene have been identified which confer resistance against this drug. The UL54 gene codes for the virus polymerase and distinct mutations in this gene may confer resistance against ganciclovir, foscarnet or cidofovir. To identify the development and extent of drug resistance, sequencing of the UL97 and UL54 genes is required. This can confirm the presence of ganciclovir, foscarnet and cidofovir resistant strains and is important to help direct a change of antiviral agents.

Finally, assessment of specific T-cell immunity has proven helpful in predicting patients at risk of HCMV reactivation and disease, as well as designing tailored preventive and treatment approaches.

Epstein-Barr Virus (EBV)

EBV is a member of the herpesvirus family and belongs to the gamma-herpesvirus subfamily and has oncogenic potential. In fact, a peculiar characteristic of the two members of the gamma-herpesviruses (EBV and HHV-8) is their correlation with many lymphomas, sarcomas and carcinomas. Strikingly, EBV-induced malignancies are associated with different virus latency phases (Table 2). Thus, EBV is pathogenic both during replication and latency.

EBV primary infection is acquired early in life and is mostly asymptomatic, justifying the impressive biologic success of this virus. Indeed, EBV seroprevalence is virtually 100% at the age of 20. Mononucleosis is the clinical manifestation of primary EBV infection in a small (but significant) fraction of individuals. Immunocompromised patients, especially transplant recipients, are at risk of complications in both the replicative phase (chronic active EBV infection) and latency (post-transplant lymphoproliferative disorders or PTLN, lymphomas and leiomyosarcoma).

Among SOT recipients, D⁺/R⁻ are at a higher risk of complications. Given the high EBV seroprevalence in young adults and adults, pediatric transplant recipients are at the highest risk of short-term complications. In addition, pediatric SOT recipients are also at the highest risk of late EBV-associated neoplasm due to the longer life expectancy and the greater cumulative effect of immunosuppression. EBV serology might be tricky to interpret due to the response to multiple antigens and the relevant antibody maturation (Table 3).

Table 2 EBV associated tumors and expression of EBV latency genes (modified from J.L.Hsu, S.L. Glaser, Critical Reviews in Oncology/Hematology 34; 27–53, 2000)

<i>EBV latency</i>	<i>Pattern of EBV latency gene expression</i>	<i>Malignancy</i>
Type I	EBNA-1 EBERs	Burkitt's lymphoma Gastric carcinoma
Type II	EBNA-1 LMP-1, -2A, -2B EBERs	Nasopharyngeal carcinoma Hodgkin's disease (HD) Nasal T/NK lymphoma
Type III	EBNA-1, -2, -3A, -3B, -3C, -LP LMP-1, -2A, -2B, EBERs	AIDS-associated non-HD lymphoma PTLD (post-transplant lymphoproliferative disorders)
Other	EBNA-1, -2 EBERs	Leiomyosarcoma

Table 3 Typical^a EBV-serological profiles using the most frequently employed antigens and Ig isotypes

Antigen/Ig isotype condition	VCA/IgG	VCA/IgM	VCA/IgA	EA/DIgG	EA/R/IgG	EBNA/Ig
Susceptible/no previous exposure	—	—	—	—	—	—
Primary infection	++	+++	+	+	+/-	—
Past infection	+	—	+/-	—	+/-	+
Inconclusive: Primary or past infection	+	+	+/-	+/-	+/-	+
Inconclusive: Primary or past infection	+	—	+/-	+/-	+/-	—
Chronic active EBV infection	+++	+	++	++	+	+/-

^a + / —, Antibodies absent or present; +, Antibodies present; ++, Antibodies present in elevated titers; + + +, Antibodies present in strongly elevated titers.

Abbreviations: EBV: Epstein–Barr virus.

VCA: Virus capsid antigens.

EBNA: EBV nuclear antigen.

EA/D: Early antigen/diffuse.

EA/R: Early antigen/restricted.

Atypical patterns include VCA IgM positive only; EBNA positive only; or VCA IgM and EBNA positive, but VCA IgG negative. Atypical patterns merit repeat testing, testing of a follow-up sample, or testing by alternate methods.

Primary EBV infection (mononucleosis) and chronic active EBV infection (often a complication of initial mononucleosis) are observed almost exclusively in pediatric transplant recipients, while PTLD is an uncommon complication of HSCT and SOT in both pediatric and adult settings. The risk of PTLD is directly correlated with the level and duration of immune suppression. Thus, transplants (or rejection episodes) requiring aggressive immune suppressive treatments bear an elevated risk of EBV-PTLD. From a treatment standpoint, it must be underlined that PTLD, as well as all EBV-associated tumors, are induced during a replication-inactive phase of the virus life cycle. Currently available anti-herpetic drugs (inhibiting viral DNA polymerases) are ineffective. Indeed, during PTLD, EBV DNA replicates in its latent form via cellular DNA polymerases in proliferating cells. Then, measurement of EBV DNA in peripheral blood of transplant patients (although pivotal in the monitoring of PTLD development) has to take into account these pathogenetic peculiarities: (1) during mononucleosis or chronic active EBV infection EBV DNA is the expression of active virus replication and it can be used to monitor the efficacy of antiviral treatment, while (2) during PTLD EBV DNA is the expression of EBV-induced cell proliferation in the absence of active virus replication and it can be used to monitor the efficacy of immune suppression tapering as well as lymphocyte B lytic treatments. Cut-off levels to start treatment for PTLD are still debated.

Monitoring EBV-specific T-cell responses to replicative phase antigens as well as to latency phase antigens might be helpful to define patients at risk of PTLD better.

Polyomaviruses (PyV)

Polyomaviruses comprise a group of non-enveloped DNA-viruses that remain after primary infection and persist in the human host. PyVs are highly prevalent worldwide in human populations and include among others BK-PyV, JC-PyV, Merkel cell Carcinoma PyV and trichospinusulosa PyV.

The most important of these viruses in the transplant setting is BK-PyV, which is of clinical significance nearly exclusively after renal transplantation or HSCT. BK-virus is latently resident in kidney cells and may replicate to high levels after renal transplantation. In the worst case, it may lead to Polyomavirus associated nephritis (PVAN) and to loss of the transplant. Recent data provide evidence that BK-PyV associated disease is caused especially by the donor BK-PyV transmitted by the transplanted kidney. The key element in avoiding the development of PVAN is preemptive routine diagnostic testing for BK-PyV DNA by quantitative PCR assays in urine and blood. While low-level BK-PyV DNA is sometimes detectable in immunocompetent persons and is of no significant clinical value, urine BK-PyV DNA levels increasing over > 7–8 log₁₀ copies/mL signify substantial virus replication and reflect an increased risk for progression to BK-PyV DNAemia and further PVAN. Moreover, the detection of decoy cells in urine, which have enlarged cell nuclei and intranuclear viral inclusions, may be of diagnostic value.

Either from the beginning, but at the latest as soon as the virus load in urine increases over > 7–8 log₁₀ copies/mL urine, quantitative PCR testing in blood is required to control the replication kinetics further. An increase of the BK-PyV DNAemia over > 3–4 log₁₀ copies/mL plasma indicates a high risk of developing PVAN. Renal histology is then required to help with management decisions to counteract further BK-PyV replication. These include reducing the individual immunosuppressive drugs to re-establish the recipient's antiviral response and avoid progression and transplant loss. Without intervention, about 50% of highly viremic patients progress to PVAN. The quantitative PCR test cut-offs mentioned above are recommendations based on specific in-house PCR assays. An international BK-PyV calibrator approved by the World Health Organization (WHO) is available and this allows comparison of different quantitative PCR-assays used in different centers.

Serology plays no role in routine testing and risk assessment of kidney transplant recipients. This is in part due to the fact that BK-PyV AB tests are not commercially available and only established in single laboratories in the course of scientific projects. However, an increasing amount of data suggest that a high level of BK-PyV specific ABs in the donor pre-transplantation is associated with a higher risk of the recipient developing PVAN, probably as it reflects a higher virus load in the donor kidney.

BK-PyV may also cause hemorrhagic cystitis in patients after HSCT. Hemorrhagic cystitis may occur in up to 25% of pediatric and up to 54% of adult allogeneic HSCT patients. Diagnosis of BK-PyV associated cystitis is made using clinical parameters as well as by virus detection in urine by PCR. High-level viruria ($> 7 \log_{10}$ BK-PyV DNA copies/mL urine) as well as DNAemia seem to predict hemorrhagic cystitis in these patients.

Other polyomaviruses cause infrequent complications in immunosuppressed patients after transplantation and are therefore not subject to routine follow up virus load testing by quantitative PCR. JC-PyV is latently present in the kidney and in the brain neurones of most people and may cause progressive multifocal leukoencephalopathy (PML) in rare cases of highly immune depressed AIDS patients or in HSCT patients. This is caused by reactivation of JC-PyV in severely T-cell deficient patients and due to progressive demyelination in the brain tissue which is mostly lethal. JC-PyV PCR tests are carried out in cerebrospinal fluid samples and also from blood to diagnose PML.

Adenoviruses (AdVs)

Adenoviruses (AdVs) are non-enveloped DNA viruses that are widely distributed. AdV contains seven species, termed A to G. Most infections with AdVs occur at a young age and in the immunocompetent host are mostly associated with mild infections, such as respiratory infections, ocular infections or gastroenteritis. However, in the immunocompromised host, and especially in children after allogeneic HSCT AdVs are important pathogens, as they may extensively replicate and may cause life-threatening infections. In these patients, AdVs may cause hemorrhagic enteritis or cystitis, or affect other organs including lung, liver, kidney or heart tissue, and finally, AdV infections may cause multiorgan failure. The lethal outcome of generalized AdV infections in children after allo-HSCT is high.

It is thought that the virus derives from extensive local replication especially in the gastrointestinal tract of severely immunosuppressed children and is further spread extensively to different organs by AdV viremia. Therefore, close routine diagnostic follow up for AdV is strongly recommended in this pediatric cohort. Also, adults may develop systemic AdV infections after allogeneic HSCT, however, this is observed to a much lower extent.

Preemptive diagnosis for AdV infections is based on quantitative AdV DNA PCR from stool and blood, using a pan-AdV PCR, detecting all AdV strains in one assay. Current PCR tests commonly target the AdV hexon gene which is a conserved region within AdV strains. Detection of virus DNA in blood is considered a marker of ongoing systemic disease. Therefore, most centers test for DNAemia routinely and on a weekly basis after transplantation. A level of $> 3 \log_{10}$ copies/mL plasma is considered critical for the progression of infection to generalized disease and requires therapeutic intervention. This involves systemic treatment with cidofovir or brincidofovir. Also, a viral load of $> 6 \log_{10}$ AdV DNA copies/g stool is considered critical. Before HSCT, intestinal AdV shedding is associated with an increased risk of later development of disseminated AdV disease post-transplantation. Therefore, AdV PCR testing of stool prior to transplantation may be a useful tool to assess the individual risk of patients for generalized AdV disease. AdV infections after solid organ transplantation are rare.

Other Viruses

There are also other viruses that may cause significant complications in immunosuppressed patients. But as these occur less frequently, routine follow up testing is not initiated in these post-transplant risk groups.

Herpes Simplex Virus (HSV)

Herpes simplex virus, especially HSV type 1, is highly prevalent in the human population. It usually causes a symptomatic or asymptomatic primary infection during early childhood and is thereafter latently present in ganglia cells. HSV may reactivate from time to time also in healthy individuals due to stressful situations or after extended sun exposure. It may then lead classically to vesicular lesions on the lips, herpes labialis, which is quite common. Under severe immunosuppression, HSV may also reactivate and may cause severe cutaneous manifestations with extended dermal lesions, which may also become necrotic. In rare cases, HSV may also affect different organs and even cases of HSV encephalitis may be observed. HSV infection is usually identified by clinically evident dermal manifestations. In difficult clinical situations, the diagnosis may be confirmed by HSV-specific PCR carried out on vesicle fluid. In generalized infection, blood or in suspected cases of encephalitis or meningitis also cerebrospinal fluid (CSF) samples will be tested by PCR. Early treatment with high dose intravenous aciclovir has to be administered as soon as possible to avoid or limit further virus dissemination. Frequently, HSV is also detected in patients in intensive care units, especially in the lower respiratory tract. Whether this has any clinical importance or whether this is due to subclinical replication under extremely stressing conditions, and eventually also due to intubation and artificial ventilation is still unclear.

Varicella-Zoster Virus (VZV)

Varicella-Zoster Virus is a herpesvirus that is highly prevalent in the population, except in younger people if they have been vaccinated already against VZV.

Primary infection with VZV manifests as chickenpox, classically associated with a generalized vesicular rash, and is highly contagious. Diagnosis is mostly made clinically on seeing the typical dermal lesions. The virus lies in a latent state in the dorsal root ganglia cells of the host and remains there for life. Reactivation of VZV is observed most frequently in older individuals and is associated with decreasing cellular immune response against VZV. Reactivation manifests typically as herpes zoster (shingles), manifesting as a vesicular rash that covers usually one dermatome. Herpes zoster may be accompanied by severe pain, or by complications affecting especially the central nervous system (CNS) and appear as meningitis, meningoencephalitis or transverse myelitis. Herpes Zoster infection is usually identified by clinically evident dermal manifestations. In difficult cases, the diagnosis may be confirmed by VZV-specific PCR performed from vesicle fluid. In generalized infection, VZV-PCR may be carried out in blood or CSF in suspected cases of encephalitis or meningitis.

VZV may cause severe complications in the immunocompromised host. Reactivation of VZV latently present in the patient may start after immunosuppression and may lead to severe cases of herpes zoster, affecting more than one dermatome. In especially severe cases not only vesicles but severe and extended necrotizing dermal lesions may be observed. The clinical picture is also clear from the dermal manifestations, but in difficult cases, VZV-specific PCR from vesicle lesions is performed. VZV infection after immunosuppression may also cause meningoencephalitis and diagnosis by VZV PCR from CSF is needed. Rarely systemic infections occur. These have a dramatic course associated with the development of multiple ulcers in the gastrointestinal tract and with multi-organ failure. Rapid detection of VZV DNA by PCR is then required, also from blood. As the clinical appearance of generalized infection is often unclear at the beginning and the course of the disease is fulminant, mortality is high. Treatment with high dose intravenous antiviral drugs such as aciclovir is mandatory in all severe cases of VZV infection in the immunocompromised host.

Children who have neither undergone primary VZV infection nor vaccination against VZV prior to immunosuppression, are at a particularly high risk of developing a primary infection with VZV after transplantation and the start of immunosuppression. Such primary varicella in the immunocompromised host is associated with especially severe clinical complications. Therefore, determination of the VZV ABs prior to transplantation is mandatory, especially in children, to assess the patients' VZV serostatus. If no VZV specific ABs are detectable pre-transplantation, VZV vaccination has to be administered before the start of immunosuppression.

Hepatitis E Virus

Hepatitis E virus is an RNA virus. HEV genotype 3 infections occur especially in pigs and boar in many countries and may be transmitted to humans mostly by eating undercooked food. Acute infection with HEV genotype 3 infection is self-limiting and asymptomatic in the immunocompetent host. However, when patients develop an HEV infection after transplantation, they may develop chronic hepatitis during immunosuppression. Undiagnosed this may lead to the rapid development of liver cirrhosis within a few years and death of the patient. Therefore, screening for HEV infection should be performed in all transplant patients with unclear elevation of liver enzymes. HEV-PCR can detect viremia from blood, and a positive result indicates ongoing acute or chronic infection. Also, HEV can be detected in the stool of the patients. HEV specific AB testing is not suitable in the immunocompromised host, as AB development may be reduced over a long time after infection in these patients. A decrease of immunosuppression and/or administration of ribavirin may lead to the termination of viral replication.

Conclusion

A number of different viruses are dangerous pathogens for the immunosuppressed host. These may not only affect the patient as a single virus infection but may also appear in combination with other virus infections or with bacterial or fungal infections under immunosuppression. The diagnostics of virus infections in immunocompromised patients is of utmost importance for the patients' short and long-time survival. But high virological expertise is needed to correctly perform appropriate tests at the optimal time points and establish exact quantification. Participation in quantitative quality control panels is needed, to allow inter-laboratory comparisons and to assess quantitative cut-off levels, which are comparable between different centers. The diagnosis of virus infections especially after transplantation and the interpretation of the test results requires good knowledge of the particular viruses, their pathogenesis and life cycle, and the mechanisms of virus latency and replication. The differentiation between non-pathogenic and potentially pathogenic virus load levels is still difficult in most virus infections, and the identification of the turning point to highly dangerous levels of virus replication is challenging and needs highly experienced experts.

Diagnosis; Future Prospects on Direct Diagnosis

Marianna Calabretto and Daniele Di Carlo, Sapienza University of Rome, Rome, Italy

Fabrizio Maggi, University of Pisa, Pisa, Italy and University of Insubria, Varese, Italy

Guido Antonelli, Sapienza University of Rome, Rome, Italy

The diagnosis of viral infection, especially the direct one (i.e., demonstration of viral particle - as a whole or through detection of viral antigens or nucleic acids), has been and is going to be, affected by several breakthroughs. Indeed, until a few decades ago, the direct diagnosis was made by performing viral isolation by using cell culture. This method, which today only in some instances still represents the “gold standard”, takes a long time to be carried out and requires highly skilled and experienced staff able to correctly interpret the viral cytopathic effect and to manage cell lines and highly pathogenic viruses. These characteristics do not fit with the current need for low-cost, accurate, and rapid virological diagnosis. Indeed, it is generally accepted that a rapid and more reliable diagnosis may lead to better management of the patient, including personalized therapy, reduced use of unnecessary drugs (for instance antibiotics), and shorter hospitalization. For the above reasons and considering the constant improvement of diagnostic assays, most clinical virology laboratories became essential in the hospital to make clinical decisions.

Although the impressive achievement in terms of technical advances, it is important to note that today there is still no diagnostic approach (i.e., molecular detection, antigen identification, virus isolation, etc.) that: meets all needs of diagnostic virology laboratories; is suitable for all clinical situations; and applies to all virus types. This indirectly means that virologists, who are aware of these limitations, use a different assay depending on any specific clinical situation.

This document provides an overview of the main technologies that, to our opinion, have been used in recent years, and will be used in the future, in the routine activity of a clinical laboratory of a big Hospital. In the framework of these technologies, we will try to outline possible future scenarios of their application in the context of the virological diagnostic.

PCR and Its Evolution

Polymerase chain reaction (PCR) is the assay that allows the amplification of nucleic acid fragments of which initial and terminal sequences are known. Its use for the quantification of viral nucleic acids in body fluids has profoundly changed virological diagnosis. Up to now, the amplification of nucleic acids through PCR represents the gold standard for the screening, diagnosis, and follow-up of several viral infections, such as HIV, HBV, HCV, CMV, respiratory viruses.

The most used tests in the laboratory are real-time PCR and reverse transcription-PCR (RT-PCR).

The real-time PCR allows detection and quantification of a viral product during the run of the assay; “real-time”, as opposed to the standard PCR which quantified it only at the end of the session. This leads to: a reduction of run assay time; the lack of need for post PCR processing; an increase in sensitivity.

RT-PCR, on the other hand, allows amplifying cDNA (complementary DNA) obtained by a previous reverse transcriptase reaction on mRNA and other RNA virus genomes.

The introduction of viral load measurement in biological fluids through PCR has led to the reduction of morbidity, mortality, and disease transmission, especially in chronic infections such as HIV, HBV, and HCV. It found application also in monitoring viral infections in transplanted patients such as CMV.

qPCR is based on the quantification of nucleic acids by comparing the number of amplification cycles, which is believed to be exponential, and the quantity of the final product of PCR with those of a reference sample. qPCR measures the intensity of fluorescence at specific times (generally at the end of each amplification cycle) to quantify the amount of target molecule. It gives the threshold per cycle (CT) and the difference in CT is used to calculate the amount of initial nucleic acid.

However, this comparison is subject to factors that could produce inaccurate data. For example, the amplification cycles may not be exponential, or the target nucleic acid quantity may not be sufficient (Pekin *et al.*, 2011; Quan *et al.*, 2018).

The future of quantitative PCR is digital PCR (dPCR).

dPCR, indeed, thanks to the advances in nanofabrication and microfluidics that have now led to systems that produce hundreds to millions of nanoliter- or even picoliter-scale partitions, breaks down the body fluid by quantifying the presence of target nucleic acid in every single droplet and the measurement of the DNA quantity takes place after the amplification is completed. This allows having a more precise and accurate measurement of the number of amplified molecules.

Furthermore, while qPCR is unable to distinguish differences in gene expression or variations in copy numbers that are smaller than twofold (Kuang *et al.*, 2018), dPCR has shown to distinguish between copy number variations of that differ by only one copy (Baker, 2012). Its greater sensitivity, accuracy, and precision make dPCR a potential evolution in virological laboratory diagnostics to test viral load in a different compartment.

Next-Generation Sequencing (NGS)

The next-generation sequencing (NGS) (also called massively parallel or deep sequencing) represents a series of technologies that allow sequencing an entire genome within a few days. The peculiarity of NGS is to include together the three main steps of sequencing: sample preparation, sequencing, and data analysis. This saves significant time and reduces the number of errors in practice. There are three ways to sequence genetic material through NGS.

The first method is similar to the classic Sanger method with the amplification and sequencing of a specific target. The second involves the amplification of all the genetic material present in the sample followed by NGS. Finally, in the third method, the viral genetic material is first enriched by various methods and then sequenced by NGS (Maggi *et al.*, 2019).

The applications of NGS in virology and clinical virology lab are various.

First of all, it allows the identification of new pathogenic and non-pathogenic commensal viruses. For example, the Schmallenberg virus, a new Orthobunyavirus that causes malformations in cattle and sheep, was discovered through NGS (Hoffmann *et al.*, 2012; Rosseel *et al.*, 2012).

Through a metagenomic approach, it is also possible to perform an etiological diagnosis of viral infection, as in the case of the recent identification of viruses responsible for diseases with severe fever but of unknown etiology (Yozwiak *et al.*, 2012; McMullan *et al.*, 2012).

Furthermore, whole – viral genome sequencing may allow: the study of genetic mutations that can lead to drug resistance; the identification of variants that can overcome the immune response of the host; the identification of diversity in the viral variants/genomes within the same host (useful in the case of viruses able to give chronic infection, such as HIV, HCV, HBV, or Herpesviruses) (Clevenbergh, 2000; Kim *et al.*, 2014; Houldcroft, 2017) and, in this framework, study of the diversity of the viral genome and its evolution; to address molecular epidemiology and viral phylogeny.

As far as HCV variants resistant to antiviral drugs are concerned, it is known that the resistance to some HCV antiviral drugs is due to mutations present in some non-structural proteins of the virus, NS3/4A, NS5A, and NS5B. Although now the issue is overcome by the introduction of very effective drugs, NGS would be possible to characterize the virus to administer the most effective antiviral drug. Besides, NGS was used to simultaneously differentiate HCV and HGV (Hepatitis G Virus) in the patient's serum. The two viruses share the same transmission mode that can cause co-infection. The simultaneous diagnosis of the two viruses, therefore, improves the management of infection and therapy (Parker and Chen, 2017).

NGS has the merit also to have demonstrated: the high variability of viruses that were believed to be genetically stable; that many anatomical sites considered sterile have their flora; that in biological samples it is possible to find viral elements not associated with diseases that are more numerous than pathogenic viruses. This aspect is important for the concept of virome, i.e., the presence of a commensal viral flora that is part of the human microbiome, the community of microorganisms present within the human body (Vu and Kaiser, 2017; Rascovan *et al.*, 2016; Freer *et al.*, 2018).

NGS produces a high value of data that must be collected, evaluated, stored, and used correctly so that the potential of this technology can be exploited to the full. To reach this goal a synergistic activity between virology and “bioinformatics” which combines biology and data processing should be planned (Barzon *et al.*, 2013).

CRISPR-Cas

The microbial clustered regularly interspaced short palindromic repeats (CRISPR) represents one of the new technologies that is going to make a revolution also in the molecular diagnostics market, and some example are already available (Joung *et al.*, 2020). In particular, such a technology has changed the perspectives of gene therapy and manipulation. CRISPR for editing cellular genes must be associated with the enzyme Cas (CRISPR-Cas) and an RNA that guides the complex to the target site of nucleic acid; the enzyme cuts the nucleic acid, triggering a cellular DNA repair mechanism that activates or deactivates the target gene or removes pieces of nucleic acid. The best example in virology is the use of technology to handle the integrated viral genome (Deng *et al.*, 2018; Ford *et al.*, 2019). Many viruses have indeed the ability to establish a persistent infection by integrating their genome into the host's DNA. CRISPR technology has been used in vitro and in animal models to achieve integrated sequences, managing to eliminate chronic viral infections. For example, it was used in vitro to inactivate HIV gene expression in microglia and T cells. Besides, targeting the HIV LTR, gag, and pol genes it was possible to eliminate HIV proviral DNA from animal cells of the spleen, lungs, colon, heart, and brain (Hu *et al.*, 2014; Wang *et al.*, 2018; Yin *et al.*, 2017). Also, CRISPR technology delivered by a lentivirus vector has been used to eliminate HIV proviral DNA from infected human peripheral blood mononuclear cells in a transgenic mouse model (Bella *et al.*, 2018).

The same results have also been achieved with other viruses, such as Herpesviruses. In particular, using CRISPR, 95% of the EBV genome in latently infected Burkitt lymphoma cells was achieved (van Diemen *et al.*, 2016).

These results suggest that in the future CRISPR technologies can be used also for therapeutic purposes like the eradication of chronic infections in the tissues and the oncological therapy of malignancies with viral etiology (Strich and Chertow, 2019; Myhrvold *et al.*, 2018).

One of the side effects of the combination of CRISPR/Cas13 is promiscuous ribonuclease activity upon target recognition. This has been exploited, combined with isothermal amplification, to quickly search for RNA or DNA with attomolar sensitivity and single-base mismatch specificity. This Cas13a-based molecular detection platform, termed Specific High-Sensitivity Enzymatic Reporter UNLOCKing (SHERLOCK), has been used to detect specific strains of Zika and Dengue virus, distinguish pathogenic bacteria, genotype human DNA, and identify mutations in cell-free tumor DNA (Roy *et al.*, 2018; Gootenberg *et al.*, 2017).

Moreover, this method seems useful because SHERLOCK reaction reagents can be lyophilized for cold-chain independence and long-term storage and be readily reconstituted on paper for field applications.

Combined with HUDSON (heating unextracted diagnostic samples to obliterate nucleases), SHERLOCK can work directly on biological fluids without having been previously extracted and in less than two hours (Gootenberg *et al.*, 2017).

Another recent method, similar to SHERLOCK, is DETECTR (DNA endonuclease targeted CRISPR trans reporter). This uses Cas12a, similar to Cas13a but working on DNA, which produces single-stranded DNA cleavage activity after recognizing the target sequence. DETECTR has been used successfully to detect human papillomaviruses 16 and 18, two of the most important genotypes that cause neoplastic transformation. This method has proved to be simple and fast compared to other diagnostic methods for the diagnosis of human papillomavirus making it suitable for its use for rapid molecular diagnosis (Chen *et al.*, 2018).

MALDI-TOF Mass Spectrometry

Matrix-assisted laser desorption/ionization-time of flight (MALDI-TOF) allows identifying with certainty and precision the type and strain of microorganism responsible for a specific pathology, through the analysis of a sample of the patient's biological fluid (blood, urine, or liquor) subjected to spectrophotometric analysis, without the need of preliminary treatments.

The sample to be analyzed is hit by a laser beam which first causes the fragmentation of its molecules and, subsequently, their ionization. Entering an electric field, these generate a signal that is read by software that produces a particular path. This will then be compared to the spectra already present in a database, allowing the recognition of a specific microorganism through this molecular "fingerprint".

In bacteriology and mycology, this technology found large application and then is widespread. In virological diagnostics is going to be used but still requires consolidation. It finds use to detect viral components in a wide variety of biological specimens, to spot genome mutations associated with drug resistance, and to identify the genotype of viruses (Cobo, 2013).

MALDI-TOF MS can be used for rapid and accurate diagnosis of influenza viruses, being able to detect the different subtypes, and for the diagnosis of the various enteroviruses that cause pediatric gastroenteritis, especially if associated with Multiplex PCR (Chou *et al.*, 2011; Piao *et al.*, 2012).

Furthermore, this method has found application in the identification of the viral genotypes of HPV, HBV, and HCV, improving the management of the infection and the response to the therapy (Gray and Coupland, 2014). Finally, through MALDI-TOF MS it is possible to identify drug resistance against antivirals, for example, resistance to ganciclovir (Zürcher *et al.*, 2012).

The main advantages of using this method derive from its rapid and reliable identification of a large variety of viruses, its simplicity of use, its sensitivity and accuracy.

On the other hand, its diagnostic use is limited due to the limited coverage of virus species in the database and MALDI-TOF devices are at the moment still expensive.

Multiplex and POCT

The need to optimize laboratory diagnosis in clinical practice has also led to the development of multiplex platforms over the years, both as regards bacteriological, parasitological, and virological diagnosis. In particular, multiplex PCRs allow detection or quantitation of sequences of multiple viruses in a single session using a set of specific primers (McCulloh *et al.*, 2014).

The advantages of multiplexing tests include reducing turn-around-time and improving patient management. The most recent multi-analytical tests allow analyzing a pattern of viruses and germs whose infections are associated with the same clinical manifestations, which possess the same tissue tropism and the same mode of infection. The manufacturing companies are dedicated to the development of syndromic panels specific for the body district, for example respiratory, gastrointestinal, central nervous system, and sexually transmitted diseases panels (Diaz-Decaro *et al.*, 2018; Huang *et al.*, 2018; Scagnolari *et al.*, 2017; Zhang *et al.*, 2015).

The application of these panels is still ongoing but we have already obtained some results.

For instance, multiplex PCR proves useful in the diagnosis of meningitis and encephalitis. Despite the suboptimal sensibility observed for a certain target, multiplex molecular panels allow simultaneous detection of multiple pathogens. Thus, in a situation that requires rapid and reliable diagnosis with small quantities of the sample – cerebrospinal fluid (CSF) – their application could improve a patient's outcome (Dien Bard and Alby, 2018).

The panels dedicated to sexually transmitted diseases that simultaneously diagnose HIV and Syphilis have led to increased compliance for monitoring patients with risky behaviors, such as drug addicts (Elnifro *et al.*, 2000).

In some circumstances, molecular assays have been made so simple to use that they are often marketed as point of care tests (POCT) which are characterized as simple and rapid diagnostic methods that can be used also by healthcare professionals with little or no laboratory experience. Over the last few years, the need for POCT has emerged considering the following advantages: POCT may be performed close to the patient thus reducing the time of diagnosis, especially in case of serious and potentially lethal

pathologies. These features allow a rapid diagnosis made at the patient's bed and also be made in complex situations where access to laboratory methods is difficult if not impossible (Briedigkeit *et al.*, 1998; Johannessen, 2015; Haleyr Giri Setty and Hewlett, 2014). In particular, this approach has found an important development in the diagnosis of HIV-1, influenza viruses, viral hepatitis, and emerging viruses such as the Ebola virus. Especially when potentially dangerous viruses are involved, it is important to adequately train health professionals in the safe collection and handling of biological samples and the correct storage and use of tests for a reliable diagnosis (Li-Kim-Moy *et al.*, 2016; Khuroo *et al.*, 2015; Kaushik *et al.*, 2016).

Multiplex and POC tests can improve the management of the patients when it needs a viral diagnosis. Through the search for multiple microorganisms simultaneously the time-around-time is reduced leading to fast clinical management of the patient. This is especially important in intensive care or emergency room, with pediatric and geriatric patients, and in situations where resources are scarce and a rapid, inexpensive, and reliable test can save many lives, such as in developing countries (Baba *et al.*, 2014).

Microfluidics

Microfluidics is a technology based on the analysis of small quantities of fluids (10^{-9} to 10^{-18} liters) through a system of channels ranging from 10 to 100 micrometers. The material used for the construction of the canals is an optically transparent, soft elastomer: the poly(dimethylsiloxane) or PDMS.

The peculiarity of this system lies in the use of very small quantities of samples and reagents, in the low cost, in its high resolution and sensitivity, in the run-time extremely short (Whitesides, 2006).

Microfluidics can be an important tool in situations where, as in developing countries, access to other diagnostic methods for viral diseases is not feasible. Microfluidics can be an excellent tool for POCT, too. First, the diagnosis of viral infection can occur within 15–30 min. The ability to correctly diagnose even low-level infections, combined with high specificity and sensitivity, allows clinicians to set appropriate therapy in a short time with the result of a better therapeutic success (Simpson *et al.*, 2018; Na *et al.*, 2018). Furthermore, the microfluidic platforms have the unique ability to control the microenvironment through the precise manipulation of very small sample volumes for the assay, finding application in the discovery of new antiviral drugs and the development of vaccines (Chi *et al.*, 2016; van der Borg *et al.*, 2018; Chaipan, 2017).

A recent study has demonstrated the ability to screen microfluidic chips and sorting HIV-1 particles according to epitope expression (Chaipan, 2017).

Microfluidic technologies reduce reaction times while providing an increased number of information on the virus compared to the techniques currently used for the measurement of Viremia, such as qPCR.

With this method, up to 12 influenza A subtypes can be found simultaneously in less than 100 min (Shen *et al.*, 2019).

Besides, the simultaneous identification of sensitive and resistant viruses makes it possible to assess the viral resistance to antiviral drugs before being administered to the patient.

Microfluidic platforms also find space in biomedical research with the possibility of carrying out multiple experiments in a single device even with small quantities of a biological sample, reducing time and costs (Na *et al.*, 2018). Such technology did not find so far an extensive application but it is our opinion that shortly the progress made by lab-on-a-chip microtechnologies will help this technology live up to its potential.

Conclusions and Future Perspectives

Laboratory diagnostics of viral diseases are gaining increasing interest from companies, researchers, and clinicians. The new technologies will replace or improve the current ones, allowing them to reach increasingly optimal management of the patient with viral diseases. Furthermore, thanks to them it will be possible to give impetus to the world of virology through the discovery of new pathogenic and non-pathogenic viral species and their interactions with the host.

Over recent years, there has been growing interest in using Artificial Intelligence (AI) in different areas of medicine. Following the recent events related to the COVID-19 pandemic, AI has shown how their application could improve the prediction, detection, and management of infectious diseases by the combination of laboratory results, medical history, symptoms, and instrumental tests, such as chest CT. Furthermore, the AI can be a useful support to the processing of laboratory results by eliminating operator-dependent interpretation errors in diagnostic tests (Mei *et al.*, 2020; Bansal *et al.*, 2020).

However, not all methods are equal and can lead to different results with the same biological sample. It is therefore important that research continues to develop ever more precise, low-cost, and accessible solutions.

TREATMENT

Antiviral Classification

Guangdi Li, Xixi Jing, and Pan Zhang, Central South University, Changsha, China
Erik De Clercq, Rega Institute for Medical Research, KU Leuven, Leuven, Belgium

© 2021 Elsevier Ltd. All rights reserved.

Nomenclature

EC₅₀ The concentration of a drug inducing its half-maximal effective response.

IC₅₀ The concentration of an inhibitor at which 50% of inhibition in its activity is achieved.

Glossary

Allosteric inhibitors Inhibitors block the enzymatic activity by targeting outside the active site of viral enzymes.

Antiviral drug resistance The reduction in the effectiveness of an antiviral agent to treat an infectious disease, probably caused by amino acid mutations within or outside the drug-binding site.

Drug susceptibility The sensitivity of viruses to one or more drugs. If a virus is susceptible, it can be treated with the drug.

Genetic barrier to resistance The threshold above which drug resistance develops to a drug or a drug class.

HAART Highly active antiretroviral therapy which contains a combination of ≥ 3 antiretroviral drugs.

Introduction

During the past decades, more than 100 antiviral agents or their combinations have been approved to treat 9 human infection diseases: HIV, HCV, influenza virus, RSV, HSV, HCMV, VZV, HBV, and variola virus (human smallpox). Antiviral agents can be possibly classified based on their chemical structures, drug targets, or mechanisms of action. For instance, most antiviral agents target either viral enzymes to block the viral replication or viral surface proteins to prevent the viral entry. Regarding the mechanisms of action, nucleoside analogs are effective viral polymerase inhibitors that resemble naturally occurring nucleosides to cause the termination of the nascent viral DNA chain, while protease inhibitors block the proteolytic processing by competing with protease substrate peptides. Based on the chemical structures, aciclovir and valaciclovir are classified as acyclic guanosine analogs to treat DNA viruses such as HSV and VZV, while cidofovir, adefovir, tenofovir alafenamide are acyclic nucleoside phosphonate analogs to treat HCMV, HBV, and HIV, respectively. Due to the variable nature of antiviral agents, this book article attempts to characterize the antiviral classification based on the drug targets in 9 human infectious diseases.

Human Immunodeficiency Virus (HIV)

HIV Reverse Transcriptase

HIV reverse transcriptase (RT) is an asymmetric heterodimer which harbors two enzymatic domains: the RNA- and DNA-dependent DNA polymerase and the ribonuclease H (Li and De Clercq, 2016). After the viral entry of HIV particles, HIV RT produces the viral DNA genome based on the template of the single-stranded viral RNA genome released from HIV particles (Das et al., 2019). To inhibit HIV genome replication, nucleoside RT inhibitors (NRTIs) and non-nucleoside RT inhibitors (NNRTIs) have been successfully developed to target HIV RT – an indispensable enzyme for HIV replication. On the one hand, the 5'-triphosphate of the NRTIs act as chain terminators. Because NRTIs lack a 3'-OH group, the incorporation of NRTIs into the newly synthesized viral dsDNA terminates the elongation of DNA primer, thereby blocking HIV reverse transcription (Das and Arnold, 2013). On the other hand, NNRTIs are allosteric inhibitors that allosterically target a hydrophobic pocket located approximately 10–15 Å from the catalytic site of HIV-1 RT (Sluis-Cremer and Tachedjian, 2008). This causes conformation changes of the HIV-1 RT catalytic site, thus interrupting the viral dsDNA replication (De Clercq and Li, 2016).

As of September 2020, fifteen HIV RT inhibitors have been approved by the US FDA for clinical use, including (1) seven NRTIs: zidovudine, didanosine, zalcitabine, stavudine, lamivudine, abacavir, emtricitabine; two NtRTIs (nucleotide RT inhibitors): tenofovir disoproxil fumarate and tenofovir alafenamide; and (2) six NNRTIs: nevirapine, delavirdine, efavirenz, etravirine, rilpivirine, and doravirine. Elvitegravir has only been approved in Russia. For more than two decades, NRTIs have been clinically used as the backbone in the highly active antiretroviral therapy (HAART, a combination of ≥ 3 antiretroviral drugs), while NNRTIs often serve as the third agent. Currently, tenofovir alafenamide and doravirine are widely administered in clinical practice because of a high genetic barrier to resistance, high safety profile, and low frequency of administration (Deeks, 2018; De Clercq, 2018). Novel RT inhibitors such as islatravir and dapivirine are currently under development (Baeten et al., 2016; Nel et al., 2016; Nakata et al., 2007).

HIV Protease

HIV protease plays an indispensable role in the proteolytic processing of Gag and Gagpol polyproteins to release key structural proteins (matrix, capsid, nucleocapsid, p6) and viral enzymes (reverse transcriptase, integrase, protease) (Li and De Clercq, 2016). HIV protease is a homodimer of two subunits and the active site of HIV protease is located at the center of the substrate-binding tunnel. This substrate-binding tunnel has been recognized as a conserved drug-binding pocket for the development of HIV protease inhibitors to prevent proteolytic processing (Ko *et al.*, 2010).

As of September 2020, 10 protease inhibitors have been approved by the US FDA. The era of protease inhibitors began in 1995 when saquinavir was the first protease inhibitor approved for clinical use. Subsequently, the US FDA approved ritonavir (a protease inhibitor and pharmacokinetic booster) in 1996, indinavir in 1996, nelfinavir in 1997, amprenavir in 1999, lopinavir and atazanavir in 2000, fosamprenavir in 2003, tipranavir in 2005, and darunavir in 2006. Over the past decades, HIV protease inhibitors have become an important ingredient of HAART (Hammer *et al.*, 1997; Gulick *et al.*, 1997). Nevertheless, the rapid emergence of resistance and poor bioavailability pose a challenge to the clinical use of protease inhibitors (Subbaiah *et al.*, 2017). Currently, darunavir is the most popular protease inhibitor (Deeks, 2014), while saquinavir and amprenavir have been virtually discontinued (De Clercq and Li, 2016).

HIV Integrase

HIV integrase, encoded by the HIV Pol gene, is an indispensable enzyme for integrating viral DNA genomes into human chromosomes by a series of DNA cutting and joining reactions (Asante-Appiah and Skalka, 1999; Esposito and Craigie, 1999). Since the viral DNA synthesized by HIV reverse transcriptase is initially blunt-ended, there are two critical steps of viral integration: (1) the 3' end processing reaction removes two nucleotides from each of the 3' ends of the viral dsDNA before viral integration; and (2) the DNA strand transfer reaction that breaks the human chromosome and 3' ends of viral DNA are joined to the 5' ends of human chromosome at the integration sites (Li *et al.*, 2015). Antiviral compounds have been screened to inhibit either the 3' end processing reaction or the DNA strand transfer reaction (Delelis *et al.*, 2008). Compounds against the 3' end processing reaction are inactive, but integrase strand transfer inhibitors (INSTIs) have shown potent antiviral activities in both in vitro and in vivo studies (Delelis *et al.*, 2008). INSTIs selectively bind near the 3' end of the viral DNA in the structural complex of viral DNA and HIV integrase, thereby blocking the DNA strand transfer reaction (Delelis *et al.*, 2008).

As of September 2020, four INSTIs (raltegravir, elvitegravir, dolutegravir, bictegravir) have been approved by the US FDA. The first-generation INSTIs such as raltegravir and elvitegravir share a low genetic barrier to resistance, causing the loss of virologic activity in clinical studies (Brooks *et al.*, 2019). In contrast, dolutegravir and bictegravir – two second-generation INSTIs – exhibit a higher genetic barrier to resistance, limited cross-resistance, and less drug-drug interactions (Oliveira *et al.*, 2018; Podany *et al.*, 2017). Currently, the WHO, IAS-USA, and EACS guidelines recommend the use of INSTIs in the first-line HIV regimens (Brooks *et al.*, 2019). Novel INSTIs such as cabotegravir are undergoing clinical development (Orkin *et al.*, 2020).

HIV GP41

GP41 is a transmembrane protein encoded by the env gene. As a key structure protein, HIV GP41 binds with GP120 to form HIV spike trimers on the surface of HIV particles (Mao *et al.*, 2012). During the viral entry, the N-heptad repeat (NHR) and C-heptad repeat (CHR) of GP41 switch to a six-helix bundle (6-HB) structure which binds to the human cell membrane and drives the viral fusion into the human cells. Many antiviral agents have been developed to target the hydrophobic pocket within the NHR trimer, therefore preventing viral entry (Mostashari Rad *et al.*, 2018).

As the only GP41 inhibitor approved by the US FDA, enfuvirtide is a fusion peptide inhibitor that mimics the N-heptad repeat and prevents the formation of the six-helix bundle structure of GP41. Clinical use of enfuvirtide requires twice-daily subcutaneous injection (90 mg/Kg for adults, 2 mg/Kg for children aged 6–16 years) (Kitchen *et al.*, 2008). Enfuvirtide is not commonly used in clinical practice because of its side effects (eosinophilia, neutropenia, increased risk of bacterial pneumonia), its short half-life, and lack of oral availability (Reust, 2011). Although many attempts have been made, the development of GP41 inhibitors remains difficult due to the emerging mutations and structural dynamics of HIV GP41.

HIV GP120

GP120, encoded by the env gene, is an envelope glycoprotein on the surface of HIV particles. During the viral entry, HIV GP120 binds to the CD4 receptor and the CCR5/CXCR4 co-receptor on the surface of human CD4⁺ T cells (Falkenhagen and Joshi, 2018; Shaik *et al.*, 2019). The Phe43 pocket and other conserved regions on the GP120 are considered as the real targets for developing anti-HIV drugs (Mostashari Rad *et al.*, 2018). The drugs targeting GP120 can be called adhesion inhibitors, mainly blocking the binding of GP120 with CD4 (Pu *et al.*, 2019).

Fostemsavir (BMS-663068) is the first GP120-directed attachment inhibitor approved by the US FDA on July 3rd, 2020. Fostemsavir tromethamine is the prodrug of temsavir – the active moiety that binds to the conserved outer domain of GP120 which is adjacent to the CD4 binding loop (Langley *et al.*, 2015). This binding inhibits the exposure of the chemokine co-receptor binding site and prevents the initial interaction of HIV GP120 with the CD4 receptor on human T cells and other immune cells.

(Langley *et al.*, 2015). Fostemsavir is recommended for heavily treatment-experienced adults with multidrug-resistant HIV-1 infections. As the only compound in the class of GP120 drugs, fostemsavir harbors a unique resistance profile and exhibits no cross-resistance with other entry inhibitors (Lataillade *et al.*, 2018).

Hepatitis C Virus (HCV)

HCV NS3/4A Protease

The nonstructural protein 3 (NS3) contains a serine protease domain and a helicase domain at the N-terminal and C-terminal regions, respectively (McGivern *et al.*, 2015). The NS3 protein acts as a serine protease to cleave HCV polyprotein precursor at four junctions (NS3-NS4A, NS4A-NS4B, NS4B-NS5A, NS5A-NS5B) to release 5 viral proteins. As a short 54-amino-acid polypeptide, the nonstructural protein 4A (NS4A) serves as an essential co-factor for the NS3 serine protease in a non-covalent complex. NS3 protease is an attractive drug target because its inhibition can terminate the polyprotein processing and restore interferon gene expression (McGivern *et al.*, 2015). NS3/4A protease inhibitors are a key element of direct-acting antivirals that effectively cure HCV infections by targeting one or more viral proteins (Li and De Clercq, 2017).

As of today, ten NS3/4A protease inhibitors have been approved, including glecaprevir, grazoprevir, paritaprevir, simeprevir, vaniprevir, voxilaprevir, asunaprevir, danoprevir, boceprevir (discontinued), and telaprevir (discontinued) (Li and De Clercq, 2017). Moreover, danoprevir was approved in China to treat patients infected with HCV genotype 1b (Miao *et al.*, 2020). Novel NS3/4A inhibitors such as seraprevir are currently under development. For instance, seraprevir is now evaluated in a phase 3 trial (NCT04001608).

HCV NS5A Phosphoprotein

The nonstructural protein 5A (NS5A) is a zinc-binding and proline-rich hydrophilic phosphoprotein that executes versatile functions in genome replication, viral particle assembly, and human-virus interactions (Ross-Thriepland and Harris, 2015). The NS5A protein in the form of a dimer or multimer localizes to the ER-derived membranes via its amphipathic helix domain. NS5A inhibitors can target the amphipathic helix domain of NS5A dimer to inhibit the conformation of double-membrane vesicles and impair HCV RNA replication factories (Shanmugam *et al.*, 2018).

As of today, six NS5A inhibitors (ombitasvir, elbasvir, velpatasvir, daclatasvir, ledipasvir, pibrentasvir) have been approved by the US FDA. These NS5A inhibitors efficiently block in vitro and in vivo viral replication, though their exact models of drug actions are yet to be elucidated (Ross-Thriepland and Harris, 2015). Moreover, the clinical efficacy of NS5A inhibitors plus other direct-acting antivirals offers more than 90% of sustained virologic responses (Li and De Clercq, 2017). Many experimental NS5A inhibitors such as ravidasvir are still under development. Ravidasvir plus sofosbuvir offered promising virologic response rates in 298 patients infected with HCV genotype 4 (Esmat *et al.*, 2017).

HCV NS5B Polymerase

The nonstructural protein 5B (NS5B) is an RNA-dependent RNA polymerase that is indispensable for HCV RNA synthesis and genome replication. The structure of NS5B consists of three subdomains: “palm”, “finger”, “thumb”, and the hydrophobic membrane anchoring C-terminus. As a promising drug target, the catalytic site of NS5B is encircled by the finger and thumb domains. NS5B inhibitors that alter structural conformation or interfere with viral RNA binding exhibit promising potency to inhibit HCV RNA replication (Kirby *et al.*, 2015).

Two NS5B inhibitors have been approved by the US FDA, including sofosbuvir (GS-7977; formerly PSI-7977) in December 2013 and dasabuvir (ABT-333) in December 2014. The NS5B inhibitors can be mainly divided into either nucleoside inhibitors (e.g., sofosbuvir) or non-nucleoside inhibitors (e.g., dasabuvir) (Li and De Clercq, 2017). On the one hand, nucleoside inhibitors block the viral RNA synthesis by mimicking natural substrates and competing with incoming nucleoside triphosphates at the catalytic site of NS5B (Li and De Clercq, 2017). On the other hand, non-nucleotide inhibitors noncompetitively block the allosteric pockets outside the catalytic site to prevent viral RNA synthesis (Li and De Clercq, 2017). For instance, dasabuvir (Kati *et al.*, 2015), GSK5852 (Voitenleitner *et al.*, 2013), beclabuvir (Gentles *et al.*, 2014), and filibuvir (Fenaux *et al.*, 2013) target the allosteric drug pockets in the palm I, palm II, thumb I, and thumb II domains, respectively. Although only two NS5B inhibitors have been approved, many novel NS5B inhibitors (e.g., beclabuvir) are still under development.

Respiratory Syncytial Virus (RSV)

RSV RNA Polymerase

RSV RNA-dependent RNA polymerase – a complex comprising the viral large polymerase subunit, the phosphoprotein, and the transcription elongation factor M2-1 – plays a critical role in viral mRNA transcription, mRNA capping/methylation, and genome

replication (Fearn and Deval, 2016). The large polymerase subunit harbors the enzymatic domains that produce subgenomic mRNAs, RNA replication, and an antigenome RNA for genome RNA synthesis, while the other proteins act as essential cofactors (Fearn and Deval, 2016). Due to its unique features and essential nature, the large polymerase protein has proved to be a promising drug target for the development of nucleoside and non-nucleoside inhibitors.

As of today, ribavirin is an FDA-approved nucleoside inhibitor that inhibits the activity of RSV RdRp, whereas it is largely discontinued to treat RSV infections due to limited efficacy and risk of serious side effects (Shook and Lin, 2017). Experimental inhibitors such as ALS-8176 and PC786 are still under clinical development. ALS-8176 (lumicitabine) is a nucleoside inhibitor with promising anti-RSV efficacy and safety in phase 2a study (NCT02094365) (DeVincenzo *et al.*, 2015; Wang *et al.*, 2015). PC786 is a potent non-nucleoside inhibitor that blocks RSV type A strains (IC_{50} : <0.09–0.71 nM) and RSV type B strains (IC_{50} : 1.3–50.6 nM) in cell cultures (Coates *et al.*, 2017).

RSV Fusion Glycoprotein

RSV fusion glycoprotein is a class I fusion protein that anchors in the membrane of viral particles via a transmembrane domain (Gilman *et al.*, 2019). During the viral entry, RSV fusion glycoprotein in the trimeric form is undergoing dramatic changes from the metastable prefusion conformation to the highly stable post-fusion conformation, thereby driving the fusion of viral membrane with the human cell membranes (Gilman *et al.*, 2019). RSV fusion glycoprotein that induces RSV-neutralizing antibody responses is a key antigen for protective immunity (Tang *et al.*, 2019). As a leading target of neutralizing antibodies and vaccines, RSV fusion glycoproteins have conserved sequences across different isolates of RSV type A and B strains (Tang *et al.*, 2019).

As of September 2020, palivizumab that binds to RSV fusion glycoprotein remains the only monoclonal antibody approved for the prevention of RSV infection in high-risk infants. Nevertheless, the clinical application of palivizumab is uncommon because of its low stability and its limited efficacy of 50% (Soto *et al.*, 2020). Ongoing studies are currently evaluating many experimental inhibitors of RSV fusion glycoprotein, including preatovir, ziresovir, sisunatovir, MDT-637, JNJ-53718678, and ALX-0171. For instance, preatovir (GS-5806) efficiently inhibits the fusion glycoprotein of RSV-A (EC_{50} : 0.51 ± 0.25 nM) and RSV-B (EC_{50} : 0.35 ± 0.15 nM) strains in cell cultures (Perron *et al.*, 2015), and it has completed clinical phase 2 trials (NCT02135614). Ziresovir is another selective and orally bioavailable inhibitor in phase 3 clinical trial (NCT04231968) (Zheng *et al.*, 2019).

Herpes Simplex Virus (HSV)

HSV DNA Polymerase UL30

HSV DNA replication requires seven viral proteins: (1) an origin binding protein UL9, (2) a single-strand binding protein ICP8; (3) a viral polymerase with two subunits UL30 and UL42; (iv) a helicase-primase complex with three subunits UL5, UL8, and UL52 (Chen *et al.*, 2011). HSV DNA polymerase is a heterodimeric complex with two subunits: (1) the catalytic UL30 subunit which offers both polymerase and proofreading exonuclease activities; (2) the UL42 subunit that promotes processivity by tethering UL30 to viral DNA via its direct DNA binding (Vashishtha and Kuchta, 2015). The UL30 subunit belongs to the B-family of polymerases and forms a typical hand-shaped structure with the catalytic residues (D717, D888) located in the palm domain for dNTP polymerization (Vashishtha and Kuchta, 2015). The UL30 subunit can replicate viral DNA with high fidelity, even in the absence of the UL42 subunit. Due to its indispensable role, the UL30 subunit has been considered as a promising drug target to block viral DNA replication (Zarrouk *et al.*, 2017).

As of September 2020, many UL30 inhibitors such as idoxuridine, brivudine, trifluridine foscarnet, aciclovir, famciclovir, valaciclovir, and penciclovir have been approved for HSV treatment. Because current compounds face the challenge of drug resistance and adverse reactions (Vollmer *et al.*, 2019), many experimental inhibitors such as synguanol (Vollmer *et al.*, 2019), mitoxantrone dihydrochloride (Huang *et al.*, 2019), and PHA767491 (Hou *et al.*, 2017) are under development. For instance, synguanol is a methylenecyclopropane nucleoside analog that competitively inhibits HSV-1 UL30 (IC_{50} : 0.33 ± 0.16 μ M) (Vollmer *et al.*, 2019). Mitoxantrone dihydrochloride inhibits viral DNA synthesis by blocking the transcription of UL30 (IC_{50} : 1.21 μ M) (Huang *et al.*, 2019). PHA767491 also inhibits UL30 to reduce the expression of HSV viral genes (UL5, UL8, UL29, UL30, UL42, UL52) (IC_{50} : 1.86 μ M) (Hou *et al.*, 2017). Antiviral agents such as pritelivir and amenamevir that target HSV helicase-primase complex are still under development (Poole and James, 2018).

HSV Envelope Protein

Although HSV particles harbor at least 15 envelope proteins, four envelope glycoproteins (gD, gB, gH, gL) play an indispensable role in viral entry into all permissive cell types (Agelidis and Shukla, 2015). The viral entry begins with the binding of gD to a human receptor (nectin-1, herpesvirus entry mediator, or 3-O-sulfated heparan sulfate) (Atanasiu *et al.*, 2018). This gD-receptor binding drives the conformation changes in gD to activate the regulatory proteins gH and gL, leading to the activation of gB into a fusogenic state for membrane fusion (Agelidis and Shukla, 2015).

Docosanol (*n*-docosanol; behenyl alcohol) is a naturally occurring antiherpetic agent approved by the US FDA as a topical treatment for herpes labialis, as well as the over-the-counter medication for cold sores and fever blisters (De Clercq and Li, 2016).

Although its exact mechanism of action remains unclear, docosanol may inhibit the interactions between HSV envelope proteins and human receptors (De Clercq and Li, 2016). Experimental inhibitors such as C19 and NGI-1 are still under development (Rinis *et al.*, 2018; Lu *et al.*, 2019).

Human Cytomegalovirus (HCMV)

HCMV DNA Polymerase UL54

HCMV DNA polymerase is a multiprotein complex that contains a catalytic subunit UL54 and a processivity factor UL44 to synthesize long stretches of viral DNA during viral replication (Appleton *et al.*, 2004). The homodimer UL44 binds to viral DNA to prevent dissociation from the template, thereby promoting the long-chain DNA synthesis within the catalytic subunit of UL54 (Appleton *et al.*, 2004). Due to its essential role in viral DNA synthesis, UL54 has been recognized as an important drug target against HCMV.

As of today, cidofovir, ganciclovir, foscarnet, valganciclovir, and fomivirsen (discontinued) have been approved for HCMV treatment. To inhibit viral DNA synthesis, cidofovir and ganciclovir are converted to DNA polymerase substrate analogs by the thymidine kinase of CMV. UL54 gene is prone to mutations that limit the efficiency of antiviral agents (Chou *et al.*, 2016). Furthermore, cidofovir may induce nephrotoxicity especially in bone marrow transplant patients (Piret *et al.*, 2017), which limits its clinical use. Novel compounds such as CMX001 (brincidofovir) are currently under development. CMX001 can be converted to cidofovir. The drug potency is much higher for CMX001 than for cidofovir. Cidofovir from CMX001 does not accumulate in the kidneys, therefore nephrotoxicity could be greatly reduced during the treatment (Marty *et al.*, 2013).

HCMV Terminase UL56

HCMV DNA terminase complex is a hetero-oligomer composed of UL56, UL89, and additional viral subunits (UL51, UL52, UL77, UL93) (Ligat *et al.*, 2018). This terminase complex cleaves HCMV DNA concatemers and packages the genome into the capsid for the DNA-packing process during the viral maturation and packaging (Ligat *et al.*, 2018). The large terminase subunit UL56 plays an essential role in the viral DNA cleavage and packaging (Ligat *et al.*, 2018). UL56 not only has the ATPase activity that hydrolyzes ATP to provide energy for the genome cutting and transfer activities but also has ATP-independent endonuclease activity driven by UL89 (Ligat *et al.*, 2018). As an indispensable viral protein, UL56 has been considered to be a promising drug target.

As of September 2020, letermovir remains the only UL56 inhibitor approved by the US FDA for preventing HCMV in adult HCMV-seropositive recipients of an allogeneic hematopoietic stem cell transplant. Based on a phase 3 clinical trial (NCT02137772), letermovir prophylaxis significantly reduced the risk of HCMV infection, and its adverse effects were mild (Marty *et al.*, 2017). Moreover, letermovir is a viral DNA-packaging inhibitor, remarkably specific for HCMV, but not other herpesviruses (Ligat *et al.*, 2018).

Human Influenza Virus

Viral RNA Polymerase

The influenza polymerase is comprised of polymerase basic protein 1 (PB1), polymerase basic protein 2 (PB2), plus either polymerase acidic protein (PA) in influenza A/B or polymerase 3 protein (P3) in influenza C/D viruses (Takashita, 2020). The PB1 subunit encodes the RNA-dependent RNA polymerase, while the PA and PB2 subunits offer the endonuclease and cap-binding activities, respectively (Wandzik *et al.*, 2020). During the transcription of viral mRNA, the cap-snatching of capped oligomers from human Pol II transcripts is mediated by the PB2 cap-binding and PA endonuclease activities. Subsequently, the PB1 active site undertakes the prime template-directed RNA synthesis, followed by the initiation, elongation, termination, and recycling of typical polymerase activities (Wandzik *et al.*, 2020). Due to their importance, PA, PB1, and PB2 have been considered as promising antiviral targets.

As of September 2020, the PA inhibitor baloxavir marboxil (S-033188) and the PB1 inhibitor favipiravir (T-705) have been approved for clinical use, while the PB2 inhibitor pimodivir (JNJ-63623872, VX-787) is currently evaluated in phase 3 trials (NCT03381196, NCT03376321). As a pyrazine derivative, favipiravir received conditional marketing approval only for patients with a novel or reemerging influenza when other antivirals are ineffective because favipiravir increases the risk for teratogenicity and embryotoxicity (Takashita, 2020). Baloxavir marboxil was approved for treating influenza A and B viruses, while its pattern of drug susceptibility follows the order: influenza A > B > C > D (Takashita, 2020). As a cyclohexyl carboxylic acid analog, pimodivir inhibits viral RNA binding by occupying the cap-binding domain of PB2, and it shows strong activity against influenza A but not B viruses (Takashita, 2020). Other novel polymerase inhibitors are still under development.

Neuraminidase

Influenza surface glycoprotein neuraminidase is known for its multifunctional roles in viral entry and viral release. During the viral entry, the glycoprotein neuraminidase contributes to the viral binding to the sialic acid receptors of human cell glycoproteins,

Table 1 Summary of viral proteins targeted by approved and novel inhibitors

<i>Human viruses</i>	<i>Viral targets</i>	<i>Approved drugs</i>	<i>Novel inhibitors</i>
Human immunodeficiency virus (HIV)	Protease	Amprenavir, atazanavir, darunavir fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir, tipranavir,	TMB-607, TMC-310911, GRL-09510
	Reverse transcriptase	NRTIs: abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir alafenamide, tenofovir disoproxil fumarate, zidovudine, NNRTIs: delavirdine ^a , doravirine, efavirenz, elvitegravir ^b , etravirine, nevirapine, rilpivirine, Bictegravir, dolutegravir, elvitegravir, raltegravir,	MK-8504, MK-8583, racivir, islatravir, rovafovir etalafenamide, censavudine, amdoxovir, elvucitabine, KM-023
	Integrase gp41 gp120	Albuvirtide ^b , enfuvirtide Fostemsavir	Cabotegravir GSK373239
Hepatitis C virus (HCV)	NS3/4A protease	Danoprevir ^b , glecaprevir, grazoprevir, paritaprevir, paritaprevir, Simeprevir,	Asunaprevir, faldaprevir furaprevir, narlaprevir, Seraprevir, vaniprevir, vedroprevir
	NS5A phosphoprotein NS5B polymerase	Daclatasvir, ledipasvir, ombitasvir, elbasvir, velpatasvir, pibrentasvir Sofosbuvir, dasabuvir	Ravidasvir, ruzasvir, odalasvir Adafosbuvir, deleobuvir, Lomibuvir, mericitabine, Radalbuvir, radalbuvir,
Human influenza virus	RNA polymerase	Baloxavir marboxil, favipiravir ^b	Pimodivir (VX-787)
	Neuraminidase Matrix protein 2	Laninamivir ^b , oseltamivir, peramivir, zanamivir, Amantadine ^a , rimantadine	Isocorilagin
Respiratory syncytial virus (RSV)	RNA polymerase	Ribavirin	Lumicitabine (ALS-8176)
	Fusion glycoprotein	Palivizumab	Presatovir (GS-5806), ziresovir (RO-0529, AK0529), MDT-637, JNJ-53718678, sisunatovir, ALX-0171
Herpes simplex virus (HSV)	DNA polymerase UL30	Aciclovir, brivudine, famciclovir, foscarnet, idoxuridine, penciclovir trifluridine, valaciclovir	Synguanol, filociclovir, MBX-2168; mitoxantrone dihydrochloride; PHA767491
	Envelope proteins	Docosanol	NGI-1, C19
Human cytomegalovirus (HCMV)	DNA polymerase UL54	Cidofovir, fomivirsen, foscarnet, ganciclovir, valganciclovir,	Filociclovir
	Terminase UL56	Letermovir	
Varicella-zoster virus (VZV)	DNA polymerase	Aciclovir, brivudine, famciclovir, valaciclovir, vidarabine	
Hepatitis B virus (HBV)	DNA polymerase	Adefovir, besifovir ^b , clevudine ^b entecavir, telbivudine, tenofovir alafenamide, tenofovir	Tenofovir exalidex
Human smallpox	VP37 envelope wrapping protein	Tecovirimat	

^aDiscontinued.^bElsulfavirine was approved in Russia, albuvirtide was approved in China; favipiravir and laninamivir were approved in Japan; danoprevir was approved in China; clevudine was approved in South Korea and the Philippines; besifovir was approved in South Korea.

leading to the enhancement of hemagglutinin receptor binding (Wen and Wan, 2019). During the viral release, neuraminidase cleaves sialic acids from cellular receptors and neuraminidase/hemagglutinin on nascent influenza virions so as to prevent virion aggregation and release new particles (McAuley *et al.*, 2019). Due to its importance, neuraminidase has been recognized as a promising antiviral target (Kumar *et al.*, 2020).

As of September 2020, neuraminidase inhibitors such as oseltamivir, zanamivir, peramivir, and laninamivir have been approved for clinical use (Table 1). Oseltamivir is used orally as the first-line therapy, but its effectiveness is compromised by the development of drug resistance mutations in influenza A genotypes such as H3N2 and H5N1 (Kumar *et al.*, 2020). Due to the emergence of drug resistance, it remains an urgent need to develop anti-influenza agents. Novel antivirals such as A-192558 and A-315675 are still under development (Gubareva and Mohan, 2020).

Matrix Protein 2

The influenza matrix protein 2 (M2) is a 97-residue single-pass membrane protein that forms pH-gated proton channels in the viral lipid envelope (Schnell and Chou, 2008). By shuttling protons inwards and outwards through the viral membrane, matrix protein 2 equilibrates pH across the viral membrane during the viral entry and across the trans-Golgi membrane of host cells during the viral maturation (Mandala *et al.*, 2020). Because the channel pore is essential for the proton shuttling, the pore of the M2 channel is a promising drug-binding pocket (Gu *et al.*, 2013).

As of September 2020, rimantadine and amantadine that target the M2 channel pore have been approved for anti-influenza treatment. For instance, amantadine targets the M2 channel by hydrophobic interactions between the adamantane group and the N-terminal gate of the channel (Gu *et al.*, 2013). Mutations (e.g., V27A, L26F) within the channel pore weaken the hydrophobic interactions of rimantadine and amantadine with the M2 channel, thereby causing drug resistance and treatment failure (Gu *et al.*, 2013). Novel inhibitors that are less prone to mutations may lead to better antiviral efficacy.

Variola Virus (Human Smallpox)

VP37 Envelope Wrapping Protein

The extinction of variola virus, the etiological agent of human smallpox was declared by the WHO in 1980 (Jordan *et al.*, 2010). The F13L gene of variola virus encodes a highly conserved 37 kDa peripheral membrane protein called VP37. Before the viral budding, the wrapping complex requires VP37 and other viral proteins to interact with human membrane proteins; subsequently, it catalyzes the maturation of intracellular viral particles into the egress-competent form of the variola virus particles (Jordan *et al.*, 2010). VP37 interacts with human proteins Rab9 and TIP47 (a Rab9-specific effector) in membrane fractions from infected cells to facilitate assembly of extracellular virus (Chen *et al.*, 2009).

As of September 2020, tecovirimat (ST-246) remains the only VP37 inhibitor approved for treating human smallpox, although its effectiveness has only been shown in animal models but not humans due to the extinction of the virus in human populations. As an 4-trifluoromethyl phenol derivative, tecovirimat blocks the interactions of VP37 with Rab8 and TIP47, thereby inhibiting the maturation of egress-competent enveloped virions for viral budding (Jordan *et al.*, 2010). Novel compounds such as NIOCH-14 are still under development (Delaune and Iseni, 2020).

Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2)

SARS-CoV-2 Polymerase

SARS-CoV-2 RNA-dependent RNA polymerase, encoded by the NSP12 gene, forms a polymerase complex with its viral cofactors NSP7 and NSP8 to catalyze the viral RNA synthesis during the viral replication and transcription (Gao *et al.*, 2020). Similar to SARS-CoV polymerase, the structure of SARS-CoV-2 polymerase contains three subdomains: fingers, a thumb, and a palm, while the catalytic site (S759-D760-D761) is located within the conserved motifs of the palm domain (Gao *et al.*, 2020). The cofactors NSP7 and NSP8 interact with the thumb, while another NSP8 binds to the fingers, thereby conferring processivity to NSP12 (Hillen *et al.*, 2020). Due to its indispensable role in viral RNA replication, SARS-CoV-2 polymerase is an important target for antiviral drug development (Li and De Clercq, 2020; Zhou *et al.*, 2020; Jiang *et al.*, 2020).

As of October 2020, remdesivir (GS-5734) has been authorized in the US for clinical use as a polymerase inhibitor to treat patients infected with SARS-CoV-2. Remdesivir acts as a delayed chain terminator to interfere with the RNA synthesis of viral polymerase and evades the proofreading of viral exonuclease (Eastman *et al.*, 2020). The intravenous use of remdesivir could shorten the recovery time and reduce the mortality rate of SARS-CoV-2 based on a randomized, double-blinded, placebo-controlled trial (NCT04280705) (Olalla, 2020). Other novel experimental inhibitors such as GS-441524 (Yan and Muller, 2020) and favipiravir (Arab-Zozani *et al.*, 2020) might offer antiviral activities against SARS-CoV-2, but their clinical use requires further investigation.

Varicella Zoster Virus (VZV)

VZV DNA Polymerase

VZV polymerase belongs to the DNA polymerase type-B family. As the essential component of VZV replication complex, DNA polymerase is encoded by the open reading frame 28 (ORF28). VZV DNA polymerase is an ideal target for the development of nucleoside analogs because it plays a critical role in viral DNA replication during the life cycle.

As of September 2020, nucleoside analogs such as aciclovir, famciclovir, valaciclovir, brivudine, and vidarabine have been approved for VZV treatment (De Clercq and Li, 2016). These compounds could effectively target VZV polymerase and block viral DNA synthesis. As a prodrug of penciclovir, famciclovir effectively prevents the recurrence of VZV, and it has only mild adverse events (Wang *et al.*, 2020). Furthermore, both aciclovir and famciclovir interventions offer high rates of benefit and showed a similar time to full crusting of lesions (Pott Junior *et al.*, 2018).

Hepatitis B Virus (HBV)

HBV DNA Polymerase

HBV RNA-dependent DNA-dependent polymerase, encoded by the open reading frame P, acts with multifaceted functions such as (1) HBV reverse transcription that synthesizes the (–) DNA strand from the viral RNA template within the catalytic site of HBV polymerase; (2) degradation of the viral RNA template by the RNase H activity of HBV polymerase (Menendez-Arias *et al.*, 2014). HBV polymerase is mainly comprised of three functional domains: the template domain (AA positions: 1–183), the polymerase domain (349–691), and the RNase H domain (692–845) (Menendez-Arias *et al.*, 2014). The catalytic site of the polymerase domain is considered as a promising drug target, whilst nucleos(t)ide inhibitors have been developed to compete with the incorporation of natural nucleotide substrates into the elongating DNA chain, thereby blocking viral DNA synthesis (De Clercq and Li, 2016).

As of September 2020, many nucleos(t)ide inhibitors (entecavir, telbivudine, adefovir dipivoxil, tenofovir disoproxil fumarate, tenofovir alafenamide, clevudine, and besifovir) have been approved for clinical use. Note that clevudine was only approved in South Korea and the Philippines, while besifovir was approved in South Korea. Despite the success of nucleos(t)ide inhibitors to suppress the viral replication, they do not eliminate the virus from the hepatocytes, and a cure of HBV infection remains yet to be discovered. Novel HBV polymerase inhibitors such as tenofovir exalidex are still under clinical development (Martinez *et al.*, 2020).

Conclusion

Based on the classification of approved antiviral agents, several features could be summarized. First, antiviral agents mostly target the viral proteins with high specificity, leading to less toxicity compared with human protein targets. Second, among 9 infectious diseases, the most popular drug targets could be listed as follows: viral polymerase, viral envelope glycoproteins, and viral protease. These three viral proteins play a dispensable role in viral replication, making them promising viral targets for most human viruses. Third, antiviral agents are mostly small molecules that can be taken orally in clinical settings, while few antibodies and peptide inhibitors have been approved for antiviral use. Compared with monoclonal antibodies and peptides, small molecules are typically cheaper, chemically stabler, structurally simpler and better permeable.

Although this article only describes 10 infectious diseases with approved drugs, future antiviral development should also focus on emerging infectious diseases such as coronaviruses, dengue, Zika, and Ebola. On October 14, 2020, the US FDA approved a mixture of three monoclonal antibodies (atoltivimab, maftivimab, odesivimab-ebgn), which marks the first FDA approval for the treatment of Ebola virus infection. Furthermore, it remains critical improving antivirals to combat emerging drug resistance mutations because drug resistance mutations have been observed in many viruses (e.g., HIV, HBV, influenza).

Antiretroviral Therapy – Nucleoside/Nucleotide and Non-Nucleoside Reverse Transcriptase Inhibitors

Timothy D Appleby and Killian J Quinn, King's College Hospital, London, United Kingdom

© 2021 Published by Elsevier Ltd.

Retroviruses and Reverse Transcription

Retroviruses are a group of related viruses that depend on reverse transcription for their replication. They are subdivided into beta-, spuma-, gamma-, epsilon-, delta- and the lenti-retroviruses, to which HIV-1 and HIV-2 belong. The term retrovirus derives from the process of converting viral RNA to proviral DNA by use of the endogenous retroviral enzyme, reverse transcriptase (RT).

Transcription is the process of copying DNA code into RNA – thus reverse transcription refers to copying an RNA code into DNA. Both DNA and RNA are composed of long chains of polysaccharide residues held together with phosphates, and each polysaccharide having a base attached to it. The two ends of a DNA and RNA chain are referred to the 5' end and the 3' ends, denoting the position at which the carbon chains link the polysaccharide, i.e., 5th position on their carbon chain, and at the other end the 3rd position.

The genetic information of retroviruses is stored within two identical copies of positive sense RNA strands which exist as a dimeric molecule within the viral capsid. The genetic information is stored within nine reading frames, between 7 and 10 kilobases in length (9.7 kilobases in the case of HIV-1). Genes can be broadly divided into three main functional groups: (1) structural (2) regulatory and (3) accessory genes. Three genes (*gag*, *pol* and *env*) encode the structural polyproteins which undergo proteolytic cleavage to give rise to a total of 15 proteins involved in the viral lifecycle and structure. The *pol* gene encodes the three enzymes, RT, protease and integrase that are essential for the virus lifecycle and which are not available via the host machinery.

The RT enzyme enables production of a complementary strand of viral DNA from single-stranded RNA (ssRNA). It is this process of reverse transcription that enables the integration of the resulting proviral DNA into the host genome and in turn effecting the persistence of the retroviral genome within the host DNA.

Owing to its clinical importance, HIV-1 is by far the most studied retrovirus. Although there are multiple targets within the HIV-1 lifecycle, antiretroviral therapy targets 4 main steps namely: (1) viral entry (2) reverse transcription of viral RNA to double-stranded proviral DNA (dsDNA) (3) integration of dsDNA into the host genome and (4) proteolytic cleavage of viral polypeptides by the enzyme protease, enabling production of new viral proteins and ultimately new virus particles.

Reverse Transcriptase Structure and Functions

RT is an asymmetric heterodimer of two related but distinct subunits, p66 and p51. It has two catalytic domains: the DNA polymerase active site and RNase H both of which are necessary to carry out reverse transcription. These are a DNA polymerase that can copy either an RNA or a DNA template, and an RNase H that degrades RNA if it is part of an RNA–DNA duplex. Viral RT harnesses host nucleotides and initiates the process of reverse transcription of RNA into RNA–DNA duplex and subsequently double stranded DNA (Ren *et al.*, 1995).

With the activity of the RNase H active site, the RNA component of the RNA–DNA double helix is digested, while the polymerase active site can then complete the synthesis of the double-stranded DNA to create a double-stranded helix which can then be integrated as proviral DNA into the host genome. RT was the first enzyme target in the development of ARV drugs and is the target for two distinct classes of ARV drug: the NRTIs and NNRTIs.

The Process of Reverse Transcription

The HIV-1 life cycle begins with an interaction between the gp120 polypeptide on the viral surface and the CD4 subunits on the target cell membrane. This interaction leads to conformational change within gp120, in turn leading to release of gp41 which unfolds in a spring-loaded like mechanism piercing the target cell membrane. The gp41 subunit itself comprises two subdomains (heptad repeat, HR-1 and HR-2) which fold backwards upon one another. This mechanism results in the HIV-1 virion being pulled into close apposition to the target cell, a mixing of the viral and cellular lipid bilayers ensues with the creation of a “fusion pore” and the viral capsid is emptied inside the target cell.

Following cytoplasmic penetration of the viral core, partial capsid dissolution and digestion of the matrix proteins releases viral RNA coupled with nucleoprotein into the host cells (“uncoating”) (Ren *et al.*, 1995). It has been estimated that there are perhaps 50 RTs within each viral capsid which are released.

A tRNA primer binds to the primer binding site on the HIV-1 RNA

Genomic viral RNA is plus (+) sense. Reverse transcription of (+) sense RNA into an RNA–DNA double helix is mediated by the RT polymerase active site. The process begins as the cellular tRNA₃^{Lys} molecule, an 18-nucleotide primer intrinsic to the host cell, hybridizes to a complementary region of the (+)RNA genome forming the primer binding site (PBS). The cellular tRNA₃^{Lys} primer is (–)sense whose 3' end is based-paired with the 5' prime end of the complementary (+)sense RNA. Although various

Table 1 NRTIs, with corresponding nucleosides, and year of licensing

^atenofovir disoproxil fumarate.^btenofovir alafenamide.

primer models can be used to initiate reverse transcription in vitro, tRNA is used by all retroviruses. Host cellular tRNA₃^{Lys} is exclusively used by HIV-1 (Hu and Hughes, 2012; Hughes, 2015).

Reverse transcriptase (RT) starts at this binding site and copies RNA into a single strand of complementary DNA

As the tRNA₃^{Lys} molecule anneals its 3' end to a complementary 5' end of the (+) sense RNA, the RT polymerase active site binds to the viral RNA-tRNA complex at the PBS. Reverse transcription is activated by a signaling motif within the U5 region (non-coding region) of the HIV-1 genome, or primer activation signal. In doing this, RT navigates the 5' end, copying the (+) RNA into a complementary strand of viral DNA, or cDNA and termed (–)strand strong-stop DNA or (–)ssDNA. To do this, viral RT harnesses host cell nucleotides and the process of reverse transcription of RNA is activated: DNA nucleotides are added onto the 3' end of the primer, synthesizing DNA complementary to the U5 and R region (a direct repeat found at both ends of the RNA molecule) of the viral RNA. At this point it only copies from the primer binding site back into the Long Terminal Repeat (LTR), so all that has been copied so far is the LTR plus a little extra (Hu and Hughes, 2012; Hughes, 2015) see “Relevant Websites section”.

In vitro experiments indicate that the addition of the first few nucleotides is a slow process which speeds up after around 10 nucleotides are added. As the (–)ssDNA is released, it anneals to the 3' terminus of the vRNA, and primes further (–) strand DNA synthesis and generates a full-length (–)strand DNA that is used as a template for (+)strand DNA synthesis.

RNAse H degrades the section of the RNA which has been copied

DNA synthesis initially creates an RNA-DNA duplex which is substrate for the RNAse H active site, resulting in simultaneous digestion of the copied ssRNA as polymerization progresses. RNAse H degradation removes the 5' end of the viral RNA thus exposing the newly formed (–)strand DNA. It is not known if the same RT molecule which synthesizes the viral DNA is responsible for digestion of the RNA template.

This allows the tRNA/RT/ssDNA to dissociate from the HIV-1 RNA, and then reattach at the *other* end of the stretch of RNA, a process known as (–) strand transfer. The ends of the (+) sense viral RNA are direct repeats which allow transfer of the newly synthesized DNA to the 3' end of the RNA whereupon (–) strand synthesis of viral single stranded DNA can continue.

As DNA synthesis continues, so too does digestion of the viral RNA by the RNAse H enzymatic domain of RT. As the RNAse H reaches a region within the viral RNA which is purine rich, digestion is halted. As a result, this portion of (+) sense viral RNA persists and acts as a primer to begin the synthesis of the (+) sense viral DNA. Synthesis continues until RT encounters the tRNA₃^{Lys} primer which was initially incorporated and then digests this via RNAse H activity of RT.

As the two ends of the DNA are complementary and easily stick together, the DNA can then circularize. RT completes the second strand of the DNA including the Long Terminal Repeat at each end. In the process of this the DNA loop breaks, leaving a double-stranded DNA fragment with a Long Terminal Repeat at each end thus leaving linear viral DNA (Hu and Hughes, 2012; Hughes, 2015).

Nucleoside/nucleotide Reverse-Transcriptase Inhibitors (NRTIs)

NRTIs and Their Mechanism of Action

NRTIs were the first active medicinal products used against HIV-1. The first to be licensed was 3'-azido-3'-deoxythymidine (AZT) in 1987, subsequently known as zidovudine (Cihlar and Ray, 2010). Since then, eight further pharmacologically useful NRTIs (abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir-DF*, tenofovir-AF**, zalcitabine) have been developed for the treatment of HIV-1 (De Clercq, 2009) (Table 1).

NRTIs are pro-drugs that need to be phosphorylated intracellularly to become the active NRTI-triphosphate nucleoside analogs, a process catalyzed by cellular kinases (Anderson *et al.*, 2004; Furman *et al.*, 1986). They are structurally similar to the host nucleoside bases normally utilized by the RT active site (DNA polymerase) in the transcription of the ssRNA of the invading HIV-1 genome into dsDNA. The analogs bind competitively to proviral DNA, displacing the host nucleosides from DNA polymerase. However, the analogs lack the 3'-hydroxyl group: as a result, the native nucleosides (adenosine, thymidine, pyrimidine, guanosine) cannot bind to the dsDNA

Table 2 summary of NRTI backbone recommendations in national and international adult HIV-1 treatment guidelines

	<i>Backbone</i>	<i>Alternative</i>
BHIVA (British HIV Association, 2016)	TDF & FTC TDF & FTC	ABC & 3TC

^awith dolutegravir, if VL < 500,000 and CD4 > 200.

thus terminating the strand elongation, and thereby the process of reverse transcription. This is known as immediate chain termination ([Sluis-Cremer et al., 2000](#)).

Tenofovir-DF (TDF) and tenofovir-AF (TAF) are nucleoside analogs that are phosphorylated at the 5' site, and are more commonly known as nucleotide analogs. This is an artificial distinction, as tenofovir acts pharmacologically by displacing host nucleosides, as with other NRTIs.

Clinical Uses of NRTIs

NRTIs were the first class of antiretroviral drugs to be used in the treatment of HIV. Although first used alone as single agents (monotherapy) with modest effect, treatment failure as a result of emergent drug resistance occurred within 3–4 months of initiation ([Larder et al., 1989](#)). Further trials examined combinations of two NRTIs used concurrently, which showed improved outcomes within treatment-naïve patients with virological control sustained for longer periods and improved clinical outcomes. Trials examined two approaches:

- (1) The addition of a second NRTI to NRTI monotherapy where treatment failure had already occurred.
- (2) Head-to-head comparisons of NRTI monotherapy and dual therapy in treatment-naïve patients ([Schooley et al., 1996](#); [Hammer et al., 1996](#); [Darbyshire and Aboulker, 1996](#)).

The improvement in outcomes with dual NRTI therapy was again short-lived, with resistance developing in the dual combinations. In 1996, triple-therapy, or highly active antiretroviral therapy (HAART), was introduced leading to great improvements in viral suppression, with higher barriers to resistance ([Lange and Ananworanich, 2014](#)).

NRTIs are now primarily used in dual combinations as the “backbone” of antiretroviral therapy for the treatment of HIV-1, with the addition of a third agent, i.e., an NNRTI, a boosted protease inhibitor or an integrase inhibitor. National and international guidelines on the treatment of HIV-1 differ slightly in their preferred backbone and third agent (**Table 2**). However, dual NRTI is the preferred backbone in all British HIV Association (BHIVA) and World Health Organization (WHO) recommendations ([British HIV Association, 2016](#); [World Health Organization, 2018](#)). The European AIDS Clinical Society (EACS) guidelines on the treatment of HIV-1 recommend dual NRTI as the backbone in all but one of their first line recommendations; EACS also recommends that a single NRTI (lamivudine) can be used with dolutegravir as first line treatment for HIV-1 ([European AIDS Clinical Society, 2019](#)).

The most used NRTI combinations are available as fixed dose combinations, in single tablets. Tenofovir-DF and emtricitabine as Truvada, and abacavir and lamivudine as Kivexa or Epzicom. Both of these combinations are now available off patent in generic formulations. More recently, tenofovir alafenamide and emtricitabine have been combined into a fixed dose combination. NRTIs are also included in a number of other single table regimens, containing other classes of drugs.

NRTI Toxicities

NRTIs are pro-drugs that are phosphorylated intracellularly into their active form. Some of the long-term toxicities with NRTIs are attributable to overactivation of this intracellular phosphorylation. NRTI-triphosphates may inhibit mitochondrial DNA polymerase γ , leading to mitochondrial failure, and a pattern of toxicities resembling mitochondrial disease, especially in the older and now, less used drugs. These include lactic acidosis/hyperlactaemia and hepatic steatosis (didanosine, stavudine, zidovudine), pancreatitis (didanosine), peripheral neuropathy (stavudine, didanosine, zalcitabine), lipodystrophy (stavudine, all NRTIs) and myopathy (zidovudine) ([Anderson et al., 2004](#); [Lewis et al., 2001](#); [Carr and Cooper, 2000](#)).

Zidovudine causes anemia and bone marrow suppression in about 5%–10% of patients. This is more common in patients with advanced HIV, and is also thought also to be as a result of mitochondrial toxicity ([Carr and Cooper, 2000](#)).

Hypersensitivity reactions occur in approximately 5% of patients taking abacavir. These reactions usually happen within the first 6 weeks of commencing treatment, but can also develop after many months. Typically, hypersensitivity reactions affect the skin and

cause fever and rash, but can affect multiple organs, including the gastrointestinal and respiratory systems. Severe reactions can sometimes develop, which can be fatal (Dean, 2012). People who have the HLA-B*5701 allele are more susceptible to abacavir hypersensitivity, and in practice all patients are tested for the allele before treatment is started. If the patient tests positive for the HLA-B*5701 allele, they should not be started on abacavir. However, hypersensitivity reactions may still occur even in the absence of the HLA-B*5701 allele. If HLA-B*5701 testing is not available, abacavir could still be starting with caution and close monitoring (Dean, 2012; Mallal *et al.*, 2008).

TDF is usually tolerated well by patients, but can cause acute and chronic renal failure, interstitial nephritis, proximal tubular dysfunction, and rarely Fanconi's syndrome. Stopping TDF due to renal complications is thought to account for fewer than 1% of discontinuations, but close monitoring of renal toxicity is suggested by most HIV treatment guidelines, especially in those most at risk of developing renal disease. These include older patients, including those with other risk factors for renal impairment, such as uncontrolled hypertension, diabetes mellitus, pre-existing low creatinine clearance and those taking nephrotoxic medications (World Health Organization, 2018).

TDF has also been shown to cause a loss of bone mineral density (BMD) and an increased risk of fractures. Studies show 1%–3% greater loss in BMD with tenofovir-DF compared with TDF sparing regimens. The mechanism by which this occurs is not absolutely clear, but it may be linked to TDF's effect on the proximal renal tubule. TDF may cause a sub-clinical tubulopathy and phosphate wasting, which may in turn drive reductions in BMD (Grant and Cotter, 2016). Tenofovir may also have a direct action on bone turnover, by acting directly on the osteoclasts and osteoblasts (Grigsby *et al.*, 2010).

Tenofovir alafenamide (TAF) is a newer formulation of tenofovir which was licensed in 2016. Plasma concentrations of tenofovir are significantly lower after oral administration of TAF, when compared to TDF. This means decreased exposure of the renal proximal tubule to the active drug, thereby decreasing the toxic effects on the kidney and bone. TAF is now recommended as a first-line treatment in BHIVA and EACS guidelines, and is an alternative to TDF for patients at risk of renal impairment patient at risk of low BMD.

Some cohort studies have shown an increased risk of cardiovascular disease with use of abacavir, including events such as acute myocardial infarction within the first 12 months of use (but not stroke) (Sabin *et al.*, 2008). This seems to be especially true in patients with pre-existing history of cardiac disease. However, this increased risk is not seen in all studies, and the link between abacavir and cardiovascular risk remains a topic of debate with concerns that such studies are confounded by selection bias of patients with a pre-existing increased cardiovascular risk (Libre and Hill, 2016).

See Table 3 for a summary of common NRTI toxicities.

Drug-Drug Interactions With NRTIs

As NRTIs are not metabolized by the CYP450 enzyme system, there are fewer potentially significant drug-drug interactions compared with other anti-retroviral drug classes (Pau and George, 2014). TAF is a substrate of P-glycoprotein (*p-gp*), and therefore will interact with P-gp inducers such as rifampicin, resulting in a much lower concentration of TAF, potentially leading to treatment failure (British HIV Association, 2016).

Mechanisms of NRTI Resistance

The mechanisms of viral resistance to NRTIs are complex. Mutations in the *pol* gene that codes for viral RT enzyme occurs under the selective pressure of NRTI drugs. One mechanism is known as discrimination, where the mutated RT loses its ability to bind to specific NRTIs, but keeps its affinity for the host nucleoside bases. This allows reverse transcription to continue without the NRTIs

Table 3 Common NRTI toxicities, taken from European AIDS Clinical Society Guidelines, Version 10.0

	<i>Skin</i>	<i>GI</i>	<i>Liver</i>	<i>Cardiac</i>	<i>MSK</i>	<i>Renal</i>	<i>Metabolic/lipids</i>	<i>Other</i>
ABC	Rash	Nausea Diarrhea		IHD				Systemic hypersensitivity (HLA B*5701 dependent)
AZT	Nail pigmen-tation	Nausea	Hepatic steatosis		Myopathy Rhabdo-myolysis		Lipodystrophy Dyslipidemia Hyperlactaemia	Anemia
3TC								
FTC								
TDF			Hepatitis		↓ BMD Osteo-malacia ↑ fracture risk	↓ eGFR Fanconi syndrome	↓ plasma lipids	
TAF							↑ weight	

Note: European AIDS Clinical Society, 2019. EACS Guideline 10.0. [cited 2020 Jun 7]. Available from: <http://www.eacsociety.org>.

causing chain termination. These are usually point mutations that confer resistance to specific NRTIs, e.g., M184V, K65R, L74V and Q151M (Marcelin, 2006).

Some mutations enhance the ability of RT to remove NRTIs that have already bound to the 3' end of the expanding pro-viral DNA. This is known as primer unblocking, and is enhanced by specific mutations known as TAMs (thymidine analog mutations), examples of which are M41L, D67N, K70R, L210W, T215Y/F and K219Q/E. These mutations are selected by zidovudine and stavudine, but they can cause cross-resistance to most NRTIs. The extent of cross-resistance depends on the number of TAMs. For example, the combination of M41, L210W and T215Y causes high-level resistance to zidovudine and stavudine, and intermediate to high-level resistance to didanosine, abacavir and tenofovir (Marcelin, 2006).

New Drugs

Islatravir is a novel agent, known as a nucleoside reverse transcriptase translocation inhibitor (NRTTI). It is an analog of deoxyadenosine and, like NRTIs, it is converted intracellularly to its active triphosphate form. Its main mode of action is through immediate chain termination. However, occasionally the proviral-DNA continues to be propagated despite incorporation of the active deoxyadenosine analog. In these cases, islatravir acts as a delayed chain terminator by causing structural changes in the proviral-DNA molecule which prevents nucleosides attaching further down the line. Islatravir has been shown to be active against HIV-1 and HIV-2, including virus with pre-existing NRTI-resistance. The active form of islatravir has a long intracellular half-life, and has the potential to be developed as a subdermal implant (Markowitz and Sarafianos, 2018).

Non-Nucleoside Reverse-Transcriptase Inhibitors (NNRTIs)

NNRTIs and Their Mechanism of Action

NNRTIs act by binding to a hydrophobic site that is remote from the active DNA polymerase site, known as the binding pocket, on the p66 subunit of the RT heterodimer. Binding causes a change in conformation of the RT heterodimer and its active enzyme site, thereby inhibiting DNA polymerase activity and blocking the process of reverse transcription of viral ssRNA to pro-viral dsDNA (Weller and Williams, 2001). NNRTI drugs are structurally diverse (Fig. 1) and, unlike NRTIs, are not analogs of nucleosides. Among the pharmacologically useful NNRTIs are efavirenz, nevirapine, etravirine, rilpivirine, and more recently doravirine.

Clinical Uses of NNRTIs

NNRTIs are used for the treatment of HIV-1 as part of combination antiretroviral therapy, and have demonstrated good efficacy in viral suppression. They are often used as the “third agent”, with the treatment “backbone” of two NRTI drug (see section above), as

Fig. 1 Chemical structures of NNRTIs (Scientific Figure on ResearchGate).

an alternative to a boosted protease inhibitor or an integrase inhibitors. There is some variation in the recommendations for NNRTI use across international guidelines. The BHIVA guidelines for the treatment of HIV-1 suggest rilpivirine as a first line third agent, with efavirenz as an alternative ([British HIV Association, 2016](#)). The EACS guidelines suggest rilpivirine, or the newer NNRTI doravirine, as a suitable first line third agent with a dual NRTI backbone, with efavirenz as an alternative ([European AIDS Clinical Society, 2019](#)). The consolidated WHO guidelines suggest efavirenz as the first line NNRTI third agent, with nevirapine as an alternative ([World Health Organization, 2018](#)), and the American guidelines favor efavirenz and rilpivirine ([Department of Health and Human Services, 2019](#)). The HIV-2 virus is intrinsically resistant to all NNRTIs ([Gilleece *et al.*, 2010](#)).

NNRTI Toxicities

Older NNRTIs, and especially nevirapine, are associated with hepatotoxicity, including rarely, fatal drug induced liver injury. Although the risk with nevirapine hepatotoxicity is increased in female patients with CD4 cell counts > 250 cells/mm³, and male patients with CD4 cell counts > 400 cells/mm³, all patients require close monitoring of liver enzymes in the weeks after starting.

Nevirapine and other NNRTIs can also cause hypersensitivity reactions, with rash commonly occurring within a few weeks of starting treatment. Hypersensitivity rash can happen in approximately 16% of patients starting nevirapine, but is also common in patients starting efavirenz and etravirine. If hypersensitivity and deranged liver enzymes occur concurrently after starting nevirapine, the medication should be stopped immediately.

Central nervous system side effects and toxicities are common with efavirenz. These usually occur early on in treatment, in approximately 40% of patients, and can include sleep disturbance and vivid dreams, depression and suicidal ideation. Most of these side effects resolve with time, and are only severe enough to need discontinuation in about 3% of patients ([Carr and Cooper, 2000](#)). See [Table 4](#) for a summary of common NNRTI toxicities.

Doravirine is a newer NNRTI which has been shown to be as effective as a boosted protease inhibitor (darunavir/ritonavir) or efavirenz-based therapy, in combination with dual NRTI backbone. It also has fewer toxicities, including fewer central nervous system side effects when compared to efavirenz, and has fewer potential drug-drug interactions. It also appears to remain effective against HIV-1 with pre-existing NNRTI resistance mutations ([Colombier and Molina, 2018](#)).

Drug-Drug Interactions With NNRTIs

All NNRTIs are metabolized by the CYP3A liver enzymes. Nevirapine and efavirenz are also metabolized by CYP2B6, and etravirine by CYP2C9 and CYP2C19 liver enzymes. Drugs that induced these enzymes can lead to reduced levels of NNRTI, and virological failure. Conversely, inhibition of these enzymes leads to increased levels of NNRTIs and potentially more side effects and toxicity. NNRTIs also act as inducers and/or inhibitors of CYP enzymes. For example, efavirenz is a mixed inducer and inhibitor of CYP enzymes, mainly inducing CYP3A and CYP2B6.

The University of Liverpool provides a comprehensive and regularly updated resource on potential drug-drug interactions: See “Relevant Websites section”.

Mechanisms of NNRTI Resistance

A disadvantage of NNRTI drugs is their low barrier to developing resistance, and the prevalence of NNRTI-resistant HIV-1 virus in ART-naïve patients ([Snedecor *et al.*, 2013](#)). Mutations on the pol gene that codes for viral RT reduce the ability of NNRTIs to bind to the binding pocket on the RT p66 subunit, thereby reducing their activity. Just one mutation can mean complete resistance to a specific NNRTI. Single mutations can also cause resistance that extends across the more than one drug in the class. For example, a K103N mutation causes high-level resistance to both nevirapine and efavirenz ([HIV Drug Resistance Database, 2020](#)). For this reason, NNRTIs are not recommended second line, after failure of a first line NNRTI

Table 4 Common NNRTI toxicities, taken from European AIDS Clinical Society Guidelines, Version 10.0

	<i>Skin</i>	<i>Liver</i>	<i>Renal</i>	<i>CNS</i>	<i>Metabolic</i>
Doravirine					
Efavirenz	Rash	Hepatitis		Depression Sleep disturbance Headache Suicidal ideation	Dislipidemia Gynecomastia
Etravirine	Rash				
Nevirapine	Rash Hypersensitivity	Hepatitis			
Rilpivirine	Rash	Hepatitis	↓ eGFR

containing regimen (British HIV Association, 2016). However, the newer NNRTI doravirine maintains activity against HIV-1 with K103N and Y181C mutations (Feng *et al.*, 2016).

Glossary

Bioavailability The proportion of a drug which enters the circulation when introduced into the body and so is able to have an active effect.

Boosting Using an antiretroviral (ARV) drug or other drug to increase the effectiveness of another ARV drug.

CD4 T lymphocyte A type of T lymphocyte that helps to coordinate the immune response by stimulating other immune cells, including B lymphocytes, CD8 T lymphocytes and macrophages.

Cytochrome P450 A group of enzymes involved in the breakdown of drugs in the liver and play a key role in the metabolism of many drugs. Cytochrome P450 (CYP450) enzymes metabolize all protease inhibitors.

Drug–drug Interaction A reaction between two or more drugs or between a drug and a food or supplement.

A drug interaction can decrease or increase the action of the drug.

Protease A type of enzyme that breaks down proteins into smaller protein units. These smaller proteins combine with HIV's genetic material to form a new HIV virus. Protease inhibitors (PIs) prevent HIV from replicating by blocking protease.

Resistance When a virus, bacteria or fungus becomes non susceptible to a drug that was previously effective.

Viral load Number of HIV RNA copies per milliliter of blood.

Viral suppression When antiretroviral therapy (ART) reduces a person's viral load (HIV RNA) to an undetectable level.

Protease Inhibitors

Introduction

The introduction of HIV protease inhibitors into clinical practice in 1995 changed the course of HIV infection, with an increase in survival in people living with HIV/AIDS (PLWHA) (Palella *et al.*, 1998). Combination therapy consisting of two nucleoside analogs and a protease inhibitor reduced HIV viral load and increased CD4 cell counts rapidly for the very first time, stopping disease progression (Ho *et al.*, 1995), and became a cornerstone of antiretroviral treatment.

Ritonavir- or cobicistat-boosted protease inhibitors represent an important antiretroviral class due to their low potential to select resistance. However, they also introduced a variety of new challenges such as undesirable side effects, dosing and absorption difficulties and interaction with concomitant drugs. These characteristics should be fully considered and understood when using protease inhibitors.

Mechanism of Action

Protease inhibitors (PIs) are one class of antiretroviral drug that target the viral enzyme, HIV-1 protease (Ali *et al.*, 2010). Protease is an essential element for viral maturation in the HIV life cycle. PIs act by binding to the catalytic site of the HIV protease inhibiting cleavage of Pol polyprotein viral precursors into mature proteins that are essential for viral replication. As a result, non-infectious immature virions are released from the cell surface (Konvalinka *et al.*, 2015).

PIs are active against HIV-1 and HIV-2. To date, ten PIs have been approved by the FDA: ritonavir, followed by indinavir, nelfinavir, saquinavir, amprenavir, lopinavir/ritonavir, atazanavir, fosamprenavir, tipranavir, and darunavir (Table 1).

Pharmacodynamics and Pharmacokinetics in PIs

Protease inhibitor concentrations in blood plasma must be high enough to inhibit HIV viral replication. The key is to maintain drug concentrations above the minimum effective concentration to ensure inhibition of viral replication and prevent emergence of resistance, and below the maximum safe concentration to avoid toxicity.

PIs have poor oral bioavailability. This is mainly due to their susceptibility to oxidation by cytochrome P450 3A4 (CYP3A4) enzymes in the enterocytes and hepatocytes as well as the presence of P-glycoprotein (*p*-gp) efflux transporters that decreases gut absorption. In addition, there is substantial variability in the concentration of plasma PI levels due to inter-individual differences in CYP3A4 (Von Richter *et al.*, 2004).

To overcome the reduced bioavailability of PIs, co-administration of potent CYP3A4 and P-gp inhibitors, known as boosting, increases PI plasma exposure thereby allowing once or twice daily dosing, resulting in enhanced anti-viral efficacy and reduced

Table 1 Classes of protease inhibitors (PIs)

<i>HIV protease inhibitor</i>	<i>PI drug</i>	<i>FDA approval</i>
Ritonavir	RTV	1996
Indinavir	IDV	1996
Nelfinavir	NFV	1997
Saquinavir	SQV	1997
Amprenavir	APV	1999
Lopinavir/ritonavir	LPV/r	2000
Atazanavir	ATV	2003
Fosamprenavir	FPV	2003
Tipranavir	TPV	2005
Darunavir	DRV	2006

toxicity (Larson *et al.*, 2014). Ritonavir and cobicistat are the two main booster agents available in clinical practice (Boffito and Moyle, 2004).

Ritonavir boosts intestinal absorption of the co-administered PI by inhibiting a number of CYP450 enzymes (2B6, 2C8, 2C9, 2D6 and 3A4) and the intestinal efflux transporter P-gp. In contrast, cobicistat inhibits CYP2B6 and 3A4 (with a lesser effect on 2C8 and 2D6 and no effect on 1A2, 2C9 and 2C19) and the efflux transporter P-gp (Nathan *et al.*, 2013). As a boosting agent, ritonavir is dosed as 100 or 200 mg per day (well below the minimum effective concentration for inhibition of viral replication).

Cobicistat is chemically similar to ritonavir, but has no antiviral activity. At a dose of 150 mg per day, it is used to boost atazanavir and darunavir and also the integrase inhibitor elvitegravir.

PIs in Combination With Other ART Classes

PIs are typically administered in combination with one or two nucleoside reverse transcriptase inhibitors (NRTI). In ART naïve and ART experienced HIV patients, ritonavir-boosted darunavir or ritonavir-boosted atazanavir in combination with an NRTI backbone are the most widely used PIs. Boosted darunavir has been shown to be better tolerated with fewer side effects (Molina *et al.*, 2008; Mills *et al.*, 2009) and a lower incidence of treatment discontinuation when compared with boosted atazanavir (Lennox *et al.*, 2014).

Protease Inhibitor-Based Regimens

Triple therapy: Boosted PI + 2 NRTI

Darunavir/ritonavir (or cobicistat) OR Atazanavir/ritonavir (or cobicistat)	Tenofovir (TDF or TAF)/emtricitabine
Darunavir/ritonavir (or cobicistat) OR Atazanavir/ritonavir (or cobicistat)	Abacavir/lamivudine

Dual therapy: boosted PI + 1 NRTI or 1 INSTI

If ABC, TAF or TDF cannot be used, dual therapy could be considered with one NRTI (lamivudine) (Cahn *et al.*, 2014) or, in those with CD4 cell counts >200 cells/mm³, one integrase-inhibitor (raltegravir) as an alternative to triple therapy for selected patients (Raffi *et al.*, 2014).

Darunavir/ritonavir	Raltegravir
Lopinavir/ritonavir	Lamivudine

Darunavir

Darunavir is available in two single co-formulated tablets, darunavir-cobicistat and darunavir-cobicistat-emtricitabine-tenofovir alafenamide.

Darunavir in combination with ritonavir or cobicistat, should not be used in patients with severe liver disease and should be avoided in individuals with sulfonamide allergy.

In individuals with wild-type virus, the recommended dose is darunavir 800 mg/ritonavir 100 mg or cobicistat 150 mg once daily (Madruca *et al.*, 2007; Clotet *et al.*, 2007). The dose of darunavir 600 mg/ritonavir 100 mg twice daily is recommended if the following resistance mutations are present: V11I, V32I, L33F, I47V, I50V, I54L/M, T74P, L76V, I84V, and L89V. Darunavir often

retains activity against HIV virus with protease resistance-associated mutations (typically the result of prior exposure to unboosted PIs) and is the PI of choice for this group of individuals.

Atazanavir

Atazanavir is available in 300 mg capsules and as co-formulated atazanavir 300 mg/cobicistat 150 mg. Atazanavir has better gastrointestinal tolerance than other PIs. It requires an acid pH for optimal drug absorption.

Atazanavir has limited activity against HIV virus with protease resistance-associated mutations. Although more “lipid friendly” than lopinavir/ritonavir ([Monforte et al., 2013](#); [Squires et al., 2010](#)), ATV/r and DRV/r have similar effects on lipids, glucose, insulin resistance ([Ofotokun et al., 2015](#)).

Lopinavir

Lopinavir in fixed combination with ritonavir is available as tablets of 100 mg/25 mg and 200 mg/50 mg and as an oral solution (80/20 mg per mL) for pediatric use. The recommended dose of lopinavir in adults is 800 mg daily in combination with 200 mg of ritonavir, usually in two divided doses.

New PIs

A new class of HIV protease inhibitor (GS-PI1) with high potency, high resistance barrier and long half-life has been developed to achieve metabolic stability without pharmacokinetic boosting. However, no new data have been presented since 2017 ([Link et al., 2017](#)).

Tolerability of PIs

Common adverse events associated with protease inhibitors include hepatotoxicity and gastrointestinal side effects, dyslipidemia, lipodystrophy, insulin resistance and cardiovascular/renal toxicity.

Side effects

Hepatotoxicity

All the approved HIV protease inhibitors are metabolized by the liver and can inhibit the CYP 3A4 drug metabolizing enzymes. Among all PIs, ritonavir is the most potent CYP 3A4 inhibitor. Atazanavir may result in an increase in the indirect serum bilirubin concentration.

Gastrointestinal

Protease inhibitors may cause diarrhea, nausea and vomiting. Lopinavir/ritonavir and fosamprenavir/ritonavir tend to show the highest rates of drug-related diarrhea, compared with atazanavir/ritonavir, darunavir/ritonavir, or saquinavir/ritonavir ([Hill et al., 2009](#)).

Dyslipidemia, lipodystrophy and insulin resistance

The effect of HIV protease inhibitor on the lipid pathway is associated with the inhibition of SREBP-1, a transcription factor involved in the gene expression of adipocytes, leading to the deficiency of adiponectin, a protein hormone that plays a key role in the development of insulin resistance and lipodystrophy ([Bastard et al., 2002](#); [Rahmouni et al., 2008](#)).

In addition, PIs can inhibit glucose transporter-4, having a direct effect on glucose uptake and this leads to insulin resistance ([Murata et al., 2000, 2002](#)).

Cardiovascular

PIs including lopinavir and darunavir (boosted with ritonavir) but not atazanavir have been associated with excess risk of cardiovascular disease ([Ryom et al., 2018](#)). ATV, possibly through its effects on bilirubin, has been associated with reduced progression of atherosclerosis (carotid artery intima media thickness) ([Stein et al., 2015](#)).

Kidney stones

Atazanavir has been associated with the development of renal stones and interstitial nephritis ([Hamada et al., 2012](#)).

Drug–Drug Interactions

Due to increased levels of other metabolized drugs when boosted-PIs are co administered, it is important to check and consider any potential drug interaction between the PI-booster and other concomitant medication (See “Relevant Websites section”). PIs can affect other drugs but also PIs can be affected by other drugs. Main drug interactions are shown in [Tables 2 and 3](#).

Table 2 Example of drugs whose plasma exposure are altered by boosted-PI co-administration

<i>Drug</i>	<i>Exposure of the non-ARV drug</i>	<i>Mechanism of drug-drug interaction</i>
Warfarin	Variable	CYP2C19 inhibition/induction
Omeprazole	Variable	CYP2C19 inhibition/induction
Pravastatin	Increase	OATP1B1/B3 inhibition
Rosuvastatin		
Atorvastatin		
Simvastatin		
Amlodipine	Increase	CYP3A/5 inhibition
Diltiazem		
Verapamil		
Metoprolol		
Digoxin		
Citalopram	Increase	CYP-2D6 inhibition
Diazepam		
Mirtazapine		
Midazolam		
Paroxetine	Variable	
Sertraline		
Fluticasone	Increase	CYP3A/5 inhibition
Budesonide		
Salmeterol		
Sildenafil		
Ethinylestradiol	Decrease	CYP3A4 induction

Table 3 Example of drugs whose co-administration alters plasma PI exposure

<i>Drugs</i>	<i>Exposure of the PIs</i>	<i>Mechanism of drug-drug interaction</i>
Clarithromycin	Increase	Inhibition of CYP3A/5
Erythromycin		
Fluconazole		
Itraconazole		
Ketoconazole		
Fluoxetine		
Efavirenz		
Carbamazepine	Decrease	Induction of CYP3A/5
Phenytoin		
Phenobarbital		
Rifampin		
Rifabutin		
Efavirenz		

Resistance to PIs

PIs have a high genetic barrier to resistance compared with other classes of ART such as (first-generation) integrase strand transfer inhibitors (INSTIs) and non-nucleoside reverse transcriptase inhibitors (NNRTIs), making them attractive agents for those with suboptimal adherence ([Gardner *et al.*, 2010](#)).

However, suboptimal plasma concentrations are highly undesirable as they can lead to drug resistance and subsequent virologic failure. In selected individuals, therapeutic drug monitoring may be a useful tool to assess adequate drug exposure ([Calcagno *et al.*, 2017](#)).

Protease Inhibitors in Low Resource Settings

Sub-Saharan Africa

In sub-Saharan Africa, where 25.5 million people are living with HIV, access to HIV drugs and treatment monitoring is compromised by a variety of factors. The challenges to adequately respond to the HIV crisis in Africa and achieve the 90/90/90 strategy include financial constrain, distance to health centers, inadequate diagnostic capacity (e.g., CD4 count, viral load), recurrent stock

out of ARVs and concurrent disease burdens. As a result, an increasing number of people in sub-Saharan Africa are at risk of treatment failure and drug resistance (Kanters *et al.*, 2017; Boyd *et al.*, 2015), and dolutegravir, a second generation INSTI with a high barrier to resistance, is increasingly replacing NNRTI in first-line therapy.

Boosted protease-inhibitor remain important drugs in second-line regimens. Boosted PI therapy plus two NRTIs, administered without genotypic resistance testing or regular viral-load monitoring, had high rate of success, showing effective viral suppression (Paton *et al.*, 2014). However, the use of protease inhibitor monotherapy has been shown to be inferior and should not be considered as an acceptable treatment alternative (Ciaffi *et al.*, 2017; Paton *et al.*, 2014). Therefore, the World Health Organization (WHO) recommends as second-line regimens a boosted protease inhibitor (atazanavir/ritonavir, lopinavir/ritonavir, or darunavir/ritonavir) with 2 NRTIs such as zidovudine with lamivudine (3TC) (WHO, 2019; SECOND-LINE Study Group, 2013).

Late presentation of HIV-positive adult patients into care is common in sub-Saharan Africa, with a high incidence of tuberculosis (TB). Several pharmacokinetic studies evaluating the effects of rifampicin on boosted PI exposure have reported high rates of liver toxicity (La Porte *et al.*, 2004; Ribera *et al.*, 2005; Haas *et al.*, 2009). Hence, for HIV/TB patients requiring PI-containing ART, rifampicin should be replaced with rifabutin (administered at a dose of 150 mg/day) where available (WHO, 2010). Unfortunately, access to rifabutin in low- and middle-income countries, is very limited (Grinsztejn *et al.*, 2014).

Protease Inhibitors in Clinical Practice

Protease inhibitors remain widely used in clinical practice despite a large number of antiretrovirals available for the treatment of HIV infection. Most guidelines recommend the use of NNRTI and INSTI (with a NRTI backbone) as first line therapy. In special populations, including those with anticipated adherence issues, confirmed or suspected HIV resistance or intolerance to other classes of ART, boosted PI remain widely used. In clinical trials of first or second line therapy, virologic failure on boosted PI (when administered with at least one NRTI) is rarely associated with emergence of PI (or NRTI) resistance-associated mutations. Hence, boosted PI are particularly attractive for people with adherence issues and the preferred agents for those who have developed resistance to NNRTI and/or INSTI.

Integrase Strand Transfer Inhibitors

Integrase strand transfer inhibitors (INSTI) are one class of antiretrovirals effective against both HIV-1 and HIV-2. Integrase represents an attractive target for drug design as it has no human counterpart and INSTI are now considered preferred options in treatment guidelines owing to their virological efficacy, safety, tolerability and, in most cases, minimal potential for interactions with co-medications. The first in class INSTI, raltegravir, was approved by the United States Food and Drug Administration (FDA) in 2007, with three further agents, cobicistat-boosted elvitegravir, dolutegravir and bictegravir subsequently approved. A fifth drug, cabotegravir, is undergoing clinical trials. See the [Table 1](#) for a summary of the key properties of approved INSTI and the investigational agent cabotegravir.

Virology

HIV-1 integrase is a 32 kDa protein produced from the C-terminal portion of the Pol gene product and catalyses the integration of reverse transcribed viral cDNA into the host chromosome through a two step process, 3' processing and strand transfer. First, integrase self-associates into tetramers on the cDNA within the cytoplasm and mediates the hydrolysis of the final two nucleotides on long terminal repeats (LTR) of the 3' ends of both strands to generate reactive nucleophilic hydroxyl groups. Integrase remains bound to cDNA as a multimeric complex which bridges both ends of the cDNA within intracellular particles called pre-integration complexes (PIC). After nuclear translocation, integrase associates with lens epithelium-derived growth factor (LEDGF)/p75 and is directed to sites of open chromatin, where it mediates the nucleophilic attack of the viral 3'-hydroxyl cDNA across the major groove of the host DNA, resulting in insertion sites which are five base pairs apart on opposite chromosomal strands. The integration process is completed by DNA gap repair including a series of DNA polymerization, dinucleotide excision and ligation reactions.

INSTI inhibit the second step catalysed by integrase, strand transfer, by competitive binding to the enzyme's active site, resulting in displacement of the 3' end of the cDNA. In addition, INSTI chelate the divalent cation (Mg^{2+} or Mn^{2+}), which is needed for integrase enzymatic activity.

The genetic barrier to resistance of the first generation INSTI, raltegravir and elvitegravir, is relatively low, such that a single nucleotide substitution may cause a major reduction in susceptibility, as well as cross resistance. Most primary resistance mutations occur at the enzyme's active site in response to drug pressure and are therefore associated with reduced viral replicative capacity (fitness). On continued drug exposure, primary resistance mutations are often followed by secondary (accessory) mutations, which either increase resistance or restore viral fitness, or both. The genetic barrier to resistance of the second generation agents, dolutegravir and bictegravir, is higher than first generation INSTI, probably due to structural differences. Second generation agents enter further into the pocket within integrase which is vacated by the displaced viral DNA base, making more

intimate contact with viral DNA, and they may also have the ability to re-adjust their conformation in response to structural changes in the active site of raltegravir-resistant integrase. Multiple amino acid substitutions are therefore usually required before antiviral susceptibility is reduced and resistance mutations are rarely selected in individuals failing dolutegravir- or bictegravir-containing cART. In general, epidemiological studies have found negligible (<1%) levels of INSTI resistance in therapy-naïve individuals, and therefore routine pre-therapy integrase sequencing is not currently recommended.

First Generation INSTI

Raltegravir

Raltegravir is a highly potent antiretroviral compound, with a minimal inhibitor concentration in the nanomolar range. Following 10 days of monotherapy, plasma HIV-1 RNA levels reduce by a mean 2.0 log₁₀ copies/ml. Dosing is with one 400 mg tablet twice daily, or two 600 mg tablets once daily. Raltegravir is generally well tolerated although the commonest reported side effects are headache, nausea and abdominal pain. Neuropsychiatric side effects have also been described, including insomnia and low mood. An uncommon but important toxicity is elevation in serum creatinine kinase levels, which may rarely be associated with rhabdomyolysis.

Raltegravir has a low potential for interaction with co-medications. However, as metabolism is through glucuronidation by uridine diphosphate glucuronosyltransferase (UGT) 1A1, strong inducers of UGT1A1, such as rifampicin, reduce raltegravir exposure. Raltegravir should therefore be avoided with strong UGT1A1 inducers where possible, or administered at a dose of 800 mg twice daily where co-administration is unavoidable. The site which binds Mg²⁺ or Mg²⁺ can be chelated by orally ingested polyvalent cations, such as Al³⁺ or Mg²⁺, which may reduce absorption. Raltegravir should therefore not be co-administered with aluminum or magnesium containing antacids.

Resistance

Most resistance mutations involve amino acid substitutions in the vicinity of the integrase inhibitor binding pocket, either directly or indirectly altering the conformation of the active site. The signature mutations, observed both in vitro and in vivo, are at residues Q148 (to H, R or K), N155 (to H) and less frequently Y143 (to C, H or R). These mutations reduce enzymatic activity and therefore fitness and are likely to disappear on discontinuation of raltegravir. Accessory mutations, some of which are natural polymorphisms, are also mostly located close to the active site.

The Y143 pathway is specific to RAL and relatively uncommon; residue 143 interacts directly with the oxadiazole ring of raltegravir, forming a stacking interaction which is abrogated when this position is mutated. By contrast, changes at residues 148 and 155 disturb the geometry of the integrase active site and thereby disrupt raltegravir binding.

Q148 mutations impart a severe fitness cost and therefore are rapidly compensated for by secondary mutations including L74M plus E138A, E138K or G140S. The most common mutational pattern in this pathway is Q148H plus G140S, which also confers the greatest loss of drug susceptibility.

N155 mutations tend to predominate early in the course of raltegravir failure, probably as changes at this position have less impact on fitness, but in ongoing drug exposure, are replaced by viruses with higher resistance, often bearing Q148H/R/K plus G140S mutations.

Clinical trials in cART naïve individuals

In a randomised controlled phase 3 clinical trial conducted in therapy-naïve patients, the virological efficacy of raltegravir was non-inferior to that of efavirenz, with fewer drug-related adverse events and smaller elevations in lipid levels (The STARTMRK study). Although originally licensed for twice daily dosing (400 mg BD), the ONCEMRK study demonstrated non-inferiority of once daily dosing of 1200 mg in achieving viral suppression.

Raltegravir-containing nucleos(t)ide-sparing regimens in therapy-naïve patients may also be effective, such as the combination of twice daily raltegravir and once daily ritonavir-boosted darunavir in patients with a baseline CD4 cell count >200 cells/uL and a HIV-1 RNA level <100,000 c/ml (NEAT001/ANRS-143 Study).

Clinical trials in cART-experienced patients

The phase 3 BENCHMRK studies demonstrated that the addition of raltegravir to optimized background therapy (OBT) in INSTI-naïve patients with multi-resistant HIV-1 infection improved virological suppression rates. However, in the SWITCHMRK studies, patients with suppressed plasma HIV-1 RNA switching from ritonavir-boosted lopinavir to raltegravir, both in combination with two nucleos(t)ide inhibitors, were more likely to develop virological failure. This was probably driven by archived NRTI resistance, compromising the NRTI backbone, in conjunction with the switch from a third agent with a high to a low genetic barrier to resistance. In the EARNEST study, patients with HIV-1 viraemia on an NNRTI-containing regimen were switched to ritonavir-boosted lopinavir, either as monotherapy, or with raltegravir, or with two to three NRTIs. Lower levels of viral RNA suppression were seen in those receiving a raltegravir- versus a NRTI-containing regimen, possibly reflecting the short half life of raltegravir and therefore greater susceptibility to development of resistance during episodes of non-adherence.

Table 1 HIV integrase strand transfer inhibitors and entry inhibitors

Drug name	Drug class	Year of FDA approval	Administration	Pharmacokinetics	Toxicity	Resistance	Examples of phase 3 studies in therapy-naïve patients	Examples of phase 3 studies in therapy-experienced patients	Other notes
<i>Integrase strand transfer inhibitors</i>									
Raltegravir	1st generation INSTI	2007	Oral	Metabolised by UGT1A1	Nausea, abdominal pain, headache	Low genetic barrier	STARTMRK-1, -2	BENCHMRK	No single tablet regimen
			Once or twice daily	Avoid with strong UGT1A1 inducers if possible	Rarely raised CK, myopathy or neuropsychiatric effects	Major RAM include Y143C/H/R, Q148H/R/K, N155H	ONCEMRK	SWITCHMRK	Longest period of safety data
				Caution with polyvalent cations			NEAT001/ANRS-143	EARNST	
Elvitegravir	1st generation INSTI	2012	Oral	Elvitegravir is metabolised by CYP450 3A4	Nausea, diarrhoea, headache	Low genetic barrier	GS-US-236-0102	GS-US-292-0109	Taken with food
			Once daily	Cobicistat inhibits CYP450 3A & 2D6	Rarely neuropsychiatric effects	Major RAM include T66I, E92Q, Q148H/R/K, N155H	GS-US-236-0103		Multiple drug-drug interactions
			Single tablet regimens:	Cobicistat inhibits transporters e.g., P-gp, MATE1, BRCP, OATP1B1, OATP1B3	↓tubular secretion of creatinine but normal GFR		GS-US-292-0104		
			E/c/TDF/FTC or E/c/TAF/FTC	Avoid with potent CYP450 3A inducers Caution with drugs metabolised by CYP450 3A Caution with polyvalent cations			GS-US-292-0111		
Dolutegravir	2nd generation INSTI	2013	Oral	Mainly metabolised by UGT1A1	Nausea, diarrhoea, headache	High genetic barrier	Single	Sailing	More insomnia & headache than other INSTI
			Once daily or	Some metabolism through UGT1A3/A9, CYP3A4, P-gp, BCRP	Neuropsychiatric effects	Multiple mutations usually required to reduce susceptibility	Spring-2	Viking-3	Further data required on association with (i) weight gain
			Twice daily if INSTI resistance	Inducers/inhibitors of these enzymes may ↓/↑DTG levels		RAM include G148H/R plus G140S	Flamingo	Dawning	(ii) neural tube defects in babies born to women conceiving on DTG
			Single tablet regimens:	DTG inhibits OCT2 and MATE1			Gemini-1, -2	Tango	
			DTG/ABC/3TC, DTG/3TC, DTG/RPV	This may ↑ serum creatinine or metform exposure Caution with polyvalent cations				Striving	
								SWORD-1, -2	

(Continued)

Table 1 Continued

Drug name	Drug class	Year of FDA approval	Administration	Pharmacokinetics	Toxicity	Resistance	Examples of phase 3 studies in therapy-naïve patients	Examples of phase 3 studies in therapy-experienced patients	Other notes
Bictegravir	2nd generation INSTI	2018	Oral	Metabolised by CYP3A and UGT1A1	Headache, nausea, diarrhoea	High genetic barrier	GS-US-380-1489	GS-US-380-1878	No long term safety data in real world cohorts
			Once daily	Inducers/inhibitors of these enzymes may ↓/↑ BIC levels	Rarely neuropsychiatric effects	Multiple mutations usually required to reduce susceptibility			
			Single tablet regimen BIC/TAF/FTC	Metabolised by P-gp and BCRP	↓ tubular secretion of creatinine but GFR normal	RAM include G118R, G148H/R plus G140S, R263K			
				Caution with inhibitors of these transporters					
Cabotegravir	2nd generation INSTI	Investigational	Oral tablet, once daily <i>or</i> Intramuscular injection 4- or 8-weekly	Metabolised by UGT1A1	Injection site reactions (mostly mild)	Minimal resistance data available RAM include G140R, Q148R	None	ATLAS	Ongoing phase 3 treatment trials with CAB/RPV Ongoing phase 3 PrEP trials (HPTN 084)
								FLAIR	
								ATLAS-2M	
<i>Entry inhibitors</i>									
Enfuvirtide (T20)	Fusion inhibitor	2003	Subcutaneous injection	No clinically significant interactions	Injection site reactions, diarrhoea, nausea, peripheral neuropathy, pancreatitis	RAM in amino acids 36-45 within HR1 of gp41	None	TORO-1, -2	Toxicity, subcutaneous route & twice daily dosing limit use
			Twice daily						
Maraviroc	CCR5 receptor antagonist	2007	Oral	Metabolised by CYP450 3A4 and 3A5	Nausea, diarrhoea, fatigue, headache	X4 or X4/R5 dual or mixed tropism	MERIT	MOTIVATE-1, -2	Rarely used if therapy-naïve
			Twice daily	Inducers/inhibitors of CYP450 may ↓/↑ MVC levels MVC dose adjusted according to presence of these agents	Less commonly postural hypotension	Mutations in the V3 loop of gp120			Contraindicated in X4, dual or mixed (R5/X4) strains
Ibalizumab-uiyk	CD4-directed post-attachment inhibitor	2018	Intravenous injection	No clinically significant interactions	Diarrhoea, dizziness, nausea and rash	Minimal data available	None	TMB-301	Monoclonal antibody (IgG isotype 4) against extracellular domain of CD4
			Once per fortnight			May involve RAM in the V5 loop of gp120			
Fostemsavir	HIV-1 gp120-directed attachment inhibitor	2020	Oral prodrug of temsavir	Metabolised by esterase-mediated hydrolysis, CYP450 3A4, P-gp, BCRP	Minimal data	Minimal data	None	BRIGHT-E	Binds extracellular domain of HIV-1 gp120
			Twice daily			Likely to involve RAM in gp120			

Elvitegravir

Elvitegravir was approved by the FDA in 2012 and is only available in the single tablet regimens of elvitegravir, cobicistat, emtricitabine and either tenofovir disoproxil fumarate (E/c/TDF/F) or tenofovir alafenamide (E/c/TAF/F). It is used in treatment naïve patients and as a switch option in those with a suppressed HIV-1 RNA without NRTI or INSTI resistance.

Elvitegravir is generally well tolerated. The commonest side effects are nausea, diarrhea and headache, and other side effects include rash and abnormal dreams. The main factors limiting its more widespread use are a relatively low genetic barrier to resistance and multiple potential interactions with co-medications. Elvitegravir is coadministered with the boosting agent cobicistat, which has no antiretroviral activity but is a potent inhibitor of cytochrome P450 CYP3A4/5. As elvitegravir is metabolized through this pathway, inhibition of CYP3A4/5 boosts elvitegravir plasma exposure, ensuring therapeutic levels are achieved. Inducers of cytochrome P450, such as rifampicin, greatly reduce elvitegravir plasma concentrations and concomitant administration is contraindicated. Caution is also required with cytochrome P450 3A inhibitors such as itraconazole, which may increase exposure to elvitegravir.

Cobicistat also has the potential for multiple interactions. Inhibition of CYP3A by cobicistat results in an increase in plasma levels of drugs metabolized through this pathway. For example, boosting of exogenous corticosteroids may produce iatrogenic Cushing's disease or suppress the endogenous hypothalamic-pituitary-adrenal axis with consequent adrenal insufficiency. Cobicistat also inhibits certain transporters, such as P-glycoprotein, multidrug and toxin extrusion transporter 1 (MATE 1), breast cancer resistance protein (BCRP) and organic anion transporting polypeptide (OATP).

As renal tubular secretion of creatinine is dependent on MATE 1, inhibition of this transporter by cobicistat results in increased serum creatinine and hence a reduced estimated glomerular filtration rate (eGFR), although without a true decline in GFR. Where cobicistat is prescribed with TDF, it is not recommended to be initiated in patients with a creatinine clearance of <70 ml/min, or if coformulated with TAF, <30 ml/min.

Clinical trials

Phase 3 trials demonstrated high rates of HIV-1 RNA suppression in therapy-naïve patients receiving either E/c/F/TAF or E/c/F/TDF, as well as non-inferiority of E/c/F/TDF by comparison with efavirenz or ritonavir-boosted atazanavir, both combined with TDF/FTC (Studies 104, 111, 102, 103). High rates of HIV-1 RNA suppression were also observed in therapy-experienced patients with a fully suppressed plasma HIV-1 RNA and no history of resistance to any of the components of the fixed drug combination who switched to E/c/F/TAF (Study 109).

Resistance

Seven elvitegravir codon mutations have been described in INSTI treatment-naïve and -experienced patients in whom therapy is failing. Elvitegravir shares the Q148 and N155H resistance pathways with raltegravir, whilst the T66 and E92 pathways are predominantly selected by elvitegravir. Y97A is associated with only a 2-fold reduction in elvitegravir susceptibility and may be a polymorphism.

Second Generation INSTI

Dolutegravir

The second generation INSTI dolutegravir was approved in 2013 and is dosed as a 50 mg oral tablet once daily, or twice daily in individuals with confirmed or suspected INSTI resistance. Dolutegravir is also available as a component of the single tablet regimens of dolutegravir-abacavir-lamivudine, dolutegravir-lamivudine, or dolutegravir-rilpivirine. Its once daily dosing, virological efficacy, tolerability and high genetic barrier to resistance have ensured its incorporation as a preferred option in many treatment guidelines.

Although well tolerated, the commonest side effects reported with dolutegravir are nausea, diarrhea and headache. Uncommon but notable associated toxicities include psychiatric disorders such as insomnia and anxiety; suicidal ideation has also rarely been reported. An association between dolutegravir use and weight gain has also recently been described although other factors, such as gender, racial background or co-administered antiretrovirals, may play a role. It is also unclear whether or not the association is pathological or represents a 'return to health' phenomenon.

A slightly increased risk of neural tube defects in babies born to mothers who conceived whilst receiving dolutegravir has also been reported. In the largest cohort reporting outcomes for women receiving a dolutegravir containing regimen in Botswana, neural tube defects were identified in 0.3% of 1683 deliveries, compared to 0.1% of deliveries born to women receiving a non-dolutegravir containing regimen. Neural tube closure occurs in the first four weeks after conception and therefore initiation of dolutegravir is relatively contraindicated during conception and in the first six weeks of pregnancy, unless alternative agents are unavailable. However, the mechanism by which dolutegravir might interfere with pregnancy is not established.

Dolutegravir is mainly eliminated through the UGT1A1 pathway but is also a substrate of UGT1A3, UGT1A9, CYP3A4, P-glycoprotein and BCRP. Therefore, co-administration of inducers of these enzymes reduces plasma exposure to dolutegravir and twice daily dolutegravir dosing may be required, or, in individuals with INSTI resistant virus, dolutegravir should be avoided. Dolutegravir also inhibits the renal organic cation transporter 2 (OCT 2) and MATE 1. As the secretory fraction of creatinine clearance is dependent on these transporters, a slight decrease in creatinine clearance is observed with dolutegravir. Plasma levels of drugs which are excreted through these transporters, such as metformin, may also increase.

Clinical trials: Therapy-naïve with 2 NRTI

Dolutegravir is highly efficacious in suppressing plasma HIV-1 RNA in randomized controlled trials in therapy-naïve individuals. Non-inferiority has been reported when comparing the performance of dolutegravir against that of raltegravir, and superiority when compared to efavirenz or ritonavir-boosted darunavir (the Spring-2, Single and Flamingo studies, respectively).

Clinical trials: Treatment-experienced

Trials reporting outcomes of individuals with suppressed HIV-1 RNA who either continued their current ART or switched to a dolutegravir-based regimen, such as the Striving study, also demonstrated non-inferiority in HIV-1 RNA responses.

In addition, dolutegravir is highly effective in the treatment of patients failing ART. In the Sailing study, INSTI-naïve individuals with unsuppressed plasma HIV-1 RNA on antiretroviral therapy were randomised to receiving OBT with either twice daily raltegravir or once daily dolutegravir for 48 weeks. Greater virological efficacy was reported in the dolutegravir group. The performance of dolutegravir has also been evaluated against a PI in patients with viraemia on first line treatment with NNRTI plus 2 NRTI. In the Dawning study, individuals with virological failure were randomised to receiving dolutegravir once daily or ritonavir-boosted lopinavir, both with two NRTIs, at least one of which was predicted to be fully active according to the resistance profile. At week 48, the proportion with a suppressed (<50 c/ml) HIV-1 RNA was greater in the dolutegravir versus the lopinavir group (84% versus 70%) respectively. However, it remains unclear whether a regimen such as dolutegravir-tenofovir-lamivudine will be effective in individuals with virologic failure who harbor multiple NRTI resistance mutations, such as K65R plus M184V.

Efficacy of dolutegravir has also been demonstrated in the difficult to treat population of INSTI-experienced individuals with viraemia and INSTI-resistant virus. In a single arm study performed in this population (Viking-3), addition of twice daily dolutegravir to an optimized background regimen resulted in HIV-1 RNA suppression <50/cml in 69% individuals by week 24.

Clinical trials: Dual therapy

A novel approach involving therapy with dolutegravir within a NRTI-sparing or single NRTI containing regimen may be advantageous, given the toxicities associated with NRTIs such as TDF or abacavir. The SWORD-1 and -2 studies demonstrated that HIV-1 RNA suppression rates following a switch of triple ART to the single tablet regimen of dolutegravir-rilpivirine was non-inferior to continuing triple therapy in patients with a suppressed HIV-1 RNA and no history of failure or NNRTI/INSTI resistance. In the GEMINI-1 and -2 studies, use of dolutegravir plus lamivudine was shown to be non-inferior in therapy-naïve individuals with a HIV-1 RNA of <500,000 c/ml and no resistance, in comparison to dolutegravir-emtricitabine-TDF. No viral resistance was selected and fewer drug-related adverse events were observed in the dolutegravir-lamivudine group. Dolutegravir-lamivudine may also be indicated as a switch option in patients with suppressed HIV-1 RNA (the TANGO study).

Resistance

Individuals with virologic failure whilst receiving a first line, dolutegravir-containing regimen, which contains at least one other agent, rarely develop resistance mutations in either integrase or other viral genes. Similarly, INSTI-naïve individuals with a history of virological failure, who initiate dolutegravir containing cART and subsequently fail to achieve virological control, rarely (~1%) develop integrase resistance.

By contrast, additional integrase resistance mutations may accumulate in individuals with INSTI resistant virus who switch from a failing first generation INSTI-containing regimen to dolutegravir. For example, in the Viking-3 study, although plasma HIV-1 RNA suppressed following the addition of dolutegravir in the majority, 32/183 (17%) patients developed additional INSTI resistance mutations associated with virological failure at week 24, most often in those with a history of Q148 mutations. INSTI resistance also frequently develops in patients receiving dolutegravir monotherapy, a strategy which should therefore be avoided.

Several integrase mutations are usually needed to confer high-level resistance to dolutegravir. The mutation G148H/R plus G140S, in combination with L74I/M, E92Q, T97A, E138A/K, G140A or N155H, are associated with 5–20 fold reduced dolutegravir susceptibility. The G118R pathway, usually involving at least one other mutation, is also associated with reduced susceptibility. The R263K mutation alone reduces dolutegravir susceptibility by only 2-fold but resistance increases in the context of additional mutations. N155H alone usually yields <2 fold reduction in dolutegravir susceptibility.

Bictegravir

Bictegravir is the most recent INSTI to be approved and is administered within a single tablet regimen with TAF and emtricitabine. It is a second generation INSTI and, like dolutegravir, has a high genetic barrier to resistance.

Bictegravir is a substrate of CYP3A and UGT1A1 and therefore caution may be required with co-administration of inducers or inhibitors of these enzymes. Bictegravir inhibits OCT2 and MATE1 although it does not appear to increase metformin exposure significantly, in contrast to dolutegravir. Bictegravir also inhibits tubular secretion of creatinine leading to raised serum creatinine levels, although these are not considered to be clinically relevant.

The drug is generally well tolerated. The most frequently reported adverse reactions of bictegravir are headache, nausea and diarrhea and less commonly the class-specific neuropsychiatric symptoms.

Phase 3 randomized controlled trials

In trials involving therapy-naïve HIV-1 infected adults who were randomised to receiving either BIC/TAF/FTC or a dolutegravir-containing regimen, non-inferiority was observed in rates of virological suppression. No treatment emergent resistance was seen in

the bictegravir group. Bictegravir is also effective at maintaining viral suppression in patients switching from other therapies, including in those infected with virus harboring M184V/I mutations.

Resistance

Bictegravir, like dolutegravir, retains activity against most viral isolates from patients harboring multi-drug resistant virus who have failed an INSTI containing regimen. In vitro, the G118R and R263K mutations confer a 14-fold, and 6-fold decrease in susceptibility, respectively. The G140S + Q148H combination reduces susceptibility to bictegravir by 5-fold, with further loss of susceptibility conferred by one or more additional mutations (L74M, T97A, S119P/T, E138A/K or Y143C/R/H and G163R). Further resistance data are likely to emerge with bictegravir's increasing use.

Cabotegravir

Cabotegravir is an investigational INSTI with structural similarities to dolutegravir. It may be administered as an oral tablet once daily or by intramuscular injection every four or eight weeks. The injectable route is enabled due to packaging of the drug within nanoparticles, resulting in a long half life (~40 days).

In the phase 3 ATLAS and FLAIR studies, individuals with suppressed plasma HIV-1 RNA receiving oral antiretroviral therapy were either switched to injections of cabotegravir and rilpivirine every four weeks or maintained on oral therapy. A comparison of the two groups at 48 weeks demonstrated non-inferiority in HIV RNA suppression rates. Although 21% of participants found injections painful, most of these considered the pain acceptable and overall <1% discontinued injectables. A preference for injectable over oral treatment was reported by 98% of participants. In a subsequent study, ATLAS-2M, therapy-experienced individuals with suppressed HIV-1 RNA were randomised to receiving either 4-weekly or 8-weekly injectable cabotegravir-rilpivirine: after 48 weeks, there was no loss of virological control using the 8-week regimen.

Overall, in the ATLAS and FLAIR studies, there were only six (0.5%) virologic failures with resistance in the group receiving injectable therapy, including two individuals infected with virus with pre-existing NNRTI resistance. However, at virological failure, all had NNRTI resistance and 4/6 patients developed INSTI resistance mutations. The development of Q148R or G140R was observed particularly in HIV-1 A1 subtype harboring the L74I integrase polymorphism.

Injectable cabotegravir is also a candidate drug for pre-exposure prophylaxis against HIV but acute HIV infection must be carefully excluded before initiating cabotegravir owing to the risk of resistance. In macaques who had been recently infected with a chimeric simian/human immunodeficiency virus, subsequent cabotegravir injections led to selection of INSTI resistance in 3/6 animals, including the mutations G118R, E92G/Q or G140R.

Entry Inhibitors

A growing number of antiretroviral agents target steps in virus entry into host cells. Currently approved drugs include the CCR5 co-receptor antagonist, maraviroc, a gp41-directed fusion inhibitor, enfuvirtide, a CD4-directed post-attachment inhibitor, ibalizumab, and an investigational drug, gp120-directed attachment inhibitor, fostemsavir. See the [Table 1](#) for a summary of the key properties of these HIV entry inhibitors.

Maraviroc

The first stage in the HIV-1 replication cycle is viral attachment to the cell membrane. The CD4⁺ glycoprotein expressed on T lymphocytes and macrophages/monocytes is the major receptor for HIV-1 and binds to the viral envelope protein, gp120. A conformational change in gp120 follows, exposing the V3 loop which then binds a cellular co-receptor, either the C-C chemokine receptor type 5 (CCR5) or the C-X-C chemokine receptor type 4 (CXCR4). Further conformational changes within the gp41 subunit enable fusion of the viral envelope and cell membrane and the release of the viral particle into the cytoplasm.

Around 80% of HIV-1 transmission involves CCR5-using viruses. Individuals who are homozygous for a gene encoding a non-functional CCR5 protein are therefore relatively resistant to HIV-1 infection. Over time, CXCR4-using viruses emerge in around 50% of untreated individuals, particularly in those with low CD4⁺ T lymphocyte counts. X4 virus also frequently predominates in those failing antiretroviral regimens. In some patients, viral strains can use both receptors (dual tropism) or there may be a mixed infection of R5 and X4 viruses.

Maraviroc binds to a hydrophobic pocket in the transmembrane helices of CCR5, leading to conformational change in the CCR5 extracellular loops. This prevents binding of CCR5 to the V3 loop of gp120 and thereby blocks virus entry.

Maraviroc is ineffective against treating X4 strains and therefore the presence of X4, dual or mixed tropic strains must be excluded prior to its use by sequencing of the V3 loop in HIV-1 RNA. If the RNA level is below the cut off required for reliable amplification, genotypic testing may be performed on proviral HIV-1 DNA. Tropism testing is not routinely undertaken in newly-diagnosed patients, as maraviroc is not a preferred first line agent in therapy-naïve individuals. In addition, tropism may change with time, and therefore the finding of R5 virus at diagnosis may be misleading for future treatment decision-making.

Maraviroc is approved for oral administration at a usual dose of 300 mg twice daily. However, it is metabolized by cytochrome P450CYP3A4 or 3A5 and therefore the dose is halved in the presence of co-administered inhibitors of these enzymes, such as ritonavir or cobicistat, or doubled in the presence of inducers, such as efavirenz.

Although usually well tolerated, the commonest side effects reported in trials are nausea, diarrhea, fatigue and headache. An additional important but uncommon toxicity is postural hypotension.

In the phase 3 MERIT trial, maraviroc was compared to efavirenz in therapy-naïve individuals, both co-administered with an NRTI backbone. The primary endpoint of non-inferiority in virological suppression rates was not met, with less viral suppression in the maraviroc arm. However, exclusion of 15% of patients who would have been ineligible by a more sensitive tropism screening assay resulted in similar response rates in the two arms.

The benefit of including maraviroc, as an antiretroviral with a novel mechanism of action, in therapy-experienced patients was demonstrated in the MOTIVATE-1 and -2 trials. Here, individuals with R5 HIV-1 infection, who had been treated with and/or had resistance to three antiretroviral drug classes, were randomised to continuing OBT or OBT plus maraviroc. HIV-1 RNA was <50 copies/ml at week 48 in 47% of those in the group receiving twice daily maraviroc, compared to 16% in the placebo group. Thus maraviroc may be included within a salvage regimen in ART-experienced individuals with R5 tropic virus, although it should not be the only fully active agent.

Antagonism of CCR5 may also have immunomodulatory effects, and trials are ongoing into the use of maraviroc for the treatment of co-morbidities with an inflammatory component, such as non-alcoholic fatty liver disease, in people with HIV infection.

Resistance to maraviroc may develop through one of two mechanisms. X4 using virus or dual or mixed tropic strains may emerge, often representing outgrowth of a pre-existing minority population. Alternatively, mutations within the V3 loop may enable gp120 to bind to CCR5 in the presence of maraviroc, although there is no consensus on the specific signature mutations. Some CCR5 antagonist-resistant viruses selected in vitro have mutations in gp41 only, but the clinical significance of these remains unknown.

Enfuvirtide

Enfuvirtide or T20 is the only approved drug in the class of antiretrovirals known as fusion inhibitors. Enfuvirtide binds to an extracellular region, the first heptad repeat (HR1), of the fusion peptide gp41, preventing its structural rearrangement and thereby blocking fusion of the viral envelope and cell membrane.

Enfuvirtide is administered by subcutaneous injection, twice daily. The most frequently reported adverse reactions are injection site reactions, diarrhea and nausea. However, numerous other adverse reactions may occur including diabetes mellitus, pancreatitis and peripheral neuropathy. No clinically significant pharmacokinetic interactions have been noted with the CYP450 pathway. However, the subcutaneous route of administration, twice daily dosing requirement and poor tolerability limit the utility of enfuvirtide in most scenarios except as a component of a salvage regimen in multi-resistant HIV-1.

The phase 3 TORO-1 and -2 studies demonstrated that the addition of enfuvirtide to optimized OBT resulted in a significantly greater reduction in HIV-1 RNA levels in individuals failing an antiretroviral regimen than in those receiving OBT plus placebo.

Resistance may develop in the context of incomplete viral suppression and is predominantly associated with mutations in gp41 HR1. However, mutations in other regions of the envelope gene, as well as co-receptor usage and density, may also affect susceptibility to enfuvirtide.

Ibalizumab-Uiyk

Ibalizumab was approved by the FDA in 2018 and is a first in class CD4-directed post-attachment HIV-1 inhibitor. It is a monoclonal antibody of IgG isotype 4 directed against domain 2 of the extracellular portion of the CD4 glycoprotein and is produced by recombinant DNA technology in murine myeloma non-secreting 0 cells. By non-competitive binding to CD4, ibalizumab interferes with post-attachment steps and thereby prevents fusion of the viral envelope and cell membranes. Ibalizumab, unlike maraviroc, is active against both R5 and X4 tropic HIV-1 strains and is indicated for the treatment of HIV-1 infected people with multi-drug resistant infection who are failing their current antiretroviral regimen.

Ibalizumab is administered intravenously as a single loading dose followed by a fortnightly maintenance dose. The most common adverse reactions are diarrhea, dizziness, nausea and rash. Drug-drug interactions have not been observed. Of note, ibalizumab binding does not impact CD4 function, given that the target is a domain on CD4 distinct from the binding site of MHC Class II molecules.

In the phase 3 TMB-301 study, heavily treatment-experienced HIV-1-infected participants with unsuppressed HIV RNA levels and resistance to at least one NRTI, NNRTI and PI, received ibalizumab with OBT. By week 25, 43% of individuals achieved an HIV-1 RNA level below <50 c/ml.

Decreased susceptibility to ibalizumab has been observed in some individuals experiencing virological failure and may be associated with genotypic changes in the HIV-1 envelope gene which results in loss of potential N-linked glycosylation sites (PNGS) in the V5 loop of gp120.

Fostemsavir

Fostemsavir is an oral prodrug of temsavir, a first in class attachment inhibitor which binds to the HIV-1 envelope protein gp120. It is an investigational agent, currently undergoing phase 3 clinical trials.

Temsavir binds to gp120 close to the CD4 binding site and prevents initial attachment to the CD4 receptor. By targeting the first step of viral attachment, before co-receptor binding and fusion, temsavir is unaffected by co-receptor tropism. In one arm of a phase 3 trial in which fostemsavir was added to OBT in heavily treatment experienced patients failing their current cART regimen (the BRIGHT study), 59% of individuals achieved HIV-1 RNA levels <40 c/ml by week 96. In phase 2 studies, several patients developed emergent substitutions in gp120 associated with reduced temsavir susceptibility although some of these individuals subsequently achieved viral re-suppression. Further data on the resistance profile are therefore required.

Pregnancy

Raltegravir is the preferred INSTI in pregnant women in view of the availability of long term safety data indicating no increased risk to the fetus. Elvitegravir/cobicistat should not be used owing to limited safety data and the risk of subtherapeutic elvitegravir plasma levels in the second and third trimesters. The slightly increased risk of neural tube defects in babies born to women who conceived on dolutegravir is outlined above. There are currently insufficient data concerning bictegravir for this to be recommended in pregnancy.

There are also only limited data on the use of maraviroc and enfuvirtide in pregnancy and no adequate data concerning the use of ibalizumab in pregnant women.

Children and Adolescents

An INSTI in conjunction with two NRTI is frequently the preferred regimen for HIV-1 infected children, with longer term safety and efficacy data in children available for raltegravir than other agents. Raltegravir may be administered as oral suspension, granules or chewable tablets and approved for use in infants and children weighing at least 2 kg under the FDA label. In children older than 6 years of age weighing at least 25 kg E/c/F/TAF may be used or, above 15 kg, a dolutegravir-containing regimen. Safety and efficacy of BIC/TAF/FTC in children under 18 years of age is not established.

Regarding entry inhibitors, maraviroc is approved for use in children weighing at least 10 kg who are over the age of 2 years. Enfuvirtide may be used in children 6 years of age or older.

Post-Exposure and Pre-Exposure Prophylaxis (PEP and PrEP)

INSTI are good candidates for use in PEP with a favorable safety and tolerability profile and the theoretical advantage of acting early in the virus replication cycle to prevent integration of viral DNA. The most frequently recommended regimen for PEP following a significant exposure to HIV-1 is a 28 day course of raltegravir plus tenofovir disoproxil fumarate and emtricitabine although alternative regimens may be prescribed. For example, DTG/TDF/FTC was used successfully in one open-label, single arm study. In cases of exposure to a resistant strain of HIV, the resistance profile may need to be reviewed before determining the optimal PEP regimen.

Although the only approved regimen for PrEP requires FTC plus TDF or TAF, phase 3 studies are ongoing into the use of alternative agents including cabotegravir. The injectable formulation is an attractive candidate owing to its long plasma half life and trials are investigating the approach of administration every 8 weeks. However, concerns have been raised that INSTI resistance may develop, for example, following initiation of cabotegravir during unrecognized primary HIV infection or after exposure to HIV during the long pharmacokinetic tail in people discontinuing therapy.

HIV-2

Few trials evaluating the use of antiretroviral agents have been completed in people with HIV-2, including no randomised controlled trials. However, INSTI are active against HIV-2 integrase in vitro and single-arm, open label clinical trials involving raltegravir plus TDF/FTC or EVG/c/TDF/FTC have shown favorable treatment responses in ART naïve individuals with HIV-2 over 48 weeks. A randomized controlled trial comparing the use of raltegravir plus TDF/FTC to lopinavir/ritonavir plus TDF/FTC is currently underway and a single arm open-label trial evaluating the use of dolutegravir with two NRTI in ART-naïve individuals is also ongoing.

Maraviroc appears to be active against some HIV-2 isolates; however, there are no FDA-approved assays that can determine HIV-2 co-receptor tropism, and HIV-2 is known to use other minor co-receptors in addition to CCR5 and CXCR4. HIV-2 is intrinsically resistant to enfuvirtide and there are as yet no data on the anti-HIV-2 activity of ibalizumab.

Introduction and Epidemiology

Respiratory syncytial virus (RSV) is a single-stranded RNA virus belonging to the *pneumoviridae* family (Genus: *orthopneumovirus*). It has two subtypes, RSV-A and RSV-B, both of which cause acute upper and lower respiratory tract infection. There is no clear association between RSV subtype and disease severity (Green Book, 2015). RSV is one of the leading causes of respiratory infection worldwide with almost all children having been infected by 2 years of age (Glezen *et al.*, 1986). In children under 5 years of age RSV is responsible for 22% of all severe acute lower respiratory tract infections worldwide (Shi *et al.*, 2017). In 2015 it was estimated that globally there were 33.1 million episodes of RSV associated acute lower respiratory tract infection in children under 5 years, resulting in 3.2 million hospital admissions and 59,600 deaths (Shi *et al.*, 2017). RSV also affects adult populations with a systematic review of articles from across the United States showing RSV to be the causative organism in 12% of acute respiratory illnesses reviewed by a medical professional (Colosia *et al.*, 2017). Among adults over the age of 65 years admitted to hospital with RSV, mortality is as high as 6%–8% (Colosia *et al.*, 2017; Falsey *et al.*, 2005) with a similar mortality rate of 8% found in hospitalized younger adults with chronic cardiac or respiratory disease (Falsey *et al.*, 2005). In the United States alone it is estimated that RSV is responsible for 170,000 hospitalizations and 10–17,000 deaths annually in the adult population (Nam and Ison, 2019; Falsey and Walsh, 2000).

RSV shows a seasonal pattern which in temperate climates such as the United Kingdom (UK) lies between October and March. The peak number of infections tends to occur within a six week period within this season each year (Green Book, 2015). In more tropical areas, RSV occurs year-round. In each season, one subtype (A or B) tends to predominate.

Pathogenesis and Immunity

RSV is transmitted between hosts via droplets or fomites. It initially infects the apical surface of ciliated epithelial cells in both the upper and lower airways via the fusion (F) and attachment (G) proteins. Although there is almost ubiquitous infection by 2 years of age, infection with RSV offers incomplete immunity (Glezen *et al.*, 1986). This results in episodes of repeated infection in both children and adults throughout life (Lambert *et al.*, 2014; Openshaw *et al.*, 2017; Gonzalez *et al.*, 2000). RSV often results in a self-limiting illness, however, there are both environmental and host factors that put individuals at higher risk of more severe clinical manifestations. Host-related risk factors in children include younger age at the start of the RSV season with those under 3 months old at greatest risk, prematurity, low birth weight, bronchopulmonary dysplasia or other underlying respiratory disease, congenital heart disease and immunosuppression (Aujard and Fauroux, 2002; Rossi *et al.*, 2007). Environmental risk factors for infants include having older siblings or living in a household with multiple other children and day care attendance (Rossi *et al.*, 2007; Simoes, 2003; Bulkow *et al.*, 2002). In older adults, underlying cardiopulmonary disease and poor functional status are associated with an increased risk of severe clinical disease (Walsh *et al.*, 2004; Duncan *et al.*, 2009).

In the initial weeks of life infants have relative protection against RSV due to transplacental transfer and transfer via breastmilk of protective maternal antibodies. However, these antibodies fall below levels that are protective by approximately three to five months of age (Openshaw *et al.*, 2017). In later childhood, antibody responses to recurrent infection are more brisk and effective than in infancy (Openshaw *et al.*, 2017). Elderly adults are also at higher risk of severe disease due to a combination of physical changes to the lungs over time alongside waning innate and adaptive immunity. Those with low serum neutralizing antibody titers against RSV appear to be at greatest risk of severe disease (Openshaw *et al.*, 2017).

Clinical Features

RSV has a range of clinical manifestations, some of which are present exclusively in certain age groups. In all age groups RSV can present as a mild self-limiting upper respiratory tract infection.

In children under the age of 1 year, RSV is the most common causative organism of bronchiolitis. Bronchiolitis is defined as inflammation of the small airways and presents with signs and symptoms including increased work of breathing, supplemental oxygen requirement, cough, fever and reduced feeding.

In children of pre-school age RSV is a causative organism of viral-induced wheeze. In this illness there is hyper-reactivity of the airways resulting in bronchospasm causing polyphonic wheeze. There may also be increased work of breathing, cough, fever and supplemental oxygen requirements.

In both children and adult populations RSV can also cause viral pneumonia/pneumonitis. The clinical features associated with this may include cough, increased work of breathing/shortness of breath, supplemental oxygen requirement and fever.

Among the adult population underlying cardiovascular disease is a significant risk factor for hospitalization with RSV. RSV in this population may present as an exacerbation of underlying cardiac disease, with 5.4% of all admissions for congestive heart failure during the RSV season thought to be attributable to RSV infection (Nam and Ison, 2019). Studies have also demonstrated an association in older adults between presence of RSV serum IgG and an increased risk of acute myocardial infarction (Ivey *et al.*, 2018; Chuaychoo *et al.*, 2019; Guan *et al.*, 2010).

Treatment Strategies

Treatment of RSV is mainly supportive and varies slightly depending on the clinical syndrome. Many of the management strategies laid out below are not specific to RSV but to the clinical manifestations which may equally be caused by a number of other respiratory viruses.

With regards to acute viral bronchiolitis in infants, the current NICE guideline states that treatment should be supportive with supplemental oxygen if saturations are persistently less than 92% and by giving fluids via naso/orogastric tube or intravenously if required (National Institute for Health and Care Excellence). Many other treatments have been trialed without success. NICE and the American Academy of Pediatrics (AAP) guidance currently recommend against the routine use of nebulized hypertonic saline, bronchodilators, antibiotics, corticosteroids (systemic or inhaled), nebulized adrenaline and montelukast for the management of acute bronchiolitis (National Institute for Health and Care Excellence; Ralston *et al.*, 2014).

Acute viral wheeze in pre-school age children may be caused by RSV and treatment remains mainly supportive. There is evidence to support the use of bronchodilators for symptomatic relief and their use is recommended in this age group by NICE guidance (NICE, 2017; Brand *et al.*, 2008). There is limited evidence for the use of oral corticosteroids in preschool acute viral wheeze. The current consensus from the European respiratory task force is that a trial should only be considered in children with wheeze of such severity that they require admission to hospital, and even in this group, evidence to support benefit is not robust (NICE, 2017; Brand *et al.*, 2008; Grigg, 2010; Brand *et al.*, 2014).

Other clinical syndromes including viral pneumonia, pneumonitis and upper respiratory tract infection in all age groups are also managed supportively with anti-pyretics, supplemental oxygen and feeding support as required.

One antiviral with activity against RSV has been licensed and is occasionally used in specific clinical scenarios. Ribavirin is a nucleoside inhibitor and is used as an anti-viral medication for a variety of infections, including RSV. A Cochrane review of 12 trials looking at use of ribavirin in infants and children with lower respiratory tract infection found that it may be effective in reducing days of mechanical ventilation in children requiring intensive care, however, the evidence base lacks sufficient power to draw firm conclusions on its efficacy (Ventre and Randolph, 2007). Ribavirin also has significant toxicity associated with it including hemolytic anemia and teratogenicity and so should be prescribed with careful attention to the risks and benefits. Its use is currently not recommended by NICE or the AAP for infants with RSV bronchiolitis (National Institute for Health and Care Excellence; Ralston *et al.*, 2014). Patients who have received haematopoietic stem cell transplant (both adults and children) are at particular risk of severe RSV infection and as such ribavirin has been used as a treatment option in these cohorts. Studies into the use of ribavirin in this cohort have mostly been small but are suggestive that it may be beneficial (Sparrelid *et al.*, 1997; McColl *et al.*, 1998; Boeckh *et al.*, 2007). Further randomised controlled trials are required in this field to establish a true effect. The second treatment that has been investigated is intravenous immunoglobulin (IVIG). A Cochrane review looking at immunoglobulin in treatment of RSV in young children found that IVIG was not effective at reducing mortality or time spent in hospital (Sanders *et al.*, 2019). As with ribavirin, there is minimal supporting evidence for the efficacy of IVIG in haematopoietic stem cell transplant recipients. In the 1990s IVIG was obtained from a pool of patients with high titers of RSV-neutralizing antibodies with the aim to create RSV specific IVIG. One product of this type known as RespiGam was licensed in 1996. This was shown to provide some passive immunity and reduce the rate of hospitalization with RSV by 41%–65% and length of stay in hospital by 53%–59% (Sandritter and Kraus, 1997). However, its manufacture was stopped in 2004 (Halsey *et al.*, 1998; Turner *et al.*, 2014). Small trials of patients (adults and children) undergoing haemopoietic stem cell transplant have also investigated combining ribavirin with IVIG. There seems to be a trend towards improved outcomes but more studies are needed. Some guidelines for this group of patients recommend ribavirin plus IVIG as treatment (Dignan *et al.*, 2016).

As discussed below, palivizumab (a monoclonal antibody against RSV) is an effective preventative agent for RSV in infants. It has also been trialed as a treatment in patients with severe LRTI or high-risk patients with URTI. However, a systematic review of palivizumab as treatment in both children and adults did not show any difference in clinical outcomes (Hu and Robinson, 2010). The review included one case report, four case series and two randomised controlled trials (RCTs). Both RCTs investigated pediatric patients only and neither were not adequately powered to assess clinical outcomes with palivizumab (Hu and Robinson, 2010). Palivizumab cannot currently be recommended as a treatment option for patients with RSV infection.

There are also a number of novel anti-viral therapies in development. They can be broadly divided into four classes; immunoglobulins, nucleoside analogs, small interfering RNA's and fusion inhibitors (Xing and Proesmans, 2019). None of these has progressed past a Phase 2 clinical study and thus a new licensed RSV antiviral remains several years away.

Prophylaxis

A key strategy in the control of RSV infection lies in prophylaxis as currently there is no effective vaccine and treatment is mainly supportive in nature. The only licensed preventative treatment for RSV is palivizumab. Palivizumab is a humanized monoclonal antibody which provides passive immunity by targeting the RSV F protein and preventing fusion with the host cell.

A randomised controlled trial of infants born at less than 35 weeks of gestation or infants with bronchopulmonary dysplasia showed that palivizumab reduced rates of hospitalization from RSV by 55% compared to placebo. Those who received palivizumab also had proportionally fewer total days in hospital, fewer days spent on supplemental oxygen and were less likely to be admitted to the intensive care unit as a result of RSV infection ([The IMPact-RSV Study Group, 1998](#)). Palivizumab has also been shown to have some benefits in otherwise healthy infants born at 33–35 weeks of gestation. In the MAKI trial, palivizumab prophylaxis resulted in a 67% relative reduction in RSV infections compared with placebo ([Blanken *et al.*, 2013](#)). It also resulted in a relative reduction of 61% in number of days of wheezing in the first year of life suggesting an improvement in chronic respiratory morbidity associated with RSV infection in infancy ([Blanken *et al.*, 2013](#)).

Although it has been shown to be clinically effective, the use of palivizumab remains controversial due to its high cost. The broadly accepted willingness to pay threshold set by the National Institute for Health and Care Excellence (NICE) in the UK is £30,000 per quality adjusted life year (QALY). An initial analysis of available evidence showed that palivizumab was not cost effective in a UK setting if delivered unselectively to all infants with an incremental cost-effectiveness ratio (ICER) of around £60,000 per QALY ([Wang *et al.*, 2008](#)). A second systematic review assessed cost effectiveness in specific subgroups of infants and found that palivizumab may be cost effective in infants with chronic lung disease and haemodynamically significant congenital heart disease at certain gestational and corrected gestational ages ([Wang *et al.*, 2011](#)). The current guideline for use of palivizumab in the UK has been set out by Public Health England upon guidance from the Joint Committee on Vaccination and Immunization (JCVI) in the Green Book ([Green Book, 2015](#)). In the infants for whom it is recommended it is delivered as monthly intramuscular injections at a dose of 15 mg/kg over the RSV season (October to March in the UK).

There are other monoclonal antibodies in development ([PATH.org](#)). MEDI8897 is a monoclonal antibody in development that has now entered phase 3 trials. Initial results suggest that it is safe to use in otherwise healthy preterm infants and it reduced medically attended RSV LRTI by 70.1% over the course of a year ([Pamela Griffin *et al.*, 2019](#)). It may have benefits over palivizumab as it has a longer half-life of 83–94 days and so may be able to be administered as a single dose to cover a 6 month period ([Domachowski *et al.*, 2018](#)).

RSV Vaccination

Since the 1960s there have been multiple trials looking for an effective RSV vaccine, without any achieving licensure. Proposed populations in whom an RSV vaccine would be beneficial include newborn infants, preschool children, pregnant women and older adults. A cost effectiveness review of different vaccination strategies to protect infants found that the most cost-effective strategy would be a seasonal approach tailored to each specific country, protecting neonates born from just before the RSV season until a few months of age ([Cromer *et al.*, 2017](#)). A vaccine could potentially be given to the mother prior to delivery or to a neonate in the first weeks of life ([Cromer *et al.*, 2017](#)). A snapshot of the landscape of RSV vaccine development as of August 2019 shows there is one vaccine currently in Phase 3 trials ([PATH.org](#)). This is an RSV-F nanoparticle vaccine targeting the maternal population ([PATH.org](#)). This trial recently reported headline results suggesting the vaccine is safe and reduced medically significant RSV LRTI by 39.4% (97.5% CI, –1% to 64%) over a 90 day follow up period ([Novavax, 2019](#)). Full results are yet to be published at the time of writing. There are multiple vaccines currently undergoing Phase 2 trials which between them target all of the potential population groups mentioned above ([PATH.org](#)). The global impact of an effective vaccine for RSV cannot be underestimated. Until that time, RSV will continue to have a significant burden of mortality and morbidity across all age groups but particularly in young children, the elderly and the immunocompromised.

Conclusion

RSV causes a significant global burden of disease in both pediatric and adult populations. It particularly affects infants, especially those born prematurely or with other health needs, and the elderly population. It can cause a wide range of clinical signs and symptoms and can result in a minor URTI through to respiratory failure and death. Although there are prophylactic and antiviral options, management is mainly supportive. A safe and effective vaccine is yet to be found, and until that time the ongoing search will remain a public health priority.

Introduction

The burden of disease related to the annual influenza epidemic is significant in all regions of the world (Wright *et al.*, 2007; Iuliano *et al.*, 2018; Federici *et al.*, 2018; Molinari *et al.*, 2007). Recent estimates suggest that 5%–10% of the population in the western world experience clinical influenza every year, resulting in medical care expenses and burden that have a major impact on public hospitals. Influenza activity observed during pandemics may also lead to increased medical care in both community-based and hospital-based health structures. As a consequence, shortage of available hospital beds (especially in the emergency rooms) and hospitals become overwhelmed by severely ill individuals requiring intensive medical care because of influenza-related complications in both seasonal and pandemic influenza (Wright *et al.*, 2007; Molinari *et al.*, 2007). Although less documented, this impact is also massive in resource-poor and countries (De Francisco Shapovalova *et al.*, 2015).

To avoid these crisis situations, annual or pandemic vaccination is promoted. However, the relatively low vaccine effectiveness observed with seasonal influenza vaccines, especially for A(H3N2) viruses, as well as the anticipated long delays before the availability of a pandemic vaccine makes the case for better use of currently available antiviral drugs and further antiviral development (McLean *et al.*, 2016). This need is also stressed in pandemic preparedness plans where the only response in the early stages of a pandemic will be the use of antivirals, especially for severe infections (Monto and Fukuda, 2020; Whitley and Monto, 2006).

Seasonal Influenza

Annually, seasonal influenza accounts for about 650,000 deaths, together with millions of severe cases and hospital admissions (Wright *et al.*, 2007). This influenza-related morbidity and mortality is mainly observed in patients with risk factors such as old age, medical comorbidities (pulmonary disease, cardiovascular disease, renal disease, liver disease, diabetes, neuromuscular disease, and cognitive dysfunction), immunocompromised status (stem cell transplant, solid organ transplant, chemotherapy, HIV infection), pregnancy, obesity, and genetic susceptibility (i.e., IFITM3 defects) (Rothberg and Haessler, 2010; Wedzhicha and Seemungal, 2007; Smeeth *et al.*, 2004; Allen *et al.*, 2017). In these patients, symptomatic treatments are often not sufficient to avoid complications and increased risk of morbidity and mortality.

Pandemic Influenza

Influenza A viruses have been responsible for four pandemics in the last 100 years (Monto and Fukuda, 2020; Taubenberger *et al.*, 2006; Spreeuwenberg *et al.*, 2018). During these pandemics, additional risk-groups have emerged (i.e., young adults aged 20–40 years in 1918; children younger than two years of age in 1957). In addition, pregnancy has clearly been recognized with a high risk of morbidity, especially in the third trimester during the 1918, 1957, and 2009 pandemics.

Zoonotic Influenza

Influenza A is a zoonotic virus that can occasionally be responsible for human infections (Peiris, 2009; Beigel *et al.*, 2005; Koopmans *et al.*, 2004; Peiris *et al.*, 1999). These zoonotic viruses are acquired through exposure to infected livestock (swine, chicken, ducks, and turkeys). In the last 40 years, an increased number of zoonotic influenza cases have been reported, with an occasional very high mortality rate. As these infections can be a pandemic threat, the patients should be handled carefully, and their infection controlled rapidly to avoid the implementation of human to human transmission. The disease management of these cases is also a driving force to develop antivirals.

To address all these situations, influenza antivirals have been developed since the 1960s (Wright *et al.*, 2007; Palese and Shaw, 2007; Aoki, 1998; Colman, 1994). Despite showing some efficacy, these products had two major limitations (Wright *et al.*, 2007): a marginal impact on the clinical disease duration in mild or non-severe cases, and (Iuliano *et al.*, 2018) a rapid emergence of resistant viruses, especially in children (Palese and Shaw, 2007; Aoki, 1998; Colman, 1994; Muthuri *et al.*, 2013). However, the clinical benefit in severe

Fig. 1 Schematic representation of the Influenza replication in the cell and the different targets for antiviral action of molecules currently available or under development. The numbering is describing where the different classes of antiviral may interact with the virus replication cycle in the cell. 1 – inhibition of H^+ -mediated decapsulation of vRNPs blocked by M2 ion channel blockers 2 – inhibition of virus release from the cell surface after budding by Neuraminidase inhibitors 3 – inhibition of virus replication and RNA synthesis by polymerase inhibitors 4 – inhibition of HA processing and maturation by blocking HA terminal glycosylation required for HA maturation 5 – inhibition of HA attachment to epithelial cells by removal of sialic acids by a bioavailable sialidase.

cases has been assessed, and antiviral usage has been promoted during the two last pandemics (1968 and 2009) (Aoki, 1998; Colman, 1994; Muthuri *et al.*, 2013). In 1968–1969, Amantadine was positively evaluated and subsequently proposed for the disease management of severe cases, and in 2009, Oseltamivir was also proposed, for the management of both severe and clustered cases.

These two antiviral drugs target two virus proteins, M2 (amantadine) and NA (oseltamivir), and aim for rapid virus clearance through impaired virus replication. However, influenza disease is not only the consequence of virus replication. The immune response that develops to combat the infection is responsible for many of the clinical symptoms that are still present after virus clearance (Wright *et al.*, 2007; Palese and Shaw, 2007). This partly explains why the current antivirals, although “virologically effective”, have limitations in the reduction of disease duration in mild cases. This has led to the development of new concepts for influenza infection treatment, with molecules targeting the host response.

In this article, we will go through the different classes of currently available antivirals and complete this list of recently developed products, some of which are alternative strategies involving host targeted molecules and immunotherapies.

Antiviral Drugs Available

Adamantanes or M2 Blockers (Fig. 1)

Adamantanes were the first class of antivirals developed and tested against Influenza during the 1960s (Palese and Shaw, 2007; Aoki, 1998). These molecules are active against influenza A viruses only. Their mode of action involves blocking the proton channel activity of the M2 complex, a function required for the acidification of the virus that allows viral uncoating and disruption of the macromolecular vRNP complex (Fig. 1) (Palese and Shaw, 2007). This disruption results in the release of the vRNP in the cytoplasm before entry into the nucleus of the infected cell. By direct interaction with the domains involved in the ion-channel activity of the M2 complex, adamantanes abort viral replication (Palese and Shaw, 2007; Aoki, 1998).

Amantadine, the first molecule of this class, showed a sub-optimal safety profile (neurological disorders) and, as a consequence, a derivative (rimantadine) with an improved safety profile was developed (Wright *et al.*, 2007; Aoki, 1998).

These adamantanes were first evaluated and used during the 1968 pandemic with some success; clinical trials have confirmed a superiority of amantadine to placebo (Wright *et al.*, 2007; Aoki, 1998) in disease management. However, they remained poorly used because of the frequent and sometimes severe side effects. In addition, it was observed that resistance could emerge rapidly, related to substitutions in the membrane-spanning region of the M2, especially at amino acids 26, 27, 30, 31, and 34 (Fig. 2)

Fig. 2 substitutions associated with resistance to Adamantanes in the ion channel of the M2 tetramer of Influenza A viruses. The alpha helix of M2 proteins with S31 substitution has a curvature that allows the ion channel to be efficient despite binding the M2 blocker in its active site (A). As a consequence of this substitution, the size of the channel is increased (B) as depicted in the cartoon. The Adamantane is in red in the cartoon.

(Wright *et al.*, 2007; Palese and Shaw, 2007; Hay *et al.*, 1986; Weinstock and Zuccotti, 2006). This resistance induced no fitness cost and was sustained in the virus progeny. Hence, the resistant viruses were positively selected in a context of antiviral pressure and were readily transmitted to contacts (Hayden *et al.*, 1991; Shiraishi *et al.*, 2003; Schilling *et al.*, 2004).

These products remained in use in several countries until the end of the 20th century. However, because of the frequency of the side effects observed and the increasing percentage of influenza A viruses resistant to adamantanes (almost 100% by 2010), these molecules are not recommended anymore (Bright *et al.*, 2005; Deyde *et al.*, 2007; Barr *et al.*, 2007).

Neuraminidase Inhibitors (Fig. 1)

The second class of antivirals developed were the neuraminidase inhibitors (NAI). The neuraminidase (NA), a glycoprotein organized as homotetramers accounting for approximately 20% of the glycoproteins of the virus surface, has an enzymatic activity (sialidase) required to cleave the linkage between the terminal sialic acid and the adjacent D-galactose (or D-galactosamine) of the cellular glycoproteins (Palese and Shaw, 2007; Aoki, 1998). This cleavage allows the release of the virus progeny after budding and facilitates the transport of the virus to the epithelial cells through the respiratory mucus containing sialylated proteins (Palese and Shaw, 2007; Aoki, 1998).

Despite subtle differences, the structure of the catalytic pockets of influenza A and B NAs are conserved for all viruses (Fig. 3). In addition, preliminary studies have shown that viruses with impaired NA function because of amino acid substitutions altering the sialidase activity (i.e., temperature-sensitive mutants) remained stacked at the surface of the cell (Palese and Shaw, 2007). As a consequence, these viruses cannot be released, and have a very low level of transmission.

The identification of the key role of the NA in virus dissemination has led to the development of high-affinity sialic acid analogs with sialidase-inhibiting activity. The first available and tested NA inhibitor (NAI) was Zanamivir (Relanza[®], Fig. 4). This molecule

Fig. 3 Neuraminidase pocket site. The neuraminidase is a tetramer with 4 active sites highly conserved within all NAs. Substitutions associated with resistance are observed either in the catalytic site or in the framework structure. The latter is changing the shape of the catalytic pocket, resulting in a reduced binding of the neuraminidase inhibitors.

Fig. 4 Sialic acids and analogs acting as neuraminidase inhibitors. Chemical structures of the neuraminidase inhibitors (A) DANA, (B) zanamivir, (C) oseltamivir carboxylate, (D) peramivir, and (E) laninamivir. Structures show the differences relative to DANA – the C4-guanidinium group on zanamivir, peramivir, and laninamivir, the C4-amino group on oseltamivir, and the pentyl side chains on oseltamivir and peramivir. From McKimm-Breschkin, 2013. Influenza neuraminidase inhibitors: Antiviral action and mechanisms of resistance. Influenza Other Respiratory Viruses (Suppl 1), 25–36.

has a very low oral bioavailability and has to be inhaled to be active (Wright *et al.*, 2007). As a consequence, specific inhaling devices have been developed to allow the administration of therapeutic doses of the product. In the clinical studies carried out in patients presenting with mild influenza, Zanamivir demonstrated a clinical benefit with a 24 h reduction of symptom duration compared to placebo, if the drug was administered within 48 h after symptom onset (Gubareva *et al.*, 2000). In addition, it was demonstrated that, as expected, virus shedding was significantly reduced. The complexity of the delivering process (inhalation) and the modest clinical benefit observed resulted in very limited use. A second NAI was introduced, Oseltamivir carboxylate (Tamiflu®), a prodrug that could be administered orally (Fig. 4) (Wright *et al.*, 2007). Virological and clinical studies showed similar effects to Zanamivir (similar reduction of virus shedding and similar reduction in clinical symptoms duration) (Gubareva *et al.*, 2000). Later, two additional NAIs were developed, evaluated, and made available: Peramivir (Rapivab®, IV or IM administration, one single dose) and Laninamivir octanoate (Inavir®, inhaled, one single dose) (Fig. 4) (Mancuso *et al.*, 2010; Ikematsu, 2011). The clinical benefits of all these NAI are very similar: A reduction of disease duration by one day.

Interestingly, at the early stage of the development of these molecules and based on the preliminary studies conducted on temperature-sensitive mutants (Palese and Shaw, 2007), the risk of emergence of resistance was considered to be very low. In vitro and in vivo studies confirmed a reduction in virus fitness when NA substitutions associated with resistance occurred (Yen *et al.*, 2005; Herlocher *et al.*, 2002; Burnham *et al.*, 2014; Ives *et al.*, 2002). Meanwhile, rare sporadic cases of resistant type A or B influenza viruses with NA harboring substitutions associated with reduced susceptibility were reported (Ferraris *et al.*, 2005; Monto *et al.*, 2006). However, in 2007, a naturally-occurring resistant clone of seasonal influenza emerged with excellent fitness. This resistant clone completely displaced the susceptible parental strain, as a result of combined evolution in NA and HA (epistasis) (Wright *et al.*, 2007; Hurt *et al.*, 2010; Meijer *et al.*, 2009; Hurt *et al.*, 2009; Dharan *et al.*, 2009).

Subsequently, surveillance for resistant viruses was reinforced, a better definition of the level of resistance (or reduced susceptibility) was proposed, and phenotypic assays were progressively implemented (chemiluminescent and fluorescent

assays) (Palese and Shaw, 2007; Ferraris *et al.*, 2005; Nguyen *et al.*, 2012; Okomo-Adhiambo *et al.*, 2014). As a consequence, a normalization was proposed in terms of testing and reporting. Briefly, the NAI susceptibility testing works through the determination of the concentration of drug required to inhibit NA enzymatic activity by 50% (measurement of an IC50 value); the level of NA inhibition being interpreted as a surrogate for virus inhibition. To facilitate the interpretation of the results, IC50 value thresholds (or cut-off) were used to separate drug-resistant and drug-sensitive viruses. To facilitate the interpretation and reporting of NAI assay results, a WHO Expert Working Group introduced a very strict set of criteria to define the antiviral susceptibility of viruses based on the fold change of IC50 values, as compared to a reference IC50 (e.g., a median IC50 of viruses of the same type/subtype) (Table 1). Interpretation of NAI assay data is type-specific (Okomo-Adhiambo *et al.*, 2014).

This normalized assay has been associated with molecular investigations of viruses showing RI and HRI phenotypes. The substitutions/deletions associated with these phenotypes showed two kinds of changes: within or near the NA catalytic site affecting the binding of one or more NAIs (catalytic substitutions), or responsible for a change in the global folding of the NA, with no changes in the catalytic pocket (structural substitutions) (Ferraris and Lina, 2008; McKimm-Breschkin, 2013). A comprehensive list of substitutions has been prepared, showing differences between the different NAs.

Recent surveillance data showed that there is only a very limited number of resistant viruses reported worldwide, mainly in H1N1pdm09 viruses and in children (Lackenby *et al.*, 2018). Individual cases are described, including in immunocompromised patients where chronic infections have been reported. There is no information about the sustained transmission of resistant viruses. A five-year-long study reporting on the resistance to NAI in treated patients showed that Oseltamivir resistance was only detected during antiviral treatment, with the highest incidence occurring among one to five-year-olds. Resistance delayed viral clearance but had no impact on symptom resolution (Lina *et al.*, 2018).

Post-licensure studies have been performed to consolidate the potential clinical benefit of the NAI usage in mild and severe influenza. Observational studies have reported the beneficial effects of NAIs, showing – in adult patients with confirmed influenza – a reduction in the likelihood of (Wright *et al.*, 2007) requiring antibiotics because of lower respiratory tract infection (44%) and (Iuliano *et al.*, 2018) being hospitalized (63%) (Katzen *et al.*, 2019; Venkatesan *et al.*, 2017). Similarly, studies conducted during the 2009 pandemic suggested that, when initiated within 48 h of symptom onset in hospitalized patients, NAIs significantly reduced mortality in adults by 62% – this remains significant even when the treatment was started after 48 h (25% overall reduction) (Muthuri *et al.*, 2014).

Post-licensure surveillance has also pointed out some very rare adverse effects of NAI, particularly of Oseltamivir. Most minor side effects associated with NAI consumption were gastrointestinal disorders such as nausea and vomiting, but not diarrhea (Doll *et al.*, 2017). Both stop rapidly after treatment cessation. In Japan, some cases of neuropsychiatric adverse events (NPAE) have been reported to be linked with Oseltamivir or Laninamivir use in adolescents (Nakano *et al.*, 2013). An in-depth analysis carried out in 2008 compared the incidence of cases in Japan and the USA, showing a higher incidence of NPAE reporting rates per 1,000,000 prescriptions in children (aged < 16 years) and adults (respectively, 99 and 28 events in Japan and 19 and 8 in the US). This study concluded that there was no link between NPAEs and Oseltamivir usage; the NPAE incidence being equivalent in influenza treated and non-treated cases (Toovey *et al.*, 2008). The mechanism for the development of NPAE remains to be elucidated. Inhaled Zanamivir is contraindicated if there is a risk of bronchospasm, even if remains difficult to quantify (Heneghan *et al.*, 2014).

In severe cases as well as in immunocompromised patients, different regimens of NAIs have been tested to increase their beneficial effect. Double or triple doses have been evaluated, showing no additional clinical benefit compared to the standard dose (Marty *et al.*, 2017). These regimens induced more severe and more frequent side effects, including gastrointestinal problems. Secondly, combinations of NAIs have also been tested (Oseltamivir plus Zanamivir). These studies did not report any clinical benefit as compared to Oseltamivir alone, or Zanamivir alone. They even reported a possible antagonistic effect with an overall reduced effectiveness (Escuret *et al.*, 2012; Duval *et al.*, 2010).

Post-exposure prophylaxis (PEP) has also been proposed for NAIs (Welliver *et al.*, 2001). Oseltamivir has been approved for this indication, with a seven-day course with a half-dose regimen. A meta-analysis calculated that Oseltamivir PEP had an efficacy of 58.5% (15.6% to 79.6) for households and 68% (34.9%–84.2%) to 89% in contacts of index cases; Zanamivir had a similar performance (Oh *et al.*, 2014). This protection has also been demonstrated in nursing homes (Welliver *et al.*, 2001). However, this half-dose regimen may trigger the emergence of a resistant virus (Wright *et al.*, 2007). Actually, a population dynamical model of pandemic influenza demonstrated that limited post-exposure prophylaxis can provide an optimal strategy in reducing the final size of the pandemic while minimizing the total number of deaths. However, post-exposure prophylaxis of close contacts in the presence of transmissible drug resistance can promote the spread of resistance, especially when combined with aggressive treatment. PEP should be used in the short term, mostly to control epidemics in closed settings (i.e., nursing homes).

Laninamivir has also been favorably evaluated as PEP in nursing homes (Kashiwagi *et al.*, 2016).

Polymerase Inhibitors (Fig. 1)

The third class of antivirals is the polymerase (POL) inhibitors. The development of these molecules has been facilitated by the determination of the crystal structure of the Pol complex and subunits ((Pflug *et al.*, 2014; Pflug *et al.*, 2018) Fig. 1). Different modes of action are used by the different POL inhibiting drugs (Fig. 5) (Mifsud *et al.*, 2019).

Table 1 Summary of the substitution association to reduced or highly reduced inhibition of Neuraminidase activity for seasonal human viruses type A (Table 1A) and type B (Table 1B). These tables are providing the a priori interpretation of the susceptibility to NAI when a specific substitution is observed in the neuraminidase of the tested virus. NI = normal inhibition; RI = reduced inhibition; HRI = highly reduced inhibition. (Ref: http://www.who.int/influenza/gisrs_laboratory/antiviral_susceptibility/avwg2014_nai_substitution_table.pdf)

Fig. 5 Structure and mode of action of the different Polymerase inhibitors A describe the normal cap snatching and RNAZ synthesis by the influenza polymerase complex (PB1, PB2, and PA). The three polymerase inhibitors available have different modes of action, as described (Baloxavir inhibits cap snatching, Pimodivir inhibits cap binding, and favipiravir inhibits RNA elongation).

Ribavirine (Ribavirin®)

Historically, this molecule showed a rather large spectrum of activity against RNA viruses, including respiratory syncytial virus (RSV) and hepatitis C. The influenza antiviral effect could be measured in vitro and in pre-clinical studies, but Ribavirine always failed to show clinical efficacy against influenza, in human challenge studies, and clinical studies (Wright *et al.*, 2007; Schofield *et al.*, 1975).

The more recently described POL-inhibiting compounds were prepared by drug design. Solving the structure of the three components of the influenza polymerase (PA, PB1, and PB2) allowed the identification of potential targets and the design of inhibiting molecules (Pflug *et al.*, 2014; Pflug *et al.*, 2018). The POL inhibitors interfere with different components of the polymerase complex.

Baloxavir Marboxil (Xofluza®)

Baloxavir Marboxil was developed after solving the structure of the Cap-snatching pocket of the PA (Pflug *et al.*, 2014, 2018). Rapidly, it appeared that a drug that would incorporate this pocket would prevent the mandatory cap-snatching function of the PA and subsequently block RNA synthesis by the influenza polymerase. Baloxavir Marboxil was developed for that purpose and the preliminary in vitro and clinical results (4 log reduction in virus production) were very encouraging (Hayden *et al.*, 2018; Omoto

Fig. 6 Virological effect of Baloxavir marboxyl as compared to placebo and oseltamivir. Panel A shows the change from baseline (dashed line) in influenza infectious viral load overtime in the baloxavir group (427 patients) and placebo group (210 patients). The mean ($\pm$ SD) viral loads on day 1 (before the initiation of the trial regimen) were 5.79 ± 1.87 and 5.56 ± 1.89 log₁₀·50% tissue-culture infective dose (TCID₅₀) per milliliter in the baloxavir and placebo groups, respectively. Asterisks indicate a P value of less than 0.05 for the comparison with placebo. Panel B shows the change from baseline in influenza infectious viral load in adults 20–64 years of age in the baloxavir group (352 patients) and oseltamivir group (359 patients). The mean ($\pm$ SD) viral loads on day 1 were 5.76 ± 1.90 and 5.94 ± 1.69 log₁₀ TCID₅₀ per milliliter in the baloxavir and oseltamivir groups, respectively. Asterisks indicate a P value of less than 0.05 for the comparison with oseltamivir. In both panels, I bars indicate standard deviations. From Hayden, F.G., Sugaya, N., Hirotsu, N., *et al.*, 2018. Baloxavir marboxil investigators group. Baloxavir marboxil for uncomplicated influenza in adults and adolescents. The New England Journal of Medicine 379 (10), 913–923.

et al., 2018). This reduction was significantly higher than observed with the INAs, or any other anti-influenza drugs, and was noted in both influenza A and influenza B viruses (Fig. 6).

The first data obtained from clinical trials were, initially, not as promising as the in vitro results.

- (1) First, the clinical impact of treatment is more or less similar to that obtained with the NAs (roughly a 24 h reduction of symptoms duration), as assessed by two randomized, double-blind, controlled trials involving healthy 12–64 years of age outpatients with acute uncomplicated influenza (Hayden *et al.*, 2018; Omoto *et al.*, 2018).
- (2) Secondly, although it was speculated that substitutions associated with resistance might be difficult to accommodate for the virus and result in a severe fitness loss, it appeared that in vitro and in vivo resistance were detected rapidly, mostly at position I38 (I38T/M/F variants) of the polymerase acidic protein of A(H3N2) viruses; other substitutions are also associated with

reduced susceptibility (Takashita *et al.*, 2019; Imai *et al.*, 2020), and this resistant virus could be readily transmitted through airborne spread (Imai *et al.*, 2020). The monitoring of the emergence of resistance (by PCR) reported resistance in 2.2% and 9.7% of baloxavir recipients in the phase two and phase three trials, respectively (Takashita *et al.*, 2019).

These clinical results and resistance patterns have been confirmed by additional observational studies; Baloxavir-Marboxyl is now licensed in Japan. It seems that the I38T substitution can emerge, be sustainable, and potentially be transmitted with a higher frequency in A(H3N2) viruses. To address this risk, in vivo studies conducted in animals and in vitro competition experiments confirmed the lack of fitness related to the I38T substitution, for A(H1N1) and for A(H3N2) viruses.

In addition, a clinical investigation showed that pre-existing resistant viruses were circulating in the community, as seen for NAI before their usage (Ferraris and Lina, 2008; McKimm-Breschkin, 2013; Takashita *et al.*, 2019; Imai *et al.*, 2020). As with NAIs, children have been reported to be more likely to develop resistance during treatment, especially during A(H3N2) infections.

As a consequence, surveillance of baloxavir-resistant I38T PA mutants in seasonal subtypes has been implemented.

Pimodivir

This third polymerase inhibitor is a non-nucleoside analog, targeting PB2 and inhibiting the docking of the cap structure in the polymerase subunit to allow RNA synthesis (Mifsud *et al.*, 2019). Because of a major difference between influenza A and B PB2 domains, Pimodivir is only active against influenza A subtypes. It allows, as with Baloxavir, a rapid decrease in virus load both in vivo and in vitro. It can be given orally, twice daily.

In a phase 2b clinical trial TOPAZ, the viral load – as measured by qRT-PCR in nasal secretions from baseline to day eight – significantly decreased in all treatment groups compared with the placebo group. A Pimodivir plus Oseltamivir combination resulted in a shorter time to symptom resolution than placebo, suggesting a synergistic effect between the two (Fig. 7) (Finberg *et al.*, 2019).

Preliminary data have been collected regarding the risk for Pimodivir resistance. Reduced antiviral activity was reported in viruses with a PB2 F363L substitution. Overall, the PB2 inhibitor gave promising results, and phase three clinical trials are testing its use as monotherapy and in combination with Oseltamivir.

Favipiravir (Avigan®)

The fourth molecule of this class is Favipiravir. It is a purine nucleoside analog that inhibits the PB1 RNA-dependent RNA polymerase (Mifsud *et al.*, 2019). It has demonstrated a large spectrum of action in vitro against influenza A and B viruses, but also against other RNA viruses including Ebola viruses (Furuta *et al.*, 2017).

Japan has approved its use to treat infection with NAI-resistant viruses. However, its use is restricted because of potential teratogenicity. No resistance has been observed so far (Hayden and Shindo, 2019).

Mechanisms of resistance have been investigated. Two substitutions located in PB1 (K229R) and in PA (P653L) have been detected in viruses resistant to Favipiravir in vitro. The K229R substitution in PB1 has a cost in viral fitness for the virus; the polymerase activity is severely impaired by this substitution. However, when compensated with the P653L substitution in PA, the viral fitness of the resistant virus is restored. This K229R substitution may induce resistance to other POL inhibitors of influenza viruses, such as ribavirin (Goldhill *et al.*, 2018).

The common feature of these polymerase inhibitors is their capacity to be associated with NAI and have a synergistic effect for the treatment of influenza. Both Baloxavir and Pimodivir have been tested in combination. Favipiravir has also been tested against influenza viruses resistant to NAI, showing good activity and demonstrating, as for the other pol inhibitors, the lack of cross-resistance with NAIs.

Drugs Under Development With Other Mechanisms of Action

HA processing blockers (Fig. 1)

Nitazoxanide is a drug that was first licensed for the treatment of parasitic diseases. It can also inhibit the replication of a relatively broad range of viruses, including influenza A and B (Beigel *et al.*, 2019; Gamiño-Arroyo *et al.*, 2019). The nitazoxanide metabolite of nitazoxanide can block the maturation process of the HA in the cell by impairing its traffic and its insertion in the cellular membrane before the virus budding. In vitro studies have shown antiviral activity at a low concentration (around 30–100 ng/mL), but the clinical trials have failed to show a clinical effect, so far.

HA attachment blockers (Fig. 1)

Fludase (DAS – 181) is a recombinant sialidase that showed potent antiviral by preventing the entry of influenza viruses in cells through sialic receptors removal from the epithelium (Beigel *et al.*, 2019). A phase two study conducted provided encouraging results. However, the antiviral effect of fludase might be limited because individuals developed antibodies against the compound during treatment (Zenilman *et al.*, 2015). This will be further investigated but, so far, no further clinical trial has been carried out.

Other HA binding inhibitors such as monoclonal antibodies targeting the globular head or the stem of the HA, and small molecules binding to the stem of the HA are in the early stages of development.

Fig. 7 Clinical impact of pimodivir and pimodivir in association with oseltamivir (Result of the TOPAZ clinical trial, see (Finberg *et al.*) Viral load over time in full analysis set, as determined by quantitative reverse transcription-polymerase chain reaction (qRT-PCR) analysis (A) and viral culture (B). The limit of quantification for the viral load assay was 4.0 $\log_{10}$ copies/mL, with a limit of detection of 3.48 $\log_{10}$ copies/mL. Results less than the limit of quantification and greater than the limit of detection ("target detected") are imputed with 3.75 $\log_{10}$ copies/mL; results less than the LOD ("target not detected") are imputed with 0 $\log_{10}$ copies/mL. Error bars are 95% confidence intervals (CIs). AUC, area under the curve; OST, oseltamivir; TCID₅₀, median tissue culture infectious dose. From Finberg, R.W., Lanno, R., Anderson, D., *et al.*, 2019. Phase 2b study of pimodivir (JNJ-63623872) as monotherapy or in combination with oseltamivir for treatment of acute uncomplicated seasonal influenza A: Topaz trial. *The Journal of Infectious Diseases* 219 (7), 1026–1034.

Perspectives at Short and Medium Term

In the context of the development of new antiviral drugs, new treatment strategies have been tested, especially during the 2009 pandemic and its aftermath. Actually, monotherapy regimens have shown their added value, but also their limits (lack of very active antiviral and clinical impact). To overcome this problem, novel antiviral strategies have been developed and tested, including host targeted molecules and combined regimens (Beigel *et al.*, 2019; McKimm-Breschkin *et al.*, 2018).

Host Target Molecules (i.e., Diltiazem)

Novel therapeutic approaches to control influenza are currently in development. As successfully proven in antiretroviral therapy (Hütter *et al.*, 2015), targeting the host instead of viral determinants may confer a broad-spectrum antiviral efficacy and a reduced risk of emergence of drug resistance (Ludwig, 2011). In that regard, DNA microarray and, more recently, RNAseq techniques – an *in-silico* assisted strategy based on transcriptional profiling and signature matching – have been developed. Based on the hypothesis that, instead of focusing on specific factors, the global host gene expression profile can be considered as a “signature” of any specific cell state, including during infection or treatment. It has been supposed that the drug-induced inhibition or reversion of the cellular transcriptomic signature of infection (“proviral status”) could establish a globally unfavorable cellular state for viral replication (“antiviral state”).

This hypothesis of signature reversion has been validated through proof-of-concept studies based on the exploitation of global virogenomic signatures of *in vitro* infections with different human and avian influenza subtypes (Josset *et al.*, 2010). Subsequently, the *in vivo* global transcriptional signatures of infection directly from paired nasal wash samples from a cohort of untreated influenza A(H1N1)pdm09-infected patients has been determined. Samples were collected during acute infection (infected) and at least three months later to ensure a recovery non-infected state (cured). Then, an *in silico* drug screening using Connectivity Map (CMAP), a Broad Institute’s publicly available database (more than 7000 drug-associated gene expression profiles obtained after treatment of cells with 1309 different FDA-approved small molecules, (Lamb, 2007)), allowed the identification of a shortlist of high-potential candidate bioactive molecules with signatures anti-correlated with those of the patient’s acute infection state. The putative antiviral properties of these “*in silico* selected” molecules were confirmed and experimentally validated in classic *in vitro* models.

The most effective compounds identified through this process were compared to the gold standard Oseltamivir for the treatment of influenza infections in mice and in an *in vitro* model of reconstituted human airway epithelium (hAE), leading to the identification of two drugs: The adrenergic receptor agonist Etilefrine (Effortil®) and a calcium channel blocker Diltiazem (Tildiem®); the latter being able to stimulate the epithelial antiviral defense during influenza A or B infection (Pizzorno *et al.*, 2019a,b). There is currently a multicenter randomized phase 2b clinical trial trying to assess the effect of this combined therapy compared to the standard of care (oseltamivir monotherapy) for the treatment of severe influenza.

This original, host-targeted, drug repurposing strategy constitutes an effective and highly reactive process for the rapid identification of novel anti-infectious drugs, with potentially major implications for the management of antimicrobial resistance and the rapid response to future epidemic or pandemic (re)emerging diseases.

Macrolides

The added value of macrolides in treating severe influenza has been discussed for some years, as a result of finding significant anti-inflammatory effects when used in adults with severe influenza. This strategy is similar to the host-targeted antiviral approach (Beigel *et al.*, 2019).

The mechanism of this anti-inflammatory/immunomodulatory effect is not fully understood, but two interesting trials conducted with Azithromycin and Clarithromycin reported a faster decline of the inflammatory markers in the Oseltamivir-Azithromycin group as compared to the Oseltamivir alone groups, and a trend toward faster symptom resolution although no differences were observed in viral RNA decline. In a second prospective study, two groups of patients received either a two-day combination of Clarithromycin 500 mg, Naproxen 200 mg, and Oseltamivir 75 mg twice daily, followed by three days of Oseltamivir, or Oseltamivir 75 mg twice daily for five days were compared (Hung *et al.*, 2017). The combination treatment was statistically associated with reduced mortality, less clinical severity, and shorter hospital stay. In addition, they also reported a reduction in the virus titers and pneumonia severity index in the combination group. This potential beneficial effect of macrolide adjunction will be further investigated.

Other Immunomodulators

Potential immunomodulators have also been tested at least in preclinical studies or suggested after limited observational studies. This includes macrolides, sirolimus, N-acetylcysteine, statins, pamidronate, nitazoxanide, chloroquine, antiC5a antibody, interferons, human mesenchymal stromal cells, mycophenolic acid, peroxisome proliferator-activated receptors agonists, non-steroidal anti-inflammatory agents, mesalazine, herbal medicine, and the role of plasmapheresis and hemoperfusion as rescue therapy (Beigel *et al.*, 2019; McKimm-Breschkin *et al.*, 2018). All these strategies deserve more investigation preferably by RCTs. Two have been tested in clinical trials, with some interesting results: macrolides (as described above) and sirolimus.

Sirolimus

In Taiwan, an open-label prospective randomized controlled trial was conducted in patients with severe H1N1 pneumonia with acute respiratory failure. Patients with confirmed H1N1 pneumonia and on mechanical ventilator support were randomized to receive – in addition to the standard of care – Oseltamivir, an adjuvant treatment of corticosteroids with an mTOR inhibitor, either with Sirolimus for 14 days or without (Jia *et al.*, 2018).

Biological and clinical monitoring showed that the outcomes were significantly better in the sirolimus group over the non-sirolimus group. The authors suggested a combination treatment with Sirolimus along with Oseltamivir as an immunomodulatory strategy for managing severe influenza.

Combined Treatments (Double, Triple)

The observed emergence of resistance in all influenza classes and the larger portfolio of anti-influenza classes are pushing the implementation of combined therapies. Most remain at the stage of preclinical, phase two, or phase three trials, but the preliminary results have already shown the limits or added values of some of the tested combinations.

NAI combinations

The potential added value of NAI combinations have been tested before, showing antagonistic effects. NAI combinations have been prohibited.

Triple therapy (amantadine, ribavirine oseltamivir)

Preliminary in vitro studies have shown a potential synergistic antiviral effect when Amantadine, Ribavirine, and Oseltamivir were combined, even with naturally resistant Oseltamivir viruses (Nguyen *et al.*, 2009). Although this treatment showed a significant decrease in viral shedding at day three as compared to the monotherapy arm in a clinical trial, no improved clinical benefit was observed (Beigel *et al.*, 2017).

Combined oseltamivir plus monoclonal antibodies

Monoclonals targeting the stalk of the HA are under development (Beigel *et al.*, 2019; McKimm-Breschkin *et al.*, 2018). Through binding at this conserved region involved in the conformational change, these antibodies inhibit the HA-mediated fusion. For example, MEDI8852 induced a high level of blockage that resulted in a significant reduction of cell-to-cell spread of the virus. A trial conducted in individuals who were 18–65 years old confirmed the decrease in viral shedding in treated subjects. A combined mAB + Oseltamivir strategy is currently being investigated in hospitalized patients (Ali *et al.*, 2018).

Combined oseltamivir plus favipiravir

This combination of recently developed antivirals has different virus targets (NA for Oseltamivir and PB1 for Favipiravir). The preclinical study conducted in a pharmacologically immunosuppressed mouse model infected with the A(H1N1) pandemic influenza virus showed that the treatment of immunosuppressed mice with high doses of Favipiravir (50 mg/kg) in combination with Oseltamivir (20 mg/kg) resulted in delayed mortality and reduced lung viral titers compared to treatment with a single drug regimen with Oseltamivir (Baz *et al.*, 2018). However, it did not prevent the emergence of Oseltamivir-resistant H275Y neuraminidase variants. Nevertheless, this regimen has been tested in a clinical trial showing interesting results and will be further investigated (Wang *et al.*, 2020).

Combined baloxavir + oseltamivir

After showing the absence of drug-drug interactions (Kawaguchi *et al.*, 2018), a preclinical study was carried out in a mice model and this treatment has been successfully tested (Hayden *et al.*, 2018).

Pimodivir and oseltamivir

This combination has been tested in a human trial (TOPAZ), as described above.

Complementary Treatments for Disease Management

Different complementary treatments demonstrated some benefit, such as passive immunotherapy with convalescent plasma and hyperimmune globulin, when administered as an adjunctive therapy for severe influenza.

On the other hand, the use of corticosteroids in severe influenza has been discussed intensively. A recently published meta-analysis showed the lack of benefit of high doses of corticosteroids (Hui *et al.*, 2018). However, short-lasting corticosteroid treatment with low doses may be beneficial. This needs further evaluation to adapt the correct dose to the clinical situation and the timing of the infection. These products should be avoided as much as possible during the anergic immune response observed during severe influenza that behaves like a severe sepsis.

ECMO (Extracorporeal Membrane Oxygenation)

ECMO has been extensively used during the 2009 pandemic when potentially reversible acute respiratory failure associated with severe influenza A (H1N1) pneumonia was observed. However, ECMO remains an expensive, resource-intensive therapy that needs trained staff with intensive care skills. Despite the value of this intervention, it has a high level of mortality. A review and

meta-analysis on the use of ECMO reported overall mortality of 37.1% with a median duration for ECMO of ten days, mechanical ventilation of 19 days, and ICU length of stay of 33 days. They concluded that ECMO therapy was associated with better survival if used very early, once the patient had been started on mechanical ventilation, as an adjunct or salvage therapy for severe H1N1 pneumonia with respiratory failure (Sukhal *et al.*, 2017).

Conclusion

There is absolutely no doubt about the crucial need for antivirals in influenza disease management. A recently published meta-analysis confirmed the added value of the currently available antivirals (neuraminidase inhibitors). These antivirals represented the standard of care for hospitalized patients, but with some limits inherent to the influenza infections (acute disease with short-lived viral shedding, capacity for the rapid development of resistance, cytokine storm responsible for some of the clinical symptoms), new classes are currently being developed against new targets to tackle some of these problems. First, polymerase inhibitors were tested and showed their synergistic effect in combination with NAIs. In addition, host-targeted strategies or immunomodulators have also been developed and tested in combination with virus-targeted antivirals. All these strategies aim to reduce the burden of influenza, but also to become an efficient first line of treatment in case of a pandemic or zoonotic influenza.

The (hopefully) successful development of all these classes of molecules will certainly be of help to reduce the burden of seasonal influenza. They will also be useful in controlling influenza infection and symptoms in frail patients or in patients admitted to the intensive care units because of severe disease. We hope that the use of new combined therapeutic strategies will show a sizeable reduction in disease duration, much better than is currently observed with mild influenza cases when treated with the limited antiviral resources currently available.

Management of Herpes Simplex Virus Infections (*Herpesviridae*)

Nicole Samies and Richard Whitley, University of Alabama at Birmingham, Birmingham, AL, United States

Brief Overview of Available Antiviral Agents for HSV Infections

Nucleoside analogs (acyclovir, valacyclovir, and famciclovir) are the drugs of choice for treatment of herpes simplex virus (HSV) infections because of their relative safety profiles. Acyclovir is an acyclic guanine analog selectively phosphorylated by viral thymidine kinase first and then by cellular enzymes to form triphosphate-acyclovir. Once triphosphate-acyclovir is formed, it inhibits the viral DNA polymerase, becomes incorporated into the viral DNA chain, and leads to chain termination. The prodrug of acyclovir, valacyclovir, is synthesized by the addition of L-valine to acyclovir. In comparison to oral acyclovir, valacyclovir's bioavailability is significantly higher at 51%–54% compared to 15%–30%. The improved bioavailability allows for less frequent dosing in comparison to oral acyclovir. The third nucleoside analog, famciclovir, is a guanine analog and prodrug of penciclovir. Famciclovir is rapidly absorbed and converted to penciclovir, and then penciclovir is phosphorylated by viral thymidine kinase into penciclovir-triphosphate. Unlike acyclovir, penciclovir has a higher affinity for thymidine kinase and does not inhibit DNA chain formation. Famciclovir is preferred over penciclovir secondary to its improved bioavailability of 77%.

In addition to nucleoside analogs, foscarnet and cidofovir can be used in the treatment of HSV infections. However because of their toxicity profiles neither is recommended as a first-line antiviral agent. Both foscarnet and cidofovir inhibit the viral DNA polymerase similar to the nucleoside analogs, but they do not require phosphorylation by viral thymidine kinase; thus, they can be used in the treatment of resistant HSV strains which have altered their thymidine kinase preventing the phosphorylation of nucleoside analogs. Foscarnet is a pyrophosphate analog that is capable of binding to a particular site on the DNA polymerase without requiring phosphorylation prior. Cidofovir is a monophosphate cytosine analog that requires phosphorylation for activation, but phosphorylation occurs through cellular kinases rather than by the viral thymidine kinase. Once phosphorylated, the diphosphate form of cidofovir inhibits the viral DNA polymerase.

Management of Infections Beyond the Neonatal Period

Orolabial Infections

Gingivostomatitis is a common presentation of primary herpes simplex virus (HSV) infection in early childhood commonly confused with herpangina or hand-foot-and mouth disease, and the diagnosis should be confirmed prior to initiating treatment. The infection can be self-limiting with oral lesions lasting about 7–10 days and fever about 3–4 days. The most common complication of the infection is dehydration requiring hospital admission for intravenous fluids secondary to poor oral intake because of the painful oral ulcerations. Although treatment is not necessary, a randomized controlled trial demonstrated a reduction in the duration of oral ulcerations, fever, poor oral intake, and viral shedding when oral acyclovir is administered within the first 72 h of symptom onset. Oral acyclovir should be preferred over intravenous acyclovir if the child is able to take medication orally. A recent study also provided recommendations for valacyclovir dosing in children greater than 3 months of age; this may be a more favorable alternative to acyclovir secondary to the convenience of administration. Bleeding of lesions is common, and reassurance should be provided to parents. Children with gingivostomatitis should be excluded from childcare or school until resolutions of symptoms because of the high risk of transmission from one child to another.

Recurrent herpes labialis infections, also commonly referred to as 'cold sores' or 'fever blisters', is a common manifestation of HSV in adolescent and adult patients. Treatment of these lesions is limited; topical treatments, including acyclovir, penciclovir, and over the counter 10% *n*-docosanol cream, are not recommended because of limited effectiveness; oral options such as acyclovir, valacyclovir, and famciclovir only have marginal benefit when taken at the initial onset of symptoms. Although oral therapies have only marginal benefit, one randomized clinical trial in adults demonstrated clinical significance in the reduction of recurrent herpes labialis lesions when oral acyclovir was prescribed for suppressive therapy. Thus, patients with at least 6 episodes of recurrent herpes labialis lesions a year may be considered for suppressive therapy for 6 months to 12 months in order to reduce the number of recurrences. Unlike gingivostomatitis, children with recurrent herpes labialis infections do not need to be excluded from school.

Other mucocutaneous infections of the upper airway caused by HSV include pharyngitis, tonsillitis, epiglottitis, supraglottitis, and laryngotracheitis, which occur in both immunocompetent and immunosuppressed patients, can be treated with oral acyclovir.

Cutaneous Infections

Herpetic whitlow can be a complication of autoinoculation from oral secretions especially in children who are thumb-suckers or nail-biters or in adults secondary to job exposure as seen with personnel in dentistry, respiratory therapists, and pediatricians. The

diagnosis of HSV should be confirmed by cultures in order to distinguish it from bacterial felon or paronychia. Treatment with oral acyclovir shows some benefit in the treatment of lesions by reduction in the duration of symptoms and viral shedding as demonstrated in a randomized controlled study that evaluated the use of acyclovir in recurrent hand lesions.

Herpes gladiatorum and herpes rugbiorum are two types of cutaneous infections seen in athletes, most notably wrestling and rugby as the names suggest. Confirmation of the diagnosis should be made prior to treatment in order to distinguish the infection from impetigo. These infections should be treated with oral acyclovir, valacyclovir, or famciclovir, and athletes should be excluded from practice and/or competition until all lesions have crusted over to prevent the spread of infection. Athletes should also be encouraged to drink plenty of fluids to stay well hydrated while on an antiviral medication due to the risk of reversible nephrotoxicity. In order to prevent the spread of HSV between athletes, coaches and family members should be educated on the appearance of herpes mucocutaneous lesions to prevent those infected from playing in close contact sports, and all mats should be cleaned before, between, and after each practice or match to reduce the risk of transmission to players. Suppressive therapy with these medications has been employed.

Patients with eczema and burns are at risk for secondary HSV infections and should be treated with antivirals to prevent further progression to disseminated infection.

Ocular Infections

Primary herpes simplex virus ocular infections include blepharitis, follicular conjunctivitis, keratoconjunctivitis, retinitis and can be caused by mucocutaneous infections (e.g., herpes labialis, gingivostomatitis) from either direct contact or nerve route transmission. Children with concerns for HSV ocular infections should be promptly evaluated by an ophthalmologist and treated to prevent further complications as HSV is the most common cause of corneal scarring and vision loss in the United States. Herpetic keratitis is the most common of all the ocular diseases caused by HSV-1 and is often self-limiting. However, treatment reduces duration of symptoms, viral shedding, and risk of corneal scarring and vision loss. The classification into one of the three main subtypes of herpetic keratitis (epithelial, stromal, and endothelial) determines management of the infection. Treatment recommendations for the epithelial subtype are to administer antiviral agents solely whereas stromal and endothelial subtypes should be treated with a combination of antiviral agents and topical corticosteroids to decrease the amount of stromal inflammation. Of note, steroids should never be used alone in treatment of ocular infections. Children should be treated with both systemic acyclovir and ophthalmic antiviral drops or ointments (e.g., 1% trifluridine or 0.15% ganciclovir). Depending on the severity of the infection, the patient may require intravenous acyclovir and then switch to oral acyclovir to complete therapy. Topical vidarabine and iododeoxyuridine were additional antiviral options previously available for use in the treatment of ocular disease, but they are no longer available in the United States. Parents and providers should be aware of the barriers in administration of topical antivirals to children (e.g., crying during administration, skipping doses, or stopping therapy prematurely) and measures should be taken to address these.

Children are at increased risk for corneal scarring and blindness with each recurrent episode. Therefore, clinicians should consider placing affected children on suppressive therapy to prevent further reactivation. Suppressive therapy poses the risk of developing resistant HSV strains; however, resistant strains are more commonly detected in immunosuppressed patients. Nonetheless, if a patient's ocular disease progresses further despite being on adequate therapy, resistance should be suspected. Foscarnet is a second-line option in treatment of ocular disease caused by herpes simplex virus and can be used for treatment of herpes simplex virus when a resistant strain is detected. Foscarnet inhibits viral DNA polymerase, which is a different mechanism of action than the nucleoside analogs (acyclovir, valacyclovir, and famciclovir) which require phosphorylation by the viral thymidine kinase – the usual site of resistance – in order to inhibit HSV replication. Foscarnet does have a significant toxicity profile, which is why it is not first line for treatment. Providers should be aware of its nephrotoxicity and provide adequate pre- and post-hydration to patients when administering the antiviral agent.

CNS Infections

Herpes encephalitis is typically caused by reactivation of HSV 1 in adults but can be a primary infection in older children and is a common cause for sporadic encephalitis. Herpes encephalitis can cause fatal complications if diagnosis and treatment are delayed. Patients must be evaluated for herpes encephalitis by cerebrospinal fluid (CSF) HSV polymerase chain reaction (PCR) and should be empirically started on intravenous acyclovir until results are confirmed. Adults and children greater than 12 years of age should receive 10 mg/kg/dose every 8 h and children 3 months to 12 years of age should receive 10–15 mg/kg/dose every 8 h. Once diagnosis is confirmed, patients should be administered intravenous acyclovir for 14–21 days. In addition, all patients diagnosed with herpes encephalitis should have head magnetic resonance imaging (MRI) performed to determine areas of the brain affected and evaluate for a possible infarction; close monitoring of renal function as well as for signs of increased intracranial pressure are essential. Other considerations in the management of patients may be the need for anti-seizure medications and possibly mechanical ventilation. The introduction of intravenous acyclovir for treatment of herpes encephalitis has dramatically improved patient outcomes regarding the reduction in the mortality. Unfortunately, morbidity continues to remain high as a result of neurologic impairment. Even with early diagnosis and initiation of intravenous acyclovir, only about 40%–55% of patients are capable of returning fully to their activities of daily living without the need for assistance. Suppressive therapy following the 14 to

21-day treatment course is not recommended as a randomized controlled trial demonstrated that 3 months of suppressive therapy with valacyclovir did not improve neurological outcomes as clinically seen in neonates following 6 months of suppressive therapy. The study was terminated at an interim analysis due to clear lack of evidence of clinical benefit.

Unlike herpetic encephalitis, Mollaret meningitis, a type of aseptic meningitis caused primarily by recurrent HSV-2 orolabial or genital infections, does not require antiviral therapy as it is usually self-limiting. Differentiation between the diagnoses can be made through the presence of degenerated monocytes in cerebrospinal fluid, which is a diagnostic clue for Mollaret meningitis, and recurrence of orolabial or genital lesions.

Genital Herpes

Genital herpes can be acquired through genital-genital, oral-genital, or genital-anal contact with a partner who either has active lesions at time of contact or is asymptotically shedding virus. Most patients are unaware of their diagnosis allowing for transmission of the virus when patients are asymptotically shedding the virus. All lesions concerning for HSV should be swabbed and sent for polymerase chain reaction (PCR) testing to confirm the diagnosis. The lesions should also be typed for either HSV-1 or HSV-2 because virus type predicts the frequency of recurrences. Infection caused by HSV-1 is significantly less likely to recur. Serologic testing on each patient should be considered in order to determine if the infection is primary (patient has no antibodies to either type of HSV), first-episode non-primary (patient has antibodies to HSV type 1 or type 2 and newly acquires the other type), or recurrent to provide appropriate counseling in regards to natural history of the infection and risk of recurrence. All patients should be screened for other sexually transmitted infections, particularly human immunodeficiency virus (HIV), as herpes simplex virus is a known risk factor for the transmission of HIV.

Treatment of genital infections includes treatment for a primary infection, episodic treatment for recurrent infections, and daily suppressive therapy for prevention of recurrent infections and reduction in subclinical viral shedding. First-line antivirals used in the treatment of genital herpes are nucleoside analogs: acyclovir, valacyclovir, and famciclovir. All three nucleoside analogs have the same efficacy, and patients may prefer one over the other depending on convenience of administration and cost. Oral therapy (or IV if severe infections) is preferred over topical therapy as it is more effective in promptly alleviating symptoms, reducing time to healing, and reducing time of viral shedding if started within 24–72 h of symptom onset. A primary (initial) infection should be treated with antiviral drugs for 7–10 days or longer if lesions are not completely healed. The most convenient antiviral prescribed for treatment of genital lesions is valacyclovir as it only requires daily dosing (Table 1). This is because of the increased bioavailability of valacyclovir when compared to oral acyclovir. However, despite convenience in administration, valacyclovir is more costly than acyclovir, and therefore, may be a contributing factor when determining which antiviral to prescribe. In addition to antiviral therapy, patients may try analgesics and warm sitz baths to aid in alleviation of symptoms.

Once patients have completed treatment for their primary infection, the decision on whether to treat each symptomatic recurrence (episodic treatment) or to be placed on suppressive therapy is dependent on each patient's preference. Episodic treatment is typically a 5-day course started at the first sign of symptoms to treat current reactivation, whereas suppressive therapy is a daily medication regimen prescribed to prevent recurrences and reduce the duration of asymptomatic viral shedding (Table 1). Shorter course therapy has been shown efficacious but may be associated with gastrointestinal upset. As noted above, patients should be aware that lesions secondary to HSV-1 have fewer symptomatic recurrences and this may also aid in decision making. Suppressive therapy does appear to be of benefit to patients and their sexual partners by reducing number of symptomatic occurrences by approximately 80% and subclinical shedding, thus, improving their quality of life. One study by Gupta *et al.* in 2004 demonstrated the decrease in recurrences and subclinical shedding in participants on acyclovir or valacyclovir in comparison to no treatment (placebo). Although the study did show a reduction in subclinical shedding, patients should be aware that despite taking a daily medication, there is still a risk of asymptotically shedding the virus and, ergo, transmitting infection. On the other hand, episodic therapy may be preferred by some patients as they are not required to remember to take a daily medication. If a patient chooses episodic treatment, they should be provided with a supply of antiviral drugs in order to start the medication at the earliest onset of prodromal symptoms in order to be the most effective. Resistance to nucleoside analogs is uncommon despite the use of suppressive therapy over long term and is mainly a concern in immunocompromised hosts.

Counseling patients on their new diagnosis is as important as prescribing antiviral therapy secondary to the stigma associated with infection and the psychological effects patients experience afterwards. Many patients experience guilt, anger, low self-esteem, and fear of transmitting to the virus to their partner or future child. Counseling should include discussion on preventing transmission of the virus to sexual partners during times of prodromal symptoms or active lesions and even when asymptomatic secondary to subclinical viral shedding. In order to reduce transmission of the virus, patients should consider refraining from sexual activity during times of active lesions, using condoms to prevent transmission, and taking daily antiviral therapy for suppression. Although these practices can reduce the risk of transmission, patients should be aware that none of these measures are completely effective at preventing transmission. Little is known about the use of antivirals for pre-exposure and post-exposure prophylaxis for a seronegative partner; therefore, it is not currently recommended. Patients of long-term relationships should be offered the opportunity to have their partner participate in the counseling session in order to also educate the partner on the disease and ways to prevent transmission. The counseling session should also discuss the ubiquitous nature of the virus in the United States and that acquisition of the virus could have occurred years prior and not be a result of infidelity.

Table 1 Treatment options for genital herpes

<i>Lesion type</i>	<i>Treatment recommendations</i>	<i>Notes</i>
Primary lesion	Oral acyclovir: 400 mg 3 times a day for 7–10 days OR 200 mg 5 times a day for 7–10 days Valacyclovir: 1000 mg 2 times a day for 7–10 days Famciclovir: 250 mg 3 times a day for 7–10 days	Treatment duration may be extended past 10 days if lesions are incompletely healed
Recurrent lesion		
Episodic therapy	Oral acyclovir: 400 mg 3 times a day for 5 days OR 800 mg 2 times a day for 5 days OR 800 mg 3 times a day for 2 days Valacyclovir: 500 mg 2 times a day for 3 days OR 1000 mg 1 time a day for 5 days Famciclovir: 125 mg 2 times a day for 5 days OR 1000 mg every 12 h for 2 doses OR 500 mg for 1 dose then 250 mg for 2 days	
Suppressive therapy	Oral acyclovir: 400 mg 2 times a day Valacyclovir: 500 mg 1 time a day OR 1000 mg 1 time a day Famciclovir: 250 mg 2 times a day	
Pregnancy	Oral acyclovir: 400 mg 3 times a day Valacyclovir: 500 mg 2 times a day	Should begin at 36 weeks gestation

Note: Workowski K.A., Bolan G.A., 2015. Sexually transmitted diseases treatment guidelines. Morbidity and Mortality Weekly Report: Recommendations and Reports 64 (RR-03), 1–137.

Due to the increased risk of vertical transmission of HSV from mother to infant, all pregnant females with a history of genital lesions should be advised to take acyclovir or valacyclovir around 36 weeks gestation, if not already on suppressive therapy, to decrease the risk of developing active lesions at time of delivery. Antiviral suppressive therapy can decrease the probability of active lesions at the time of delivery and therefore, prevent the need for cesarean delivery but it does not completely prevent subclinical viral shedding. Women should be advised that infants are still at risk of perinatal transmission. The American College of Obstetricians and Gynecologists has recommended cesarean delivery for any woman presenting with active genital lesions or prodromal symptoms (burning, tingling, and/or itching in genital area) at time of delivery whether these lesions represent a new primary infection, non-primary first episode infection, or a reactivation. A prospective cohort study demonstrated cesarean delivery at time of active genital lesions greatly reduced transmission of herpes simplex virus from mother to infant, but it did not completely prevent the development of neonatal herpes infection in neonates. Other factors such as duration of rupture of membranes, application of fetal-scalp electrodes, and subclinical shedding contribute to the risk of transmission. Currently the risk of performing cesarean sections in all women with a previous history of genital herpes outweighs the benefit, and thus, cesareans are not recommended unless there are active lesions or prodromal symptoms indicating a reactivation at time of delivery. Also, screening all pregnant women for HSV serologic status is not recommended. Thus, women who are presumed seronegative during pregnancy but are in a relationship with a known seropositive spouse should refrain from sexual contact during their third trimester to prevent acquisition of the virus in order to decrease risk of transmission to their newborn.

Neonatal Herpes Simplex Virus Infection

Early recognition and prompt initiation of antiviral therapy in infants has prevented further disease progression and significantly improved morbidity and mortality. Therefore, any neonate presenting with concerns for neonatal HSV infection should undergo a complete evaluation. The evaluation includes performing culture and PCR on any concerning mucocutaneous lesion, obtaining mucous membrane culture and PCR of eye, nasopharynx, mouth, and rectum, obtaining blood HSV PCR and serum alanine aminotransferase (ALT), and performing a lumbar puncture to evaluate cerebrospinal fluid (CSF) for HSV with PCR. Both the use of culture and PCR are currently recommended for the detection of HSV DNA in mucocutaneous lesions and the eye, nasopharynx, mouth, and rectum as the superiority of PCR has not yet been established in the detection of HSV DNA from these sites in

neonates. However, PCR is quickly replacing viral cultures in many laboratories due to the costs related to performing viral cultures, the known increased sensitivity of PCR in the diagnosis of HSV DNA in genital lesions, and the quicker turn around time (24 h for PCR vs 2-5 days for culture). Once the full evaluation has been completed, all infants should be empirically started on intravenous acyclovir pending results of all the viral HSV studies. Diagnostic results will provide the information needed to classify the infant into a subtype, which will then determine the duration of treatment. The three subtypes of neonatal HSV infection are: skin, eye, and mouth (SEM), central nervous system (CNS), and disseminated disease.

Once the diagnosis has been confirmed, all infants regardless of their disease classification should have an ophthalmologic exam and neuroimaging. Infants diagnosed with skin, eye, and mouth (SEM) disease should receive 14 days of intravenous therapy, and those with CNS or disseminated disease should receive a minimum of 21 days of intravenous acyclovir. Treatment was extended to 21 days in infants with CNS and disseminated disease secondary to a large proportion (40%) of infants continuing to detect HSV DNA in the CSF by PCR after 14 days of therapy with intravenous acyclovir. Any infant with CNS involvement requires a repeat lumbar puncture prior to completion of 21 days to determine if the evidence of virus, namely viral DNA, has been cleared from the CSF. If the HSV PCR remains positive near completion of 21 days, intravenous acyclovir should be continued for an additional week in the infant and another lumbar puncture will need to be repeated at the end of the week to reassess for clearance of the virus. Intravenous acyclovir should be continued until the HSV cerebrospinal fluid PCR is negative. Infants that require longer than 21 days of intravenous acyclovir have been shown to have worse outcomes. While on intravenous acyclovir, complete blood cell counts should also be obtained twice a week and renal function closely monitored to evaluate for any signs of neutropenia or renal toxicity respectively. If infants develop severe neutropenia (<500 cells/ μL) during the treatment course with intravenous acyclovir, the acyclovir dose can be decreased or granulocyte colony-stimulating factor (G-CSF) can be administered if the absolute neutrophil count remains low despite a reduction in the dose.

Dosing recommendations for intravenous acyclovir have been derived from studies performed by the National Institute of Allergy and Infectious Disease (NIAID) Collaborative Antiviral Study over the last 30 years. Acyclovir quickly came into favor in the treatment of neonatal HSV infection because of the ease in administration and less toxic side effects. Initially low dose acyclovir when studied in comparison to vidarabine did not show therapeutic superiority. Later studies demonstrated improved outcomes when high a dose of intravenous acyclovir was used during treatment. Currently acyclovir is in the only nucleoside antiviral agent approved in the use of neonates as further studies are pending on the pharmacokinetics and safety of valacyclovir in neonates.

Suppressive therapy with oral acyclovir should be administered after the completion of either the 14- or 21-day treatment course of intravenous acyclovir for a total of 6 months. Suppressive therapy, when given over a 6-month period, has demonstrated a reduction in the number of cutaneous recurrences and improved developmental outcomes in neonates. Infants should be closely monitored for neutropenia during the 6 month course with a complete blood cell counts at the 2nd and 4th week of administration and then monthly thereafter. If the patient develops severe neutropenia (<500 cells/ μL), prescribers should consider holding the patient's acyclovir while waiting for recovery of the patient's absolute neutrophil count. The suppressive dose should be adjusted monthly to account for the patient's rapid growth. Although suppressive therapy has improved outcomes for neonates, neurologic impairment in infants diagnosed with encephalitis continues to remain high.

Measures to prevent the transmission of HSV to infant include: cesarean delivery in those with active genital lesions limiting the use of fetal scalp electrodes, and preventing exposure to oral secretions in persons with an active cold sore or a younger child with gingivostomatitis. A guidance statement by the American Academy of Pediatrics also recognizes the risk of infants developing HSV disease when born to mothers with active genital lesions at time of delivery and provides recommendations on managing these infants in attempt to diagnose infants with HSV disease early before disease progression occurs. Any genital lesion concerning for HSV should be evaluated and, if positive, typed for HSV-1 or HSV-2. Serologic testing should then be performed on the mother because determination of a mother's serologic status is imperative in determining the risk of transmission to an infant. A mother with a first-episode primary infection (no antibodies to HSV-1 or HSV-2) is a greater risk of transmitting HSV to their infant than a mother with a first-episode non-primary infection (mother has antibodies to HSV type 1 or type 2 and newly acquires the other type) and recurrent infection (reactivation of virus mother already has antibodies to).

All infants born to a mother with an active genital lesion should have a mucous membrane culture and PCR obtained from conjunctiva, nasopharynx, mouth, and rectum and blood HSV PCR performed at 24 h of life. The 24 h of lifetime point is chosen to avoid possible transient maternal contamination. If the infant is born to a mother with known history of genital herpes and the infant remains asymptomatic after birth, acyclovir can be held, and the infant can be discharged as early as 48 h of life as long as all HSV testing remains negative, infant has available access to medical care, and parents receive education on the signs and symptoms of neonatal HSV disease to monitor for. If these criteria cannot be met, the infant should remain hospitalized until culture is confirmed negative or is negative at 96 h, whichever is first. However, if any HSV test returns positive, the infants should undergo further evaluation with lumbar puncture to assess for central nervous system involvement and serum ALT to assess for systemic involvement. If the additional testing is negative, the infant should receive 10 days of empiric treatment with intravenous acyclovir. However, if the results return abnormal, the infant should be treated with intravenous acyclovir for either 14 or 21 days depending on classification.

If the infant's mother has no prior history of genital herpes and presents with active lesions at time of delivery, serologic testing on the mother is extremely helpful in determining infant's risk as mentioned above. In addition to mucous membrane culture and PCR, the infant should also have a lumbar puncture and serum ATL performed. Intravenous acyclovir should also be initiated. If mother's genital lesion is confirmed to be primary or non-primary infection, and the infant's testing is all negative, the infant should be empirically treated for 10 days with intravenous acyclovir. If the testing is abnormal, the infant should be classified into SEM, CNS, or

disseminated disease and treated accordingly. If mother's genital lesion is confirmed to be a reactivation, and all HSV testing on the neonate is negative, the infant can be discharged home with parents after they receive education on monitoring for signs and symptoms of neonatal HSV to monitor for. However, if the surface cultures or HSV blood PCR return positive, but the CSF HSV PCR and ALT are negative, the infant should be continued on IV acyclovir for a total of 10 days. If the CSF HSV PCR and/or ALT are abnormal, the infant should be treated based on classification of neonatal HSV disease for a total of 14–21 days.

Immunocompromised Hosts

Oral or intravenous acyclovir as well as valacyclovir and famciclovir remain treatments of choice for management of HSV infections in immunocompromised hosts, depending upon severity of infection, risk of dissemination, and degree of immunosuppression. However, immunocompromised patients are known to have a high rate of resistant HSV strains to acyclovir and other nucleoside analogs (valacyclovir, famciclovir) because of their similar mechanism of action when compared to immunocompetent hosts. Thus, other antiviral agents (foscarnet or cidofovir) besides nucleoside analogs should be considered for treatment in these patients if disease progresses despite adequate antiviral therapy. Resistance generally emerges after long-term administration of the antiviral. Resistance can be overcome at times with using higher than the typical recommended doses of acyclovir. However, when resistance cannot be overcome, cidofovir and foscarnet are alternative therapeutic options. These antivirals do not require phosphorylation in order to be active as with nucleoside analogs, and therefore, they are effective alternatives in treating HSV resistant strains. Both cidofovir and foscarnet have significant toxic side effects, limiting their recommendation to a second line treatment alternative.

Immunoprophylaxis

Several different vaccines have been studied for effectiveness in both therapeutic and prophylactic trials of HSV-1 and 2, but to date, no vaccine has demonstrated significant efficacy. There are currently several other vaccines contenders being evaluated, but these have not yet been studied in clinical trials.

Nomenclature

aa	Amino acid	IgG	Immunoglobulin G
ABS	Adenine triphosphate-binding site	IgM	Immunoglobulin M
bp	Base pair(s)	MMR	Measles-mumps-rubella
BVDU	(E)-5-(2-bromovinyl)-2'-deoxyuridine	MMRV	Measles-mumps-rubella-varicella
CNS	Central nervous system	NBS	Nucleoside-binding site
DNA pol	Deoxyribonucleic acid polymerase	pOka	Parental Oka
EC ₅₀	50% effective concentration	PZN	Post zoster neuralgia
EDTA	Ethylene diamine tetraacetate	RNA	Ribonucleic acid
ELISA	Enzyme-linked immunosorbent assay	s.c.	Subcutaneous(ly)
FAMA	Fluorescence antibody membrane antigen test	STIKO	Standing Vaccine Commission of the Robert Koch Institute, Germany
gE	Glycoprotein E	TK	Thymidine kinase
HIV	Human immunodeficiency virus	TK-	Thymidine kinase negative
HSV-1	Herpes simplex virus type 1	TKa	Thymidine kinase altered
HSV-2	Herpes simplex virus type 2	TKr	Thymidine kinase reduced
i.m.	Intramuscular(ly)	UL28	Unique long 28
i.v.	Intravenous(ly)	UL36	Unique long 36
IFAT	Indirect immunofluorescence test	VZIG	Varicella-zoster immunoglobulin
IgA	Immunoglobulin A	VZV	Varicella-zoster virus

Glossary

Congenital varicella This syndrome may occur in the newborn after maternal chickenpox between the 5th and 24th weeks of gestation. As a consequence of intrauterine VZV infection, the characteristic clinical findings consist of dermatomal skin lesions, neurological defects, eye diseases, and/or limb hypoplasia.

Post zoster neuralgia Pain lasting longer than 4 weeks and occurring again after pain-free interval, caused by an irreversible necrosis of ganglion cells.

UL28 VZV gene 28 localized in the unique long gene region.

UL36 VZV gene 36 localized in the unique long gene region.

UN 3373 Label for shipping category B biological substances; category B includes most known microorganisms.

Laboratory Diagnosis

Submission of Samples

Varicella-zoster virus (VZV)-positive samples are considered as category B, risk group 2 dangerous goods and dispatched in accordance with UN 3373. For this purpose, the primary container with the patient's sample must be shipped with an overpack of adsorbent material in a transportable box. Shipment is possible at room temperature. Cooling is recommended only if the samples are intended for virus isolation in cell culture.

Direct Detection of Virus

Acute VZV infection is diagnosed by detection of the virus ([Table 1](#)). The method of choice is polymerase chain reaction (PCR) to detect viral genomes in vesicle fluid or swabs. Depending on the clinical manifestations, additional samples such as cerebrospinal fluid (CSF), tissue, bronchoalveolar lavage, ethylene diamine tetraacetate (EDTA) blood, amniotic fluid, aqueous humor, pharyngeal secretion, saliva or tear fluid are collected. PCR is used to examine CSF in acute infections of the central nervous system (CNS) and amniotic fluid in prenatal diagnostics after varicella during pregnancy. In immunosuppressed patients with zoster, the detection of VZV DNA in the blood may be helpful in assessing the potential risk of disseminating infection. In addition, virus isolation from vesicle contents or swabs can be used. However, isolation of VZV is only possible in a few cell types such as human embryonic fibroblasts ([Fig. 1](#)). Furthermore, this procedure is time-consuming, requires a high degree of experience and has no

Table 1 Overview of methods for direct detection of VZV or VZV DNA

<i>Principle</i>	<i>Method</i>	<i>Patient samples</i>
Detection of viral DNA	Polymerase chain reaction (PCR)	Vesicle content/swab, in 1 ml physiological saline or viral transport medium Cerebrospinal fluid, tissue, bronchoalveolar lavage, EDTA blood, amniotic fluid, aqueous humor, pharyngeal secretion, saliva, tear fluid
Viral isolation	Viral growth in cell culture, detection by monoclonal antibody	Vesicle content in viral transport medium with special swab, tissue, bronchoalveolar lavage; transport under cooling (2–8°C)
Virus antigen detection	Immunofluorescence test using monoclonal antibody Reduced sensitivity and specificity	Cell-rich vesicle content in viral transport medium with special swab, tissue
Discrimination between wild-type/vaccine strains, genotyping	PCR, Restriction fragment length polymorphism analysis, sequencing	Vesicle content in viral transport medium with special swab, tissue, cerebrospinal fluid, viral isolate

**Fig. 1** VZV-induced cytopathic effect in human embryonic lung fibroblasts.

clinically relevant sensitivity. In most cases, only vesicle fluid with a high viral load is suitable for virus isolation. For successful virus isolation, early and careful sampling and optimal transport of the sample are essential.

Viral isolates are characterized by immunofluorescence with monoclonal fluorescence-labeled antibodies. The direct qualitative detection of VZV antigens in vesicle content or swabs using commercial detection systems can provide results within a few hours but is characterized by reduced sensitivity and specificity. When interpreting the results, it should be noted that methods for the direct detection of VZV including nucleic acids or antigens do not distinguish between primary and recurrent VZV infections. The distinction between wild-type VZV and vaccine strains can be made by restriction fragment length polymorphism analysis or sequencing (genotyping).

Detection of Antibodies

VZV antibody detection (**Table 2**) is especially indicated when susceptible persons have to be identified to offer protection with active or passive immunoprophylaxis. Past VZV infection is diagnosed by detecting VZV IgG in serum or plasma, and positive VZV IgG indicates immunity. Due to high seroconversion rates, the determination of antibody status after varicella vaccination is not necessary for healthy children, adolescents and adults. In contrast, immune status control is recommended in immunodeficient individuals and healthcare workers after vaccination. In daily laboratory practice, ligand assays or partially immunofluorescence tests to detect VZV-specific IgG are common. Regardless of the test used, any result interpreted as VZV IgG-positive by that laboratory can be used as a criterion for immunity against varicella. Persons with indeterminate VZV IgG results are classified as “non-immune”. Commercial test kits differ in sensitivity so that very low antibody titers are not detected. Therefore, highly sensitive tests such as special glycoprotein enzyme-linked immunoassays (ELISA) or the fluorescence antibody membrane antigen test (FAMA) should be used to determine the immune status especially after varicella vaccination and for vaccine studies.

Primary VZV infection (varicella) can normally be diagnosed by determining VZV IgG seroconversion in serum or plasma. This requires the availability of sequentially collected samples where the initial result is VZV IgG-negative. The earliest VZV IgM can be detected from the fourth day after the onset of the disease, usually in combination with VZV IgG. Even though VZV IgM can be used in practice to confirm an active VZV infection, it should be noted that IgM antibody detection will be considerably delayed after the onset of varicella exanthema and is only possible in a maximum of 50%–60% of patients with zoster. Thus,

Table 2 Overview of methods for determination of VZV-specific antibodies

Method	Remarks
Ligand assays (ELISA, chemiluminescence immune assay etc.)	Determination and differentiation of Ig classes (IgG, IgM, IgA) in serum, plasma and cerebrospinal fluid, based on whole viral antigen of VZV-infected cell cultures or viral glycoproteins Simple performance, commercially available, automated
Indirect fluorescence antibody test (IFAT)	Determination and differentiation of Ig classes (IgG, IgM, IgA) in serum, plasma and cerebrospinal fluid Simple performance, commercially available, requires experience for evaluation
Fluorescence antibody membrane antigen test (FAMA)	Determination of antibodies against VZV glycoproteins in serum, reference test for determination of immunity
VZV IgG avidity (ELISA or IFAT)	Differentiation between primary infection (varicella) and recurrent infection after virus reactivation (generalized zoster)
Neutralization test	Determination of antibodies against VZV glycoproteins in serum, good correlation with FAMA

this marker is unreliable and unable to distinguish between a primary and a recurrent VZV infection. In addition, numerous commercial VZV IgM immunoassays show reduced sensitivity and may show false-positive results due to cross-reactions with other herpes viruses, especially herpes simplex virus (HSV). VZV IgA can often be determined in latently VZV-infected individuals, but high titer values correlate exclusively with zoster disease. In the case of VZV infection with involvement of CNS, the earliest increase in intrathecal antibody index (cerebrospinal fluid and serum from the same day of collection) can be detected around 10–12 days after symptom onset. Therefore, determining intrathecal VZV-specific IgG is only suitable for the retrospective diagnosis of VZV-associated CNS infections. The determination of VZV IgG avidity allows the differentiation between primary (varicella) and recurrent infections (zoster). However, there has been little experience with this test procedure so far. In principle, serological findings in immunodeficient patients are not reliable and should therefore be interpreted with caution. Despite acute or past infection, antibody findings in these individuals may also be negative.

Antiviral Treatment

Antiviral Agents in Clinical Use

The administration of antiviral agents may successfully block replication of VZV in infected cells. Early administration, especially in zoster within 72 h after onset of exanthema, can reduce tissue damage and thus diminish or even prevent the destruction of affected ganglion cells. The acyclic nucleoside analogs acyclovir including its prodrug valaciclovir, famciclovir (prodrug of penciclovir) and the cyclic nucleoside analog brivudine ((E)-5-(2-bromovinyl)-2'-deoxyuridine, BVDU) are available for the antiviral treatment of VZV infections (Table 3). The specificity of antiviral activity is based on the phosphorylation by the viral thymidine kinase (TK) to their mono- (acyclovir, penciclovir) or diphosphates (brivudine) while cellular enzymes catalyze the further phosphorylation steps to triphosphate. The activity spectrum is defined by the presence of the key enzyme, the viral TK. The triphosphates of the nucleoside analogs inhibit and fix the viral DNA polymerases (pol) and are incorporated into the growing DNA chain as a “false” substrate. In acyclovir/valaciclovir, this leads to chain termination due to the absence of the hydroxy group in the 3' position, which is essential for further linkage. In other nucleoside analogous compounds, their incorporation into DNA is possible.

Acyclovir

Acyclovir is used as the first-line antiviral drug to treat VZV infections. However, a disadvantage is that acyclovir has a low oral bioavailability of about 15%–30%. Varicella in high-risk patients and zoster disease in immunocompetent patients can be treated orally. In severe VZV infections, especially in immunocompromised patients, acyclovir must be administered intravenously (i.v.). Acyclovir is not officially licensed as antiviral therapy during pregnancy, and administration should be especially avoided in pregnant women before the end of the 14th gestational week. However, results from the manufacturer's pregnancy registries and a Danish population-based retrospective cohort study have not shown an increased rate of major birth defects after oral administration of acyclovir and its topical use. Nevertheless, patients should be informed about the limited data, especially during early pregnancy, and give consent before the drug is used. After i.v. administration of acyclovir, CNS side effects have occasionally been observed, while oral medication may be associated with gastrointestinal side effects. Drugs that can cause renal toxicity should not be combined with acyclovir at the same time. Laboratory kidney and liver parameters must be monitored. If kidney function is impaired, the dose of acyclovir must be reduced.

Valaciclovir

Valaciclovir is the L-valyl ester prodrug of acyclovir. After oral administration, valaciclovir is converted into acyclovir by a hepatic enzyme, valaciclovir hydrolase. Since the oral bioavailability of valaciclovir is 54%, the considerably higher acyclovir concentrations compared with oral acyclovir result in longer dosing intervals and higher compliance. Valaciclovir is approved for the

Table 3 Antiviral drugs against VZV in clinical use

Antiviral drug	Administration	Indication and dosage
Acyclovir	intravenously	Severe and disseminated VZV infections, zoster under immunosuppression; adults: $3 \times 5\text{--}10$ mg/kg body weight per day for 7–10 days, children: 3×500 mg/m ² body surface per day for 7–10 days
	orally	Zoster, varicella in risk patients; adults: 5×800 mg per day over 7 days, children: 5×15 mg/kg body weight per day (max. 4000 mg/day) for 7 days
Valaciclovir ^a	orally	Zoster; immunocompetent adults and adults with mild or moderate immunosuppression: 3×1000 mg per day for 7 days
Famciclovir ^b	orally	Zoster; immunocompetent adults: 3×250 mg per day for 7 days, immunodeficient adults or adults with zoster ophthalmicus: 3×500 mg per day for 7–10 days
Brivudine	orally	Zoster; immunocompetent adults: 1×125 mg per day for 7 days
Foscarnet	intravenously	VZV infections caused by TK-negative (acyclovir-resistant) VZV strains; adults: 3×40 mg/kg body weight per day for 10 (max. 20) days, children (off label use): 3×60 mg per kg body weight per day for 10 (max. 20) days

^aProdrug of acyclovir.^bProdrug of penciclovir.

antiviral treatment of zoster in immunocompetent adults and adults with mild or moderate immunosuppression. The drug is not approved for the antiviral treatment of VZV infections in childhood and adolescence. Valaciclovir is also not licensed in pregnant women. Although available data are reassuring as to the safety of valaciclovir in pregnancy, there is substantially less experience than with acyclovir. Possible side effects are comparable to those after taking acyclovir.

Famciclovir

Famciclovir is the inactive diacetyl ester prodrug of penciclovir, which results from the separation of two ester groups in the small intestine and liver. Penciclovir is an acyclic nucleoside analog derived from ganciclovir by replacement of the ether oxygen atom in the acyclic side chain by a methyl bridge. The oral absorption of penciclovir is very low. Therefore, this drug is only used for the antiviral treatment of local HSV infections. After oral administration, famciclovir has a bioavailability of 77%. Compared to acyclovir, the higher stability of penciclovir triphosphate might result in prolonged antiviral efficacy. Famciclovir is used to treat zoster in immunocompetent adults and immunocompromised patients from 25 years of age. As with valaciclovir, famciclovir is not approved in childhood, adolescence and pregnancy because of limited information on safety. In rare cases, famciclovir may cause headache, mental confusion and nausea.

Foscarnet (trisodium phosphonoformate)

The pyrophosphate analog foscarnet inhibits the viral DNA pol of numerous DNA and RNA viruses by preventing pyrophosphate exchange. Since foscarnet does not need to be metabolized for its antiviral activity, it is also effective against TK-negative VZV strains that are resistant to nucleoside analogs. For this reason, foscarnet is recommended as an alternative antiviral treatment if clinical resistance to acyclovir is suspected.

Brivudine ((E)-5-(2-bromovinyl)-2'-deoxyuridine)

The cyclic nucleoside analog brivudine is converted by viral TK into its mono- and diphosphate. Brivudine is administered orally and has a bioavailability of about 40%. It may be used to treat zoster in immunocompetent adults. Since the safety profile is not known due to a lack of studies, brivudine is not approved for antiviral therapy in children and adolescents. Therefore, the risk-benefit ratio should be carefully assessed before the substance is used in younger age groups, and parents must be informed (off-label use). In principle, brivudine is well tolerated. Nevertheless, gastrointestinal disturbances, impairment of kidney function, an increase in liver enzyme values and reversible changes in blood count may occur. Simultaneous administration of 5-fluorouracil or other 5-fluoropyrimidines leads to increased and potentially dangerous toxicity leading to deaths that have been reported in the past.

Development of Resistance

Varicella-zoster virus resistance to antiviral drugs such as acyclovir or foscarnet is rare and has been described in the literature only in immunocompromised patients with zoster, e.g., acquired immunodeficiency syndrome or immunosuppression by cancer or transplantation. The disturbed immune response and the long-term administration of antiviral drugs given as treatment or chemoprophylaxis are key for the development of resistance. The weakened immune response leads to prolonged virus replication, and resistant virus mutants can occur more frequently due to an increased number of natural spontaneous mutations. Under antiviral treatment, resistant viruses are selected and cannot be eliminated by the impaired immune response. In general, resistance is associated with non-synonymous mutations located in the gene of the target molecule or in the gene of proteins responsible for the metabolism or efficacy of antiviral agents. For acyclovir and its nucleoside analogs, resistance is based almost exclusively on non-synonymous mutations of the TK gene (*UL36*) and rarely on amino acid (aa) changes in the DNA pol gene (*UL28*), mostly associated with resistance to foscarnet. In contrast to TK, which is not required for the replication of VZV, the DNA pol is an essential enzyme within the viral replication cycle. According to current knowledge, VZV strains that are resistant to acyclovir due

VZV thymidine kinase

VZV DNA polymerase

Fig. 2 VZV thymidine kinase (above) and DNA polymerase (below) with functional domains (gray boxes; ABS: ATP-binding site; NBS: Nucleoside-binding site) and conserved regions (black boxes). In the gray boxes above or below the corresponding protein, the confirmed amino acid substitutions from the literature related to the natural gene polymorphism (NP) or resistance (RES) to acyclovir (thymidine kinase) as well as acyclovir, foscarnet and cidofovir, respectively, (DNA polymerase) are summarized.

to mutations in the TK gene are always cross-resistant to famciclovir and brivudine. To date, there are only a few studies in the literature in which the significance of TK and DNA pol mutations has been proven by phenotypic findings.

Thymidine kinase gene

The VZV TK gene is 1026 bp in size and encodes 342 aa (Fig. 2). This gene contains two functional domains, a nucleotide (adenosine triphosphate)-binding site (aa 12–29) and a nucleoside (substrate)-binding site (aa 129–145), and three further conserved regions. Unlike the TK of HSV-1 and HSV-2, few natural polymorphisms have been identified in the VZV TK, but it is important to distinguish each of them from resistance mutations. Compared to the frequently used reference VZV strain Dumas (GenBank accession No. X04370.1, clade 1), all European VZV wild-type strains include the aa polymorphism Serine288Leucine.

Similar to HSV, the resistance mutations of the VZV TK gene are assigned to three phenotypes:

- (1) TK negative (TK⁻, no TK activity detectable, occurs most frequently).
- (2) TK reduced (TK^r, reduced TK activity, 1%–15% of normal activity).
- (3) TK altered (TK^a, altered TK substrate specificity, no phosphorylation of acyclovir and other nucleoside analogs).

Resistance to acyclovir may be caused by stop codons, frameshifts (deletions or insertions) or aa substitutions within and outside conserved gene regions. Since only a few validated resistance mutations have been reported in the literature, new or unknown mutations must always be expected in the genotypic analysis of clinically or phenotypically resistant VZV strains.

DNA polymerase gene

The VZV DNA pol gene is 3585 bp in size and encodes 1195 aa (Fig. 2). There are eight conserved regions with the designations I to VII and A. Similar to the TK gene, only a few natural polymorphisms have been reported for the DNA pol. Resistance-related aa substitutions are mostly localized in conserved gene centers. So far, little research has been carried out on natural polymorphisms and resistance-related mutations of the VZV DNA pol gene.

Resistance Testing

Antiviral therapy failure is assumed for VZV infections if no clinical improvement can be observed within 10–21 days after starting antiviral drugs, usually acyclovir. This means that there is reason to believe that they are resistant virus strains. In these cases, alternative antiviral treatment with foscarnet is indicated. In parallel, genotypic resistance tests of viral TK and possibly DNA pol should be carried out and, if a virus isolate can be detected in the cell culture, phenotypic resistance tests should also be performed. Due to it taking at least 3 weeks to grow, phenotypic resistance testing has usually no clinical relevance, but the procedure can help to characterize new mutations or gene variations that are not yet clear as to their significance for resistance.

Phenotyping

Phenotyping is regarded as the gold standard for antiviral resistance testing, but this procedure cannot be performed in most cases of suspected clinical resistance because VZV isolation in cell culture has a low sensitivity. The plaque reduction assay has been established as the method of choice. After the addition of the antiviral compound to be tested in a descending dilution series, the 50% effective concentration (EC_{50}) is estimated, resulting in 50% inhibition of viral replication. To assess the possible resistance, a sensitive VZV reference strain, e.g., pOka strain, should be tested in each experiment in parallel as a control. It is a decisive advantage that phenotyping allows a clear interpretation of the results. However, the methods used are time-consuming, material-intensive and non-standardized. In practice, phenotypic resistance tests can only be performed if swabs are obtained from vesicle fluid from which the virus can be isolated in cell culture. For results interpretation, the most common and reliable method for nucleoside analogs is to classify VZV strains as resistant if the measured mean EC_{50} value is three to five times higher than the corresponding value of the sensitive control strain. For resistance to foscarnet, EC_{50} values $> 330 \mu\text{M}$ were found to be solid.

Genotyping

As with HSV, the VZV genotyping resistance test is performed by amplification and sequencing of TK and DNA pol gene sequences. To identify non-synonymous mutations, sequence data must be compared with the published sequences of a sensitive reference strain available in the gene bank (e.g., VZV strain Dumas, accession number X04370.1). The advantages of genotyping are a significantly shorter delay of approximately 2 days compared to phenotyping and a direct examination of patient samples. The limited amount of viral DNA can have a limiting effect. A major drawback is the fact that only a little information is available on proven resistance-associated aa substitutions. Therefore, only stop codons or frameshift mutations can be interpreted with high probability with respect to resistance. Furthermore, the analysis of genotypic resistance can be difficult if a mixture of viral strains with different genotypes is present. Therefore, in clinical practice, it is a problem to define a questionable resistance of VZV strains on the basis of genotypic results. Recently, phenotypic testing of recombinant VZV isolates has been shown to be the best method to validate the significance of any resistance mutations.

Prevention

Prevention of Varicella by Vaccination

All available varicella vaccines are live-attenuated vaccines, and nearly all are based on the VZV Oka strain. There is only one non-Oka vaccine (SuduvaxTM, Green Cross, South Korea) available. The Oka strain (parental Oka, pOka) was isolated in the early 1970s from the vesicle fluid of a three-year-old child with chickenpox, whose surname Oka was used to designate this strain. Oka-derived varicella vaccines induce both humoral and T-cell immunity. The seroconversion rate is used as a criterion for assessing vaccine immunity, i.e., the presence of VZV IgG 6–8 weeks after vaccination in individuals who were VZV IgG-negative pre-vaccination. In healthy individuals, the seroconversion rate was calculated to be more than 95% after a single vaccine dose and 98%–99% after two doses, while in at-risk patients, the rate was 80%–90%. However, clinical efficacy was estimated to be partially lower depending on the duration of the post-vaccination period. Taken together, the efficacy of the vaccine in healthy children was between 80% and 97% and 93%–96% for the first and second doses, respectively.

After universal varicella vaccination was introduced in the United States in 1995, the frequency of varicella was reduced by 90% by 2008. In all age groups, the frequency of varicella fell to 71%–84% by the year 2000, and hospitalization due to varicella decreased threefold to fourfold. In the monitored regions, the average vaccination rates for children were approximately 80%. The pronounced herd immunity also led to a reduction of varicella incidence in non-vaccinated individuals. Studies suggest that the antibodies induced by the vaccine persist in a high percentage of vaccinees over decades. As a result of decreasing or insufficient immunity after a one-dose vaccination, a breakthrough disease from 43 days after vaccination can occur after massive virus exposure. Thus, varicella outbreaks in schools and day-care centers, as well as breakthrough diseases in vaccinated persons, have been reported despite high vaccination coverage in the United States after one-dose vaccination. Because there is only adequate protection if the varicella vaccine is administered twice, a two-dose vaccination scheme was introduced in the early 2000s. A shift in varicella to a higher age is not to be expected with vaccination coverage of $\geq 70\%$ comparable to those in the United States and Germany. Reservations against varicella vaccination are mostly justified by the scenario that a decrease in the incidence of varicella can lead to a reduced spread of wild-type viruses and that older people can develop zoster more frequently. In the United States, an influence of varicella vaccination on the incidence of zoster in adults could not be observed, and the current data from different countries confirm these findings. However, zoster has been shown to be 3–12 times less common in children vaccinated against varicella than in unvaccinated children. The disease in vaccinated children tends to be clinically milder and the exanthemas often occur anatomically in the dermatomes corresponding to the sites where the varicella vaccine was given.

In July 2004, universal varicella vaccination was included in the vaccination schedule for all children and adolescents in Germany. By 2011, vaccination coverage had risen to almost 70%. Initially, a single vaccination with monovalent varicella vaccines was recommended for children aged between 1 and 13 years. Since 2009, the recommendation of the Standing Vaccine Commission of the Robert Koch Institute (STIKO, Berlin, Germany) has provided for a two-dose schedule as the standard for varicella vaccination. In subsequent years, this recommendation was implemented without reducing vaccination rates. The first dose of varicella vaccine is administered at the age of 11–14 months, either at the same time as the first measles-mumps-rubella (MMR) vaccination or at the earliest 4 weeks later. The second dose of varicella vaccine is recommended at the age of 15–23 months, preferably with the

Table 4 Recommendations for indication immunizations against varicella in Germany

<i>Risk groups</i>	<i>Persons</i>	<i>Remarks</i>
Individually (not occupational) increased exposure, disease or complication risk, protection of others	Seronegative women who want children	Two doses of varicella vaccine
	Seronegative patients before planned immunosuppressive therapy or organ transplantation	Special hints for vaccination in patients under immunosuppressive therapy without VZV-specific antibodies should be considered
	Susceptible persons with severe neurodermitis	“Susceptible persons” means: No vaccination and no varicella history or anti-VZV IgG-negative in case of serologic testing
	Susceptible persons with close contact to the two aforementioned	
Occupational	Seronegative persons (including trainees, interns, students and volunteers) in the following fields of activity: • Medical facilities including facilities of other human medical health care professions • Activities involving contact with potentially infectious material • Care facilities • Community facilities • Facilities for the joint accommodation of asylum seekers, persons obliged to leave the country, refugees and late repatriates	Total of 2 vaccinations (if MMR vaccination is indicated, use MMRV combination vaccine if applicable)

combined measles-mumps-rubella-varicella (MMRV) vaccine. Since a slightly increased risk of febrile seizures was observed 5–12 days after the first vaccination with the combined MMRV vaccine, the information currently available suggests that separate administration of trivalent MMR vaccine and monovalent varicella vaccine should be preferred.

For unvaccinated 5–17-year-olds without a varicella history, two-dose varicella or MMRV vaccination is recommended as a catch-up vaccination. The minimum interval between two doses of the varicella or MMRV vaccine should be 4–6 weeks. The varicella vaccine is recommended as vaccination for all individuals summarized in [Table 4](#). Currently, the monovalent varicella vaccines Varilrix® from GlaxoSmithKline and Varivax® from MSD Sharp & Dohme GmbH as well as the tetravalent MMRV vaccine Priorix-Tetra® from GlaxoSmithKline are available in Germany. All vaccines are administered subcutaneously (s.c). The recommendations provide varicella vaccination as post-exposure prophylaxis for non-vaccinated individuals without varicella history after contact with individuals at risk. Vaccination should be carried out within 3 days after the onset of the exanthema in the index case or within 5 days after contact with the index case. Sentinel results from the “Varicella” working group at the Robert Koch Institute showed a decrease in varicella incidence of 80%–90% by 2012, affecting all age groups. However, the age groups most affected were those for which the vaccine recommendations applied (1–4 years) or where the vaccination was highly effective (5–9 years). It is significant that infants susceptible to varicella also benefit from herd immunity.

Important contraindications of varicella vaccination are intensive immunosuppressive therapy and pregnancy including the period 4–6 weeks before a planned pregnancy. However, according to current knowledge, there is no risk of prenatal malformations if the varicella vaccination is given accidentally during or shortly before pregnancy. In very rare cases, the transmission of the vaccine virus has been reported from immunocompetent vaccinated individuals to susceptible contacts persons. This is basically possible if the vaccine develops an exanthema with vesicles through which the virus can be transmitted. In contrast, immunodeficient patients with varicella caused by the vaccine virus may have a higher risk of virus transmission. Persons at risk for severe varicella, including pregnant women and neonates of mothers with no history of varicella, should therefore avoid contact with vaccinees. However, pregnancy is not considered a contraindication for vaccinating an unprotected child. After varicella vaccination, side effects such as redness and swelling at the injection site and pain at the injection site may occur in about 4% of vaccinations. 3%–5% of vaccinated children develop skin lesions localized at the injection site. In a further 3%–5% of children, less pronounced varicella-like exanthema may occur 2–6 weeks after vaccination, but adolescents and adults are affected twice as often as children. Varicella-like exanthemas within 2 weeks after vaccination are usually caused by wild-type virus infections. Later exanthemas up to 42 days after vaccination are usually associated with the vaccine virus. Accidental vaccination of seropositive individuals is not associated with an increasing number of side effects.

Passive Immunoprophylaxis of Varicella

Passive VZV immunoprophylaxis with varicella-zoster immunoglobulin (VZIG) can prevent the onset of varicella or considerably attenuate the course of the disease. Therefore, the administration of VZIG was recommended for susceptible at-risk patients after exposure to varicella or zoster. These include the groups summarized in [Table 5](#). If non-vaccinated pregnant women without a varicella

Table 5 Susceptible at-risk patients for whom the administration of VZIG (inclusive dosage and point in time) is recommended after exposure to varicella or zoster in Germany

<i>Risk patients</i>	<i>Dosage</i>	<i>Point in time</i>
Unvaccinated pregnant women without varicella history	VZIG i.v.: 25 IU/kg (0.1 ml/kg/h for 10 min, with good tolerability increase to maximum 1 ml/kg/h)	As soon as possible and not later than 96 h after exposure
Immunocompromised patients whose immune status against varicella is uncertain or negative	VZIG i.m.: 15 IU (normally 0.2 ml) per kg, divided between different parts of the body if more than 2 ml for children up to 20 kg, and more than 5 ml for adults	
Newborns whose mothers develop varicella within 5 days before and 2 days after birth	1 ml/kg i.v. (or 0.5 ml/kg i.m.)	Immediately after birth or outbreak of exanthema in the mother
Preterm infants from 28 weeks gestation whose mothers have no immunity, after exposure during the neonatal period	1 ml/kg i.v. (or 0.5 ml/kg i.m.)	As soon as possible and not later than 96 h after exposure
Preterm infants younger than 28 weeks after exposure during the neonatal period, regardless of the immune status of the mother		

history are passively immunized, it should be noted that the main reason for administering immunoglobulin is to protect them from severe varicella infections and complications. So far, there is no evidence that this cost-intensive approach prevents the spread of fetal disease in the form of congenital varicella syndrome. However, one should be aware that the administration of VZIG is the only way to prevent congenital varicella syndrome after viral exposure of an unprotected woman during the first 20 weeks of pregnancy.

An important prerequisite for the efficacy of passive immunoprophylaxis is the timely administration of VZIG. While previous instructions recommended administration within 3 days and a maximum of 10 days after the beginning of exposure, the current STIKO recommendation recommends “as soon as possible and not later than 96 h after exposure”. An “exposure” was defined as (1) one hour or longer together with an infectious person in a room, (2) personal contact or (3) household contact. For the administration and dosage of VZIG (Table 5), the manufacturer's instructions must be considered. If necessary, the post-exposure application of VZIG can be combined with antiviral chemoprophylaxis.

Prevention of Zoster by Vaccination

The age-related increase in zoster incidence correlates with the decrease of specific T-cell immunity. Therefore, an attempt was made to stimulate the specific cellular immunity in elderly people and thus enable the prevention of zoster. Inspired by the success of the varicella vaccine, a live-attenuated zoster vaccine was developed at the beginning of 2000 containing at least 14-fold higher concentrations of the vaccine virus than in the varicella vaccine. A large study has shown that vaccination of adults can reduce the incidence and severity of zoster by approximately 50% and the incidence of post zoster neuralgia (PZN) by 67%. According to the available information, protective immunity is maintained for at least 7 years. The vaccine is well tolerated. Site effects are local reactions at the injection site such as redness, swelling, pain and touch sensitivity. Under the brand name Zostavax®, the first vaccine for the prevention of zoster and PZN for people aged 50 and over was approved in Europe in 2006. Sanofi Pasteur MSD (Lyon, France) holds the European marketing authorization. The vaccine is administered s.c. as a single dose. Like all live vaccines, this zoster vaccine is contraindicated for immunosuppressed patients and pregnant women. The vaccine can be administered at the same time as the inactivated influenza vaccine while it should not be administered at the same time as the pneumococcal vaccine. Zostavax® has been available in Germany since September 2013. Although the zoster vaccination was part of the public vaccination recommendations in different federal states of Germany, the STIKO has not issued an official recommendation to use a live-attenuated zoster vaccine for standard vaccination. Accordingly, the vaccination with the live zoster vaccine was not an affordable service within health insurance. The main reason for this was that the effectiveness of the vaccination decreases with increasing age and ranges from 70% in the 50–59-year-olds to 41% in the 70–79-year-olds to less than 20% in the ≥ 80-year-olds. Thus, the protection period of the vaccination was documented only for a few years. Furthermore, modeling results from clinical studies showed only a small reduction of the total number of zoster cases by vaccination, which can be between 2.6% (vaccination with 50 years) and 0.6% (vaccination with 80 years) depending on the age of the vaccinated person. In addition, immunosuppressed people who have a significantly increased risk of developing zoster and its complications cannot be vaccinated with the attenuated live vaccine. The epidemiological risk-benefit assessment of the vaccination with Zostavax® did not lead to the recommendation of a standard vaccination in Germany. However, the vaccination of an individual patient can make sense after an individual risk-benefit assessment.

Several years ago, a second zoster vaccine based on recombinant adjuvant VZV-specific glycoprotein E (gE) was developed, which is of fundamental importance for the development of VZV-specific immunity. A liposome-based adjuvant serves as an enhancer of immunity. Since March 2018, this new zoster subunit inactivated vaccine designated Shingrix® and manufactured by

GlaxoSmithKline has been approved in Europe for the prevention of zoster. After administration of two doses, this inactivated vaccine reduced the frequency of zoster between 90%–97% in immunocompetent individuals over 50 years of age in phase III studies, and the vaccine efficacy against PHN was 89% in adults over 70 years of age. So far, two studies on immunodeficient patients have also been conducted. After three vaccine doses at one and three-month intervals, respectively, in 121 adult cancer patients who had undergone an autologous stem cell transplantation, one month after the last immunization (6 months after transplantation), humoral and cellular gE-specific immunity was significantly increased compared to placebo and persisted for up to one year. A similar study of 123 adult HIV patients also demonstrated an increased specific cellular and humoral immune response persisting for 18 months. All available data demonstrated that the adjuvant zoster subunit inactivated vaccine could effectively prevent zoster and PZN in immunocompetent people 50 years of age and older. Efficacy across all age groups from 50 years of age is 92% for protection against zoster and 82% for protection against PZN. Vaccination is safe but very reactive. Local and systemic reactions such as pain at the puncture site or fever, fatigue, headache and myalgia of 1–2 days often occur. It is of great advantage that the vaccine also induces a robust humoral and cellular immune response in immunodeficient individuals. Since December 2018, STIKO, in Germany, has recommended vaccination with the adjuvant zoster subunit inactivated vaccine for general use as a standard vaccine for persons aged 60 years and older and as an indication vaccine for immunosuppressed persons and patients with other severe basic diseases (e.g., rheumatoid arthritis, chronic kidney disease, chronic obstructive lung disease, diabetes mellitus) 50 years and older to prevent zoster, its complications and late sequelae. The vaccination series consists of two intramuscular (i.m.) vaccinations at intervals of at least 2 months and up to a maximum of 6 months. This vaccination is no substitute for an indicated chickenpox vaccination.

Treatment and Prevention of Herpesvirus Infections in the Immunocompromised Host

Sara H Burkhard and Nicolas J Mueller, University Hospital of Zurich, Zurich, Switzerland

Introduction

Immunodeficiencies are caused by the defective function of one or several components of the immune system. They can be divided into genetically inherited primary deficiencies and acquired secondary immune deficiencies. Primary immunodeficiencies can go unnoticed due to the lack of symptoms or result in serious and recurrent infections. Although severe defects are rare, they often lead to high mortality in early childhood and are predominantly inherited in a recessive and X-chromosome linked manner. Secondary immune defects are much more common. They can be caused by environmental factors such as malnutrition or result from diseases like infections and cancer, or the administration of cytotoxic drugs. In such conditions, the immune defect is often unwanted, while in some cases, the immunosuppression is induced with therapeutic intention. Exemplary, organ transplantation would not be possible without immunosuppressive drugs because a fully functional immune system would cause the rejection of the allograft.

Immunodeficiencies can also be distinguished by the nature of the underlying defect. Primary immunodeficiencies are currently classified into nine categories defined by the signaling pathway or immune cell type affected. The study of these distinct genetic defects and associated diseases has aided the understanding of the immune response to various pathogens. We now know that the control of viral infections is mainly dependent on T cell function and, to a lesser extent, Natural killer (NK) cells and antibodies. Secondary immune defects roughly cluster into two main groups and a combination thereof. In the first group, patients are treated with cytotoxic drugs and radiation therapy, which results in the impaired generation of neutrophil granulocytes and mucosal barrier dysfunction. The deficiency in this first line of immune defense usually predisposes individuals to bacterial and fungal infections. The second group includes patients in whom T cells are targeted, yielding a defect in cellular immunity. This is usually the case in patients treated with immunosuppressive drugs to contain autoimmune disorders or to prevent the rejection of a transplanted organ.

A T cell defect is also the underlying cause of the immunosuppressive state of patients suffering from acquired immune deficiency syndrome (AIDS) caused by the infection with the human immunodeficiency virus (HIV). The HIV pandemic, which started in the 1980s, raised awareness of the diverse types of opportunistic pathogens that take advantage of the impaired T cell function. Viral infections were observed frequently, many of them being caused by members of the Herpesviridae family. The high incidence of herpesvirus infections among AIDS patients is, to some degree, explained by the ability of herpesviruses to latently persist in a large percentage of the population. As seen in HIV infected subjects, the loss of T cell surveillance can then lead to herpes virus reactivation, replication, and subsequent disease. Classically, AIDS patients would present with cytomegalovirus (CMV) retinitis, Epstein-Barr virus (EBV)-associated lymphoma or the human herpesvirus (HHV)-8 associated Kaposi sarcoma. Thanks to more efficient antiretroviral therapies, HIV replication can now be controlled in the great majority of patients, which leads to recovery of T cell function. For patients with access to treatment, this results in a similar susceptibility to infections as seen in the general population.

There is a rising number of patients treated with immunosuppressive drugs. This is explained by an increase in the number of conditions requiring immunosuppression and the prolonged survival of patients under improved therapeutic regimens. For autoimmune disorders, the blockade of specific pathways involved in the pathogenesis of disease has proven successful. This may be achieved by monoclonal antibodies or small molecule inhibitors. Although such patients may still suffer from opportunistic infections, the therapeutic immune defect is usually more limited, often not resulting in an elevated susceptibility to infection. Transplantation medicine is another field that has seen major advances in the last few decades but still requires a more general immunosuppressive approach. This immunosuppression is achieved by the combination of immunosuppressive drugs that are usually administered for a lifetime. Although subsequent development of a certain immune tolerance to the transplanted organ allows reducing drug dosages, patients are particularly vulnerable in the early months after transplantation. In this phase, induction therapy and initiation of high dose maintenance immunosuppressive therapy prevent acute organ rejection. Just like in antiviral immunity, allograft rejection is mainly mediated by T cells. Upon transplantation, T cells are activated by non-self major histocompatibility complexes (MHC). To limit the cellular immune response, donor and recipient MHC classes are matched before transplantation. However, the lack of organs eligible for transplantation and the urgency of finding a recipient for an organ from a deceased donor limit accurate MHC matching. This, in turn, results in the need for more potent immunosuppression. Also, the adaptive response to minor histocompatibility antigens is not accounted for pre-transplantation and is thought to mirror immunity to viral proteins. It is evident that the immunosuppression that prevents allograft rejection will lead to an increased susceptibility to viral diseases, and again herpes virus infections are at the forefront. Therefore, we will focus on the presentation, management, and treatment of herpesvirus infections in transplanted patients.

Cytomegalovirus (Human Herpesvirus 5)

Cytomegalovirus (CMV) is one of the most common infections occurring after organ transplantation and is related to significant morbidity and loss of graft function. In the immunocompromised host, CMV infection is often more severe,

causing meningoencephalitis, retinitis, gut inflammation, hepatitis, pneumonitis and polyradiculopathy. These end-organ diseases are the result of the invasion and local tissue damage by CMV. However, most often, CMV disease presents with non-specific symptoms such as fever, malaise, decreased leukocyte and platelet count, or elevated liver function values. This symptom complex is usually referred to as a viral syndrome.

Pre-Transplant Risk Stratification

The main strategy of disease prevention begins with the risk stratification before transplantation. This is performed by serological testing, which is achieved by measuring donor and recipient CMV IgG. Thereby, the clinician can evaluate whether donor and recipient have been exposed to CMV previously. For seronegative organ recipients, serological testing is periodically repeated before transplantation as primary infection and subsequent seroconversion could occur.

Upon solid organ transplantation the highest risk of infection is observed when a seropositive donor is combined with a seronegative recipient (D^+/R^-). In this case CMV can be transmitted *via* the organ transplanted into a host lacking CMV immunity. In this setting, the risk of CMV disease post-transplantation is as high as 56%. Intermediate risk is expected in seropositive recipients (R^+) due to CMV reactivation upon immunosuppression. Simultaneous infections with different CMV serotypes are thought to explain the marginally elevated risk in the D^+/R^+ compared to the D^-/R^+ setting. D^-/R^- serostatus is linked to the lowest risk in adult recipients, as *de novo* CMV infection is rare. Prior to hematopoietic stem cell transplantation, recipient immune cells specific for CMV are usually eliminated due to induction therapy. Thus, post-transplantation immunity depends on donor immune cells. Studies have identified a survival advantage for recipients receiving an allotransplant from a seropositive donor compared to those receiving stem cells from seronegative donors. This protective effect was eliminated by T cell depletion, suggesting a central role of CMV specific donor-derived T cells for the control of CMV infection.

The serological risk stratification for CMV before transplantation has a direct impact on patient management and prevention of disease after transplantation. It may, for instance, guide the indication and duration of prophylactic measures taken. Due to the inaccuracy of disease prediction by the D/R risk stratification, there is a need for alternative methods. Assessment of the CMV-specific T cell quantity and functionality has been investigated and shows promising results. Methods involve enzyme-linked immunosorbent assays (ELISAs) or enzyme-linked immunosorbent spots (ELISpots) measuring interferon (IFN) γ release by T cells activated with CMV peptides, some of which are commercially available. Assays using intracellular cytokine staining or MHC-multimer staining of CMV specific T cells rely on analysis by flow cytometry. Performing such T cell assays before transplantation does not take into consideration the influence of the immunosuppression after transplantation, often severely impairing T cell responses. Currently, there is limited literature on the use of pre-transplantation risk stratification by T cell assays.

Prevention Strategies of CMV Disease After Transplantation

The two approaches of “universal prophylaxis” and “pre-emptive therapy” have been proven valuable to prevent CMV disease after solid organ transplantation. For universal prophylaxis, patients are given an antiviral drug in reduced dosage. The administration should be started shortly after transplantation, as this is the time where the threat of acute rejection demands the most potent immunosuppressive regimen. Prophylaxis is continued for the first 3–12 months after transplantation depending on the transplanted organ type, immunosuppressive regimen and serological risk stratification. In the D^-/R^- group, with the lowest risk, preventive therapy is not recommended. The prophylactic approach harbors the risk of late-onset CMV disease after discontinuation of antiviral prophylaxis.

The late-onset disease affects about 20% of patients and is a particular concern to patients with a D^+/R^- serostatus, severe immunosuppression and transplant rejection. Another drawback of universal prophylaxis is that patients are exposed to antiviral treatment and adherent adverse effects for a substantial time period. This is particularly critical for subjects undergoing stem cell transplantation where the toxic effects of some antiviral drugs on the bone marrow limit the use of universal prophylaxis. In those populations, clinicians can opt for preemptive therapy.

This approach involves the frequent screening for CMV replication after transplantation, followed by antiviral treatment should viral DNA be detected. Early antiviral intervention is essential as it can limit the severity of CMV related disease. Surveillance is usually performed by the measurement of CMV DNA by quantitative PCR in plasma or whole blood. The positive result is commonly referred to as DNAemia, as the majority of CMV DNA detected in the blood was demonstrated to be fragmented and non-functional.

Since the World Health Organization standardization of qPCR protocols to measure DNAemia, there is a higher degree of assay reproducibility between laboratories. There is, however, no agreement on what DNA threshold should trigger antiviral treatment and whether this threshold should be adapted to the serological CMV risk. It has been suggested that the change in the level of DNAemia over time should be considered to be relevant in predicting disease.

In case CMV qPCR is not available, measurement of the CMV antigen pp65 by ELISA can be a valuable alternative. In contrast, measurement of CMV IgG is not useful for post-transplantation surveillance as serological responses are impaired or delayed due to the immunosuppression. The preemptive strategy was shown to have similar overall outcomes regarding CMV disease and graft function as the universal prophylaxis for most types of transplants. While preemptive therapy is associated with a higher rate

of CMV DNAemia, late-onset CMV disease and side effects of treatment are more frequently observed in patients receiving prophylactic medication. Thus, the choice of approach is determined by the individual risk for CMV disease and antiviral toxicity.

The main drug used for CMV prevention is the oral prodrug valganciclovir, while intravenous ganciclovir is administered on rare occasions. These drugs are ideal for prophylaxis as they also protect against other herpes virus infections, *e.g.*, varicella-zoster virus or herpes simplex virus. Unfortunately, myelosuppressive adverse effects limit the use of ganciclovir and valganciclovir after hematopoietic stem cell transplantation and are frequently observed after solid organ transplantation. Letermovir, an inhibitor of the terminase complex of CMV, was recently approved for CMV prophylaxis in hematopoietic stem cell transplant recipients. In clinical trials using letermovir, hardly any myelotoxicity was observed. Importantly, letermovir has no antiviral activity against other herpes viruses; hence additional administration of prophylactic antiviral compounds may be required. Alternative substances are currently being evaluated in clinical trials.

The use of intravenous immunoglobulins or CMV-specific IgG was suggested to reduce the incidence and severity of CMV disease. Due to the better control of CMV replication under ganciclovir or valganciclovir, the sole application of immunoglobulins for prophylaxis has become uncommon. However, it may be useful for high-risk patient populations, given in combination with antiviral compounds or when managing subjects with contraindications for common antiviral drugs.

Currently, monoclonal CMV antibodies are in development. Various vaccines are also being engineered and some have proceeded to early clinical studies. Vaccination approaches involve the use of live attenuated virus, viral vectors, recombinant subunits or gene-based vaccines, some of them providing promising results. Several vaccinations were shown to induce the production of neutralizing antibodies, lower DNAemia, preventing infection or reducing CMV episodes.

Diagnosis of CMV Disease and Treatment

In the case of a viral syndrome, the association of non-specific symptoms and detection of CMV DNA in the blood usually prompts the initiation of therapy. Tissue invasive CMV disease, in contrast, does not always cause elevated DNAemia. This is most frequently observed in gastrointestinal disease or pneumonitis. Therefore, detection of the virus in biopsy material should be performed whenever possible to confirm the suspected diagnosis. Histological criteria such as inclusion bodies or detection of viral antigen by immunohistochemistry are used to diagnose localized CMV disease.

Once the diagnosis has been established, oral valganciclovir and intravenous ganciclovir are the preferred agents. Both antiviral drugs have been shown to achieve comparable long-term outcomes. As oral therapy is more convenient, intravenous treatment with ganciclovir is reserved for severe disease and where oral bioavailability may be impaired, for example, in gastrointestinal disease due to rapid intestinal passage or mucosal damage.

Treatment should be continued for a minimum of two weeks. To monitor therapy success, weekly blood CMV DNA load testing is performed. Usually, treatment is only stopped when two negative DNA measurements have been obtained or DNAemia drops below a certain threshold. For tissue invasive disease treatment can be stopped when clinical symptoms have ceased, but a two-week course is usually given to all patients. Recent studies suggest that the assessment of CMV specific T cell immunity may assist the decision to stop the administration of antiviral substances in primary infection. Using a CMV specific ELISA for IFN γ release by T cells, antiviral treatment could safely be stopped when a CMV specific immune response had been detected. Similarly, intracellular staining-based assays demonstrated the inability to clear CMV DNAemia in the absence of T cell responses.

Apart from pharmacological treatment of CMV disease, optimizing host factors can support immune control. Lower blood concentrations for calcineurin inhibitors – an immune-suppressing agent frequently used after solid organ transplantation – have been associated with more rapid clearance of DNAemia. In contrast, immunosuppressive regimens containing a mammalian target of rapamycin (mTOR) inhibitor may be advantageous due to their suggested direct anti-CMV effect. In severe disease, the reduction of all immunosuppressive agents should be considered.

Upon successful treatment of the disease, some patients will develop recurrent CMV disease. After solid organ transplantation, CMV relapses affect up to 35% of patients. Certain risk factors are connected with the development of CMV relapses. These include primary infection, deceased-donor transplantation, high-level CMV DNAemia, delay in CMV DNA regression after the initiation of treatment, multimorbidity, transplant rejection, strong immunosuppressive regimens, thoracic organ transplants and invasive gastrointestinal disease. Patients at risk should be closely monitored for CMV DNAemia and symptoms after discontinuation of therapy. To further limit CMV relapses, the administration of prophylactic medication after resolved CMV disease was trialed. As subsequent studies demonstrated that this approach of secondary prophylaxis failed to prevent relapses, it is not generally recommended. Still, many centers have adopted this strategy.

Antiviral Drug Resistance

Antiviral drug resistance is rarely an issue in immunocompetent hosts, as CMV infection does not usually require treatment. In contrast, immunocompromised patients may suffer from a clinical disease that cannot be controlled by the suppressed immune response. Thus, antiviral therapy is initiated and exerts a selection pressure required for drug-resistant viral subpopulations to propagate. Drug-resistant CMV first emerged among patients with AIDS, where the loss of drug susceptibility complicated as many as 20% of cases after 9–12 months of antiviral treatment. Optimizing treatment regimens reduced the frequency of antiviral drug resistance, which now occurs in 5%–12% of transplant recipients.

Certain host and therapy-related factors are connected with an increased risk of developing CMV drug resistance. These include prolonged antiviral drug exposure and persistent CMV replication under therapy due to impaired CMV immunity. The latter is often observed in the D⁺/R⁻ risk group, in patients on more potent immunosuppressive regimens or with inadequate CMV treatment. The emergence of ganciclovir resistance seems to be connected to antiviral drug doses used for CMV treatment, especially if it is repeatedly started and stopped, as it is only observed in up to 3% of the patients given prophylactic doses. Drug resistance should be suspected and investigated when patients do not improve or relapse under treatment. Although resistance rarely develops during the first 6 weeks of antiviral therapy, testing is recommended in unresponsive patients after two weeks of therapy. However, it is not unusual that DNAemia increases after initiation of therapy during the first week.

Single or multiple mutations lead to different levels of drug resistance and further mutations can be acquired by the virus over time. Testing for resistance is performed by sequencing of viral DNA and comparison with the wild-type sequence. As with all sequence-based resistance testing, mutations can reflect mere sequence polymorphism or confer to drug resistance. The amount of evidence for any given mutation to result in resistance reaches from theoretical predictions to *in vitro* assays or description of clinical cases. The level of resistance is often reported as the change of drug concentration required to suppress viral propagation by 50%. These fold-changes are then categorized so that a 2–5 fold increase refers to a low-grade, 5–15 fold is moderate and > 15 means high-level resistance. The numbers obtained for single mutations can be added should multiple mutations be detected.

Genotypic assessment of resistance requires a certain quantity of CMV DNA. Thus, resistant viral subpopulations of low frequency may not be detected, leading to the assumption that the virus is drug susceptible. Also, resistant CMV subpopulations have been isolated from specific organs, while the mutation was not detected in CMV DNA isolated from blood. Applying technologies such as deep sequencing may improve the detection of drug-resistant subpopulations in future.

Sequencing of CMV codons 400–670 and 300–1000 are usually performed as these contain the most known mutations involved in resistance in the UL97 kinase and the UL54 DNA polymerase, respectively. In 90% of patients on ganciclovir treatment, the UL97 kinase mutation appears before the UL54 polymerase mutation. UL54-associated resistance may signify cross-resistance to other antiviral drugs and often leads to a loss of viral fitness.

If a previously unknown mutation is detected by sequencing, resistance can be assessed by recombinant phenotyping. For this assay, the mutated gene is transferred to a laboratory CMV strain that is then tested for phenotypic resistance to antiviral substances. This is a timely and labor-intensive process and is therefore rarely used clinically.

In the case of low-level resistance, an increase in ganciclovir dosage and improving host factors, such as reducing immunosuppression, may be sufficient to overcome resistance. If genetic testing reveals a high-level of resistance, switching the antiviral agent is recommended. In case of life-threatening disease, the antiviral drug foscarnet is added prior to genetic testing for resistance. The salvage therapy using foscarnet is often successful, but metabolic side effects and nephrotoxicity limit its use. Newer compounds such as letermovir, maribavir and brincidofovir are still not approved for the treatment of CMV disease but may be available for compassionate use. The use of CMV hyperimmunoglobulin and intravenous immunoglobulin has thus far only been reported in case studies.

The idea of improving cellular immunity towards CMV has fueled the study of adoptive T cell transfer. Recently, this approach was reported to be successful in a number of case studies. An adoptive T cell transfer may play a role in complex cases as the generation of autologous CMV T cells takes several weeks and is costly. Therefore, the creation of HLA matched T cell banks is of great interest. Several agents have been used for off label treatment due to their anti-CMV effects *in vitro*. Such drugs include the mTOR inhibitors sirolimus and everolimus, leflunomide and artesunate, and addition to antiviral therapy can be considered in complicated cases.

HSV (Herpes Simplex Virus, Human Herpesvirus 1 and 2)

Immunosuppressed patients experience more severe herpes simplex virus (HSV)-associated disease and shed virus more frequently. Primary infection post-transplantation has been described, but disease mostly results from reactivation of latent HSV after a previous infection. Therefore, serological testing before transplantation is useful to assess the individual post-transplant risk.

Most patients present with typical mucosal and skin lesions, even after immunosuppression, allowing diagnosis on clinical grounds. Lesions can, however, be atypical and include unusual locations. This can render clinical discrimination from lesions caused by other diseases difficult. Consequently, a diagnosis should involve the detection of HSV DNA by PCR from samples collected in mucocutaneous lesions. PCR was shown to be the most sensitive test for HSV detection. Although less sensitive, direct fluorescent antibody assays deliver rapid results. More severe HSV diseases, such as disseminated mucocutaneous disease, visceral disease, esophagitis, hepatitis, and pneumonia, are also observed. Just as in immunocompetent hosts, retrograde reactivation can lead to disease of the central nervous system. Obtaining tissue, cerebrospinal fluid or blood samples for the detection of HSV DNA confirms the diagnosis.

Many transplant recipients receive prophylactic valganciclovir or ganciclovir to prevent CMV disease, effectively averting HSV reactivation or infection. For patients not receiving CMV antiviral prophylaxis, or when a preemptive strategy is adopted, HSV prophylaxis may be considered in HSV seropositive transplant recipients. This is also true for the use of agents for CMV prophylaxis that do not have anti-HSV-activity, as is the case with letermovir.

Preventive measures should cover the first months after transplantation because this is when the majority of HSV infections occur. Prophylaxis and treatment involve antiviral medication with aciclovir and valaciclovir. With localized disease, oral regimens

are preferred and are continued for a minimum of 5–7 days and until the HSV lesions have resolved. For severe manifestations, intravenous administration of aciclovir and the reduction of immunosuppressive medication should be considered.

As immunosuppressed patients are exposed to longer courses of antiviral treatments, aciclovir resistance is an emerging issue. Frequency of drug resistance in such patients can range from 2.1% to 10.9% and it is more often observed in AIDS patients or after hematopoietic stem cell transplantation compared to patients receiving solid organ transplants. Drug resistance should be considered in the case of treatment-refractory disease and a history of previous exposure to antiviral therapy. Mutations causing aciclovir resistance are most frequently detected within the thymidine kinase UL23, implying a cross-resistance to other antiviral substances such as famciclovir, valaciclovir and ganciclovir. Both genetic testing and phenotypic assays are used to identify mutations causing drug resistance. While waiting for antiviral resistance to be confirmed, the antiviral regimen is usually switched to foscarnet or cidofovir. After successful treatment, aciclovir resistance is sometimes lost in virus strains detected upon HSV reactivation.

Recurrent disease is defined as two or more HSV reactivations after the first episode. In this case, suppressive pharmacological therapy can be considered. Such prophylactic treatment was shown to be associated with a lower frequency of aciclovir resistance when compared to repetitive treatment of relapses.

Varicella Zoster Virus (VZV, Human Herpesvirus 3)

Primary infection (chickenpox) is most often seen in children and rarely in adults. On the contrary, Varicella-zoster virus (VZV) reactivation (shingles, herpes zoster) is observed frequently particularly in the immunosuppressed host. Most patients with immune defects present with a classical manifestation of VZV infection. The frequency of severe symptoms, such as multi-dermatomal herpes zoster, a prolonged disease course and complications is, however, elevated in immunocompromised patients.

Rarely, VZV reactivation can affect internal organs, most commonly causing pneumonia, encephalitis and hepatitis, referred to as visceral herpes zoster. In some cases of visceral disease, patients may lack skin lesions. If skin lesions are present, they are more likely to be atypical in appearance. For more uncommon presentations, PCR is the most sensitive test to detect viral replication in the tissue or body fluids. As a distinction from HSV infection may be difficult clinically, multiplex assays detecting both HSV and VZV have been developed. Alternatively, fluorescent labeling of viral antigen can be used in tissue biopsies or scrapings from vesicles and ulcers.

Assessing previous VZV exposure by serology VZV is suggested for patients on transplant waiting lists. The result is used to estimate the post-transplantation risk of infection but also determines if patients are eligible for vaccination and what vaccine should be used. Live attenuated Oka vaccine may be offered to susceptible individuals before transplantation. For seropositive patients above 50 years of age, vaccination with either the live-attenuated Oka herpes zoster vaccine or the adjuvanted subunit herpes zoster vaccine is recommended. These vaccines are partially effective as they can reduce the incidence and severity of disease but fail to prevent herpes zoster completely. Recent recommendations favor the recombinant subunit over the live attenuated vaccine as it shows superior efficacy against herpes zoster and elicits a more long-lasting effect in immunocompetent subjects.

Post-transplantation live attenuated vaccines are contraindicated but the subunit vaccine for herpes zoster can still be safely applied.

Initiation of herpes zoster treatment is suggested up to 72 h after the appearance of first cutaneous lesions, but later administration can be considered in immunosuppressed patients on an individual basis. Antiviral substances include aciclovir and valaciclovir. Famciclovir and brivudine have not been tested in immunocompromised patients, and with brivudine, interaction with 5-Fluoropyrimidine must be avoided. Disease severity determines whether antiviral drugs should be administered orally or intravenously. Therapy should be continued for a minimum of 7 days and until skin lesions have fully crusted. As for HSV, drugs used to prevent CMV disease, namely ganciclovir, valganciclovir and foscarnet, show anti-VZV activity.

Human Herpes Virus – 6 and 7

After solid organ transplantation, HHV-6 reactivation has been reported in 20% to 82% of transplant recipients. In the majority of reactivations, HHV-6B is identified. Mostly, reactivation occurs early after transplantation and does not cause any symptoms. In the case of symptomatic disease, fever and bone marrow suppression the most common presentations but rashes, hepatitis, gastro-duodenitis, colitis and pneumonitis have also been described. Limbic encephalitis caused by HHV-6 infection is mainly associated with hematopoietic stem cell transplantation.

For HHV-7, the frequency of reactivation is estimated to be seen in up to 46% of transplant recipients and also occurs in the early phase after transplantation. Symptomatic disease is rare and was primarily reported to cause fever and bone marrow suppression resulting in thrombocytopenia. The pathogenic potential of HHV-7 remains unclear as HHV-7 replication is detected in many asymptomatic immunosuppressed patients.

HHV-6 (and probably HHV-7) infections have been associated with fungal infections, accelerated liver fibrosis in hepatitis C virus infections after liver transplantation bronchiolitis obliterans post lung transplantation and allograft dysfunction or rejection. Initially, HHV-6 and -7 were also linked to a higher frequency of CMV-associated disease. Subsequent studies, however, failed to show a correlation between co-infection and the clinical course of CMV disease.

The preferred method of diagnosing infection is qPCR from peripheral blood or PBMCs. Due to DNA fragments from lysed cells, HHV-6 DNA detection by PCR from plasma only reaches a specificity of 84% for active viral replication. Furthermore,

diagnostics are limited by the lack of standardized assays, thresholds and by the fact that viral replication does not imply clinical disease. Consequently, the relationship between HHV-6 DNAemia and clinical symptoms is unclear. Further diagnostic testing such as HHV-6 DNA detection in tissue samples or radiological appearance may help establish the diagnosis.

Persistent high-level plasma HHV-6 DNA by qPCR may also suggest that integration of the HHV-6 genome into the germline has taken place and, thus, does not reflect viral replication. This rare event can be inherited, clusters within families, and approximately 1% of the European and US American populations are affected.

There are no randomized, controlled trials demonstrating antiviral treatment efficacy and recommendations based on *in vitro* data. Furthermore, no antiviral drugs have been licensed to treat HHV-6 and -7 related diseases. *In vitro* ganciclovir, foscarnet, cidofovir and brincidofovir have been shown to suppress HHV-6 replication. Several studies have described the successful treatment of HHV-6 using those antiviral drugs after solid organ transplantation. Therapy is recommended in the case of HHV-6 encephalitis and should be considered with a clinical disease that could be linked to HHV-6.

In the case of HHV-7, cidofovir and foscarnet have shown anti-viral activity *in vitro* while ganciclovir and aciclovir did not achieve this effect.

Screening for HHV-6 and -7 and prophylactic measures are not routinely recommended.

Epstein–Barr Virus (Human Herpesvirus 4)

Epstein–Barr virus (EBV) disease in the immunosuppressed individual ranges from systemic presentations such as infectious mononucleosis to more localized disease including hepatitis, pneumonitis, gastrointestinal, hematological manifestations, and neoplasia. The hematological disorders can be serious, causing hemophagocytic lymphohistiocytosis or macrophage activation syndrome, which results in the uncontrolled activation of immune cells.

An important property of EBV is its oncogenic capacity caused by the integration of viral DNA into the host cells' genome. During immunosuppression, the lack of cytotoxic T cell responses allows EBV to transform lymphocytes, potentially resulting in their uncontrolled proliferation. In particular, post-transplantation lymphoproliferative disorders (PTLDs) pose a great challenge. EBV-related PTLD usually arises from B cells but T and NK cell-derived PTLD is also seen. The latter may be caused by increased viral replication in the immunosuppressed, allowing for infection of cells normally not targeted by EBV. About 50% of PTLDs are EBV related and mostly occur within the first year after transplantation. This disease entity is decreasing in incidence, while late presenting EBV-negative PTLD is seen more frequently. A change in induction regimens partly explains this. The application of polyclonal anti-lymphocyte antibodies, which were administered in higher doses in the past, is a known risk factor for PTLD development. An elevated risk for PTLD is seen in EBV seronegative recipients who may contract a primary infection, making the pediatric population particularly vulnerable. This is why the serostatus before transplantation should be determined and most centers measure viral capsid antigen (VCA) IgG and Epstein–Barr nuclear antigen-1 (EBNA-1) IgG.

The type of organ transplant is another determinant of PTLD risk and the highest incidence is observed after hematopoietic stem cell transplantation, particularly transplantation of haploidentical cells. Good prediction models are, however, lacking, and the individual risk is difficult to ascertain.

Clinical presentation of PTLD can range from asymptomatic to fulminant organ failure and tumor lysis. Early signs include fever, lymph node or tonsil enlargement and changes in the hematogram. Due to organ damage such as hepatitis, colitis, pneumonia and cerebritis, symptoms can be very diverse and mimic an infectious disease process or organ rejection. PTLD frequently involves extranodal sites such as the gut, solid allograft and the central nervous system.

Diagnosis is established by histology from lesion biopsy and disease can be categorized into six subclasses defined by the World Health Organization. The detection of EBV nucleic acid or proteins in the tissue establishes a link to the EBV-associated pathogenesis. Monitoring for EBV-related disease is usually performed by measuring plasma EBV DNA by PCR. Generally, high-level EBV DNAemia or a rapid increase in blood EBV DNA load is correlated with an elevated risk of developing PTLD. However, there is a lack of standardization of thresholds, frequency and time points of viral load measurement.

Due to the lack of antiviral drugs with activity against EBV, preemptive strategies and therapy involve reducing the immunosuppressive regimen as an initial step. This conversely risks provoking an acute transplant rejection as seen in 37% of patients followed in a prospective trial. If this approach fails, administration of rituximab – a B cell depleting antibody directed towards CD20 – can be considered in CD20 positive PTLD. Rituximab was the first treatment to improve prognosis drastically. Combined with the reduction of immunosuppression, rituximab achieves a response rate of 44%–79% and complete remissions in 20% to 55%. If the PTLD is still unresponsive to treatment, the next step involves the use of chemotherapy. In rare cases of PTLD such as peripheral T cell lymphoma, Hodgkin's lymphoma, Burkitt's lymphoma and central nervous system lymphoma, chemotherapy is considered as first-line therapy. Further treatment modalities include the adoptive transfer of EBV-specific T cells, surgical resection and radiotherapy.

Human Herpes Virus-8

Due to discrepancies in the geographic distribution of HHV-8, seropositivity rates range from approximately 5% to 50%. This explains the variable frequency of HHV-8 associated pathologies. HHV-8-related disease can affect immunocompetent subjects but is more often related to immunosuppression. Sexual transmission is the predominant mode in HIV positive men who have sex

with men. Besides advanced HIV disease, post-transplant immunosuppression is a risk for progression to HHV-8-associated diseases. After organ transplantation in HHV-8 endemic regions, seroconversion in mismatched donors and recipients is seen frequently. HHV-8 DNAemia, however, usually arises from HHV-8 reactivation after immunosuppression and is rarer. Symptoms include fever, rash, lymphadenopathy and cytopenia but can also be more severe in the case of lymphoproliferative B-cell disorders, gammopathies, bone marrow failure and hemophagocytic syndrome.

Similar to EBV, integration of HHV-8 DNA explains the oncogenicity of this virus. Kaposi sarcoma, caused by the uncontrolled proliferation of mesenchymal cells, is the leading clinical presentation linked to the reactivation of HHV-8. Transformation of endothelial cells causes the formation of blood-filled vascular channels, giving the lesions the typical purple color. Kaposi sarcomas can present as blotches or nodules and are usually found on skin or mucosa but can affect visceral organs. HHV-8 also causes lymphoproliferative disease by infecting B cells at different stages of development. This includes multicentric Castleman disease, presenting with enlarged lymph nodes, flu-like symptoms and organ dysfunction, and primary effusion lymphoma, affecting body cavities often without forming a solid tumor mass. Altogether, these lymphoproliferative conditions are rare since the advent of effective antiretroviral treatment for HIV infected individuals. The mortality rate can reach 60% in the case of Kaposi sarcoma and is even higher for body cavity lymphomas. Serologic testing pre-transplantation can be considered to stratify the risk in endemic areas but is not generally recommended. Higher levels of immunosuppression, particularly anti-lymphocyte agents, increase the risk of HHV-8 disease. When disease is suspected, the diagnostic standard involves tissue biopsy and detection of virus-associated antigens or HHV-8 DNA.

Management of HHV-8 related disease usually starts by reducing the immunosuppression as this was shown to result in complete remission in 30% of cases. Favoring mTOR inhibitors over calcineurin inhibitors may be beneficial as regression of Kaposi sarcoma was reported with the use of drugs such as sirolimus. As for other herpes viruses, mTOR inhibitors may have a direct anti-HHV-8 activity but may also suppress tumorigenesis by inhibiting vascular growth. Due to the lack of prospective controlled trials, antiviral treatment is not routinely supported, although HHV-8 is susceptible to aciclovir, ganciclovir and cidofovir *in vitro*. For neoplastic disease, radiotherapy and chemotherapy may be part of treatment. For multicentric Castleman disease, treatment with rituximab appears promising even though the transformed B cells lack CD20 expression.

Management of Adenovirus Infections (*Adenoviridae*)

Albert Heim, Hannover Medical School, Hanover, Germany

© 2021 Elsevier Ltd. All rights reserved.

Nomenclature

c/ml Copies per milliliter; viral genome equivalents (copies) measured in human body fluids (most frequently blood, cerebrospinal fluid or urine), not harmonized to WHO standard preparations

HAdV Human (Mast-)Adenovirus

LRTI Lower respiratory tract infection

URTI Upper respiratory tract infection

Glossary

DNAemia Presence of viral DNA in peripheral blood, either cell-associated or in plasma. The term is used for viremias and are usually detected by nucleic acid amplification techniques e.g., Polymerase chain reaction (PCR).

Latency/latent infection Long term infection of a host with a virus without the production of infectious virus progeny, thus the host is neither affected by a disease nor infectious. On a cellular level, latently infected cells contain complete viral genomes but viral gene expression is usually

restricted to a few genes. Latent infection of a host can be lifelong (as in herpesvirus infections) or limited to a period of several months to years, as seen in adenovirus infections. Latency may lead to reactivation of virus replication with shedding of infectious virus and disease manifestations.

Virus load Concentration of virus DNA measured in peripheral blood samples (whole blood, plasma, or serum) for diagnostic purposes by quantitative nucleic acid amplification techniques (e.g., real-time PCR). Values are given as c/ml or if harmonized according to WHO standard preparations as IU/ml.

Taxonomy

Family and Genus

The seven species of human adenoviruses (HAdVs) (A to G) are members of the *Adenoviridae* family, genus *Mastadenovirus*, thus their correct name is human mastadenovirus according to the International Committee on Taxonomy of Viruses. However, their previous (and now vernacular) name HAdV is widely accepted and used in this article. HAdV species were initially defined by phenotypic properties (e.g., hemagglutination) but are nowadays clearly backed by molecular phylogenetic criteria based on complete genomic sequences. Therefore, HAdV types that belong to the same species (A to G, see [Table 1](#)) are more closely related to each other and frequently have similar tropism, disease association, and virulence. Tropism of HAdV types is influenced by their use of different cellular receptors they attach to with their highly variable fiber knob. Other factors that can contribute to their different tropism and virulence are the interaction of the penton base with the secondary cellular receptor, and early gene products interacting with regulators of the cell cycle, replicating the viral genome and interfering with the immune system. Moreover, recombination events between HAdV types of the same species are feasible, resulting in novel (geno-)types that may contain sequences coding for immunogenic epitopes of low prevalence (sero-)types within a genomic backbone of a more virulent and prevalent type ([Fig. 1](#)). Thus, these recombinant types can be positively selected for by an immune escape mechanism.

Types and Subtypes

Typing was based on serology (neutralization testing and as a surrogate technique hemagglutination inhibition testing) up to type 51 (serotypes), but later on, almost all novel types (genotypes) were defined by genomic criteria that include either recombinant phylogeny of genes coding for major capsid proteins or novel genes. Type numbers were assigned chronologically according to the first isolation of a novel HAdV. Therefore, low numbers are somewhat associated with more prevalent types and/or easy propagation on cell cultures but types with closely related numbers do not have to be closely related to each other (for adenovirus species and types, see [Table 1](#)). According to more precise but somewhat outdated differentiation techniques, genome types (not to be confused with genotypes) and intermediate types were defined on a subtype level to describe adenoviruses associated with high virulence and unusual disease associations or to study infection chains. Genome types were defined by restriction fragment length polymorphisms and intermediate types by different typing results in neutralization testing (based on the hexon neutralization epitope ϵ) and hemagglutination inhibition testing (based on the fiber knob epitope γ). Many of these genome types and intermediate types were reanalyzed by complete genomic sequencing, found to be recombinant adenoviruses fulfilling the genotype criteria for a novel HAdV type and reassigned with a new type number. For example, the genome type 19a – which is associated with epidemic keratoconjunctivitis – was reassigned as type number 64.

without compromising their replication in cell cultures. However, this deletion was never observed in clinical isolates because E3 gene products protect infected cells from the action of the immune system.

Epidemiology

HAdVs are prevalent worldwide and it can be assumed that every adult has survived infections with multiple types, but of course, not all types. HAdV infections of neonates are observed rarely because of maternal passive immunity against highly prevalent types. However, sporadic infections with types not covered by passive immunity may present as severe lower respiratory tract infections (LRTI) and even disseminated infections (see below) in neonates.

As maternal passive immunity wanes at an age of 6–12 months, toddlers get frequently infected with highly prevalent HAdV types of species C (e.g., types 1, 2, and 5), species B (e.g., 3 and 7), and species F (types 40 and 41). Infections with highly endemic species C HAdV types present as upper respiratory tract infections (URTI), sometimes in combination with gastroenteritis. Adenovirus latency in lymphoid cells of the adenoids and gastrointestinal tract is a sequel of these infections and can last for several years after primary infections but is not lifelong in contrast to herpesvirus latency. HAdV latency usually results in intermittent low-level shedding of HAdV DNA and infectious virus with respiratory secretions and feces. The epidemiological significance of this shedding remains obscure, but adenovirus latency may result in clinically significant reactivations in immunosuppressed individuals. Infections with species B types – also associated with respiratory tract infections and occasionally affecting the lower respiratory tract – can be more frequently observed as epidemics. Transmission of respiratory HAdV types is by droplets and smear infections but, in contrast to many other respiratory viruses, not limited to the typical winter season.

Adenoviruses are considered to be the third most frequent cause of viral gastroenteritis (after rotavirus and norovirus infection). Infections with species F adenovirus types frequently cause gastroenteritis outbreaks in toddlers and young children. At a slightly higher age (kindergarten and primary school), HAdV types of species A (12, 18, and 31) can cause small gastroenteritis outbreaks at these institutions. Transmission is by the fecal-oral route, frequently by smear infections, and difficult to control due to very high virus loads in feces (up to 10^{10} /ml). Therefore, nosocomial transmission chains can be observed.

Older children, adolescents, and young adults are prone to respiratory infections with the less prevalent HAdV species B types with respiratory tropism (e.g., 14, 21, and 55, in addition to 3 and 7) and infections with type 4 (species HAdV-E). These can cause epidemics in summer-camps and military barracks. The same types also cause pharyngoconjunctival fever and conjunctivitis outbreaks and some of these can be traced back to insufficiently chlorinated swimming pools.

As many adults are immune to the above-mentioned highly prevalent types, adenovirus infections mostly present as sporadic cases of individuals exposed to the types for which they are susceptible. For example, adults can also be affected in outbreaks of adenovirus types with respiratory tropism (e.g., 3, 4, 7, 14, 21, and 55). Genitourinary infections of adults – urethritis, for example – can be transmitted sexually and are caused by types usually associated with respiratory and eye infections (types 2 and 37, respectively) but these infections appear to be rather sporadic cases or small infection chains. Hemorrhagic cystitis can be observed both in adults and in children and is clearly associated with a few types of species HAdV-B (11, 34, and 35) but cases are rather sporadic. However, it is thought that these infections are underdiagnosed in mild, non-hemorrhagic cystitis cases. Seniors are frequently affected by large outbreaks of epidemic keratoconjunctivitis, which can also affect younger patients. Epidemic keratoconjunctivitis is caused by a few types of species HAdV-D (8, 37, 53, 54, and 64 – previously labeled as 19a). Transmission is by smear infection. Previously, insufficiently disinfected medical devices at ophthalmologists' offices were a major route of transmission. Nowadays, transmission at ophthalmologists' offices can still be observed because the crowding of patients in the waiting room facilitates smear infections from non-disinfected surfaces. Control of transmission is not an easy task because of the very high HAdV concentrations in eye secretions. The majority of other HAdV species D types are far less virulent, not associated with eye infections but rather with mild to asymptomatic gastrointestinal and respiratory infections.

Adenoviruses can cause severe, sepsis-like, disseminated infections in severely immunosuppressed patients of all age groups. These are most frequently observed in pediatric patients after allogeneic stem cell transplantation. As the majority of these infections are reactivations of latent adenovirus, which has a higher prevalence in pediatric patients, these cannot be completely avoided by hygiene measures.

Clinical Description of Infection

Incubation Period

The incubation period of HAdV Infections is usually short, within a range of one to two weeks. It may be even shorter in gastroenteritis and URTI. By contrast, many disseminated infections of immunosuppressed patients originate from latent adenovirus infections, which may have been established several years ago.

Due to the multitude of HAdV types with different tropism and virulence, a multitude of different diseases are associated with HAdV infections. Clinical manifestations of HAdV infections are also influenced by the age and immune status of the infected person.

Upper Respiratory Tract Infections

Many of these occur early in life and are self-limiting and mild. Usual symptoms are fever, nasal congestion, rhinitis, pharyngitis with sore throat, and cervical lymphadenopathy. Sometimes, otitis media may be present. An exudative tonsillitis may also be observed and can be clinically indistinguishable from a group A streptococcal infection. As C-reactive protein levels are elevated and infections may also occur without the typical seasonality of other respiratory virus infections, these may be falsely diagnosed as bacterial infections and treated unnecessarily with antibiotics. Most of these infections are caused by the few types of HAdV species C and a few types of species B (e.g., 3 and 7).

Lower Respiratory Tract Infections

URTI with types of species HAdV-C and -B may progress to LRTI with symptoms of cough, (pseudo-)croup, and bronchitis. Bronchiolitis and pneumonia can be severe and sometimes fatal, particularly in neonates and young children less than two years of age. A pertussis-like syndrome has also been reported, but the etiological significance of HAdV is questionable. In older children and adults, another small group of adenovirus types is clearly associated with severe LRTI (bronchiolitis, pneumonia, ARDS): type 4 of species HAdV-E and several types of species HAdV-B: 14, 21 (subtype 21a), 55, and 66 (previously labeled as genome type 7 h or intermediate strain 7H3) as well as, occasionally, types 3 and 7. Infections with these types account for the outbreaks of severe lower respiratory tract diseases in young military recruits reported most frequently in the US military and occasionally in other militaries. Stress and fatigue in military recruits as well as the cold season promote severe LRTI, including acute respiratory distress syndrome (ARDS).

The role of adenoviruses in asthma remains controversial, but long-term sequelae (bronchitis obliterans, bronchiectasis, and chronic atelectasis) of these LRTI are more frequently reported.

Ocular Infections

Corneal infection is typical in epidemic keratoconjunctivitis. This may begin with conjunctivitis with a "foreign body in the eye" sensation and progresses with corneal erosions and infiltrates that impair vision and painful edema of the eyelids. Acute inflammatory symptoms resolve in about two weeks. Unfortunately, blurred vision due to chronic infiltrates of the cornea (numuli), photophobia, and a foreign-body sensation may persist for months to years. Most cases of epidemic keratoconjunctivitis are caused only by a few types of species HAdV-D (8, 37, 53, 54, and 64). Several other HAdV types are associated with less severe ocular infections. Acute follicular conjunctivitis resolves without consequence in a few weeks but acute hemorrhagic conjunctivitis may also be observed. Pharyngoconjunctival fever is a typical manifestation of HAdV infection presenting with follicular conjunctivitis in combination with upper respiratory tract symptoms as pharyngitis, fever, and – occasionally – lymphadenopathy and malaise. All these eye infections usually do not affect the cornea and are associated with types 3, 4, and 7 of species HAdV-B and HAdV-E but may be caused by other types occasionally.

Gastroenteritis

The enteric HAdV of species F (types 40 and 41) and species A (types 12, 18, 31) are the third most common cause of viral gastroenteritis. In some cases, HAdV upper respiratory tract infections (see above) may also present with gastroenteritis symptoms. Species HAdV-F infections predominate in children below two years old. Symptoms include mild fever, vomiting, abdominal pain, and diarrhea – which is usually watery and non-bloody, lacks fecal leukocytosis, and lasts for about ten days. If dehydration is adequately treated, the vast majority of immunocompetent patients recover uneventfully. Mild enteritis is also observed in many cases of upper respiratory infections with non-enteric types of HAdV (see above). Other gastrointestinal syndromes infrequently associated with non-enteric adenovirus types include intussusception, acute mesenteric lymphadenitis, and appendicitis. However, more studies on these disease associations are required because HAdV DNA detection in these diseases may have been due to coincidental HAdV latency in gut-associated lymphoid tissue.

Genitourinary Diseases

Genitourinary diseases – including genital lesions, urethritis, cystitis, and hemorrhagic cystitis – are occasionally caused by HAdV. Cystitis and hemorrhagic cystitis of children and adults is clearly associated with a few types (11, 34, 35) of species HAdV-B. Although usually self-limiting, these infections may progress to graft nephritis in renal transplant recipients. Moreover, there are hints that these infections may also become latent for several years. Genital lesions and urethritis by HAdV can be sexually transmitted but are infrequent manifestations of HAdV infections with types usually associated with other diseases (e.g., type 2 and 37).

Fig. 2 Pathogenesis of disseminated adenovirus disease in immunocompromised patients. The source of human adenoviruses (HAdV) infection can be either de novo infection or reactivation from latent/persistent infection of the lymphatic tissue, for example, of the gut or the upper respiratory tract. After local replication, for example, in the gastrointestinal tract, HAdV spreads via the peripheral blood to other organs, such as the liver, bone marrow, central nervous system, urogenital, or respiratory tract. Massive HAdV replication in the affected organs leads to tissue destruction and causes the respective organ manifestation, such as enteritis, hepatitis, or pneumonia (here designated in *italics*). Virus progeny is shed to the blood or stool. Multiple organ involvement as well as disseminated intravascular coagulation might lead to a “septic” picture of disease and result in a very high lethality. From Ganzenmueller, T., Heim, A., 2011. Adenoviral load diagnostics by quantitative polymerase chain reaction: Techniques and application. *Reviews in Medical Virology* 22 (3), 194–208. doi:[10.1002/rmv.724](https://doi.org/10.1002/rmv.724).

Diseases Infrequently Associated With Human Adenoviruses Infections

Exanthems are occasionally associated with HAdV infections. Severe neurologic manifestations, such as meningoencephalitis and encephalitis, have been described occasionally and diagnosed by HAdV DNA detection in cerebrospinal fluid. HAdV DNA has also been detected in acute myocarditis of otherwise healthy people but more studies are needed on this topic. Adenovirus type 36 (species HAdV-D) infections have been linked epidemiologically to obesity – although this is controversial – as well as the association of HAdV infections with fetal demise and Kawasaki disease.

Adenovirus Infections of Immunocompromised Patients

All of the above-mentioned HAdV diseases may be prolonged and more severe in immunocompromised individuals including, for example, the progression of a respiratory infection from the upper to the lower respiratory tract or from cystitis to graft nephritis. Nevertheless, HAdV infections are only infrequent complications of solid organ transplant recipients and associated with periods of increased immunosuppression. HAdV infections of solid organ transplant recipients may be associated with the graft and are hard to discern from rejection. For example, in liver transplant patients, infections are most often associated with diarrhea, graft hepatitis, and sometimes pneumonia; in renal transplant recipients, acute hemorrhagic cystitis, graft nephritis, and pneumonia. Without proper adenovirus diagnostics, HAdV graft infections can be mixed up with rejection, and increased immunosuppression to treat supposed rejection may result in graft loss.

HAdV infections are most frequently observed in pediatric allogeneic hematopoietic stem cell recipients, about 20% may present with an HAdV infection and about 5% succumb before screening and treatment options develop. Disease most frequently starts with endogenous reactivation of a latent HAdV infection in the gastrointestinal tract (**Fig. 2**) resulting in gastroenteritis or asymptomatic HAdV shedding with the feces. Less frequently, de novo infections of the gastrointestinal tract or respiratory tract are observed. Anyway, these primary localized infections lead to viremia and subsequent organ infections (e.g., hepatitis, pneumonia, pancreatitis, encephalitis), which may be life-threatening. Lymphopenia (<300 μ l) and extensive use of immunosuppressive drugs to treat graft versus host disease are risk factors for the progression to disseminated disease, which is indicated by an increase of

Fig. 3 Typical kinetics of the human adenoviruses (HAdV) blood load, leukocyte counts, and transaminase levels in a stem cell transplant (SCT) recipient with fatal disseminated HAdV disease. The graph depicts the HAdV DNAemia kinetics in peripheral blood of an SCT recipient, who died from multiple organ failure due to disseminated HAdV disease on day 126 after SCT. As a surrogate marker of severe hepatitis, the transaminase levels (aspartate transaminase) are indicated in U/L. Continuously declining leukocyte counts (leukocytes/ml), within parallel increasing HAdV DNAemia, highlight the role of the cellular immune response for the clearance of HAdV infections. From Ganzenmueller, T., Heim, A., 2011. Adenoviral load diagnostics by quantitative polymerase chain reaction: Techniques and application. *Reviews in Medical Virology* 22 (3), 194–208. doi:10.1002/rmv.724.

virus loads in peripheral blood. High-level viremia (10^6 – 10^{10} copies HAdV DNA/ml) is typical for this disease and associated with sepsis-like symptoms and failure of multiple organs (e.g., hepatitis and pneumonia) resulting in high mortality rates (Fig. 3). Both lysis of cells of visceral organs by HAdV replication and induction of a “cytokine storm” like sepsis by high loads of HAdV in the peripheral blood contribute to its pathophysiology. Disseminated disease of pediatric patients is most frequently caused by types 1 and 2 of species HAdV-C, less frequently by the other types of species C and type 31 of species HAdV-A.

In adult allogeneic hematopoietic stem cell recipients, HAdV infections are less prevalent, probably because adults may less frequently have HAdV latency, but disease manifestation is as severe as in the pediatric group. Types of species HAdV-C can be detected, as in pediatric patients, but several types usually associated with cystitis (11, 34, and 35 of species HAdV-B) can almost exclusively be found in this adult age group as an etiology of disseminated disease.

Since highly active antiretroviral therapy became available, HAdV complications in HIV infected patients were hardly ever observed. Previously, AIDS patients presented with chronic gastroenteritis, severe hemorrhagic cystitis, adenovirus-associated pneumonia, meningoencephalitis, and hepatitis as well as disseminated disease. In this group of patients, multiple types of species HAdV-D have been observed as etiological agents.

Animal Adenoviruses

Adenovirus infections can be found in almost all vertebrae (fish, reptile, bird, and mammal). Although typical zoonotic infections have not been described in humans, several adenovirus types infecting humans or simians share parts of their genomic sequences because of previous recombination events. These results of complete genomic sequencing indicate inter-(host-)species transmission events in the phylogeny of adenovirus types, infecting humans and adenovirus types infecting simians.

Diagnosis

Polymerase Chain Reaction (PCR) for Human Adenoviruses DNA Detection

In general, detection of HAdV DNA by nucleic acid amplification technologies (usually PCR) is the preferred diagnostic procedure for all types of adenovirus infections. Diagnostic specimens taken from the affected body site are appropriate (e.g., urine in cystitis cases, nasopharyngeal swabs in upper respiratory tract infections), although a few pitfalls have to be considered.

The huge genetic diversity of HAdV impedes the detection of all types in a single reaction, but several “generic” PCRs have been published and are also commercially available. However, some other commercially available diagnostic PCRs do not detect all types — sometimes only a very limited number of HAdV types. Many of these PCRs are parts of highly multiplexed PCR panels that detect multiple viral and bacterial pathogens associated with respiratory infections or gastroenteritis. Diagnostic claims and

intended use of these assays should be carefully checked. For example, a highly multiplexed PCR assay for gastroenteritis diagnostics may merely detect types 40 and 41 of species HAdV-F. Thus, this will underdiagnose gastroenteritis caused by other HAdV-types (e.g., gastroenteritis outbreaks in older children caused by types of species HAdV-A and sporadic gastroenteritis cases caused by types of species C, D, and G). Moreover, this assay will probably not detect adenovirus gastroenteritis in immunosuppressed patients, where species HAdV-C and -A types predominate. Of course, it is also not appropriate for screening purposes in this group of patients (see below).

Another pitfall of HAdV diagnostics by PCR (and to a lesser extent by virus isolation on cell cultures) is the detection of a latent HAdV infections coincident with another acute respiratory or gastrointestinal infection. About 5% of upper respiratory specimens or feces specimens of healthy or otherwise infected children can be HAdV DNA positive if a sensitive PCR protocol is used. Moreover, even EDTA blood specimens of healthy children with HAdV latency can be occasionally positive. Although analytically correct, these results are diagnostically misleading. Adenovirus shedding and DNAemia during latent infections is intermittent and always at low levels, whereas in all acute HAdV infections, an abundance of HAdV DNA is typical. Therefore, the simple solution to this diagnostic problem is either to limit the sensitivity of PCR protocols or to use real-time PCRs (using a cut off for high Ct values).

Quantitative Human Adenoviruses PCRs and Screening of High-Risk Patients

Diagnosis of disseminated disease previously required detection of HAdV (by virus isolation or histopathology) at multiple body sites, which was of course a tedious procedure. More recently, high virus loads in peripheral blood were found to be closely associated with disseminated infections. Therefore, testing EDTA blood (or plasma) samples by quantitative PCR became the standard diagnostic procedure for disseminated HAdV disease of immunosuppressed patients. Several generic real-time PCR protocols for HAdV DNA have been published and diagnostic assays are also available commercially. Multiple studies on virus loads in hematopoietic stem cell recipients demonstrated that disseminated disease and significantly higher mortality are associated with high peak virus loads in peripheral blood usually in a range between 10^6 and 10^{10} c/ml, whereas peak virus loads $<10^4$ c/ml were not. However, all these studies were not harmonized to a WHO standard, and different conclusions – if any – have been made on threshold virus loads for a therapy decision. Anyway, the occasional detection of low HAdV DNA concentrations in feces, respiratory materials, or blood should not be mistaken as the diagnosis of a severe HAdV infection but it rather indicates HAdV latency and a potential risk for severe HAdV infections.

In allogeneic hematopoietic stem cell recipients who are at a high risk for a disseminated HAdV infection (reactivation or de novo), weekly screening of blood virus loads is recommended by American and European guidelines to achieve an early diagnosis and facilitate preemptive therapy. Several studies in pediatric HSCT recipients have shown that additional weekly stool screening for HAdV DNA can detect reactivation even earlier and that increasing virus loads in stool precede HAdV DNA detection in peripheral blood by about one week. However, stool screening may fail in case of a de novo HAdV infection. Therefore, it should be performed only in addition to blood screening for HAdV.

Real-time PCR protocols can also be used for all other diagnostic applications that usually do not require quantification. Nevertheless, discerning highly positive specimens from weakly positive specimens can be helpful to diagnose acute infections in contrast to low-level HAdV shedding in latency.

Other Diagnostic Methods

Detection of HAdV antigens by ELISA and other (e.g., lateral flow) methods is feasible in stool samples and eye swabs with high HAdV loads, using commercial assays. However, their sensitivity and specificity are lower than PCR-based assays. Virus isolation on cell cultures was the previous gold standard of adenovirus diagnostics, but many laboratories stopped performing it because the time of detection is much slower than PCR. A549 cells are appropriate for most adenovirus types with the exception of types 40 and 41, which require Graham 293 cells for replication. Virus isolation is feasible from respiratory tract materials, eye swabs, urine, and stool but several days (up to three weeks) are required for the development of a CPE. An early CPE, observed during the first 24 h after inoculation of the cell culture, is not caused by HAdV replication but by toxic effects of HAdV penton base proteins, which can be present in high concentrations in clinical specimens.

Diagnosis of adenovirus infections by serological methods cannot be recommended due to the multiplicity of HAdV types. Type-specific neutralization tests can be regarded as reliable but are more appropriate for seroepidemiological and immunity studies. Adenovirus ELISAs use a group-specific epitope on the internal side of the capsid on the hexon protein but cut-offs are rather arbitrarily set; thus, any result is questionable.

Adenovirus Differentiation and Typing

For many diagnostic purposes, precise HAdV typing is not required but, basic differentiation on the HAdV species level can be quite helpful. For example, high virus loads of species HAdV-C in the feces of an HSCT recipient usually predict disseminated disease, whereas species HAdV-F does not. This differentiation can be easily performed with multiplex PCRs (conventional or real-time) for

the different HAdV species. Sequencing of amplicons of the usual generic diagnostic PCRs also provides rapid information on the HAdV species.

Typing is most frequently performed nowadays by sequencing the highly variable loops 1 and/or 2 of the main neutralization determinant ϵ on the hexon protein. This procedure is equivalent to the classical neutralization assays but can be more rapidly performed directly with diagnostic specimens (without prior virus isolation). However, results are equivocal because several of the new (geno-)types (type numbers > 53) share neutralization epitope sequences with one of the older (sero-)types. Precise typing requires additional sequencing of the highly variable loops on the fiber knob and penton base. These additional sequence data help identify all HAdV types unequivocally, including the recombinant (geno-)types. By contrast, even a combination of classical serological typing methods (neutralization testing and hemagglutination inhibition testing) may fail with a few of the new (geno-)types. Complete genomic sequencing of HAdV is also feasible to type cell culture isolates or even HAdV DNA directly from diagnostic samples when the viral load is high. By complete genomic sequencing, all types, subtypes, and strains can be identified precisely. Previously, restriction fragment length polymorphisms were used to differentiate genomic variants of HAdV types as genome-types (not to be confused with genotypes) but this approach became obsolete when next-generation sequencing became available.

Treatment and Prevention

Antivirals

As adenovirus infections of immunocompetent patients are usually mild and self-limiting, these do not really require antiviral treatment – just symptomatic and supportive therapy. Some of these infections may be treated unnecessarily with antibiotics if a diagnosis of HAdV infection has not been made because its symptoms (e.g., fever, elevated c-reactive protein, and tonsillitis) may lead to a suspicion of bacterial infection. A few severe diseases of immunocompetent patients (e.g., pneumonia and epidemic keratoconjunctivitis) would be sensible targets for antiviral treatment; however, this is not established. In a few cases of pneumonia, experimental therapy with cidofovir was reported but its efficacy remains unclear.

In immunocompromised patients, a reduction of immunosuppressive therapy, if feasible, is of outstanding importance because disseminated disease and lethal outcomes are clearly associated with high levels of immunosuppressive treatment or lymphopenia. In some cases, HAdV infection may mimic graft rejection (e.g., HAdV nephritis) or graft versus host disease (e.g., HAdV gastroenteritis). Without a diagnostic workup for HAdV, these cases had been treated with high dose immunosuppression resulting in graft loss, disseminated disease, and many fatalities. On the other hand, many immunosuppressed patients with a HAdV infection and viremia lack any specific symptoms until they reach high virus loads ($> 10^6$ c/ml). However, antiviral therapy tends to fail in patients with high virus loads. Therefore, a weekly blood (and stool) screening of high-risk patients is essential. As preemptive therapy, a reduction of immunosuppressive therapy and the application of antiviral agents (off label use) should be considered.

Several antivirals – including ganciclovir, ribavirin, cidofovir, and its prodrug brincidofovir – have in vitro activities against adenovirus. As many HAdV reactivations and infections were observed during ganciclovir prophylaxis for CMV infections and, in some cases, even during high dose therapy of CMV infections, the clinical use of ganciclovir for HAdV infections should not be considered.

Ribavirin may not have activity against all HAdV types but has gained an orphan drug status for HAdV infections. However, results of case reports and case series on ribavirin therapy were rather inconclusive and included therapy failures. Therefore, ribavirin is no longer frequently used for HAdV infections.

All HAdV types are susceptible to cidofovir in vitro. Although cidofovir resistance can develop with serial passages, little resistance has so far been detected in isolates from cidofovir-treated patients. Prospective controlled clinical trials have never been published, but several case reports and retrospective studies suggested some efficacy and a reduction of mortality if cidofovir is used as preemptive therapy. However, this is not a proof of the efficacy of cidofovir as other measures (reduction of immunosuppression) may have contributed to the more favorable outcomes. Moreover, HSCT patients can clear their HAdV infection spontaneously with hematopoietic regeneration and rising lymphocyte counts. In contrast to high HAdV loads, low peak HAdV loads in peripheral blood are not associated with mortality. Hence, the use of a threshold virus load (e.g., 10^4 copies/ml blood) to trigger preemptive cidofovir treatment has been suggested to avoid overtreatment and unnecessary side effects. Other factors supporting the treatment decision are T cell depletion, severe lymphopenia, and rapidly increasing virus loads.

A lipid conjugate of cidofovir – brincidofovir (CMX001), which can be administered orally – reaches higher intracellular concentrations and better antiviral activity with lower nephrotoxicity than cidofovir. However, diarrhea is the main side effect of brincidofovir. Although a randomized placebo-controlled clinical trial for the preemptive treatment of asymptomatic HAdV-DNAemia in HSCT patients did not show a significant effect on the primary endpoint, a positive trend was observed. In addition, many case studies support the view of a higher efficacy of brincidofovir.

Although preemptive antiviral therapy can limit HAdV infection for some time, clearance of HAdV DNAemia is clearly associated with increased lymphocyte counts and the detection of adenovirus specific T cells. Therefore, immunotherapeutic interventions – either using donor lymphocyte infusions or the adoptive transfer of HAdV-specific cytotoxic T lymphocytes expanded from naive T cells – were developed. The latter approach holds promise to avoid graft-versus-host disease associated

with donor lymphocyte infusion. As the *in vitro* expansion process requires several days, diagnosis of HAdV infection has to be made early, bridging with antiviral agents as cidofovir is usually required.

Vaccines

An oral vaccine against HAdV types 4 and 7 is available only for the US military. This vaccine is effective to prevent respiratory infections, which can be severe in military recruits. Surprisingly, it consists of replication-competent, non-attenuated viruses contained in enteric-coated tablets. After ingestion, the HAdV infection seems to be limited to the gastrointestinal tract, and protective immunity against subsequent respiratory infections with these types is induced.

Germicides

Infectious HAdV can survive for long times in liquids or dried on surfaces; moreover, as a non-enveloped virus, it is resistant to common detergents. Therefore, there is a high risk for smear infections. However, HAdV is sensitive to heating and many chemical germicides. These should be certified for their activity against HAdV, but due to the very high virus loads in feces or eye swabs, even these may fail. Therefore, a combination of thorough cleaning and subsequent use of germicides can be considered.

Introduction

The hepatitis A virus (HAV) and hepatitis E virus (HEV) are small RNA viruses mainly enterically transmitted. There are two forms of infectious particles; one corresponds to non-enveloped particles that are shed in the feces and the other is cloaked in host cell membranes and circulates in the blood. This membrane envelopment protects the HAV and HEV against neutralizing antibodies. Although both are ancient viruses, they are still a frequent cause of disease affecting millions of individuals annually.

Many individuals with HAV and HEV infections are asymptomatic or have mild symptoms. However, severe liver disease is also observed. In contrast to HAV and HEV genotypes 1 and 2, HEV genotypes 3 and 4 infections can lead to chronic hepatitis and cirrhosis in immunocompromised patients. For these patients, reduction of immunosuppression or ribavirin therapy can eradicate HEV. Extrahepatic manifestations such as neurological and renal diseases have been described in association with acute and chronic HEV infections.

Validated HAV immunoassays are largely available but HEV serological and nucleic acid tests have only recently made available. The improvement of virological tools for HEV diagnosis allowed a deep change in the understanding of the epidemiology and pathology of HEV infection.

Taxonomy

Hepatitis A Virus

HAV belongs to the family *Picornaviridae*, genus *Hepatovirus*. HAV has a primitive capsid related to that of picorna-like viruses (dicistroviruses) that infect insects. The nucleotide sequences of HAV strains vary little over time or place. There are six closely related genotypes (I to VI) but only one serotype. Genotypes I to III, further divided into subgenotypes A and B, are associated with infections in humans, while genotypes IV to VI are simian in origin. Evolutionary ancestral forms have been found in small mammals such as bats, rodents, hedgehogs, and shrews.

Hepatitis E Virus

HEV belongs to the *Hepeviridae* family, which includes two genera (*Orthohepevirus* and *Piscihepevirus*) and five species. The species *Orthohepevirus A* includes HEV that infects humans and several other mammals. *Orthohepevirus B* infects chickens, while *Orthohepevirus C* infects rats and ferrets, *Orthohepevirus D* infects bats, and *Piscihepevirus A* infects cutthroat trout. Two cases of infection with *Orthohepevirus C* HEV were reported recently despite its genetic differences from the other human pathogenic strains. The species *Orthohepevirus A* consists of at least eight distinct HEV genotypes but only one serotype. Genotypes 1 and 2 are strictly human and circulate in developing countries where sanitary conditions are poor. They are responsible for outbreaks. HEV genotype 3 is widely distributed around the world while HEV genotype 4 is found mainly in Asia. Genotypes 3 and 4 have animal reservoirs, mainly pigs, and infect humans in developed countries. HEV genotypes 3 and 4 have been detected in a wide variety of animals, including domestic pigs, wild boar, deer, rabbits, and mongoose. HEV genotypes 5 and 6 have been detected in wild boar in Japan but not yet in humans. HEV genotype 7 was recently detected in dromedary camels; it also caused chronic hepatitis in an immunosuppressed individual who regularly consumed camel milk and meat. Lastly, HEV genotype 8 has been found in Bactrian camels.

Epidemiology and Transmission

HAV and HEV are both transmitted mainly by the fecal-oral route. But despite their modes of transmission being quite similar, their epidemiology differs.

Epidemiology

Hepatitis A virus

HAV is distributed worldwide but its epidemiological pattern varies between populations, depending on sanitation and socioeconomic status. One way of assessing the endemic penetration of HAV is based on the age at which seroprevalence reaches 50% of the population: very high (<5 years), high (5–14 years), intermediate (15–34 years), and low (>35 years) (Fig. 1).

Fig. 1 Geographic distribution of HAV infections. HAV: colors represent different endemic patterns based on the age at which 50% of the population is HAV IgG positive [red: very highly endemic (< 5 years); orange: highly endemic (5–14 years); light green: intermediately endemic (15–34 years); dark green: low endemic (> 35 years)].

Very high and high endemicity pattern

The rates of HAV transmission in low-resource countries with poor sanitation, such as most area in Africa and parts of Asia, are very high and HAV is acquired in early childhood. Infections are asymptomatic and lead to universal protection against HAV in later life. Most people are exposed to HAV and become seropositive before they are 5 years old.

Low endemicity pattern

The circulation of HAV is limited in high-resource countries with good sanitation and hygienic conditions (North America, Europe, Australia, Japan, etc.), and most people in all age groups are susceptible. However, HAV seroprevalence is higher in older people due to a cohort effect. Introduction of HAV into the population of these countries can trigger waves of transmission with symptomatic disease (jaundice), in men who have sex with men (MSM) for example, or through importation of contaminated food.

Intermediate endemicity pattern

HAV infections are fairly common in intermediate-resource countries like North Africa, South America and Western Asia, where symptomatic disease occurs in children over 5 years old and young adults. Socio-economic development and improved hygiene have led to a change in HAV epidemiology in these countries, with more cases of disease, more hospitalizations, and more deaths, despite reduced HAV transmission. This public health problem has led to increased prevention, including universal childhood HAV vaccination.

Hepatitis E virus

HEV genotypes 1 and 2

HEV genotype 1 is highly endemic and prevalent in South, Central, and South-East Asia, as well as in Africa and the Middle East (Fig. 2). HEV genotype 2 is prevalent in western Africa and Mexico. Although HEV genotype 1 was responsible for frequent outbreaks in China over the past few decades, it is now less prevalent. HEV genotype 4 infections have become more prevalent, perhaps due to improved sanitation and increased income. It is estimated that 20.1 million new infections occur annually in Asia and Africa. Determining the real seroprevalence in these areas is difficult as a variety of serology assays with quite different sensitivities have been used. However, published data indicate that 20% to more than 50% of people living in most parts of Asia and Africa have HEV antibodies. Most of the asymptomatic cases are adolescents and young adults. Infection in children is more often asymptomatic than in adults.

HEV genotypes 3 and 4

HEV genotype 3 is the main HEV genotype circulating in Europe, North America, and South America, while genotype 4 is predominant in Asia (Fig. 2). Cases of genotype 4 HEV infection in Europe are sporadic and locally acquired while genotype 1 infections are travel-associated. The total number of reported symptomatic cases in Europe increased ten-fold between 2005 (514 cases) and 2015 (5617 cases), but the percentage of cases hospitalized decreased from 80% in 2005 to around 50% in 2015. A meta-analysis showed that the prevalence of IgG in the general population in Europe is influenced by the assay used for the

Fig. 2 Geographic distribution of HEV infections. HEV: colors represent the predominant HEV genotypes in each area (pink: HEV genotypes 1 and 2; green: HEV genotype 3; blue: HEV genotype 4).

detection. Thus, 52% of the heterogeneity was explained by 3 parameters: the assay used, the geographical location and the cohort studied. Hence, the seroprevalence of IgG can be <10% in countries like Italy, Ireland or Scotland and >20% in others like France, the Netherlands or Germany. The estimated seroprevalence of IgG in France was 22.4%, based on more than 10 000 French blood donors. There were geographical differences: rates were higher in the South and North East. But seroprevalence can vary from over 80% to below 20% even in high-rate areas like South-West France. Historical data indicated a seroprevalence of 21% in the United States, while more recent data suggest that the prevalence of HEV IgG is 6%. However, few data are available for the United States, probably due to the lack of FDA-licensed anti-HEV serology assays.

Transmission

Hepatitis A virus

Although a highly effective, safe hepatitis A vaccine was developed in the early 1990s, HAV is still an important cause of acute viral hepatitis worldwide. The virus is readily transmitted and outbreaks are frequent, especially in developed countries where herd immunity in the population is low. There is no animal reservoir for human HAV strains.

Water- and food-borne transmission

Most cases of HAV are due to ingesting contaminated water or food, but swimming in water contaminated by adjacent septic systems or sewage is also a risk. A variety of foods have been implicated in hepatitis A outbreaks. Food can be contaminated at any point during processing, harvesting, preparation, or distribution. Seafood, vegetables, and fruit are classic vectors. The largest reported hepatitis A outbreak was associated with consumption of raw clams in Shanghai in 1988: around 300,000 individuals were infected. Hepatitis A outbreaks due to contaminated food remain a public health problem in developed countries with low or intermediate endemicity.

Person-to-person transmission

Close contact between infected and susceptible people is the most common mode of HAV transmission in developing and developed countries. Transmission is facilitated by the prolonged shedding of HAV in the feces before and after the onset of symptoms, and asymptomatic infections, especially in young children. This type of HAV transmission occurs frequently in close institutions like schools, nurseries or day care centers.

Other modes of transmission

Outbreaks of HAV infection frequently occur among MSM. HAV is not transmitted by the semen but by oral contact with fecally contaminated sites. The initial introduction of HAV into an MSM community is followed by its rapid spread and subsequent persistence.

Outbreaks of HAV infection have been also reported among people who inject drugs.

Lastly, HAV can, very rarely, be transmitted by the transfusion of blood or blood products. In some cases, the recipients are HAV IgG positive. Blood donors are not screened for HAV because acute HAV infections are sporadic among blood donors and there are no chronic carriers. However, the plasma industry tests all sources of plasma by testing mini-pools for HAV nucleic acid.

Hepatitis E virus

HEV genotypes 1/2 and genotypes 3/4 are transmitted differently. HEV genotype 1 and 2 infections occur mainly in developing countries, where up to 25% of infected pregnant women can die of severe hepatitis. It can be responsible for outbreaks in areas where it is highly endemic. Drinking contaminated water is the main route of transmission and outbreaks are often linked to fecal contamination of drinking water. Person-to-person transmission of HEV is uncommon. The transmission from infected women to their newborns is well documented, and transmission of HEV genotype 1 through blood transfusions has been reported.

HEV genotypes 3 and 4 are found in high-income countries. Since these genotypes have animal reservoirs, the main route of their transmission is from eating HEV-infected animal products, especially undercooked meat. Eating infected pork liver, pork products containing liver, and other raw or undercooked pork meat are the main sources of HEV infections. Infected game meat is another source of human infection. Strains of rabbit HEV have been detected in humans. HEV shed by infected animals can contaminate water sources, leading to the accumulation of HEV in fruit, vegetables, and shellfish. Hence, HEV RNA (HEV genotype 3) has been detected on red fruit, strawberries, salads and in spices, as well as in oysters and mussels. Recent studies in many European countries, China and Japan have also shown that HEV can be transmitted by transfusion of blood products. Most cases of transfusion-transmitted HEV infection are asymptomatic, and only a small proportion of recipients of infected blood products develop symptomatic hepatitis. The frequency of blood donors testing positive for HEV RNA across many countries ranges from 1:600 to 1:14,799. Blood donors are now systematically screened in several European countries.

Clinical Presentation and Course

Hepatitis A virus

The clinical manifestations of HAV infection usually range from asymptomatic infection to fulminant hepatitis, depending on the age of the patient. Thus, 70% of infected children under 6 years old are asymptomatic while over 70% of infections in adults are symptomatic. Symptoms, including fever, malaise, nausea, vomiting, abdominal pain, dark urine and jaundice, develop after an incubation period of approximately 4 weeks (range 2–7 weeks). Other symptoms like myalgia, pruritus, diarrhea, arthralgia or skin rash are less common. While there is no evidence of chronic liver disease or persistent infection after acute hepatitis, some patients (4%–20%) suffer from prolonged disease or relapsing disease lasting up to 6 months, with prolonged HAV excretion in the feces.

Atypical manifestations reported following HAV infection are: relapsing hepatitis, prolonged cholestasis and complicated cases with acute kidney injury or autoimmune hepatitis. Relapsing hepatitis A is defined by a biphasic peak of serum liver enzyme (aminotransferase) with 4–7-week intervals between the first and second peaks. Prolonged cholestatic hepatitis A is associated with pruritus, fatigue, loose stools and weight loss. Prolonged cholestatic cases can be predicted by the detection of HAV RNA in the plasma after 20 days of illness, while relapse is not predictably linked to the presence of plasma HAV RNA. Acute kidney injury occurs in 1.5%–4.7% of patients with non-fulminant hepatitis A. Renal damage may be due to pre-renal factors associated with anorexia, nausea, vomiting, diarrhea and fever as well as the nephrotoxic effect of hyperbilirubinemia, immune complex-mediated nephritis, interstitial nephritis and rare massive intravascular hemolysis. Other rare extra-hepatic manifestations have been reported: autoimmune hemolytic anemia, aplastic anemia, pure red cell aplasia, pleural or pericardial effusion, acute pancreatitis and neurological complications (mononeuritis, mononeuritis multiplex and Guillain-Barré syndrome).

Fulminant hepatitis is a rare complication of HAV infection. The incidence varies between 0.015% and 0.5% of acute hepatitis A cases. Older adults with underlying chronic liver disease are at greatest risk of acute liver failure.

HAV infection during pregnancy is associated with a great risk of maternal complications and preterm labor, despite the relatively mild features of the disease. Fetal outcome is usually benign despite prematurity.

Hepatitis E Virus

Most acute HEV infections are asymptomatic or minor systemic illnesses, whatever the genotype. The typical early phase symptoms of acute hepatitis E that develop after an incubation period of 2–6 weeks are unspecific and include: flu-like myalgia, arthralgia, weakness, and vomiting. Symptoms of acute hepatitis include jaundice, fatigue, itching, nausea, pale stools, and dark urine. The clinical symptoms and signs are indistinguishable from those of other forms of viral hepatitis.

Acute hepatitis E in immunocompetent patients usually resolves spontaneously. Although reinfections are possible, they are less likely to develop symptomatic hepatitis than non-immune individuals. A few HEV-infected individuals (0.5%–4%) develop acute liver failure. Patients with pre-existing chronic liver diseases are at increased risk of liver failure and mortality can be as high as 67%. There have been cases that have needed liver transplantation following HEV infection.

Pregnant women are at high risk of developing symptomatic disease if they become infected with HEV genotype 1 during the second and third trimesters. Many progress to acute liver failure, haemorrhagia and eclampsia, and the mortality rate can reach 15%–25%. Miscarriages, preterm deliveries, stillbirths and perinatal mortality are all more frequent in HEV genotype 1-infected pregnant women. Their new-born babies are also at risk of HEV infection through maternal–fetal transmission and of developing complications, such as anicteric or icteric hepatitis, hypoglycemic and neonatal death. Conversely, pregnant women infected with

HEV genotype 3 or HEV genotype 4 do not suffer from such maternal mortality, perhaps because HEV genotype 1 replicates more rapidly in decidual and placental tissues than do other genotypes.

Immunocompromised patients, such as those on immunosuppressive therapy following solid organ transplantation, patients with hematological disease on chemotherapy, patients with rheumatic disorders on heavy immunosuppression immunotherapy, and HIV-infected patients with low CD4 T cell counts, can all suffer from chronic HEV infections. Most immunosuppressed patients are asymptomatic. Chronic HEV infection is defined as HEV replication that persists for more than 3 months. Patients infected with HEV genotype 3, HEV genotype 4 or HEV genotype 7 can suffer from chronic HEV infections. A single case of chronic HEV genotype 1 infection has been reported; this needs confirmation.

One third of solid organ transplant (SOT) recipients or patients with hematological disease spontaneously clear the virus, while two-thirds develop a chronic infection. The use of tacrolimus (a more potent immunosuppressant than cyclosporine A), a low lymphocyte subset count and less-active anti-HEV-specific T cell responses are more frequently associated with the development of a chronic infection in SOT patients. About 10% of chronically infected patients develop cirrhosis a few years after their infection. Lastly, liver fibrosis can regress after HEV clearance. While HEV reactivation after clearance is very rare, reinfections can occur and can lead to chronic hepatitis.

The awareness of extrahepatic effects of HEV infections has increased. Most involve the neurological and renal systems. HEV infections are associated with a range of neurological injuries and cases of neurological injury in HEV genotype 1-infected Asians and HEV genotype 3-infected Europeans have been reported. These neurological injuries seem to be more frequent in immunocompetent patients (22.6%) than in immunocompromised ones (3.2%). The neurological disorders associated with an HEV infection include neuropathic pain, painless sensory disorders, neuralgic amyotrophy (Parsonage-Turner syndrome), Guillain-Barre syndrome, encephalitis/myelitis, mononeuritis multiplex, Bell's palsy, vestibular neuritis, myositis and peripheral neuropathy. All the HEV-infected patients with neurological manifestations generally have normal or modestly abnormal liver function. Thus, the neurological symptoms and signs dominate the clinical picture in these patients.

Both acute and chronic HEV infections can lead to impaired renal function. Renal biopsies from patients infected with HEV genotype 1 and HEV genotype 3 show signs of glomerular disease, including membranoproliferative glomerulonephritis with or without cryoglobulinemia and membranous glomerulonephritis. Flare-ups of pre-existing IgA nephropathy may also occur in patients infected with HEV. HEV RNA was detected in the cryoprecipitate from the serum of an immunocompetent patient with an acute HEV infection who presented with cryoglobulinemic membranoproliferative glomerulonephritis. HEV infection has been identified as an independent predictive factor for cryoglobulinemia in SOT recipients. Clearance of HEV is associated with improved renal function and a decline in proteinuria in most patients, which suggests that HEV is probably the cause of the renal injury. Hence, patients with hepatitis who have impaired renal function or proteinuria should perhaps be screened for HEV.

Lastly, acutely infected patients may display hematological disorders like thrombocytopenia, autoimmune hemolytic anemia, aplastic anemia, and acute liver failure associated with pure red-cell aplasia. Up to 25% of HEV genotype 3-infected patients can suffer from asymptomatic monoclonal gammaglobulin but the clinical significance of this observation is uncertain. Acute episodes of pancreatitis have been reported in patients infected with HEV genotype 1 from South-East Asia but not those with HEV genotype 3 or HEV genotype 4 infections.

Diagnosis

Clinical manifestations and biochemical tests alone cannot distinguish between an HAV and an HEV infection. Serum alanine aminotransferase activity is elevated during the prodromal phase and during the initial part of the icteric phase (Fig. 3). An HAV/HEV infection can be diagnosed either directly by detecting the genome or antigen in the blood or other body fluids or indirectly by detecting antibodies in the serum. The IgM response is detected around the time that the serum alanine aminotransferase activity increases. Thus, the presence of HAV/HEV IgM in the serum is a key marker of an acute infection. The IgG response appears shortly after the IgM response and can persist for several years.

Antigen Detection

Hepatitis A virus

HAV antigen can be detected in both blood and fecal samples by immunoassays, but this is less sensitive than nucleic acid assays. No commercial assay is presently available.

Hepatitis E virus

Assaying for HEV capsid antigen can be used to diagnose an HEV infection. The sensitivity of the available commercial assay (Wantai Biological Pharmacy, China) is 91% (88% in immunocompetent and 94% in immunocompromised patients) and the specificity is 100%. This assay could be used for the direct diagnosis of an HEV infection by laboratories with no molecular diagnosis facilities.

Fig. 3 Virus detection (HAV RNA or HEV RNA) at different sites and serologic response (IgM and IgG antibodies). ALT, alanine aminotransferase.

Table 1 Commercial molecular assays for the detecting/quantifying HAV or HEV RNA

Virus	Manufacturer	Product name	Type of test	Analytical sensitivity
HAV	Altona Diagnostics	Real Star HAV RT-PCR	<i>In vitro</i> diagnostics real-time PCR qualitative test	46 IU/ml
	Hologic/Grifols	Procleix Parvo/HAV	Transfusion, TMA allowing simultaneous detection of HAV and Parvovirus B19	1 IU/ml

	Roche	COBAS HEV	Transfusion, real-time PCR qualitative test	7 IU/ml

Nucleic Acid Detection

Hepatitis A virus

HAV RNA can be detected in the blood and feces by RT-PCR or TMA before the increase in alanine aminotransferase activity and the appearance of clinical symptoms. Several commercial tests are available, with limits of detections ranging from 1 to 46 IU/ml ([Table 1](#)).

Hepatitis E virus

HEV RNA can be detected in the blood, other body fluids and feces using nucleic acid amplification. Most RT-PCR assays, including commercial assays, target ORF3. A TMA assay performed on a fully automated platform is well adapted for high throughput testing. The limit of detection of current assays is 7–188 IU/ml ([Table 1](#)). Reverse transcription droplet digital PCR gives absolute quantities of HEV RNA without a standard curve. Lastly, the loop-mediated isothermal amplification assay provides a one-step single tube amplification of HEV RNA.

Serological Tests

Hepatitis A virus

Enzyme or chemiluminescent immunoassays for HAV IgM and IgG are commercially available in either microplate or multi-parametric automated formats ([Table 2](#)). The diagnostic performance of these immunoassays in terms of sensitivity and specificity is well established (> 95%). No commercial rapid immunochromatographic assay is presently available.

Table 2 Commercial immunoassays for detecting anti-HAV and anti-HEV antibodies

HAV IgM, a key marker of acute infection, is detectable from the time the alanine aminotransferase activity increases and persists for 3–6 months thereafter. False positive results are possible, especially when the clinical picture does not reflect the HAV infection and there is no HAV IgG.

The presence of HAV IgG alone is a marker of past infection or vaccination. Testing for HAV IgG can be used to identify the unvaccinated individuals who require immunization, but the cost-effectiveness of screening depends on both age and epidemiologic parameters. Post-vaccination tests are not required due to the high efficacy of HAV vaccines.

Hepatitis E virus

Enzyme immunoassays for HEV IgM and IgG are commercially available in Europe and Asia in formats for microplates and multiparametric automated instruments (Table 2). Several immunochromatographic assays are also available in different countries. The antigens used are usually recombinant ORF2 capsid protein and/or ORF3 protein from HEV genotype 1 strain. The diagnostic performance of these immunoassays varies considerably and should be carefully evaluated.

The presence of HEV IgM in the serum is a key marker of an acute infection. Using a validated PCR assay as a reference, studies have shown that the sensitivity of IgM immunoassays is >97% for immunocompetent patients and 80%–85% for immunocompromised patients; their specificity is >99.5%. Longitudinal follow-up of patients with acute hepatitis E proven by nucleic acid testing showed HEV IgM persisted for 6–12 months.

The presence of HEV IgG alone is a marker of a past infection. It is difficult to compare seroprevalence rates for different populations obtained by different laboratory methods because the analytical sensitivity of IgG immunoassays varies enormously. The limits of detection of commercial HEV IgG assays vary from 0.25 WHO unit/ml to 2.5 WHO unit/ml when measured with an international standard (WHO reference reagent established in 2002; National Institute for Biological Standards and Control, Code 95/584). As highlighted in a meta-analysis of studies of HEV seroprevalence in Europe, the most sensitive immunoassay produced

the highest estimates of HEV IgG seroprevalence. Determining the HEV IgG concentration could be useful for estimating the risk of reinfection after a natural infection or vaccination.

Vaccines and Antiviral Agents

Hepatitis A Virus

Prevention against an HAV infection can be afforded by adequate sanitation and housing facilities, together with good personal hygiene. Passive or active immunization, before or after exposure, also provides effective protection against HAV infection.

Immunoglobulin

Passive immunization with human immunoglobulins can be used for pre-exposure prophylaxis. An intra-muscular injection of immunoglobulins (0.02–0.06 ml/kg) is effective within hours of injection and for periods of 12–20 weeks.

Human immunoglobulins can also be used for post-exposure prophylaxis, especially in immunosuppressed people, individuals at risk of severe disease, and infants less than 1 year old. As the average post-exposure incubation period of hepatitis A is about 28 days (but could be as short as 15 days), the time for intervention is only about 2 weeks. While immunoglobulins may protect against the symptoms of hepatitis A, they may not prevent infection following exposure. In recent years, the decline in the concentrations of HAV antibodies in the plasma pools used to prepare immunoglobulins has raised the question of the efficacy of these immunoglobulins in post-exposure prophylaxis. In addition, the short duration of protection and the increasing cost of immunoglobulins has led to a search for alternatives.

Vaccine

Inactivated hepatitis A vaccines contain virus particles produced in cell culture, purified, inactivated with formalin, and adsorbed onto aluminum hydroxide. Vaccines that combine hepatitis A and typhoid protection and hepatitis A and hepatitis B protection have been licensed, as have hepatitis A monovalent vaccines. The immunogenicity of the combination vaccines is equivalent to that of the monovalent hepatitis A vaccine. Live-attenuated HAV vaccines are available in China. Traditionally, two doses of inactivated vaccine at an interval of 6–12 months are recommended, beginning after 12 months of age. The protective efficacy is nearly 95% and protection lasts for at least 10 years. Modeling studies predict that 88% of individuals who were seronegative prior to vaccination will remain protected for at least 30 years. Consequently, the Centers for Disease Control and Prevention now recommend the pre-exposure prophylaxis of 2–40 year-old exposed patients with vaccine instead of immunoglobulins. The threshold for protection from HAV infection in humans is an antibody concentration of 10–33 IU/ml, depending on the assay used. However, clinical experience suggests that vaccination may provide protection even when no HAV antibodies can be detected using standard immunoassays. A positive test for total HAV antibodies signifies immunity to hepatitis A.

Optimal strategies for determining the need for HAV vaccination are based on seroprevalence. Vaccination is not routinely recommended for people living in areas where HAV is very prevalent. Almost all such people are asymptotically infected with HAV in childhood, which effectively prevents clinical hepatitis A in adolescents and adults. Vaccination of all children may protect the health of adolescents and young adults living in countries where HAV prevalence is intermediate. The vaccination of all babies in Argentina with a single dose of inactivated HAV vaccine at 12 months led to marked reduction in the incidence of symptomatic hepatitis A, fulminant hepatitis, and liver transplantation. Targeted vaccination of high-risk groups (travelers to regions of high HAV endemicity, MSM, injecting drug users, immunosuppressed patients, patients infected with HIV, and patients with chronic liver disease) is generally recommended for people living in countries where HAV prevalence is low, but extension to the general population is sometimes an option. The United States began targeted hepatitis A vaccination for high-risk groups and children living in high-incidence communities in 1999. The Centers for Disease Control and Prevention recommended, in 2006, that every child between 12 and 23 months old should be vaccinated.

Clinical trials suggest that an inactivated HAV vaccine effectively prevents infection when given within 14 days post-exposure. This has been confirmed by a randomized controlled trial that included 1080 susceptible children and adults. They were given either immunoglobulins or one dose of inactivated HAV vaccine. Symptomatic infection occurred in 3.3% of Ig recipients and in 4.4% of those vaccinated.

Treatment

There is no specific treatment for hepatitis A. Recovery from symptoms may be slow, taking several weeks or months. Supportive care includes adequate hydration and nutritional support so as to maintain patient comfort and an adequate nutritional balance, including replacing fluids lost by vomiting and diarrhea. Acetaminophen should not be used to control fever because of its liver toxicity. Anti-vomiting medication should not be given.

Considering that acute renal failure or hemolytic anemia may complicate hepatitis A, renal function should be regularly tested, along with complete blood analysis. Individuals with hepatitis A and acute liver failure can be treated with N-acetylcysteine, while liver transplantation is considered for the sickest patients. However, HAV-related fulminant hepatitis resolves spontaneously more frequently than does fulminant hepatitis of other etiologies. This makes the decision to transplant or not rather difficult.

Hepatitis E Virus

Prophylaxis

Adequate sanitation and housing, together with personal hygiene, provide the best protection against HEV infection in developing countries. To these can be added avoiding eating uncooked or undercooked meat. "At risk" food should be cooked thoroughly, with an internal temperature of 71°C for 20 min to completely inactivate HEV.

The high prevalence of viremic blood donations in developed countries and the great proportion of immunocompromised blood recipients has led practitioners to define measures to improve blood safety. The inactivation of pathogens in blood components using amotosalen is not effective for HEV, while treatment with riboflavin (vitamin B2) plus ultraviolet light has a limited effect. Consequently, several developed countries have adopted measures to improve blood safety based on the epidemiology of HEV. All blood donations are screened in Ireland (since 2016), the United Kingdom, the Netherlands (both since 2017) and Switzerland (since 2018). Plasma donations intended for transfusion to patients at risk of severe disease have been selectively screened in France since 2013.

Vaccine

Two vaccines against HEV vaccines have been developed; one is a 56-kDa subunit antigen (amino acids 112–607 of ORF2 expressed by cultured insect cells) and the other is a subunit antigen, HEV 239 (amino acids 368–606 of ORF2 expressed by *Escherichia coli*). Only HEV 239 has been licensed for use in humans, and it is only available in China. The Hecolin® vaccine was developed to elicit protective antibodies against all HEV genotypes and provides cross-protection for both genotypes 1 and 4. The efficacy of this three-dose vaccine is 97%, as judged by its ability to prevent episodes of symptomatic acute hepatitis and its long-term efficacy during follow-up. Modeling studies suggest that it can provide protection for up to 30 years. The vaccine seems to be safe for pregnant women. However, its safety and efficacy has not been tested on patients with chronic hepatitis or on immunosuppressed patients.

The concentration of HEV IgG needed to prevent infection after a natural infection or vaccination in clinical trials is still unknown, although one study reported that an antibody concentration of 2.5 WHO units/ml is protective. However, both immunocompromised and immunocompetent patients with antibody concentrations below 10 WHO units/ml have suffered reinfection.

Management of acute hepatitis E

Most immunocompetent individuals who have acute hepatitis E do not require antiviral therapy with ribavirin because HEV is spontaneously cleared. Whether early treatment with ribavirin helps clear the virus or decreases the risk of liver failure remains to be determined. A few acutely HEV-infected patients have been treated with ribavirin. Their liver enzyme activities were rapidly normalized and they all cleared HEV RNA quickly. However, there was no control group and the ribavirin doses and treatment durations varied greatly. Thus, spontaneous improvement cannot be ruled out. Corticosteroids might decrease the risk of progression to liver failure in patients with fulminant hepatitis E. Some case reports have found that corticosteroid therapy improved liver function. Lastly, some case of HEV infection required liver transplantation.

Management of chronic infections

The first-line treatment of organ transplant patients with chronic hepatitis is to reduce their immunosuppressive drugs, especially those targeting T cells (such as calcineurin inhibitors), when possible (Fig. 4). This allows one-third of patients to clear the HEV. The HEV infection in the remaining two-thirds of patients can be efficiently treated by ribavirin monotherapy. Most (78%) patients achieved a sustained virological response after 3-months of ribavirin therapy. Longer treatment (6 months) can allow HEV clearance in relapsers. Persistent HEV shedding in the feces at the end of therapy is associated with HEV relapse. The main side effects of ribavirin treatment are dose-dependent anemia, dry cough and skin reactions. The ribavirin dose should be adapted to maintain hemoglobin and eGFR concentrations because chronically infected patients can suffer from anemia or impaired renal function.

It has been suggested that ribavirin inhibits HEV replication by inhibiting inosine monophosphate dehydrogenase (IMPDH), leading to the depletion of guanosine triphosphate pools. Deep sequencing analysis has identified several HEV RNA mutations, such as G1634R. Recent studies have shown that ribavirin increases HEV heterogeneity that seems to be reversible. However, the role of HEV RNA variants and their impact on HEV treatment outcome are uncertain.

Pegylated-interferon has also been successfully used to treat HEV infections in liver transplant patients. A 3-month course of pegylated IFN α produced a sustained virological response in a few liver transplant recipients and in a patient with a chronic HEV infection who was on hemodialysis. However, IFN α cannot be used in other organ transplant patients because it increases the risk of acute rejection. Consequently, ribavirin therapy is the main drug used to treat chronic HEV infections. Pegylated-IFN α therapy is restricted to liver transplant patients who do not respond to ribavirin. No other therapy is available for other transplant patients (Fig. 4).

Lastly, a few cases of chronic HEV infections in immunocompromised patients other than SOT has been reported. Pegylated-IFN α , ribavirin or a combination of the two was used to effectively treat HEV infections in patients with hematological disease receiving chemotherapy and patients who were HIV-positive.

Fig. 4 Treatment algorithm for immunocompromised patients who are solid organ transplant recipients.

Conclusion

While HAV is an ancient virus, it remains a frequent cause of disease that affects millions of individuals annually despite the availability of efficacious, safe hepatitis A vaccines. The worldwide improvements in sanitary and socio-economic conditions has shifted the epidemiological pattern of hepatitis A. The vaccination of infants could be an efficient way of controlling the infection in an entire population.

HEV is a major health problem in developing countries, where it is responsible for sporadic outbreaks. Improved sanitary conditions and the availability of a vaccine will help decrease the incidence of infections in these countries. HEV infections also cause several problems in developed countries. These include zoonotic transmission, transfusion transmission, persistence in immunocompromised patients, and severe forms in patient with pre-existing liver diseases. Any meat at risk should be thoroughly cooked to prevent the food-borne transmission of HEV. Strategies to prevent transfusion transmitted infections must be implemented according to the prevalence of HEV in each specific country. The use of ribavirin has been a major advance in the management of chronic infections in immunocompromised patients. However, new anti-HEV compounds are needed to treat patients who relapse or do not tolerate ribavirin.

PEG-IFN Pegylated interferon alfa, an immunomodulatory used for finite therapy.

Management of Chronic Hepatitis B and Hepatitis D

Chronic Hepatitis B

Introduction

Management of chronic hepatitis B (CHB) requires careful consideration of treatment indications given the requirement for long-term therapy in most patients. For patients who are in need of therapy, options include nucleo(s)tide analogs (NA) and pegylated interferon alfa (PEG-IFN), both with their own advantages and limitations.

Treatment Indications

The indications for treatment in patients with CHB are based on a risk profile conferred by a combination of (1) the extent of hepatic fibrosis, (2) the level of viremia and (3) the severity of liver inflammation. They are based on observations from long-term follow-up studies which have shown that these are the main determinants of progression of liver disease to cirrhosis, hepatocellular carcinoma (HCC) and liver-related mortality (Terrault *et al.*, 2016; European Association for the Study of the Liver, 2017; Chen *et al.*, 2006, 2011).

Current treatment guidelines from both the European Association for the Study of the Liver (EASL) and the American Association of Study of Liver Disease (AASLD) recognize that all patients with cirrhosis and viremia require urgent treatment. In patients without cirrhosis, a combination of HBV DNA levels, ALT levels and extent of liver inflammation and fibrosis is used to determine indication for treatment (Table 1) (European Association for the Study of the Liver, 2017; Terrault *et al.*, 2018a). Liver biopsy is still the gold standard for assessment of hepatic fibrosis, but it is associated with significant risks to the patient. As a result, it has been mostly supplanted by either non-invasive indices that predict the extent of fibrosis (such as the aspartate aminotransferase – to platelet ratio index [APRI] and fibrosis score based on 4 factors [FIB-4]) and/or liver stiffness-based assessment (e.g., Fibroscan). It is important to note that high rates of misclassification have been reported with both APRI and FIB-4, and that liver stiffness based methods may overestimate the extent of fibrosis in the presence of significant liver inflammation (European Association for the Study of the Liver and Asociacion Latinoamericana para el Estudio del H, 2015; Sonneveld *et al.*, 2019a).

In patients not meeting standard treatment criteria, antiviral therapy may be considered in patients at higher risk of HCC, such as those with a family history of HCC, or HBeAg positive patients aged over 30 with high levels of HBV DNA but persistently normal ALT levels (European Association for the Study of the Liver, 2017). Patients with extrahepatic manifestations may also be treated even if they do not meet conventional treatment criteria (European Association for the Study of the Liver, 2017).

Treatment Goals in CHB

Eradication of HBV from infected host hepatocytes cannot be achieved with currently available drugs due to persistence of covalently closed circular (ccc)DNA despite antiviral therapy. The aim of treatment is therefore to reduce or stop progression of

Table 1 Treatment indications

Guidelines	HBeAg positive			HBeAg negative		
	HBV DNA	ALT	Liver Histology	HBV DNA	ALT	Liver histology

	>2000	>ULN	At least moderate inflammation and/or fibrosis	>2000	>ULN	At least moderate inflammation and/or fibrosis
	>20,000 detectable	>2 × ULN N/A	N/A Cirrhosis	>20,000 detectable	>2 × ULN N/A	N/A Cirrhosis

Abbreviations: ULN, upper limit of the normal range; AASLD, American Association for the study of Liver Diseases; EASL, European Association for the Study of the Liver; N/A, not applicable.

liver inflammation to liver fibrosis and cirrhosis, and to prevent occurrence of hepatocellular carcinoma (HCC). Various surrogate endpoints are used to assess treatment efficacy in clinical practice (Terrault *et al.*, 2016; European Association for the Study of the Liver, 2017). Frequently used endpoints include normalization of ALT (biochemical response), loss of HBeAg from serum with or without seroconversion to anti-HBe (serological response), suppression of HBV DNA to low (<2000 IU/mL) or undetectable levels (virological response), and improvement of liver histology. Complete remission of disease (sometimes called functional cure) is defined by a loss of HBsAg from serum, since the HBsAg negative state is associated with an excellent prognosis with very low relapse rates in immunocompetent patients (Perrillo, 2006; van Zonneveld *et al.*, 2004). For patients treated with NA, HBV DNA kinetics may be further categorized as complete virological response (HBV DNA undetectability) or partial virological response (at least 1 log HBV DNA decrease after commencing therapy, but persistently detectable HBV DNA at 1 year). Virological breakthrough is defined as a 1 log increase of HBV DNA above the nadir and may be the result of emergence of non-compliance or, more rarely, emergence of viral resistance.

Treatment Options

Current treatment options for patients with CHB consist of the nucleos(t)ide analogs (NA) and pegylated interferon alfa (PEG-IFN). Both classes have different modes of action that translate into different treatment durations and different treatment goals.

Nucleos(t)ide Analogs

NA are oral antiviral agents that inhibit the HBV polymerase/reverse transcriptase and cause chain termination. Until recently there were 5 available NA, including entecavir (ETV), tenofovir disoproxil fumarate (TDF), adefovir dipivoxil (ADV), telbivudine (TBV) and lamivudine (LAM). Recently, the novel tenofovir prodrug tenofovir alafenamide has been approved for the management of CHB, based on the results of an ongoing phase 3 trial showing non-inferiority with regard to antiviral efficacy when compared to TDF (Agarwal *et al.*, 2018). Because continuous treatment with LAM, TBV and ADV is associated with high rates of resistance and subsequent therapy failure these drugs are no longer recommended for the treatment of non-pregnant patients with CHB.

Among treatment naïve patients long-term therapy with ETV or TDF results in near universal HBV DNA suppression to undetectable levels in compliant patients (Zoutendijk *et al.*, 2011; Buti *et al.*, 2015). Despite long-term HBV DNA suppression the rates of HBsAg loss remain low, often <1% per year (Zoutendijk *et al.*, 2011; Buti *et al.*, 2015). As a result, long-term therapy is required for most patients. Antiviral resistance has not yet been demonstrated definitively for TDF, and resistance rates with ETV appear to be very low among patients not previously exposed to LAM. As a result, failure to achieve undetectable HBV DNA is frequently caused by either non-compliance or may be the result of a delayed response due to high baseline viremia. Continuation of antiviral therapy in the absence of viral breakthrough has been shown to be successful in most patients (Zoutendijk *et al.*, 2011). However, failure to achieve complete HBV DNA undetectability is observed in a small minority of patients. Persistent low level viraemia has been associated with a higher risk of adverse outcomes in patients with cirrhosis, but this has so far not been demonstrated for patients without advanced liver disease (Kim *et al.*, 2017). Treatment adaptation is therefore advised in cirrhotics with low level viraemia (European Association for the Study of the Liver, 2017). For non-cirrhotic patients low levels of detectable HBV DNA (<69 IU/mL) do not have to prompt therapy adaptation and may be sometimes accepted (European Association for the Study of the Liver, 2017).

Safety

NA are generally well-tolerated. The most important safety issues are associated with long-term therapy. In particular, long-term ADV and TDF therapy has been associated with reductions in bone mineral density and creatinine clearance, and in rare cases

Table 2 Management of NA failure

Failed NA	Options
Lamivudine (LAM)	Switch to TDF or TAF
Adefovir (ADV)	LAM naïve: switch to entecavir (or TDF or TAF) LAM experienced: switch to TDF or TAF
Telbivudine (TBV)	Switch to TDF or TAF
Entecavir (ETV)	Switch to TDF or TAF
Tenofovir DF (TDF) or Tenofovir AF (TAF)	Switch to ETV
Multidrug resistance	Switch to TDF or TAF Consider TDF + ETV

Abbreviations: TDF, tenofovir disoproxil fumarate; TAF, tenofovir alafenamide; ETV, entecavir; LAM, lamivudine.

development of Fanconi syndrome (Udompap *et al.*, 2018). The risk of renal and bone events may be lower with TAF when compared to TDF, although Fanconi syndrome has also been observed in a patient treated with TAF (Agarwal *et al.*, 2018; Bahr and Yarlagadda, 2019; Grossi *et al.*, 2017). Monitoring of renal function and phosphate levels is therefore advised in patients treated with any of these agents. Among patients with severe liver disease, several case reports have suggested a risk of severe lactic acidosis with ETV therapy, although ETV has also been used safely in patients with decompensated cirrhosis (European Association for the Study of the Liver, 2017; Lange *et al.*, 2009; Hung *et al.*, 2019). In any case, careful monitoring of liver and renal functions is always indicated in patients with advanced liver disease.

Choosing the Appropriate First-Line Agent

Among treatment naïve patients without significant comorbidities ETV, TDF and TAF are all excellent options. Based on the possible risk of renal and bone events in patients treated with TDF, patients at increased risk should preferably be treated with ETV or TAF. Among patients with a reduced renal function, ETV (adjusted dose) or TAF (no dose reduction if clearance >15 mL/min) are the best options.

Management of Patients With NA Failure

In patients who failed on older generations of NA (i.e., LAM, TBV or ADV), resistance testing may be performed to confirm presence of mutations that confer reduced susceptibility to NA. Mutations associated with LAM resistance may confer cross-resistance to ETV, whereas ADV resistance has been associated with somewhat lower response rates to TDF when compared to treatment naïve patients. However, long-term TDF has been successful in the majority of patients with ADV treatment failure. TDF monotherapy has also been effective in patients with ETV failure, with combination therapy only required for a select few patients with previous LAM failure who experience partial responses after long-term TDF therapy (Patterson *et al.*, 2011; Lim *et al.*, 2019; Zoulim *et al.*, 2016). Based on these findings, recommendations have been made for treatment adaptation in patients who failed on NA therapy (Table 2).

Finite NA Therapy

All current guidelines recognize that therapy may be discontinued in patients who have confirmed HBsAg negativity (European Association for the Study of the Liver, 2017). Relapse rates after drug withdrawal in HBsAg negative patients are very low in the absence of immune suppression and irrespective of anti-HBs seroconversion. Given the rarity of HBsAg loss with NA therapy, several studies have examined the possibility of discontinuation of NA in HBsAg positive patients. Recent studies show near universal increases in HBV DNA after drug discontinuation, with a subset of patients experiencing significant flares. However, a subgroup of patients achieves sustained HBV DNA levels <2000 IU/mL or even HBsAg loss without a need for further treatment (Berg *et al.*, 2017; Chang *et al.*, 2015; Hadziyannis *et al.*, 2012). Since these favorable outcomes occur in only a minority of patients, current focus is on identifying patients most likely to achieve off-treatment sustained responses. While various factors have been shown to be associated with sustained disease remission, including serum levels of hepatitis B core related antigen (HBcrAg) and HBsAg, no definitive recommendations can yet be made on patient selection (Sonneveld *et al.*, 2019b; Hsu *et al.*, 2019). Nevertheless, guidelines suggest that therapy discontinuation may be considered in select patients without cirrhosis, in particular HBeAg positive patients who experienced HBeAg seroconversion and completed at least 12 months of consolidation therapy, and HBeAg negative patients who have been successfully treated for multiple (at least 3) years (European Association for the Study of the Liver, 2017). Careful monitoring is always indicated after drug withdrawal as major flares may occur. At this time, drug withdrawal is only advised in the context of studies.

Pegylated Interferon Alfa

Interferon alfa (IFN) has both immunomodulatory and direct antiviral effects in patients with CHB. The availability of the pegylated IFN alfa (PEG-IFN) has allowed once weekly subcutaneous dosing. PEG-IFN is used as a finite treatment course, typically for one year. Response is then assessed at 6–12 months post-treatment. Its main advantage is that it offers a chance at finite treatment for a subset of patients with a response, although this is offset by reduced tolerability when compared to the NA. Responses are defined differently for HBeAg positive and HBeAg negative patients and response rates vary widely across subgroups. Careful patient selection is therefore key to effective use of this agent in clinical practice.

Efficacy in HBeAg-Positive Patients

HBeAg seroconversion was observed in 29%–30% of patients at 6 months post-treatment in two pivotal trials (Janssen *et al.*, 2005; Lau *et al.*, 2005). A combined endpoint of HBeAg loss with HBV DNA <2000 IU/mL at 6 months post-treatment was achieved in 23% in a recent meta-analysis of 3 global randomized trials (Sonneveld *et al.*, 2013b), and HBsAg seroconversion was achieved in 4%–6% (Janssen *et al.*, 2005; Lau *et al.*, 2005). A long-term follow-up study of a predominantly European cohort showed that serological and virological response rates were sustained in the majority of initial responders through a mean of 3 years of follow-up, with increasing rates of HBsAg loss up to 30% in patients who became HBeAg negative after treatment (Buster *et al.*, 2008).

Efficacy in HBeAg-Negative Patients

In the registration trial for PEG-IFN in HBeAg-negative CHB response was defined as an HBV DNA level <20,000 copies/mL with normalization of ALT at 24 weeks post-treatment. This was observed in 36% (Marcellin *et al.*, 2004). In another study comparing PEG-IFN alone with PEG-IFN plus ribavirin in a predominantly European cohort, response rates (HBV DNA <10,000 with normal ALT) at 24 weeks post-treatment were similar in both groups (16%–20%) (Rijckborst *et al.*, 2010b). Long-term virological remission of HBeAg-negative disease, defined as sustained HBV DNA levels <2000 IU/mL, is achieved in around 23% of treated patients (Marcellin *et al.*, 2009). Patients with an initial response may experience relapse during long-term follow-up, although a subset may also achieve HBsAg loss (Marcellin *et al.*, 2009).

Safety of PEG-IFN in CHB

PEG-IFN treatment is associated with considerable side-effects. The most frequently reported side-effects were a flu-like syndrome, myalgia, headache, fatigue and local reactions at the site of subcutaneous injection (Janssen *et al.*, 2005; Lau *et al.*, 2005; Marcellin *et al.*, 2004). PEG-IFN therapy may result in hepatitis flares, which may lead to decompensation and death in patients with advanced liver disease. PEG-IFN is therefore contra-indicated in patients with (a history of) decompensated cirrhosis (Perrillo, 1989; Perrillo *et al.*, 1990; Perrillo, 2001; Flink *et al.*, 2005). PEG-IFN treatment is also associated with mild myelosuppressive effects, but PEG-IFN associated cytopenias are easily managed with dose-reductions and only rarely result in clinically significant infection or bleeding (van Zonneveld *et al.*, 2005). The combination of PEG-IFN with TBV is contra-indicated due to a high risk of myopathy.

Selection of Patients for PEG-IFN Therapy

Since response rates to PEG-IFN are limited, baseline selection of patients with the highest probability of response is essential for optimal use of PEG-IFN. Several baseline predictors have been identified that can be used to guide patient selection (Table 3).

HBeAg-Positive Patients

Multiple factors have been identified that are associated with response to PEG-IFN in HBeAg-positive patients. Response rates are highest in those with HBV genotype A and those with higher baseline levels of ALT (Janssen *et al.*, 2005; Lau *et al.*, 2005). Various

Table 3 Baseline factors associated with higher probability of response to pegylated interferon

Table 5 Stopping-rule for HBeAg positive patients treated with pegylated interferon based on HBsAg levels during therapy

Week	HBV Genotype			
	A	B	C	D
12 HBsAg	No decline	>20,000	>20,000	No decline
24 HBsAg	>20,000	>20,000	>20,000	>20,000

Note: At week 12, HBV genotype specific stopping rules are applied. No genotyping is necessary at week 24.

other factors, including lower baseline HBsAg levels, have been identified in subsequent meta-analyses (Buster *et al.*, 2009; Chan *et al.*, 2018). Based on these findings we proposed a simple scoring system to rapidly screen patients for potential PEG-IFN eligibility (Table 4) (Buster *et al.*, 2009). A more extensive scoring system may subsequently be used for individual patient counseling (Buster *et al.*, 2009; Chan *et al.*, 2018).

Future studies are focussing on genetic predictors of response, novel cytokines and viral mutants that may together be used to optimized individualized decisions (Sonneveld *et al.*, 2012a,b, 2013a; Brouwer *et al.*, 2019). These are however not yet ready for clinical application.

HBeAg-Negative Patients

Less data are available on predictors of response to PEG-IFN in HBeAg-negative patients, which is unfortunate given the even lower response rates in this subgroup. A recent meta-analysis showed higher rates of response in patients with HBV genotype C and younger patients, with inconsistent results regarding HBV DNA levels and HBsAg levels across HBV genotypes (Table 4). A scoring system based on this meta-analysis could be used for assessment of the probability of treatment success (Lampertico *et al.*, 2018).

On-Treatment Prediction of Response

HBeAg-Positive Patients

On-treatment monitoring of viral replication using HBV DNA, HBeAg and HBsAg levels may help to predict response during therapy. On-treatment HBV DNA and HBeAg decline is associated with higher rates of response, but diagnostic accuracy is suboptimal (Fried *et al.*, 2008; Sonneveld *et al.*, 2013c). Recent studies have shown a strong association between on-treatment HBsAg levels and the probability of response. Failure to achieve on-treatment declines and/or persistently high HBsAg levels were shown to predict failure with high accuracy (Sonneveld *et al.*, 2010, 2013b,d). Based on these findings, HBV genotype specific stopping-rules have been defined for HBeAg-positive patients treated with PEG-IFN (Table 5) (Sonneveld *et al.*, 2013b).

HBeAg-Negative Patients

Similar to observations in HBeAg-positive disease, HBV DNA decline on-treatment is associated with treatment response in HBeAg negative CHB patients treated with PEG-IFN (Takkenberg *et al.*, 2009). Subsequent studies have also shown that failure to achieve an on-treatment HBsAg decline is associated with non-response to therapy (Moucari *et al.*, 2009; Marcellin *et al.*, 2010). In the landmark European PARC study, which enrolled predominantly genotype D patients, a combination of HBsAg and HBV DNA levels allowed for reliable prediction of non-response to PEG-IFN. Patients who did not have an HBsAg decline by week 12, and who also failed to achieve a decline of >2 log IU/mL of HBV DNA, had no chance of achieving a sustained response (Rijckborst *et al.*, 2010a). These findings were subsequently validated in two large independent trials, with superior performance among patients with HBV genotype D (Sonneveld *et al.*, 2012a). Current guidelines therefore recognize that patients complying with these criteria should discontinue therapy for futility.

Optimizing Response Rates: Treatment Prolongation and Combination Therapy

The current licensed treatment duration for PEG-IFN is 48 weeks. Reducing the treatment duration has been shown to result in lower response rates (Cheng *et al.*, 2014; Liaw *et al.*, 2011). One study of genotype D HBeAg negative patients showed higher response rates with 96 weeks of therapy (Lampertico *et al.*, 2013). A non-controlled study of HBeAg positive patients treated with PEG-IFN with LAM or ADV for 96 weeks also showed promising results (Cao *et al.*, 2013; Wang *et al.*, 2016). Confirmation of these findings is however required before this can be implemented in clinical practice. Theoretically, combination treatment with PEG-IFN and NA could increase response rates through complementary modes of action. Studies have however consistently shown higher on-treatment response rates, including HBsAg loss, which have been off-set by off-treatment relapse (Janssen *et al.*, 2005; Lau *et al.*, 2005; Marcellin *et al.*, 2004; Sonneveld *et al.*, 2016). Combination therapy is therefore not advised.

Optimizing Response to NA With PEG-IFN

Various studies have evaluated the efficacy of PEG-IFN add-on therapy to NA. These studies have shown increased HBV DNA, HBeAg and HBsAg declines, and also higher rates of HBeAg seroconversion and HBsAg loss with PEG-IFN add-on when compared to continued NA monotherapy (Brouwer *et al.*, 2015; Bourliere *et al.*, 2017; Lampertico *et al.*, 2019; Chi *et al.*, 2017). However, absolute response rates are low and predictors of sustained response are not yet established. Serum HBsAg levels may be useful to identify a subset more likely to respond, but clinically relevant cut-offs remain elusive (Liem *et al.*, 2019). Current guidelines therefore do not recommend PEG-IFN add-on strategies at this time, although if effective selection tools become available this might be an option for a subset of patients.

Management of CHB in Special Populations

Pregnancy

All pregnant women should be tested for HBV infection. The risk of perinatal transmission in babies born to HBsAg positive mothers may be profoundly reduced by a combination of passive and active vaccination of the newborn, and combination therapy is considered cost-effective in settings with adequate healthcare infrastructure (European Association for the Study of the Liver, 2017; Chen *et al.*, 2013). In the context of severe cost constraint, HBIG administration is sometimes limited to babies born to highly viremic (HBeAg positive) mothers, although this strategy is generally not recommended in guidelines (European Association for the Study of the Liver, 2017; Chen *et al.*, 2013).

The risk of transmission despite vaccination is predominantly determined by the level of viremia. Patients with high HBV DNA levels (>200,000 IU/mL and/or high HBsAg levels (above 4–4.5 log IU/mL)) should be treated with a NA to reduce the probability of perinatal transmission (Song *et al.*, 2019). TDF is the preferred agent based on the extensive clinical experience in CHB and HIV infected patients. In pregnant women with low viremia and without signs of significant liver fibrosis treatment may be deferred until after delivery. Post-partum flares may occur both after therapy discontinuation and in untreated patients.

Immunosuppression

Immunosuppression can cause HBV reactivation which may result in fulminant hepatic failure and death. CHB guidelines recommend screening for past or current HBV infection in all patients undergoing significant immunosuppression. The risk of reactivation is determined by HBsAg status (higher in HBsAg positive patients) and with increasing severity immunosuppression. It is recommended that all HBsAg positive patients at risk for reactivation receive prophylactic antiviral therapy. Among HBsAg negative, anti-HBc positive patients, the risk of reactivation should be used to guide decisions on the need for prophylactic therapy. Patients at moderate to high risk should receive prophylaxis.

Chronic Hepatitis Delta

Introduction

Hepatitis delta virus (HDV) is a defective RNA virus that requires HBsAg to complete virion assembly and secretion after autonomous replication. HDV infection can occur as an acute co-infection with HBV and HDV, which evolves to chronicity in only 2% of patients, or as an HDV superinfection in patients with a CHB infection resulting in a chronic HBV-HDV infection in 70%–90% of patients. In most cases of HDV infection, HBV DNA levels are suppressed HDV. HDV is a highly pathogenic virus and can cause severe liver injury that may result in fulminant hepatic failure and rapid progression to cirrhosis and hepatic decompensation, as well as an increased risk of liver cancer (Hughes *et al.*, 2011).

Screening

The EASL and Asian Pacific Association for the Study of the Liver (APASL) guidelines on management of CHB recommend to rule out HDV coinfection in all patients with a CHB. In the AASLD guideline on hepatitis B screening is only advised in patients with specific risk factors including migrants from regions with high HDV endemicity, a history of intravenous drug use or high-risk sexual behavior, individuals infected with HCV or HIV and patients with elevated aminotransferases with low or undetectable HBV DNA ([European Association for the Study of the Liver, 2017](#); [Terrault *et al.*, 2018a](#); [Sarin *et al.*, 2016](#)).

Treatment Indication and Goals

Patients with positive HDV RNA levels have an indication for antiviral therapy as liver disease can progress rapidly. However, risks and benefits of initiating therapy should be considered, including severity of liver disease which may be a contraindication to IFN based therapy ([Terrault *et al.*, 2018b](#)).

A complete virological response of both HBV and HDV infection, thus comprising both HBsAg loss and undetectable HDV RNA levels, is the most desirable endpoint of therapy. However, this occurs only in a small number of patients. The primary aim of anti-HDV therapy is therefore sustained off-treatment HDV RNA undetectability. Due to the high rate of late relapses after initially successful treatment, the definition of “sustained viral response” should be used with caution and long-term monitoring is essential ([Yurdaydin *et al.*, 2019](#)).

Treatment Options

Interferon Alpha

Interferon alpha (IFN) is the only available drug that has been proven to have antiviral efficacy in chronic HDV infection. A Cochrane meta-analysis including five randomized controlled trials comparing IFN treatment for 3–12 months with a no-treatment control group showed that a sustained suppression of HDV RNA at six months of follow-up post-treatment was seen in 17% of patients treated with IFN (compared to 5% in the control group, $p = 0.02$) ([Abbas *et al.*, 2011](#)). Response to IFN based therapy is associated with improved clinical outcomes ([Wranke *et al.*, 2017](#); [Palom *et al.*, 2019](#)). Currently, standard IFN has been replaced by pegylated interferon alpha (PEG-IFN) because of a prolonged plasma half-life time allowing a once-a-week administration. Studies evaluating the efficacy of PEG-IFN for the treatment of chronic HDV infection showed slightly better results, with sustained suppression of HDV RNA at six months post-treatment in 25%–30% of patients ([Wedemeyer *et al.*, 2011](#); [Triantos *et al.*, 2012](#)). Unfortunately, subsequent relapse rates are substantial. Long-term follow-up data from the HIDIT-I trial, the largest randomized trial investigating the safety and efficacy of PEG-IFN with or without adefovir in patients with a chronic HDV infection, showed a late relapse of HDV RNA in more than half of the patients (58%) through approximately four years of follow-up ([Heidrich *et al.*, 2014](#)). Therefore, long-term follow-up with HDV RNA monitoring remains needed in patients with a negative HDV viral load after treatment as long as HBsAg is present in serum ([Heidrich *et al.*, 2014](#)).

The optimal duration of PEG-IFN therapy is not well defined. Current guidelines recommend treatment with PEG-IFN for at least 48 weeks ([European Association for the Study of the Liver, 2017](#); [Terrault *et al.*, 2018a](#); [Sarin *et al.*, 2016](#)). Several studies tried to increase efficacy by prolonging treatment duration. As of yet, treatment prolongation has not been consistently shown to be superior to conventional treatment durations ([Heller *et al.*, 2014](#); [Wedemeyer *et al.*, 2019](#)), although some patients may benefit from a prolonged course of treatment (so-called slow responders) ([Niro *et al.*, 2016](#)). On the other hand, preliminary studies that investigated shorter treatment durations up to six months showed relapses in almost all patients after discontinuation of therapy ([Di Bisceglie *et al.*, 1990](#); [Porres *et al.*, 1989](#)).

Based on existing data from previous studies, an accurate prediction of virological response in patients treated for a chronic HDV infection remains difficult. No clear stopping rules have been defined ([European Association for the Study of the Liver, 2017](#); [Terrault *et al.*, 2018a](#); [Sarin *et al.*, 2016](#)). However, studies have demonstrated that HDV RNA levels at week 24 of treatment with PEG-IFN are associated with treatment outcome ([Keskin *et al.*, 2015](#); [Karaca *et al.*, 2013](#); [Yurdaydin *et al.*, 2008](#)). For example, HDV RNA negativity within 24 weeks of therapy was a strong predictor for sustained HDV suppression at 24 weeks post-treatment with a positive predicted value of 71%. Conversely, a decrease in HDV RNA level of less than 1 log combined with no decrease in HBsAg level effectively identified non-responders ([Keskin *et al.*, 2015](#)). Confirmation of these findings is required before they can be implemented in clinical practice.

Nucleo(s)ide Analogs

The use of nucleo(s)ide analogs (NA) has been extensively explored in chronic HDV infected patients. Several studies investigated the effect of NA treatment as monotherapy, but no effect on HDV viremia was observed ([Wedemeyer *et al.*, 2011](#); [Yurdaydin *et al.*, 2008, 2002](#); [Niro *et al.*, 2005](#)). Furthermore, addition of NA to PEG-IFN therapy did not improve treatment outcome in several randomized trials ([Wedemeyer *et al.*, 2011, 2019](#); [Abbas *et al.*, 2016](#)).

Although NA are not effective against HDV, use of NA is recommended in patients with active HBV replication with persistent elevated HBV DNA levels (>2000 IU/mL), and/or in presence of cirrhosis (European Association for the Study of the Liver, 2017; Sarin *et al.*, 2016; Terrault *et al.*, 2018b), as predominance of both viruses can fluctuate during the natural course of disease and since HBV DNA levels may be associated with more rapid disease progression (Schaper *et al.*, 2010).

Future

New therapies are urgently needed for the treatment of chronic HDV, because of the overall poor treatment response and high rate of relapse after treatment with PEG-IFN. Several new drugs targeting various steps of the HBV and HDV life cycle, such as lonafarnib, Myrcludex-B, PEG-IFN lambda and nucleic Acid Polymers (NAPs), are being evaluated in phase 1 and 2 studies and have shown promise. Registration studies are expected to be commencing soon (Yurdaydin *et al.*, 2019).

Studying Population Genetic Processes in Viruses: From Drug-Resistance Evolution to Patient Infection Dynamics

Jeffrey D Jensen, Arizona State University, Tempe, AZ, United States

© 2021 Published by Elsevier Ltd.

Glossary

Background Selection Reduction in genetic diversity due to purifying selection against deleterious mutations at linked sites.

Distribution of Fitness Effects (DFE) The statistical distribution of selection coefficients of newly arising mutations, as compared to a reference genotype.

Mutational Meltdown The accumulation of stochastic effects which may result in population decline and ultimately extinction.

Selective Sweep The result of a beneficial mutation being driven to high frequency by positive selection, together with linked variation.

Site Frequency Spectrum (SFS) Summary of the frequencies of observed segregating mutations in a population.

In this article, I briefly summarize the population genetic environment in which within-patient viral populations are evolving – discussing the roles of genetic drift as modulated by the infection history of the patient, selection acting on newly arising deleterious and beneficial variants and the related linked selection effects on the genome, and the underlying mutation and recombination/reassortment rates as well as replication behavior. I conclude with a consideration of how an improved understanding of these processes specifically, and evolutionary genomics in general, can inform therapeutic strategies in the future.

The Population Dynamics of Infection

The natural starting point in any evolutionary analysis is a consideration of the effects of genetic drift. This stochastic evolutionary force is generally described in terms of the effective population size (N_e) – that is, the idealized size of the population which would experience the observed amount of genetic drift. This is opposed to the census population size (N), that is, the current number of individuals in the population. There are multiple reasons why N_e may be strongly reduced relative to N , including changes in census population sizes over time as well as natural selection itself, as will be described throughout this article. While viral population census sizes are known to often be exceptionally large, it is important to appreciate that viral effective population sizes are much more constrained, owing both to underlying modes of transmission and infection dynamics as described below – with N_e having been estimated to only be on the order of hundreds to thousands (Hughes, 2009; Miyashita and Kishino, 2010; Renzette *et al.*, 2013). This is significant with regards to viral population genetics as it suggests an upper limit on the efficiency of natural selection, given that this efficacy is dictated by N_e . It relatedly serves as a reminder of the pervasively important role of genetic drift in governing evolutionary outcomes, and the generally unjustified adaptation-centric view of virus genome evolution still forwarded in certain sections of the virology community.

Thus, before treating the topic of selection, one must firstly consider the neutral population dynamics of the organism in question. In the case of a viral population sampled from a patient, these dynamics likely include a strong population bottleneck (*i.e.*, a temporary reduction in population size) associated with the initial infection – these bottlenecks may be quite severe, with some primary infections being established by a very small number of infecting units. After this initial infection, the viral population will often next enter a phase of rapid population growth. This combination of bottlenecking and growth will leave signatures in the genomic patterns of variation, which in turn may be used to estimate the timing of infection, the severity of the bottleneck, the rate of within-patient population growth, and indeed the relative difference between N_e and N . In certain viruses that compartmentalize, these dynamics might also include population sub-structuring, in which isolated or semi-isolated viral populations are established in different compartments (*e.g.*, in different organs) within a single host. These compartments may or may not be connected by gene flow, via the plasma for example.

Multiple approaches have been developed within the field of population genetics to infer these demographic models and their underlying parameters. It is perhaps most helpful to introduce such methodology within the context of a specific application. For this purpose, I will examine recent work in human cytomegalovirus (HCMV), a member of the Herpesviridae family of dsDNA viruses. HCMV is characterized by a particularly large genome (~235,000 base pairs), and is nearly ubiquitous in human populations, with a seroprevalence of 30%–90% in the US and >90% in adults outside of the developed world (Kenneson and Cannon, 2007; Boeckh and Geballe, 2011). Though asymptomatic in most individuals, HCMV can lead to severe symptoms in immunocompromised patients and neonates, and is the most common cause of birth defects resulting from an infectious agent (Hassan and Connell, 2007; Manicklal *et al.*, 2013).

A large literature has accumulated demonstrating that HCMV has high levels of genetic variation within a host (Spector *et al.*, 1984; Drew *et al.*, 1984; Haberland *et al.*, 1999; Meyer-König *et al.*, 1998; Faure-Della Corte *et al.*, 2010), despite encoding a DNA polymerase with proofreading activity (Nishiyama *et al.*, 1983), with several recent high-throughput whole-genome studies revealing the full extent of this variation (Renzette *et al.*, 2011, 2013, 2014, 2015, 2016, 2017; Hage *et al.*, 2017; Pokalyuk *et al.*, 2017). Utilizing such whole-genome data sampled from the urine and plasma compartments of five congenitally infected infants, Renzette *et al.* (2013) found that the sub-structuring effect of compartmentalization was particularly strong – as assessed by F_{ST} , a measure of differentiation between populations – with these two compartments from a single patient being as diverged as samples from two unrelated patients. Utilizing the observed frequencies of genome-wide segregating sites in these congenitally infected patient samples – the site frequency spectrum (SFS) – they additionally inferred the demographic model characterizing each infection. Specifically, Renzette *et al.* inferred a population bottleneck associated with the initial infection (*i.e.*, the movement of the virus from the maternal compartment to the fetal plasma compartment), and a second bottleneck associated with the subsequent infection of the kidney compartment (*i.e.*, as assessed by the urine sample). The severity of the bottleneck characterizing the initial infection was not as strong as earlier results had suggested, with dozens or even hundreds of virions characterizing fetal infection. By estimating the age of the bottleneck, this work also provided the first inference of the timing of fetal infection.

In follow-up work with longitudinal sampling of the plasma, urine, and saliva compartments, Pokalyuk *et al.* (2017) also found evidence for subsequent admixture with maternal HCMV populations after the initial infection and compartmentalization, suggesting re-infection post-birth via, for example, breast milk (Numazaki, 1997; Enders *et al.*, 2011). While these mixed infections can certainly be a significant player in governing levels and patterns of genomic variation as described by Pokalyuk *et al.*, there has been an unfortunate tendency of some authors to only focus on this admixture process while neglecting the variety of other selective and demographic processes which also determine levels of variation (*e.g.*, Cudini *et al.*, 2019; though see Jensen and Kowalik, 2020).

Given that no current method exists to prevent maternal-fetal transmission, or to reduce the severity of fetal infection (Britt, 2017), such a characterization of population dynamics may be crucial to future therapeutic strategies. For example, clinically imposing a more severe population bottleneck during pregnancy may reduce HCMV variability within the fetus, limiting the pool of variation on which natural selection may subsequently act, thereby potentially improving treatment outcomes. Immunotherapy advances have produced therapeutics capable of reducing the rate of maternal transmission in other viruses, including hepatitis B and HIV, and may thus represent a promising route for HCMV as well (Tseng and Kao, 2017; Voronin *et al.*, 2017).

Direct Selection and Linked Selection Effects

With regards to the direct action of natural selection in viral populations, positive selection related to antiviral drug resistance or immune evasion has received particular attention for obvious reasons (see review of Irwin *et al.*, 2016a). This search for adaptive loci is generally based around identifying the patterns of selective sweeps (Maynard Smith and Haigh, 1974) in viral genomes, owing to the genetic hitchhiking effects induced from the rapid rise in frequency of the beneficial mutation towards fixation. However, though it receives comparatively less attention in the virology literature, it is well understood that the vast majority of new fitness-impacting mutations in any organism are deleterious rather than beneficial (*e.g.*, Crow, 1993; Lynch *et al.*, 1999; Bank *et al.*, 2014b; and see reviews of Eyre-Walker and Keightley, 2007; Bank *et al.*, 2014a). The selective removal of these harmful variants by purifying selection will serve to further reduce the effective population size to an extent largely dictated by the rate of recombination and the strength of selection (Charlesworth *et al.*, 1993; Charlesworth, 2013). In addition, genomic linkage to this frequent input of deleterious mutations will reduce the probability of fixation of other linked sites – including reducing the likelihood of adaptation (Hill and Robertson, 1966; and see Pénisson *et al.*, 2017).

Importantly, just as the increase in frequency of a beneficial mutation can lead to the genetic hitchhiking of linked variation towards fixation in the genome (leading to a selective sweep effect), so too can the removal of the much larger input of deleterious mutations lead to the genetic hitchhiking of linked neutral variants towards loss. This effect – the loss and reduction in frequency owing to linkage with deleterious variants – is known as background selection (Charlesworth *et al.*, 1993). This effect can be of major consequence in viral populations given their coding-dense genomes (in which most new mutations are expected to be deleterious), particularly in the absence of recombination. Though this is yet to be thoroughly studied in viral populations, initial work has found a much more dominant role for background selection relative to selective sweeps in shaping within-patient genomic variation (*e.g.*, Renzette *et al.*, 2016).

Quantifying the relative input of deleterious, neutral, and beneficial mutations, means understanding the shape of the distribution of fitness effects (DFE). There are three general types of methods for performing such inference. The first involves the artificial creation of a mutation, one at a time or in combination, in order to measure the resulting fitness effect on an otherwise wildtype background under lab-controlled environmental conditions (*e.g.*, Fowler *et al.*, 2010; Hietpas *et al.*, 2011, 2012; Bank *et al.*, 2014b). The second approach, mutation-accumulation, maintains a population in a laboratory and allows mutations to naturally occur and accumulate, and fitness is generally quantified and related to this accumulation at multiple time points (*e.g.*, Foll *et al.*, 2014; Ferrer-Admetlla *et al.*, 2016; Lynch *et al.*, 2016; Long *et al.*, 2018). Aside from these two experimental approaches, a third approach is based on the direct sampling of natural population data (*e.g.*, from a patient infection, in the case of viral populations) – using either single time point (*e.g.*, Keightley and Eyre-Walker, 2007; Schneider *et al.*, 2011; Tataru *et al.*, 2017; Johri *et al.*, 2020) or multiple time point data (*e.g.*, Malaspina *et al.*, 2012; Mathieson and McVean, 2013; Foll *et al.*, 2015;

Sackman *et al.*, 2019). These approaches generally rely on fitting a population history using patterns of variation at neutral sites, and then using that history to quantify the DFE at putatively selected sites.

One particularly important aside here of great relevance to the virology community, is the danger of basing such selection analyses on consensus sequences (*i.e.*, the representation of each patient's viral sample by a single sequence, which represents the most common allele at each site in a given within-patient viral population). While common practice, this tremendous loss of information (*e.g.*, all rare alleles – which represent the vast majority of variation – are neglected), combined with the associated ascertainment issue of only viewing high frequency mutations, can wreak havoc on evolutionary inference. For example, Renzette *et al.* (2017) demonstrated that earlier work based on consensus sequences had incorrectly arrived at the conclusion that most sampled segregating variation in HCMV was strongly selected owing to this consensus ascertainment – whereas when full within-patient population-level data was considered, it was clear that most segregating variation was in fact neutral or nearly neutral, consistent with general expectations (Kimura, 1968; Ohta, 1973; and see Jensen *et al.*, 2019; Morales-Arce *et al.*, 2020b).

Finally, it is important in this regard to appreciate that the correct evolutionary null model must necessarily account for the population infection dynamics discussed in the first section, together with the purifying and background selection effects discussed above. As viral populations are characterized by changing population sizes owing to infection bottlenecks and subsequent growth, and as the input of deleterious mutations is a constant process, an accounting for these processes is necessary to establish a baseline expectation for levels and patterns of variation, on top of which positively selected outliers may be identified. A neglect of these neutral dynamics can lead to serious mis-inference. For example, Feder *et al.* (2016) examined consensus HIV-1 population sequence data from 6717 drug-treated patients sequenced over a 24-year span. They found, as expected, that the change in variation observed in the viral population was correlated with the degree of treatment effectiveness. They used this pattern to argue that less effective treatments may be associated with so-called soft selective sweeps (*i.e.*, positive selection on a previously neutrally segregating genomic variant, or on multiple simultaneously occurring and identical genomic variants), whereas more effective treatments may be associated with hard selective sweeps (*i.e.*, positive selection on a *de novo* beneficial mutation). Perplexingly, they assumed identical strengths of positive selection, and identical within-patient demographic histories, between patients receiving effective and ineffective treatments. Revisiting this data, Harris *et al.* (2018) demonstrated that if one accounts for these variable fitness effects, and the inherent reality that more effective treatments reduced viral population sizes more than less effective treatments, these data observations can be explained entirely without invoking soft selective sweeps. Hence, it is always crucial to first account for the underlying neutral dynamics.

Other Key Aspects of the Population Genetic Environment

Apart from the effects of genetic drift and direct and linked selection described above, multiple other evolutionary processes are necessary to consider in order to develop a more holistic view of within-host viral population dynamics. For example, while the DFE describes the fitness effects of mutations, the rate of input of mutation is itself an important evolutionary parameter, as is the rate of recombination/reassortment, as that dictates the extent to which these newly arising mutations will be linked (and thus experience Hill-Robertson interference). Inference about mutation and recombination is similarly possible from within-patient polymorphism data. Returning to the HCMV example, Renzette *et al.* (2015) calculated genome-wide rates of mutation and recombination in 500 base pair windows across the genome for 48 longitudinal samples from 18 patients, inferring an average mutation rate of 2.0×10^{-7} new mutations per site per replication, similar to rates observed from murine cytomegalovirus (Drake and Hwang, 2005; Sanjuan *et al.*, 2010; and see review of Sackman *et al.*, 2018).

Importantly, viral mutation rates have generally been thought to be inversely correlated with genome size (Gago *et al.*, 2009), with the general interpretation being, for example, that RNA-based viral genomes are smaller than DNA genomes owing to intrinsically error-prone polymerases (Drake and Holland, 1999; Elena and Sanjuán, 2005). However, it appears more likely that, given that selection operates on the total genome-wide deleterious mutation rate (Kimura, 1967; Lynch, 2008), the selection pressure for replication fidelity (per site) is simply reduced in smaller genomes. This interpretation, as described in the 'drift-barrier hypothesis', has been widely supported across the tree of life (Lynch, 2011, 2012). In other words, genome-wide viral mutation rates are pushed to the lowest levels possible by natural selection, thus predicting the widely-observed correlation between effective population size and mutation rate, as well as between genome size and mutation rate. While some in the virology community retain the notion that viruses may be selected to maintain high mutation rates to better deal with fitness challenges, there is simply neither empirical nor theoretical support for the validity of such a view.

Finally, as much of population genetic inference is based on the Wright-Fisher model and Kingman coalescent – in which there is an assumption of a Poisson-shaped progeny distribution in which the variance equals the mean and is small relative to the population size – there is a growing appreciation that violations of this assumption must be accounted for when studying virus populations, which are highly variable in this regard. As such, virus genealogies are better characterized by more generalized Moran and multiple-merger coalescent models (see Donnelly and Kurtz, 1999; Pitman, 1999; Sagitov, 1999; Schweinsberg, 2000; Eldon and Wakeley, 2008; Matuszewski *et al.*, 2018; and see reviews of Tellier and Lemaire, 2014; Irwin *et al.*, 2016b). Specifically, violations of this progeny distribution assumption may elevate linkage disequilibrium even in the presence of frequent recombination (Eldon and Wakeley, 2008; Birkner *et al.*, 2013), and skew estimates of F_{ST} (Eldon and Wakeley, 2009). As such, these model violations may be mistaken for either population size change or positive selection if not accounted for (Matuszewski *et al.*, 2018; Sackman *et al.*, 2019).

Recent theoretical and statistical developments have provided some inroads into estimating, and thus accounting for, progeny skew from within-host pathogen populations. This work has demonstrated an ability to co-estimate the degree of progeny skew together with population size change, mutation rate, and positive selection from within-patient polymorphism data (Eldon *et al.*, 2015; Matuszewski *et al.*, 2018; Sackman *et al.*, 2019; Morales-Arce *et al.*, 2020a), providing a more appropriate null model for the study of pathogen evolution.

An Outlook on Evolutionarily Informed Treatment Strategies

The ability of the above described inference approaches to study drug-resistance mechanisms, and thus quantify the likelihood of adaptively evading a given therapeutic strategy within an experimental evolution setting, has been well-justified in the literature. Namely, identifying positively selected mutations in experimental viral populations challenged with possible drug-treatments individually or in combination, may elucidate potential routes to resistance, and highlight drugs requiring more complex (and lower probability) mutational evasion routes. For example, the commonly used influenza drug oseltamivir acts as a competitive inhibitor by binding to a hydrophobic pocket in the viral surface protein – an action which can be effectively blocked by mutations near the binding site (Collins *et al.*, 2008). Initially, the high fitness cost of the most common oseltamivir-resistant mutation, NA H275Y, was hypothesized to make the development of resistance unlikely (Ives *et al.*, 2002) – though resistance spread rapidly in the 2007–8 flu season owing to the limited number of required mutational steps (Moscona, 2009; Bloom *et al.*, 2010), an important drawback that became clearer in subsequent experimental evolution studies (*e.g.*, Foll *et al.*, 2014).

Other strategies with wider genomic effects may thus prove more fruitful – ideally ones requiring at least multiple mutation steps in order to confer resistance. Over the past decades, the notion that an excessive input of mutations can drive population extinction has been explored both theoretically and empirically, beginning with the foundational work of Lynch and Gabriel (1990) and Lynch *et al.* (1993). This possibility owes to the fact that the vast majority of fitness-impacting mutations are deleterious, or said another way, there are many more ways to disrupt rather than improve genomic function. This so-called mutational meltdown is achieved once the mean viability of the population drops to the point that the average individual cannot replace itself, at which time the population begins to decline resulting in a snowball effect leading to ultimate extinction. The cause of this final meltdown-phase is in fact the accelerated reduction in the efficacy of natural selection that results from the decline in N_e – that is, the declining population size allows for the further fixation of deleterious mutations via genetic drift, which in turn further reduces the efficacy of selection, allowing for further deleterious fixations, and so on.

Given that many viruses are naturally characterized by high mutation rates, and thus may commonly reside near a threshold of mutational load, a therapeutic increase in mutation rates may indeed induce this phase in which the input of new mutation overwhelms the ability of natural selection to remove this deleterious load. While such a scenario is often referred to as lethal mutagenesis in the virology literature (Bull *et al.*, 2007), the mutational meltdown framework is more general and critically incorporates the additional effects of genetic drift inherent to all populations (see Matuszewski *et al.*, 2017). The ability of an increased mutation rate to induce such extinction in a patient viral population has been relatively well explored and justified in RNA viruses (Loeb *et al.*, 1999; Crotty *et al.*, 2000; Lanford *et al.*, 2001; Crotty *et al.*, 2001; Severson *et al.*, 2003; Airaksinen *et al.*, 2003), using a variety of drugs including ribavirin and, more recently, favipiravir (Furuta *et al.*, 2013; Baranovich *et al.*, 2013; Bank *et al.*, 2016; Ormond *et al.*, 2017). Pertinent to the 2020 pandemic, Sheahan *et al.* (2020) recently demonstrated that the ribonucleoside analog EEID-1931 has a mutagenic effect in SARS-CoV-2 passaged in cell culture and, working in a mouse model, found a positive correlation between increased viral mutation rates and the degree of therapeutic efficacy. This work lends support to other recent calls to better investigate the potential therapeutic strategy of mutational meltdown in the context of CoV-2 (Jensen and Lynch, 2020; Santiago and Caballero, 2020; Jensen *et al.*, 2020).

While this represents a potentially promising and generalized treatment strategy for existing (and future unknown) pathogens, a number of important open questions remain in this regard. These will necessitate further theory work related to the necessary mutation rate turn-up required to induce this effect with realistic DFEs, as well as a more complete exploration of the interplay with underlying recombination rates (when applicable); as well as a more cohesive experimental effort to accurately quantify natural viral mutation rates via mutation-accumulation studies, in order to establish baseline values. What is clear however is that new viral pathogens will continue to emerge, a comprehensive understanding of their evolutionary trajectories will be critical for designing effective clinical treatments and interventions, and hence that a better union of the fields of population genetics and medicine will prove to be of great value.

VSV Vesicular stomatitis virus;

Glossary

Arming Insertion of additional genes into the oncolytic virus genome to increase therapeutic efficacy.

Bystander effects Cytotoxic effects on non-infected cells in the vicinity of infected cells.

Immune checkpoint blockade Treatment with antibodies that block inhibitory signaling in immune cells, especially T cells.

Shielding Genetic or chemical modifications to avoid antibody neutralization of viruses.

Targeting Modifications of viral tropism to increase tumor specificity.

Definition

Oncolytic virotherapy is the treatment of cancer with viruses that replicate preferentially in tumor tissue, damaging it. Selectivity for tumor tissue can occur naturally, and be enhanced by genetic engineering.

Introduction and Historic Notes

Virus infection may be responsible for a significant fraction of human cancer deaths. Nevertheless, shortly after the discovery of animal viruses, observing physicians reported cancer regressions coincident with natural infections, most notably in patients with lymphoma or leukemia. These patients were suffering from viral hepatitis, glandular fever, chickenpox, or measles. For example, before a virus was discovered as the causal agent, influenza was associated with leukemia remission. In a 1910 report, the Italian gynecologist De Pace observed tumor lysis and subsequent tumor remission in a cervical cancer patient after rabies vaccination. These and other anecdotal observations inspired early clinical trials in the second half of the 20th century.

These trials did not meet current ethical standards for clinical investigations. Infectious body fluids or tissue samples were administered to cancer patients. For instance, in a 1949 trial, 22 patients suffering from Hodgkin's lymphoma were treated with sera or tissue extracts from patients infected with hepatitis B virus. The first patient died after treatment, and 13 developed hepatitis. Seven patients were reported to show amelioration and four experienced reduction of lymphoma burden. In 1953, a case series was published reporting transient remission of acute leukemia after intramuscular injection of glandular fever sera in three out of five treated patients. Trials with several human pathogenic viruses were conducted, including flaviviruses such as dengue and West Nile virus. In the latter, viremia and intra-tumoral virus were observed in many patients, with several cases of encephalitis and few cases of transient delay in tumor progression. These approaches to therapy can only be understood in the light of the general hopelessness of what was then cancer treatment.

The advent of tissue culture in the 1950s and 1960s allowed viruses to be propagated in a more defined environment. In addition, it became possible to assess the extent of virus spread and virus-induced cell death in cancer cell lines. Based on *in vitro* experiments, an adenovirus, at that time called adenoidal-pharyngeal-conjunctival virus, emerged as a candidate oncolytic virus. In 1956, this virus was administered to patients with cervical carcinoma by either intratumoral, intra-arterial or intravenous administration. This treatment showed a favorable safety profile. Extensive tumor necrosis occurred in 26 of 40 treated patients, but all patients ultimately succumbed to their tumor within a few months.

Another important development in the assessment of the safety and oncolytic efficacy of viruses was the use of models based on transplantable or spontaneous murine tumors. These models were used to characterize the efficacy of animal viruses including two herpes viruses, equine rhinopneumonitis and infectious bovine rhinotracheitis virus, as well as a murine negative sense RNA virus termed "M-P virus" at the time, which was later identified as a lymphocytic choriomeningitis virus, and the poultry pathogen Newcastle disease virus (NDV), a member of the *Paramyxoviridae* family.

Simultaneously with the testing of several animal viruses as oncolytics, cancer regressions coincident with natural human infections continued to be reported. In the 1970s several case reports described coincidence of infections with measles virus (MeV),

Fig. 1 Lymphoma remission after measles infection. *Left panel:* patient on admission with Burkitt's lymphoma; note the swelling around his right eye. *Center panel:* patient three weeks later after contracting measles by natural infection; note the rash on his skin. *Right panel:* Patient five weeks later. Tumor and measles exanthem have resolved completely. Reprinted with permission from Bluming, A.Z., Ziegler, J.L., 1971. Regression of Burkitt's lymphoma in association with measles infection. *Lancet* 2 (7715), 105–106.

another member of the *Paramyxoviridae* family, with regressions or remissions of leukemia and lymphoma. One of these reports included a striking visual documentation of Burkitt's lymphoma remission following natural measles ([Fig. 1](#)).

In 1974, a large clinical trial with a third member of the *Paramyxoviridae* family naturally infecting humans, mumps virus, was reported. Ninety patients with various terminal cancers were treated by different routes of administration including intravenous or intratumoral injection, local application after scarification of the tumor, oral or rectal administration and inhalation. Side effects were minimal, and 79 of 90 patients experienced tumor remission, including several apparently complete responses. In some patients, signs of increased anti-tumor immunity were observed. However, there was no follow up. In summary, by the end of the 1970s, several clinical trials based on human or non-human viruses reported acceptable toxicities, but limited efficacy.

This situation contrasted with the availability of effective chemotherapy and radiation therapy clinical interventions, and resulted in the decline of research activities in the oncolytic virus field. At this crossroads, it was evident that viruses with increased cancer specificity were needed. However, to achieve this goal, three areas of research needed development: methods for directly documenting viral spread *in vivo*, a deep understanding of the virus tropism determinants, and technology to generate recombinant viruses with specified characteristics.

Re-engineered Viruses: The Beginnings

The “natural” oncolytic properties of some viruses were initially inferred by the coincidence of cancer regressions with natural infections. Subsequently, when tissue culture systems for animal cells were established, it became evident that almost every virus grows much better in transformed cancer cell lines than in primary cells. We now know that the multistep process of cancer progression can affect multiple components of the cellular response to viral infection, favoring the replication of many different viruses. Thus, many viruses have “natural” oncolytic properties.

On the other hand, oncolytic properties are not universal, but depend on proper matching of virus and host cell. Virus families have evolved specificities for different cell types, and this natural diversity impacts on the oncolytic properties of each virus. To be a cancer therapeutic, viruses need to efficiently enter cells. If this happens, the host cell is per definition susceptible ([Fig. 2](#), center). Following cell entry, depending on the outcome of several interactions between cellular intrinsic immunity proteins and viral proteins, the virus will replicate. In this case, the host cell is per definition permissive to infection and will ultimately be lysed ([Fig. 2](#), right).

In the last three decades, research on the tropism determinants for viruses of several different families greatly progressed. This was facilitated by the establishment of methods to easily visualize and quantify virus spread in the host using reporter genes, and to document how virus replication in different locations relates to therapeutic efficacy. In addition, our understanding of tumor biology greatly improved; more sophisticated animal models were included in pre-clinical testing of new therapeutics; and large arrays of diagnostic markers are being used for in-depth evaluation of clinical trial results.

Based on this deeper knowledge of the biology of both viruses and cancer, new viruses with improved oncolytic activities have been generated, and many of these recombinant viruses are now in pre-clinical development. In particular, four DNA viruses and five RNA viruses are either approved therapeutics or in different clinical trial phases. [Table 1](#) lists one or two selected examples of approved or experimental cancer therapeutics derived from each of these nine families. It indicates the virus family and name, the genetic changes introduced, the routes of administration, whether the virus was given alone or in combination with another cancer therapeutic, and the clinical trial identifier and time frame.

Fig. 2 Susceptibility and permissiveness of cancer cells determine the outcome of oncolysis. *Top panels:* cancer cell that does not express a viral receptor and is therefore not susceptible to the virus. *Center panels:* cancer cell that expresses a viral receptor, allowing viral entry. However, the cell is not permissive for the virus, which does not replicate and cannot cause oncolysis. *Bottom panels:* cancer cell both susceptible to, and permissive for the virus. The virus replicates, ultimately leading to oncolysis. (Created with BioRender.com.)

While this table is only a snapshot of current state-of-the-art research, some general conclusions can be drawn. First, virus-based cancer therapeutics are well tolerated, even at the highest doses achievable by current manufacturing processes, after both localized and systemic administration. In addition, although virus shedding was documented in the urinary and respiratory tract, especially after systemic administration, no transmission from a cancer patient to health care providers, or other contacts, has been noted. Second, three of the most successful oncolytic viruses express as immunomodulatory transgene the granulocyte-macrophage colony-stimulating factor (GM-CSF) (Table 1, DNA viruses). This may be due to the combination of replicative oncolysis with GM-CSF-mediated inflammation to induce adaptive immunity against tumor antigens. The third conclusion is cautionary: several viruses have fallen short of the efficacy expectations that were set by pre-clinical models. This fact underscores the importance of improving efficacy of current generation virus-based cancer therapeutics.

Three Classes of Modifications

Current clinical trials of oncolysis face several challenges. Insufficient efficacy can be addressed by more aggressive dosing, which is being enabled by continuing technological advances in virus production. However, more aggressive dosing requires improved tumor specificity of future vectors to maintain the current safety profiles. Cancer specificity can be improved by *targeting*. Targeting, which is based on the introduction of different layers of cancer specificity, either at the cell entry or post-entry levels, can enhance both efficacy and safety of oncolytic vectors.

Another key challenge for oncolytic therapy is to avoid immediate neutralization of the vectors through circulating antibodies, which can arise in patient populations via natural contagion, scheduled immunization, or prior administration of an oncolytic virus. Temporary *shielding* from the host immune response can provide a window of opportunity for the effective initiation of the oncolytic process. Shielding can be achieved by changing or physically masking the epitopes that are recognized by neutralizing antibodies.

The third key challenge for oncolytic therapy is the need to reach and eliminate not only all the cells in a primary tumor, but also tumor metastases. This challenge is addressed by *arming* viruses with proteins that sensitize not only infected tumor cells but also uninfected metastases, to subsequent combination therapies or immune destruction. Arming occurs through the expression of a foreign gene: for example, a prodrug convertase activating an anticancer therapeutic *in situ*, or an ion channel facilitating radiosensitization, or a cytokine promoting immunostimulation.

Table 1 Selected examples of current clinical trials with viruses from nine families^a

Fig. 3 Entry and post-entry targeting of oncolytic viruses. Left column: normal cells. Right column: cancer cells. Top panels: receptor targeting. The viral RBP is engineered to no longer recognize its natural receptor, while attaching to a tumor-specific surface protein. This approach has been pioneered with enveloped viruses. Center panels: transcriptional regulation of replication. Virus replication is placed under control of a promoter active in tumor cells, but not in normal cells. This approach has been pioneered with viruses whose replication depends on cellular polymerase II. Bottom panels: post-transcriptional regulation of replication. This process takes advantage of the downregulation of certain microRNAs in tumor cells. Viruses engineered with microRNA target sequences in their genome replicate only in absence of the cognate microRNA. (Created with BioRender.com.)

While not all genetic modifications of viruses fall precisely within one of these classes, the targeting, shielding and arming principles guide the continuous improvement of oncolytic viruses.

Retargeting Virus Tropism

The term targeting describes virus modifications that confer greater specificity for tumor cells by improving infection of diseased tissues or decreasing infection of healthy tissues, or both. Tumor specificity can be enhanced either at the stage of virus entry into the cells by modifying receptor choice (Fig. 3, top panels), or post entry during replication. Post-entry targeting can be achieved either at the transcription initiation level through the use of cancer-specific promoters (Fig. 3, center panels), or post-transcriptionally by inserting microRNA (miRNA) target sequences into viral genomes that restrict virus replication in healthy tissues (Fig. 3, bottom panels). For all these targeting strategies, a deeper understanding of tumor biology has facilitated the development of viruses that exploit tumor-specific alterations such as altered expression of cell surface proteins, transcription factors, and microRNAs.

Cell Entry Targeting of Enveloped Viruses

All viruses require interactions with surface molecules on host cells to start infection. Surface proteins preferentially expressed on tumor cells can be exploited for entry targeting. This targeting strategy requires modification of the receptor-binding proteins of viruses. These modifications are either genetic and generate chimeric proteins, or they use chemical adapters to link specificity domains to virus particles.

Genetic modifications of the receptor-binding proteins (RBP) of viruses are desirable because they are retained after replication. To redirect viral tropism by receptor targeting, their RBP are modified in two ways: first, ablation of binding to the natural receptor, or receptors. Second, engineering of binding to receptors preferentially or exclusively expressed on tumor cells.

Fig. 3 (top panels) illustrates receptor targeting by RBP genetic engineering. Measles virus (MeV), an enveloped negative strand RNA virus of the *Paramyxoviridae* family, is used as an example. Receptor targeting is most advanced for enveloped viruses owing to the plasticity of their surface glycoproteins, whose evolution is not restricted by the multiple constraints imposed by icosahedral symmetry on the capsids of other viruses.

The *Paramyxovirus* membrane fusion apparatus is easy to manipulate because receptor binding and membrane fusion functions are mediated by two different proteins. For MeV, the residues required for entry via the natural receptors have been identified and then mutated to disable binding to the natural receptors. Retargeting was completed by adding to the entire ectodomain of the RBP a moiety recognizing a cancer-specific receptor of interest. A flexible linker was introduced between the RBP ectodomain and the targeting moiety to allow its movement.

Initially small peptide ligands for growth factor receptors were used to prove that the MeV RBP can bind targeted receptors without losing its membrane fusion support function. It was then shown that single-chain antibodies can also be used as specificity domains. Single-chain antibodies comprise only the variable domains of both light and heavy chains, which confer antigen specificity, and are far smaller than complete antibodies.

Single-chain antibody fragments are well suited for retargeting of enveloped viruses, since they share with viral glycoproteins the same intracellular synthesis and transport pathways. Receptor targeting using single-chain antibody fragments has also been developed for the *Herpesviridae*, although the membrane fusion apparatus of these large DNA viruses is more complex and involves five glycoproteins. On the other hand, the single protein membrane fusion system of the *Retroviridae* family has proven difficult to retarget without extensive loss of cell entry efficiency.

Cell Entry Targeting of Non-Enveloped Viruses

Receptor targeting of non-enveloped viruses with icosahedral capsids is challenging due to the strict structural constraints imposed by icosahedral symmetry. Nevertheless, receptor targeting by genetic modification has been achieved for *Adenoviridae*. For instance, short peptides or ligands with specificity for tumor surface proteins have been inserted at one end, or into a flexible region, of the adenovirus RBP. Targeting is completed by mutations that ablate binding to the natural receptors.

More invasive capsid modifications have had different degrees of success. In addition to the icosahedral symmetry constraints, targeting strategies must take in account that adenovirus capsids are assembled in the cytosol, rather than transiting through the endoplasmic reticulum. Therefore, ligands that require folding, oxidation or other post-translational modifications in the endoplasmic reticulum are unsuitable.

As alternative entry targeting strategy, adapter molecules have been developed. These adapters bind with one end to the adenovirus capsid, and with the other end to a cancer cell protein. This approach poses less structural constraints than the addition of specificity domains. However, cell entry occurs through the targeted receptor only during the first round of replication.

Cell Entry Targeting by Protease Activation

Another cell entry targeting strategy is based on the selective activation of virus particles in the tumor microenvironment. This strategy, which takes advantage of the requirement of proteolytic cleavage for the activation of fusion proteins, has been used to retarget cell entry of *Paramyxoviridae* and *Retroviridae*.

Protease targeting requires two modifications: first, inactivation of the cleavage site used by the cognate protease expressed in the natural host cells. Second, introduction of a cleavage site recognized by proteases secreted in the tumor microenvironment, such as matrix metalloproteinases. Since protease cleavage requires not only a specific recognition sequence, but also its accessibility by the cognate protease, engineering of efficient proteolytical activation may not be straightforward and require iterative cycles of optimization through mutagenesis. For example, the protease cleavage sites of the MeV and Sendai virus fusion proteins have been re-targeted following this principle.

Transcriptional Regulation of Replication

The most potent oncolytic viruses are arguably wild-type viruses. However, these viruses can kill normal cells, hence causing dose-limiting toxicities. Thus, oncolytic therapy has been developed almost exclusively based on attenuated viruses. On the other hand, attenuation is always relative to the target cell. Ideally, oncolytic viruses should be completely attenuated in normal cells, but maintain normal replication in cancer cells.

Towards this, two replicational targeting strategies have been developed. The first aims at modulating the transcription of a gene controlling the early phases of replication. The second focuses on the selective transcription of virulence factors expressed late during the viral cycle. These strategies have been developed for viruses whose replication depends on cellular polymerases, in particular the *Adenoviridae* and the *Herpesviridae*.

Early transcriptional control of replication is best developed for the *Adenoviridae* (**Fig. 3**, center panels). It can be achieved through the substitution of the promoter modulating transcription of Adenovirus early proteins by commonly used cancer-associated promoters, such as telomerase, or a prostate-specific antigen promoter in case of prostate cancer. Alternatively, there is now a burgeoning number of tumor-associated promoters that were identified using gene expression profiling in different cancer

types. Certain elements of these promoters are now being used to control viral replication at the level of early transcription in new vectors proceeding through clinical trials.

Another strategy aims at generating recombinant viruses that retain full virulence only in cancer cells by exploiting tumor-associated promoters to selectively activate the expression of virulence factors. This strategy is most advanced for the *Herpesviridae*, large DNA viruses that code for several virulence factors whose expression can be altered in combination. For example, a glioma-specific promoter is used to control the expression of the neurovirulence gene ICP34.5 of a herpes virus 1 recombinant used for glioma therapy.

Post-Transcriptional Regulation of Replication

An alternative strategy for targeting viral replication exploits differential expression of microRNAs between tumors and normal tissues. This approach requires identification of microRNAs that are expressed in non-target tissues, but downregulated in tumor cells. Target sites for microRNAs are inserted into the untranslated regions of viral transcripts. These viral transcripts are degraded by the cellular microRNA machinery in cells that express the cognate microRNAs, abrogating viral replication (Fig. 3, bottom panels).

The post-transcriptional regulation of replication principle was initially developed with a picornavirus that was an effective oncolytic but also caused significant toxicities due to myositis. Target sites for muscle-specific microRNAs introduced into the genome of this virus prevented myositis, while therapeutic efficacy was maintained.

With extensive knowledge about microRNA expression in tumors, and the relative ease with which these relatively short target sequences can be incorporated into virus genomes without negatively affecting replication, negative targeting via microRNAs has been extended to several oncolytic virus platforms. These include members of the *Adenoviridae*, *Herpesviridae*, *Paramyxoviridae*, *Poxviridae*, and *Rhabdoviridae*. Towards this, multiple perfect match microRNA sequences have been expressed in the untranslated regions of essential viral mRNAs.

Preferential Tumor Spread

Cancer targeting can also be achieved by favoring preferential spread of viruses in tumor tissue through the exploitation of specific defects in innate immunity. For example, many cancer cells cannot produce interferon (IFN), or cannot respond to IFN stimulation. In these cells, even attenuated viruses with defective IFN control proteins, and thus unable to replicate in normal cells, replicate and spread.

This principle has been exploited for the precise targeting of certain viruses for which the mechanisms of interferon inactivation are understood in depth, like the *Paramyxoviridae*. For example, analyses of the interactions between cellular innate immunity proteins and the MeV proteins controlling their function, have guided the generation of recombinant viruses that retain oncolytic efficacy in tumor tissue, while not spreading in normal cells.

Combination of Targeting Modalities

Multiple targeting modifications have been combined in second-generation recombinant oncolytic viruses. Therefore, most viruses that are currently in pre-clinical trials, or in early clinical trials, are targeted according to more than one modality. Targeting combinations allow to sequentially increase tumor specificity, augmenting safety. This is important, especially since armed viruses are being developed to augment the efficacy of virotherapy approaches.

Shielding From the Host Immune Response

Like any pathogen, oncolytic viruses are recognized as “non-self” by the host immune system, resulting in an anti-viral immune response. Innate, cellular and humoral anti-viral immunity can hamper efficacy of virotherapy.

While innate and cell-mediated responses can limit viral spread, neutralizing antibodies can inactivate the virus before it reaches the tumor. This is a major impediment to intravenous application of oncolytic viruses which, from a clinical perspective, is the preferred route of administration due to its feasibility and the potential to reach disseminated tumor sites. Therefore, avoiding premature viral clearance by neutralizing antibodies has been one focus in the development of advanced oncolytic therapies. Plasmapheresis has been applied to deplete neutralizing antibodies, but this process is complex and costly.

Virus Engineering

Virus engineering strategies have been developed to avoid antibody neutralization. These strategies include generating chimeric viruses that are not recognized by neutralizing antibodies. These chimeric viruses, which can be used for sequential rounds of therapy, can be generated by serotype exchange.

Serotype exchange is an option for most viruses, such as vesicular stomatitis virus (VSV) and adenovirus. In this approach, the viral proteins that are recognized by neutralizing antibodies, or parts of these proteins, are exchanged. For example, since all neutralizing epitopes of VSV reside within its glycoprotein, it is sufficient to replace it with that of another serotype (Fig. 4, top left panel).

Fig. 4 Shielding strategies. *Left column: virus engineering. Right column: chemical shielding and cell carriers. Left column, top panel.* Serotype exchange. For vesicular stomatitis virus (VSV) exchange of the envelope glycoprotein is sufficient to generate a virus that is temporarily not neutralized. *Left column, center panel.* Multiple epitope replacement. For adenoviruses, epitopes on two capsid proteins must be precisely swapped to generate a virus that is temporarily not neutralized. *Left column, bottom panel.* Chimeric viruses. For MeV, exchange of both envelope glycoproteins with those of a related virus is required to generate a virus that is temporarily not neutralized. *Right column, top panel.* Chemical shielding, shown for adenovirus. Small polymers are added to purified virus particles. *Right column, bottom panel.* Cell carriers, shown for MeV. Cell carriers are infected *ex vivo* prior to administration. Infection is transmitted to cancer cells either by heterofusion, or by released viral particles. Modified from Miest, T.S., Cattaneo, R., 2014. New viruses for cancer therapy: Meeting clinical needs. *Nature Review Microbiology* 12, 23–34. (Created with BioRender.com).

In contrast, both hexon and fiber proteins harbor neutralizing epitopes of adenoviruses (Fig. 4, center left panel). To circumvent neutralizing antibodies, hexon-chimeric and fiber-chimeric variants have been generated. This was a complex endeavor because the hexon capsid protein encodes seven distinct loops that all contribute to neutralization; these loops were individually replaced while leaving the backbone of the hexon protein intact.

Serotype exchange is not an option for viruses, such as MeV, which have a single serotype. In a variation on this strategy (Fig. 4, bottom left panel), the two MeV envelope glycoproteins were replaced with those of canine distemper virus, a closely related animal *Morbillivirus* whose proteins are structurally very similar. All these variations on the theme of serotype exchange require a balance between sufficient protein diversity to avoid cross-neutralization, and enough structural similarities to support particle formation.

Chemical Shielding and Cell Carriers

An alternative to genetic modification of the viral surface proteins is chemical shielding of viruses (Fig. 4, top right panel). Different hydrophilic polymers have been used for this purpose. A prerequisite for successful application of chemical shielding is

that viral entry is not impeded. This has been demonstrated for representatives of the *Adenoviridae*, *Poxviridae*, and *Rhabdoviridae*. Chemical shielding can have several positive effects: in addition to reducing sensitivity to pre-existing neutralizing antibodies, it can limit the *de novo* induction of humoral and cellular immune responses, and uptake into non-target tissues.

Processes based on carrier cells have been developed for systemic administration of oncolytic viruses. In addition to protecting viruses from neutralization, cell carriers may possess inherent tumor tropism, thus targeting virus delivery. Cell carriers are infected *ex vivo* prior to administration. Immune cells, mesenchymal stem cells and also malignant myeloma cells have been used as carriers for oncolytic viruses. Meanwhile mesenchymal stem cells carrying adenovirus or MeV have entered clinical testing. Notably, both chemical shielding and cell carriers do not shield the viral progeny, which may limit the efficacy of these approaches.

Arming Viruses

Another key challenge for oncolytic therapy is the need to reach and eliminate not only all the cells in a primary tumor, but also tumor metastases. Oncolytic viruses as standalone therapies have not achieved durable tumor clearance, but their arming with additional therapeutic genes may address this challenge. Most arming strategies rely on “bystander effects”, i.e., the killing of non-infected tumor cells. Bystander cell killing can be elicited by prodrug convertases, radiosensitizers and immunomodulators (Fig. 5).

Prodrug Convertases

Prodrug convertases are enzymes that activate non-toxic substrates, converting them into cytotoxic substances (Fig. 5, top panel). Prodrug-encoding viruses derived from *Herpesviridae*, *Adenoviridae*, *Poxviridae*, *Paramyxoviridae*, and *Rhabdoviridae* have been developed. The clinically most advanced approach is a replication-competent retrovirus encoding the prodrug convertase cytosine deaminase (Table 1). This enzyme converts a precursor into the active chemotherapeutic 5-fluorouracil (5-FU). 5-FU can diffuse out of the cell and into surrounding cells, exerting toxic effects also on non-infected cells. Compared to systemic chemotherapy, oncolytic virus-encoded prodrug convertases can reduce systemic toxicity by local concentration of the active drug at the site of viral replication, that is within the tumor.

Radiosensitizers for Therapy and Imaging

Arming with radiosensitizers aims at local concentration of radioisotopes for ablation of malignant tissue (Fig. 5, center panel). The sodium iodide symporter (NIS), whose physiological role is to concentrate iodide in the thyroid, has been incorporated into multiple viruses to facilitate tumor ablation. Administration of NIS-encoding viruses and certain β -emitting isotopes enables localized radio-virotherapy: radioactive ions are concentrated within infected tumor cells, and these radioisotopes also affect surrounding, non-infected cells.

An additional key application of NIS is imaging, which enables real-time tracking of viral gene expression and spread. This is done in pre-clinical and clinical studies using γ -emitting isotopes that accumulate at the sites of viral replication. These isotopes, which have much more effective tissue penetration than fluorescence or bioluminescence, have allowed to characterize at high resolution the replication of oncolytic viruses *in vivo*. In particular, the combination of imaging viral replication by single photon emission computed tomography (SPECT) with tissue imaging by computed tomography (CT) allows to correlate virus replication and distribution with measures of clinical efficacy. In worst case scenarios, SPECT-CT can identify off-target viral replication.

Immunomodulators

The successes of cancer immunotherapy in recent years rekindled interest in the immunotherapeutic effects of oncolytic virotherapy. Virus-mediated tumor cell lysis leads to the release of tumor antigens in a highly immunostimulatory context. This can induce anti-tumor immune responses via *in situ* vaccination effects. Arming oncolytic viruses with immunomodulatory transgenes aims at enhancing and shaping these anti-tumor immune responses (Fig. 5, bottom panel).

The immunomodulator most commonly harnessed for this purpose is GM-CSF. GM-CSF recruits and activates antigen-presenting cells, which in turn stimulate T cells. GM-CSF is expressed by three of the clinically most advanced viruses (Table 1). Further immunomodulatory transgenes include cytokines and immune checkpoint blocking antibodies.

However, non-specific immunostimulation may result not only in activation of anti-tumor, but also anti-viral immunity. To specifically direct immune responses against tumor cells, bispecific antibodies for recruitment of immune effector cells to tumor cells have been encoded in oncolytic viruses. Furthermore, oncolytic viruses encoding tumor antigens have been generated to prime and expand tumor-specific T cells. This approach has entered clinical development (Table 1).

Additional arming strategies include encoding pro-apoptotic factors, or factors which counteract inhibitors of apoptosis to increase tumor cell death. Oncolytic viruses encoding short hairpin RNAs, microRNA mimics, and microRNA decoys to inactivate pro-tumorigenic factors have also been reported. Metabolic reprogramming of the tumor microenvironment is also attempted.

Fig. 5 *Arming strategies.* *Top panels:* prodrug activation. Cancer cells are infected by a virus that expresses a prodrug convertase that activates non-toxic precursors (prodrugs) into therapeutically active toxic metabolites. These metabolites diffuse within the surrounding tissue, killing bystander cells. *Center panels:* radiosensitization. Cancer cells are infected by a virus that expresses a symporter like NIS, which concentrates radioisotopes in infected cells, leading to radiation-induced death of the infected cell, and of nearby bystander cells. Shown here is radiation-induced DNA damage in a bystander cell. *Bottom panels:* immuno-stimulation. Cancer cells are infected by a virus that expresses an immunostimulatory gene like GM-CSF. Infected cells activate anti-tumor immune responses. GM-CSF activates dendritic cells to present tumor antigens to T cells via MHC molecules and to express costimulatory molecules such as CD80. Recognition of the presented antigens by a T cell with a cognate T cell receptor (TCR) primes an anti-tumor immune response, leading to T cell-mediated anti-tumor cytotoxicity. Modified from Miest, T.S., Cattaneo, R., 2014. New viruses for cancer therapy: Meeting clinical needs. *Nature Review Microbiology* 12, 23–34 (Created with BioRender.com).

Fig. 6 Clinical trials of oncolytic virotherapy in combination with other treatments. Clinical trials initiated in the last 5 years (2015–2019) are categorized by type of combination therapy.

Combination Therapies

A paradigm of cancer treatment is that no single drug or therapy will cure cancer. Surgical removal of tumors, chemotherapy, radiation therapy, and now also immunotherapy and oncolytic virotherapy are used in combination to treat cancer patients. Indeed, several current clinical trials combine an oncolytic virus with other therapeutics (Table 1). In particular, more than half of all trials initiated in the years 2015–2019 combine virotherapy with at least one additional treatment modality (Fig. 6) and it is to be expected that oncolytic viruses will increasingly be integrated into combination therapy regimens.

For instance, adenovirus H101, the first clinically approved oncolytic virus, is applied in combination with standard chemotherapy for head and neck cancer (Table 1). Several other combinations of chemotherapy and virotherapy are currently in clinical trials. Some of these protocols take advantage of virus-encoded enzymes to locally convert prodrugs into active chemotherapeutics, as outlined above.

In pre-clinical studies oncolytic viruses have also been combined successfully with targeted therapies. For example, Talimogene laherparepvec (T-vec) showed synergistic effects with kinase inhibitors (MEK inhibitors) in mouse models of melanoma. So far, radiosensitizers have only been used for therapeutic purposes in pre-clinical models, but several trials have included imaging to assess the biodistribution of the virus.

The prospect of inducing anti-tumor immunity through oncolytic vaccination prompts the use of viruses in immunotherapeutic regimens. The combination of oncolytic virotherapy with immune checkpoint blockade appears especially promising and is increasingly pursued in clinical trials (Fig. 6). The proposed mechanism of action for this combination is that oncolytic virotherapy induces tumor-specific T cell responses that are subsequently reinforced by checkpoint blockade.

The sheer endless possibilities to combine oncolytic viruses with different cancer treatments require prioritization. Future studies will be guided by better understanding of the mechanisms of action of cancer therapeutics as well as their interactions with other treatments and stringent testing in more refined pre-clinical models.

Complex combination therapies raise questions regarding the optimal dosing and scheduling of the individual treatment components. Several groups have attempted to mathematically model combination treatments with oncolytic viruses to inform dosing and scheduling with the aim to predict – *in silico* – the most effective combination regimens.

Surgery is a mainstay in treatment of many cancer types. Incorporating oncolytic viruses into the treatment of these cancers allows for so-called “window of opportunity” clinical trials. Oncolytic viruses are administered in a neoadjuvant setting, that is before surgical removal of the tumor. Histological assessment of the tumor tissue for signs of viral replication and immune infiltration can provide valuable insights into therapeutic effects, or lack thereof, of oncolytic virotherapy.

To summarize, the dual mechanism of action of oncolytic viruses, namely direct intratumoral spread followed by inflammatory boosting of the anti-tumor immune response, makes them ideal partners for combination with immune checkpoint inhibitors and other immune-oncology agents. Another current priority is research on synergies with conventional anticancer drugs.

Perspectives

Viruses are emerging as a promising new modality in the fight of cancer. While current oncolytic virotherapy approaches are very safe in humans, therapeutic efficacy has been less than expected from pre-clinical studies. This may reflect the fact that many current approaches are based on highly attenuated viruses, and that generalized attenuation interferes with clinical efficacy.

Next-generation viruses will seek to retain wild-type replicative competence in cancer tissue, while entry targeting and post-entry replication control mechanisms will restrict their spread in off-target tissues. In addition, arming strategies based on chemo-, radio-, or immuno-therapies will be potentiated by enhance virus replication in tumors.

Next-generation oncolytic viruses will be deployed strategically, based on deeper understanding the susceptibility of different tumor types, and on progress in stratifying patients. In synergy with approved cancer therapeutics, oncolytic viruses are finding their niches in the treatment of cancer.

PREVENTION

Surveillance of Infectious Diseases

Norman Noah, London School of Hygiene and Tropical Medicine, London, United Kingdom

© 2021 Published by Elsevier Ltd.

Glossary

Case–fatality rate Number of persons dying of an infection divided by total number of persons with the disease. Thus, CFR of 5% means that 5 of 100 persons with the infection died. It is distinguished from “Mortality Rate” which measures the death rate in the whole population.

Endemic An infection continues in a country, though may vary in incidence at different times. Many enteroviruses, adenoviruses and respiratory viruses are endemic.

GUM clinics The term GenitoUrinary Medicine clinics is often used for special clinics for sexually transmitted infections (STIs).

Incidence The rate of new infections (number by population) in a given time – for example, 5 cases of influenza per 1000 per year. Good for short-term infections.

Outbreak and epidemic Most infectious disease epidemiologists do not distinguish between these terms and

use them interchangeably. Generally, an outbreak is defined as a localized increase in cases, whereas an epidemic is more widespread, perhaps affecting a whole country.

Outbreak When an infection occurs at a frequency higher than expected for that time or place. It is basically an increased incidence which is usually unexpected. Two linked cases is also theoretically an outbreak.

Pandemic This term should be restricted to infections affecting many countries, and may extend virtually worldwide. SARS spared many countries and indeed some continents, but it was a pandemic. SARS-CoV-2 and AIDS undoubtedly caused pandemics.

Prevalence The number of infections at any one time in a given population, expressed as a rate. Good for chronic infections such as chronic hepatitis B or C and serological studies (e.g., prevalence of varicella antibody at age 15 in a given population is 95%).

Introduction

Surveillance is undoubtedly an essential – indeed critical – ingredient of any disease control program. It is used to paint a picture of the progress and overall burden of infection or disease, so that any preventive or therapeutic action can be measured as it advances. In this way, the impact of an infection, the effect of an intervention or health promotion strategy, health policy, planning, and delivery can be monitored. Surveillance is the ongoing and systematic collection of routine data which are then analyzed, interpreted, and acted upon. It is essentially a practical process, which nevertheless can be useful in other ways. Its main purpose is to analyze time trends – but these can include not simply fluctuations in overall numbers, but also changes in age and sex distributions, geographical locations, and even possibly, in some of the more sophisticated established surveillance systems, at-risk groups (such as particular social, ethnic and occupational groups). Surveillance is essential for evaluating the impact of an intervention, such as mass vaccination, on a population. It can also act as a fairly sensitive system for the early detection of outbreaks.

Essential Characteristics of Surveillance

The word *ongoing* in the description of surveillance helps to distinguish it from a survey, which is usually finite, tends to focus more on one or more groups of persons, and involves a questionnaire. Nevertheless, surveillance does not have to continue forever – when it is no longer useful, it should be stopped.

To be *systematic* and *consistent* are other important ingredients of surveillance. If reporting centers are not consistent in what they report, nor regular, the data they send in will be uninterpretable, and probably useless. Defining what needs to be reported, its frequency, and agreeing on the criteria for making a reportable diagnosis are necessary to make sense of the data.

Timeliness is another important ingredient of a surveillance system. This is especially the case with infection. It is particularly essential for the early recognition of outbreaks, but it is important also in evaluating the success or otherwise of programs to control the spread of an infection e.g., the effect of lockdown on coronavirus disease (COVID-19) on a population.

Representativeness is another important ingredient of a surveillance program. The program has to be representative of the effect of that infection on a population. This may not always be possible, and any biases and inconsistency in reporting has to be taken into account in interpreting the data.

Completeness is generally less important than representativeness, especially for relatively common infections. Completeness becomes important if or when the number of infections decreases, whether on its own or through a public health intervention. For some serious infections, completeness may also become important. Completeness is discussed in more detail later in this article.

The *collection of routine data* is another important characteristic of surveillance, especially with surveillance of laboratory infections. Generally, testing of samples is done for diagnosis, not primarily for surveillance. As laboratory testing is expensive, making further use of the results by contributing to surveillance makes for more efficient use of information, and the contribution to surveillance itself can

often justify further testing. Typing echoviruses or coxsackie viruses can seldom be justified on clinical grounds alone, but the surveillance of serotypes can provide valuable information on the epidemiology of these viruses, their clinical characteristics, seasonality, and age and sex distributions – and of course whether there has been an outbreak. Echovirus 4 for example tends to be rare, fairly localized even within a country, but, when it occurs, it has a high aseptic meningitis rate, and causes a short and sharp autumn outbreak. Echovirus 9 on the other hand is far more common, more widespread geographically when it causes an epidemic, more benign, with a macular rash, and with meningitis not an especially common manifestation. The weekly patterns of some of these viruses can provide clues on future resurgences. Echovirus 4 as stated, comes and goes in one season. In the autumn of 1974, a small outbreak of echovirus 19 did not disappear entirely throughout the winter. A further and much larger outbreak in the autumn of 1975 was predictable, and occurred.

Although surveillance is essentially a practical exercise, this article attempts to show that surveillance can also be useful in giving us clues about an infection, whether it be its natural history, etiology, severity, or outcome.

Collection of Data: Sources of Data in Surveillance of Viruses

Death Certification

In most developed and middle-income countries, deaths are certified primarily for legal reasons, but have proved to be an important data source to use for surveillance. Clearly, they tend to be useful mainly for serious infections, and may suffer from inaccuracies, but remain a useful basic data source. Diseases with a high mortality rate and a short duration of illness (the viral hemorrhagic fevers for example) will obviously be better represented by death certification than those with a low mortality. HIV/AIDS, before the era of HAART, had a high mortality but long periods of symptomless and symptomatic infection, so that death certification data needed careful interpretation. It is well known that death certification standards of accuracy vary not only from country to country, but also within countries. In England, in the early years of the HIV epidemic, it was shown that deaths in single men had risen in number although AIDS was not mentioned on the death certificates. With influenza outbreaks there is usually an increase in total mortality in the elderly otherwise unaccounted for. The reporting of deaths from SARS-CoV-2 both within and between countries is also known to be inconsistent. Excess deaths have become a useful measure in estimating mortality from influenza and SARS-CoV-2.

Laboratory reporting systems can sometimes be another useful source of information on mortality from infection.

Notifications

Surveillance systems such as statutory notification tend to be based mainly on clinical features. These can be very useful for common diseases with distinctive clinical syndromes, such as measles and mumps. It is important however not to make a disease notifiable unless there is a good reason for it: “good” reasons include a mass vaccination program (when surveillance is virtually mandatory), any other mass control program, or serious diseases for which contact tracing, mass or close contact prophylaxis or investigation into source is necessary. Serious less common viral infections such as poliomyelitis are notifiable in most countries. This is because contact tracing and preventive measures can be taken. Broader clinical diagnoses, such as aseptic (viral) meningitis, may on the face of it be less useful to notify, as it is usually impossible at the bedside to distinguish such causes of it as, for example, the coxsackie B viruses, echoviruses, and mumps. Nevertheless, notification of aseptic meningitis can be useful because a rapid rise in notified cases may need to be investigated further. Moreover, the timing of any epidemic may give a clue to etiology – mumps meningitis tends to increase in spring and is usually accompanied by a concurrent outbreak of clinical mumps, while enterovirus epidemics are more likely to occur in autumn.

Other Sources of Data

Specific general practitioner (GP) surveillance systems are useful in providing data of epidemiological value for common infections that are not notifiable, such as the common cold or chickenpox (in UK). They are of course clinically based, but are nevertheless useful, and often surprisingly accurate, possibly because those GPs who subscribe to a surveillance system are motivated to do so. GP surveillance systems are often sentinel-based, that is, based on a sample of GPs in a country, region, or area. In the English system, GPs provide data on the base populations of their practices, so that rates of infection can be provided as a routine, a feature that is almost unique amongst surveillance systems. Thus, they are good for common infections which to make notifiable would possibly be wasteful, such as chickenpox. Moreover each sentinel would normally provide complete reporting. GP surveillance systems also tend to be good for timeliness and completeness. Outbreaks of influenza are often first recognized by GPs.

Laboratory Data

It is useful to think of laboratory data as being of qualitative rather than quantitative value as they add quality and detail to disease surveillance. Thus, in the example already used for aseptic meningitis, a precise diagnosis of mumps, echovirus, or coxsackie type is

particularly useful in clustering and outbreaks. Indeed, as the enteroviruses exhibit a strong late summer/autumn seasonal pattern with each enterovirus returning to its baseline in winter, when numbers of a particular type continue to be reported at a level higher than the winter baseline, the return of this virus to cause another epidemic in the following summer can usually be safely predicted. Laboratory data are also essential in qualifying food poisoning and gastroenteritis. Separating viral from bacterial causes is a useful first step, as their management tends to be very different. Norovirus gastroenteritis can be food-borne, but also spreads very easily from person-to-person because an extremely small dose is necessary for infection to occur, and the virus being fairly resistant to the environment will survive for some time. Management therefore must concentrate on hygiene. Rotavirus on the other hand is not commonly known to be foodborne. It can be distinguished from norovirus by its strong winter pattern in temperate climates, and its preponderance in infants. With most bacterial causes of food poisoning, especially the salmonellas, management often depends on the removal of the offending food. This is less common with viruses – only occasionally do hepatitis A or norovirus cause outbreaks of food poisoning. Laboratory surveillance is particularly essential for unraveling the mass of respiratory viral infections that afflict humans, such as respiratory syncytial virus, adenoviruses, parainfluenza viruses, and rhinoviruses. Indeed, it is particularly useful for influenza – not only separating it from influenza-like illness, but also in identifying influenza A and B, and if A, the subtype and variant. The constituents of every influenza vaccine depend on laboratory data.

Surveillance of Outbreaks

Surveillance of outbreaks (as opposed to individual infections) can be revealing, and important to allow public health measures. In one incident, routine surveillance revealed two cases of hepatitis B associated with one tattooist. Inspection of the notification data on hepatitis revealed 33 cases in all associated with the tattooist. The existence of the noroviruses was suspected in the UK many years before the organisms were identified. This was because some outbreaks which did not fit the characteristics of known infections but had characteristics of their own had occurred. There are some surveillance systems specifically for outbreaks. One example is EpiWATCH. This is run by the National Health and Medical Research Council (NHMRC) Center for Research Excellence Integrated Systems for Epidemic Response in Australia. Epidemic intelligence systems such as EpiWATCH can be useful for the global surveillance of outbreaks.

Hospital Admissions

These can be useful for certain more serious infections, such as hepatitis and encephalitis. They can be unwieldy, generally lack detail, and often are published a year or more after the events have occurred. Special more timely surveillance systems can be created, as for example with SARS-CoV-2 in 2020.

Serological Surveillance

Serological surveillance has become increasingly important, and is a useful tool in assessing the immunity of a population, though it can also be used to identify vulnerable individuals. The immunity of a population can be vaccine-induced, and serological surveillance is a valuable adjunct to the methods available to monitor a mass immunization program. Vulnerable age groups can be identified, and booster doses of the vaccine introduced. An example of the importance of serological surveillance in determining public health policy is included below (analysis by person).

Surveillance of Viruses in Nonhuman and Environmental Sources

To build a picture of an infection, animals, birds, and the environment have been placed under surveillance. Rabies in foxes and other wildlife, influenza in birds, pigs, and other animals, are examples of important and fairly successful surveillance systems. With the more recent examples of the emerging viruses such as Nipah and the group B coronaviruses, this type of surveillance is becoming important. At the time of writing, there are some surveillance systems for influenza A virus in avians and humans. Environmental surveillance of sewage and other wastewaters for wild and vaccine polio virus, as well as other viruses, exist.

Other Sources of Data

Records of sickness absence, absence from school, calls to an emergency room, if available, can provide speedy information that something has happened, but tend to be nonspecific. Surveillance of antiviral resistance will become important. AIDS was first discovered in the US when the use of a drug for treatment of the then rare *Pneumocystis carinii* infection in gay men began to increase. Surveillance of prescriptions or drug usage as a means of monitoring infection will probably increase in importance.

Newer Types of Surveillance System

Syndromic Surveillance

There is no strict definition of this type of surveillance. One description is: “Syndromic surveillance complements traditional public health surveillance by collecting and analyzing health indicators in real time”. It is usually based on an increase in an unusual group of clinical features which may lead to investigation. One of the earliest examples of this, though not a virological one, was the recognition of an unusual cluster of symptoms (subsequently labeled the Eosinophilia–myalgia syndrome) linked to L-tryptophan consumption originating from a single source in Japan. This was a dietary supplement manufactured using genetically-engineered bacteria. The beginning of the outbreak of SARS-CoV-2 was an increase in an association of unusual clinical features in Wuhan – in effect a new syndrome. Although there was some delay in reporting this particular unexpected increase, the primary objective of this type of surveillance is to recognize an outbreak as early as possible. Sudden changes in numbers of doctors’ prescriptions for specific drugs, school or workplace absenteeism may also be used to uncover new outbreaks or new infections. Electronic surveillance systems are now being developed to detect new outbreaks – whether virological, bacteriological, or chemical. The fear of terrorism has stimulated this greater interest in syndromic surveillance. Syndromic surveillance will undoubtedly become more important with time.

Sentinel Surveillance

Sometimes, for research purposes or otherwise, more detailed or higher quality data on an infection or infections are required than normally available through a passive system. It may be too much of a burden – and probably wasteful – to expect all laboratories or other sources of data to include or collect this extra information. In this instance a form of active surveillance can be introduced. A sentinel surveillance system can be set up using a selected – and willing – number of motivated laboratories. Chosen laboratories would be expected to diagnose a reasonable number of cases of the infection, be within a fairly large area in which they would be expected to diagnose all cases of the infection, and of course to be technically excellent. Sentinel surveillance systems tend to be time limited, and are unsuitable for rare infections.

Enhanced Surveillance

Enhanced Surveillance is a term used for infections of public health importance to combine epidemiological and microbiological data, as well as other types of information necessary. It may include data from a range of sources. For COVID 19, clinical and microbiological as well as social data such as ethnic background have been collected by several countries, including from asymptomatic persons. Serological testing gives information on immunity both in a person as well as in a community. This information can be obtained from primary care and various other settings, including places of education, medical institutions and care homes. Clearly, enhanced surveillance is expensive on costs and manpower, and should only be put into practice for special reasons, such as a pandemic. Further examples covering HIV are given in the next section; many of these are also relevant to Covid19.

Active Surveillance

This is a form of enhanced surveillance to ensure completeness and consistency. Reporting sources have to report make negative returns whether or not they have had cases.

Surveillance of HIV/AIDS

The association of HIV/AIDS with stigma makes surveillance of this infection especially difficult. It is an example of the importance of tailoring surveillance to a specific serious infection if it becomes necessary to do so.

In the UK and some other countries with data protection acts, HIV infection, as with other STIs, is not notifiable. Special confidential surveillance systems through clinicians and GUM clinics, as well as laboratories, are in place. These are especially important for assessing risk factors. Inclusion of risk factors is essential for targeted intervention – for example, the proportions and rates of new diagnoses attributed to men who have sex with men, heterosexual sex, mother-to-infant, blood transfusion, IVDUs, and other needlestick injury.

Laboratory reporting is essential. Death certification is useful, though it has been shown that men who have sex with men, and probably those with other risk factors, are under-represented. In the UK, matching reported cases with death certificates is very important, as it allows for detection of deaths due to AIDS (such as pneumonia) as well as deaths associated with AIDS, and which are seen now in HIV-infected individuals – these include liver and cardiovascular disease, overdoses, and malignancies.

A surveillance system, based on unlinked anonymous testing of samples of blood taken routinely from certain at-risk population or occupational groups has been shown to provide valuable information on HIV infection in these populations. Specific screening systems for blood donors, military recruits, commercial sex workers, and family planning/termination of pregnancy

Fig. 1 Measles notifications: cases and deaths, England and Wales 1940–2006. Reproduced from the Health Protection Agency (www.hpa.org.uk).

Fig. 2 Notifications of acute poliomyelitis in England and Wales 1912–1993. Reproduced from the Health Protection Agency (www.hpa.org.uk).

clinics are also useful if these populations are to be targeted. Behavioral surveillance should also be seriously considered, to assist in identifying future trends, healthcare planning, as well as for specific health promotion efforts.

Attributes of Surveillance Systems

Completeness

Incompleteness is an almost universal drawback of most notification systems. They should never be dismissed for this reason alone. Statutory notification systems can be essential for surveillance and control. For common infections completeness may not be worth striving for, because notifications (assuming consistency in reporting) will generally provide information on trends, as well as fairly accurate information on age, sex and seasonal distributions, and possibly on place. Notifications were able to show a small increase in measles cases in the early 2000s which led to the need for a preschool booster.

The effect of mass vaccination programs can also be monitored fairly closely with statutory notification systems, as with measles ([Fig. 1](#)) and acute paralytic poliomyelitis ([Fig. 2](#)) in the UK. When a mass vaccination or other universal control program reduces the incidence of an infection to low levels, completeness becomes much more essential. For serious infections also, such as SARS or Lassa fever, for which contact tracing or other control measure is necessary, completeness is essential.

In active surveillance, reporters make negative returns if they have had no cases during the reporting period, to ensure completeness. In some countries, enhanced surveillance has been used to assess more accurately the true incidence of an infection – regions or districts are chosen to report all cases of a particular infection or infections. It is a hybrid of active and sentinel surveillance.

Timeliness

Timeliness is important for infections for which urgent public health measures have to be undertaken, such as SARS-CoV-2, poliomyelitis and viral hemorrhagic fever, as well as any outbreak. In some instances, infections, not normally urgent, can become so as an elimination program progresses. In a country with elimination of measles as its goal, a case of indigenous or imported measles needs to be dealt with urgently, as it may lead to an outbreak if not controlled immediately. Laboratory data are often not timely, and hospital data generally even less so, but can make up in accuracy what they lose in timeliness.

Accuracy

Accuracy is clearly important, though some minor degrees of inaccuracy can be tolerated in some common infections. Clinical data are most liable to have some inaccuracies, though even laboratory data may be inaccurate. Case definitions and quality control systems can be useful to improve accuracy.

Representativeness

For surveillance to provide an accurate picture of the impact of a particular infection, representativeness is essential. It is perhaps the most important quality for any surveillance system. Having a wide coverage of reporting clinicians and laboratories, or a well-chosen sample of sentinel sites, is necessary for the data collected to be representative of an infection in a country. Sometimes it may be necessary to assess data from various sources, such as notifications/GPs (clinical), hospital, laboratory, and death certificates.

Consistency

Consistency is another crucial basic attribute of any surveillance system. Reporters must know what to report (case definition) and how often. Otherwise it will not be possible to interpret trends. Active surveillance is one way of ensuring consistency.

Analysis of Data

Time

The three basic analyzes by time, place, and person should be routine. Computer programs have made analyzes of data quicker but somewhat less flexible. There is no standard period for analysis by time. Depending on what the surveillance intends to show, yearly, quarterly, monthly, four-weekly, or weekly time intervals can be used. In surveillance, time intervals shorter than this are rarely used, although daily data were provided in many countries to monitor SARS-CoV-2. Monthly intervals have the disadvantage of having unequal numbers of days in each month, and are difficult to use when reporting is weekly; for seasonal trends four-weekly periods are better but cannot be divided into quarterly periods. In viral surveillance, four-weekly rather than weekly intervals tend to be most useful in showing seasonal changes. There is more likely to be more variation (“noise”) in weekly intervals, making for less smooth changes. For secular trends, quarterly or annual intervals are generally used. Analyzing by time can reveal regular changes in the periodicity of viruses, enabling some of them to be predicted.

A basic knowledge of seasonal and secular patterns makes it easier to detect changes that signify a possible epidemic, and to differentiate these from a random variation. It is important to remember when analyzing laboratory data that there is often an interval, which can be 2 weeks or more, between date of onset and date of reporting.

Person

Analysis by age and sex is another basic analysis in surveillance. It can identify those most affected, and vulnerable groups. Changes in age distributions may provide important clues about a changing viral infection, and the effect of mass interventions on the age distribution of an infection can be monitored. Changes in the age distribution of measles in 1994 in the UK signified that an epidemic in older children was imminent, and the vaccine schedule was changed to include an extra booster injection (MR) to children aged 5–16 years. This averted the outbreak and the booster dose became a permanent feature of the routine immunization schedule in the UK. Indeed the changes in age distribution following mass vaccination could be considered an epidemiological side effect of mass vaccination. Requests for occupational groups and travel histories should be selective. For poliomyelitis, SARS, dengue, and the viral hemorrhagic fevers, travel histories are required. Occupational group may be useful for norovirus, and hepatitis types A, B, or C. Specific risk factors may be worthwhile for HIV, hepatitis B and C.

Table 1 Stages of a viral infection

<i>Clinical</i>
A. Uninfected
B. Infected
1. Asymptomatic
2. Symptomatic unreported
3. Symptomatic, sees a doctor
4. Symptomatic, admitted to hospital
5. Symptomatic, dies/survives

Note: Chronic carriers can occur at any of the B stages – for example, hepatitis B or C.

Table 2 Stages in laboratory diagnosis

A. Uninfected
B. Infected
1. Asymptomatic
2. Symptomatic, unreported
3. Symptomatic, sees a doctor
4. Symptomatic, specimens submitted
5. Symptomatic, specimens positive
6. Symptomatic, specimens reported to surveillance system

Place

Analysis by place can pinpoint local outbreaks. Some echoviruses (e.g., echovirus type 4) can cause rare short local outbreaks, other types (e.g., types 9 and 11) are more common and more widespread. Food-borne outbreaks of hepatitis A and norovirus are generally picked up locally through routine surveillance, but sometimes more extensive outbreaks caused by a more widely distributed foodstuff, including shellfish or frozen soft fruit, may be identified.

Interpretation

Collection and analysis are generally routine functions; skill is required in interpretation of the data. No statistic is perfect, and surveillance data, like all data, must be interpreted with caution. One must take into account the origins of the data – clinical, laboratory, or hospital. Not only must the reliability, or otherwise, of the data be evaluated, but what the data signify in the natural history of the infection must also be recognized.

Every viral infection has its stages and these must be recognized before surveillance data can be sensibly interpreted. At what stage are the data being collected important to understanding and interpretation? Using influenza or hepatitis A as examples, and a defined population (**Table 1**), only a proportion of persons in the defined population will be infected with the virus. They can only be comprehensively detected by screening, and serological surveillance will identify these persons, or assess population immunity (B1 in **Table 1**). In HIV/AIDS surveillance, unlinked anonymous testing of samples of blood taken routinely at say, an antenatal clinic, can give vital information on the prevalence of HIV infection, since in this infection presence of antibody denotes infection, not immunity. A smaller proportion will be ill (B2), but only some of these will visit a doctor (B3). Surveillance systems based on GP consultation rates have now been recognized as an important addition to the spectrum of a disease, and many countries have excellent systems. Of those patients that do visit their family doctor, only some will be admitted to hospital (B4). Finally, only some will die (B5).

For laboratory data, the stages are slightly different (**Table 2**), but still important in understanding what the reported data mean. As before, only a proportion of persons will be infected (B), some will be asymptomatic (B1), a smaller proportion will be ill (B2), and an even smaller proportion still visit their doctors (B3). Not all doctors will send specimens to a laboratory (B4), and only a proportion of these specimens (B5), depending on accuracy of the identification process, the method of transport, the fragility of the organism, and the swabbing or other sampling technique, will be positive. Finally, depending on the level of consistency of reporting, only some of these will be reported (B6). It is essential to recognize these stages in interpreting surveillance data.

Biases will inevitably occur between these stages. Collection of data in routine surveillance is not normally a scientific process as one has to rely on readily available data – data obtained mostly for other reasons, such as to make a definitive diagnosis. Only the most severe cases die, and death certification thus provides, at best, a limited view of any disease. Similarly, only certain types and severity of cases will be admitted to hospital (some admissions are for social reasons for example) or even visit their family doctor.

Certain age, sex, and perhaps social or occupational groups are more likely to seek medical help, be investigated and be reported. In laboratory data, more severe cases, or children, are perhaps much more likely to be investigated in detail.

These shortcomings of surveillance data do not make them useless – but their strengths and limitations must be recognized.

Feedback

If interpretation is turning statistics into information, feedback is getting the information across to those that matter, and those that need to know, so that action – the objective of surveillance – can be taken. Without feedback, surveillance is pointless. Feedback is most likely to be informative if undertaken by those most closely involved in the surveillance cycle, and who understand the significance of the data they are receiving.

Feedback should be aimed at contributors and those in public health. Contributors will then be aware of which viruses are circulating and this will help them to know what to look for in their own tests (e.g., what echovirus or adenovirus types are in circulation). Moreover, routine surveillance will undoubtedly uncover outbreaks of infection, which will need further investigation and control at local, national, and even international level. An interesting and welcome side effect of a flourishing microbiological/feedback surveillance system is that it often stimulates better quality control within reporting laboratories.

Regular feedback is essential, not only to contributors, but also to those who can act for the public health. Regular and useful feedback encourages good and regular reporting. Generally, the periodicity of feedback should reflect the frequency of reporting – weekly feedback for weekly reports for example. Regular topic-based reviews are also important.

Evaluation of Surveillance

A surveillance system is like a country's train system. Once the rail lines have been built, the goods that will be carried along those lines can be changed according to need. Similarly, in a surveillance network, once the lines of communication have been laid down, the data being reported can be changed according to what is most important at the time (though probably not too frequently). Nevertheless, surveillance systems should ideally be frequently evaluated for usefulness, as well as for accuracy, efficiency, and effectiveness.

They should also be sufficiently flexible, so that “new” or emerging infections can be included in an emergency or when the need arises. The successful implementation of international surveillance for SARS was instrumental in controlling it. Emergency surveillance was also essential following the tsunami of 2004, and is also necessary for the successful management of other disasters following earthquakes, hurricanes, and floods.

Surveillance systems should be evaluated before they are set up, and again at regular intervals thereafter. Before implementing a surveillance system, is there an adequate public health and administrative infrastructure in place to take action? Are the data to be collected representative and sufficiently timely for the specific infection? Are they useful, and is action being taken on the information? If not, is the feedback inadequate?

Global and International Surveillance

The ease and speed of modern travel, the distribution of goods (especially foodstuffs) across increasingly wide parts of the world, and the uncontrollable spread of birds and other wildlife across boundaries has made global and international surveillance essential for outbreak and infection control. Surveillance of viral infections such as influenza and SARS-CoV-2 now requires the expertise of many professionals – epidemiologists, virologists, and vaccinologists, clinicians, statistical modelers, veterinarians, managers, and planners. These occur in many different countries so that information can be exchanged, and attempts made on a global basis, to prevent the next pandemic. Epidemics of Zika virus, dengue and West Nile virus have also spread widely recently. AIDS/HIV was destined to become a global problem almost from the time of its first discovery. On a more positive note, SARS was contained through the use of international surveillance; and surveillance was the backbone of the smallpox eradication program.

International surveillance can also be used for the detection of international outbreaks of food poisoning caused by the distribution of foodstuffs across a wide number of countries. An outbreak of hepatitis A in England was caused by frozen raspberries grown and frozen in another country; and another outbreak of hepatitis A, this time in Czechoslovakia (before it became separate republics) was caused by strawberries used to make ice cream; the strawberries had been imported from another Eastern European country. There are now well-established trans-European surveillance systems for salmonella infections and legionnaires' disease, as well as for viral infections.

The need for surveillance will never diminish or disappear. Surveillance systems will only improve, become increasingly sophisticated, and become increasingly relied upon and used. Control of infection will not be possible without it.

Preparing for Emerging Zoonotic Viruses

Reina S Sikkema and Marion PG Koopmans, Erasmus Medical Center, Rotterdam, The Netherlands

© 2021 Elsevier Ltd. All rights reserved.

Emerging infectious diseases (EID) have been defined as diseases whose incidence increased over the past decades or are predicted to increase in the foreseeable future ("see Relevant Websites section"). This definition includes known infections with new properties, or known infections in new geographic regions, infections that were not previously recognized, and new infections resulting from spillover of pathogens from an animal reservoir to humans. Although difficult to state with certainty, current consensus is that EID outbreaks have increased significantly in the past decades, both in terms of size and number of causative pathogens (Smith *et al.*, 2014; Allen *et al.*, 2017). The majority of EIDs are thought to originate from animals, of which wildlife is the most important source of human outbreaks (Allen *et al.*, 2017; Jones *et al.*, 2008). Such spillovers can occur directly, or through vectors such as mosquitos, ticks and sandflies. Examples of past outbreaks are SARS (Peiris *et al.*, 2004), MERS (Zaki *et al.*, 2012), Avian Influenza (Lai *et al.*, 2016), Ebola (Dudas *et al.*, 2017) and Zika virus (Gubler *et al.*, 2017). Compared to common endemic diseases, the burden of disease may be relatively limited, but the unexpected nature, high case fatality rate, the uncertainty of sources and modes of transmission, and the paucity of medical and non-medical countermeasures make EIDs a threat to global human and animal health. Fear of spread, travel restrictions, and unpredictable self-imposed avoidance of a region can cause serious socio-economic disruptions on local and global level (McCloskey *et al.*, 2014).

Drivers of (Emerging) Zoonotic Diseases

Infectious disease emergence has proven extremely challenging to predict, and human cases of a wide range of emerging or re-emerging pathogens have been reported all over the world and throughout the year. However, when outbreak data of emerging disease outbreaks in the last decades are combined, some specific conditions or risk factors seem to drive disease emergence (Woolhouse, 2011). The main general drivers that have been described can be summarized as changes in (1) human demographics with the consequential growing demand for food production (Jones *et al.*, 2008), (2) land use, including agricultural changes (Jones *et al.*, 2013; Gortazar *et al.*, 2014) (3) international travel and trade (Gortazar *et al.*, 2014; Randolph and Rogers, 2010), (4) climate change and weather (Allen *et al.*, 2017; Gortazar *et al.*, 2014) (Fig. 1).

Fig. 1 Global changes acting as drivers of infectious disease emergence and spread in the One Health domains.

In the case of zoonotic EIDs, the first step towards an outbreak of human disease or mortality is the occurrence of spill-over of a pathogen from an animal reservoir host to humans. (Plowright *et al.*, 2017; Karesh *et al.*, 2012; Petersen *et al.*, 2018). The majority of human EIDs originate from wildlife (Jones *et al.*, 2008; Allen *et al.*, 2017). However, humans are usually not in close contact with wildlife. Therefore, occasionally there is an additional intermediate host species involved where a pathogen is amplified and that is in closer contact with humans (Karesh *et al.*, 2012; Plowright *et al.*, 2015). Well known examples are Nipah virus, Hendra virus or SARS-CoV, that originate from bats and amplify in pigs, horses and civet cats used as food source, respectively (Plowright *et al.*, 2015). The risk of animal to human spill-over depends on a plethora of factors. The aforementioned drivers of disease emergence create circumstances that facilitate such spill-over. Additionally, the risk of spillover is influenced by the pathogen itself. In general, RNA viruses are zoonotic more often than DNA viruses (Olival *et al.*, 2017). A possible explanation for this is their genetic plasticity, caused by the replication mechanism: most RNA viruses replicate with the use of virus-encoded RNA polymerases which – in contrast to the host cell DNA polymerase – do not have so-called proof-reading capacity. Proofreading is a mechanism to reduce the amount of errors in the nascent strands of newly produced copies of (pathogen) genomes, and the lack of proofreading leads to copies that contain a higher number of mutations when comparing the progeny genomes with those of the parent sequences. As a consequence, hosts infected with such RNA viruses shed a mutant swarm of viruses. When they then encounter a bottleneck, for instance an exposure of a new host, chances are that within the swarm variants exist that are better adapted (by chance) to infect a new host (Domingo and Perales, 2019).

One possible consequence of this flexibility is described as “phylogenetic host breadth” and “host plasticity”, which reflect the diversity of known hosts, and therefore are significant predicting factors for zoonotic potential of viruses (Olival *et al.*, 2017; Kreuder Johnson *et al.*, 2015). Additionally, the dynamics of a pathogen in a reservoir host population is a very important factor for human health risk, and is governed by population structure, host density, host behavior and contact patterns, shedding patterns, stability of pathogens outside a host, levels of immunity, events that stress the population, and more. As a consequence, the resulting risk of infection for humans may vary depending on season, location, weather and host distribution for example (Plowright *et al.*, 2017; Karesh *et al.*, 2012).

The second step towards outbreaks of emerging diseases is the ability of a pathogen to transmit between humans. In general, it is thought to be less likely that enveloped viruses and segmented viruses are associated with human-to-human transmission, similar to viruses with acute durations of infection but the evidence for that is largely observational and certainly not black and white (Geoghegan *et al.*, 2016; Walker *et al.*, 2018). For instance, the majority of top ranking epidemic and pandemic threats listed by the world health organization (WHO) are enveloped viruses (“see Relevant Websites section”). Viral host plasticity is not only associated with spill-over but also increases the risk of human-to-human transmission and international spread (Kreuder Johnson *et al.*, 2015). Moreover, the increased interconnectivity and the overall increase of the human population facilitate rapid spread of novel pathogens.

Disease X

A recent report by the Global Preparedness Monitoring Board warned that a global Influenza pandemic, similar to the 1918 Spanish flu, could spread around the world within 36–50 h, and would take the lives of 50–80 million people. Such an epidemic could destroy nearly 5% of the global economy (“see Relevant Websites section”). The examples of Ebola, SARS, and avian influenza have shown that zoonotic disease outbreaks can be very disruptive because of fear for spread and uncertainty of how to contain them even when there is limited onward transmission (Bartsch *et al.*, 2015; Qiu *et al.*, 2018). (“see Relevant Websites section”). The devastating Ebola outbreak in West Africa in 2014–2015 led to a specific call for action by the members of the World Health Assembly, charging the WHO to come up with a new vision to be better prepared for the future, given the increasing likelihood of such outbreaks. A list of priority diseases was developed, for which an urgent need for accelerated research and development of countermeasures was identified, due to their potential to cause a public health emergency. (“see Relevant Websites section”). In an update in 2018, the term disease X was used to describe a serious international epidemic caused by a pathogen currently unknown to cause human disease. The rationale behind the inclusion of disease X is that a completely unknown disease etiology limits the ability for development of fast track diagnostics, vaccines and therapeutics. Therefore, preparedness and response in case of disease X requires a significantly different approach compared to the other diseases on the list.

According to the International Health Regulations, WHO Member States are obliged to maintain effective disease surveillance and laboratory systems and to report newly emerging diseases that could spread internationally (“see Relevant Websites section”). However, setting up surveillance for diseases that are still unknown is complicated, and extensive surveillance can be costly, especially in the case of diseases that emerge at the human-animal interface. The disease X track therefore is thought to stimulate thinking in terms of generic solutions that increase EID preparedness.

Emerging Disease Detection and the One Health Concept

A key component of early control of emerging diseases is their early detection (Bonacic Marinovic *et al.*, 2014; Chan *et al.*, 2010). As part of the WHO Blueprint initiative, the need for diagnostics for the priority diseases has been stressed. The West African Ebola virus outbreak in 2014 had already disseminated widely into three countries by the time it was confirmed by an international

laboratory, almost 4 months after the index case succumbed to the disease (Baize *et al.*, 2014; Coltart *et al.*, 2017). Similarly, phylogenetic reconstruction of Zika in the Americas predated the time of introduction to almost two years before it was recognized as a health emergency (Thézé *et al.*, 2018). Although easily criticized, the delays in disease detection are not surprising as symptoms of most EID are not specific, and overlap with major “common” diseases that clinicians are familiar with (Sigfrid *et al.*, 2018). Similarly, clinical diagnostic laboratories focus on these common conditions, and may not have the expertise to detect rare and novel causes of disease (Sigfrid *et al.*, 2018). Efforts to increase preparedness for EID are increasingly moving towards risk-based early detection. As most EID come from animal reservoirs, the need for this has reinvigorated the One Health approach.

The concept of One Health is described by the US Center of Disease Control (CDC) as follows: “One Health recognizes that the health of people is connected to the health of animals and the environment. It is a collaborative, multisectoral, and transdisciplinary approach—working at the local, regional, national, and global levels—with the goal of achieving optimal health outcomes recognizing the interconnection between people, animals, plants, and their shared environment.” Although the concept has already been known since Hippocrates launched his theories on human health around 400 BCE (“On Airs, Waters, and Places”; Aristotle “Historia Animalium”) The specific term “One Health” however only came up in the 21st century (Evans and Leighton, 2014; Sikkema and Koopmans, 2016). Since then, the One Health concept is increasingly being endorsed and implemented in national and international policy and research. An important milestone was the publication of the FAO-OIE-WHO tripartite concept note, on “Collaboration, sharing responsibilities and coordinating global activities to address health risks at the animal-human-ecosystems interfaces” (“see Relevant Websites section”) Also, the number of scientific publications that mention the term “One Health” showed a major increase in the recent decade (Sikkema and Koopmans, 2016). Although in practice true integration of information and collaboration between different sectors still proves to be challenging (Sikkema and Koopmans, 2016; Farag *et al.*, 2019; Dos *et al.*, 2019; Manlove *et al.*, 2016), the implementation of the One Health concept has great potential for EID preparedness and response.

Moreover, there has been a vast increase of (digital) data in the past decade that has great potential to be used for zoonotic disease prediction, early detection and control (Becker *et al.*, 2019; Masri *et al.*, 2019). This is not only caused by the shift of traditional diagnostics to multi-analyte technologies such as next generation sequencing, but also by the large increase of for example environmental, financial and social media information collection (Simonsen *et al.*, 2016; Shi and Wang, 2019). However, the use of this “Big Data” with different data types of multiple origins also makes the analysis much more challenging (Khoury and Ioannidis, 2014). The use of big data has been advocated and explored in some aspects of public health and infectious disease prediction, but this is also mostly restricted to only one of the required domains (clinical, public health, academia) or sectors (human health, animal health, environmental health, informatics, artificial intelligence) instead of a true crosscutting One Health analysis. Moreover, this, again, calls for multidisciplinary collaborations, since the traditional expertise involved in One Health or Public Health, such as veterinary or medical specialists or epidemiologists, generally do not have sufficient experience in working with such large and diverse data sets.

Developing Targeted, Risk Based Sampling

To identify risk areas, or so-called hotspots of disease emergence or spread, both knowledge of possible drivers or risk factors for emergence can be used, as well as detailed spatial and quantitative information on these drivers, for example locations where ecosystem disruptions took place or where farming systems or livestock population sizes have gone through significant changes. Other information, that could be mapped to identify risk areas for known and unknown diseases are vectors, animal reservoirs, human population, habitat and climate. (“see Relevant Websites section”). There are currently many open-access databases available online, that contain information that has great potential to be used for zoonotic disease prediction, early detection and control. Examples of currently available information are: animal tracking data (Tian *et al.*, 2015) (“see Relevant Websites section”; “see Relevant Websites section” United States Geological Survey), animal and human outbreak information (Cauchemez *et al.*, 2014) (WAHID; ADNS; WHO), animal populations and trade (Simons *et al.*, 2016) (FAOSTAT), weather and climate (Ryan *et al.*, 2015) (NASA; ECA&D; USGS FEWS NET), country economic data (Farag *et al.*, 2018) (World Bank) and many others.

After defining geographical hotspot areas, risk of EID outbreaks also requires a detailed understanding of human and animal populations at risk. For example, past research indicates that humans in contact with animals, especially in the case of wildlife or animal populations that experienced changes in husbandry, population size or other characteristics are at a higher risk of infection with an (emerging) zoonotic pathogen (Jones *et al.*, 2008; Jones *et al.*, 2013; Allen *et al.*, 2017). However, the intensity and nature of the human-animal interface differs greatly, depending on animal species, animal husbandry systems, eating habits, traditions, etc. Additionally, with human demography, migration and travel, current populations and communities are no longer homogeneous or isolated. Selecting a human population at-risk therefore is complex and people-at-risk move in an increasingly large geographical area. (“see Relevant Websites section”).

Therefore, there is an increasing need and necessity to tailor surveillance and risk predictions to local circumstances. This calls for the inclusion of social sciences in disease surveillance and infectious disease preparedness (Bedford *et al.*, 2019). (“see Relevant Websites section”).

Animal trading patterns and common practices surrounding animal trading have been shown to be particularly important factors in the spread of zoonotic infectious diseases. Livestock farming has undergone massive changes and expansion in the past decades, with increasing international trade (“see Relevant Websites section”). Increasing size and connectivity of the trading networks, including human contacts such as farmers, traders and consumers, result in increased risks of disease transmission and

spread (“see Relevant Websites section”). Within the poultry production sector, for example, there are large differences between large scale, intensive industrialized production systems and traditional small-scale rural poultry production systems, and associated animal and public health risks. The main type of production system, as well as the organization of the trade chain, and the degree and frequency of human and wildlife contact differs greatly between regions. In South East Asia, the majority of poultry is reared in backyard farms, with complicated subsequent trade chains, involving many traders and live poultry markets (Moyen *et al.*, 2018; Sealy *et al.*, 2019). This influences infectious disease risk and possible spread. Farms that keep their poultry outdoors generally have a higher chance of AI outbreaks, because of their contact with wild birds (Bouwstra *et al.*, 2017; Wibawa *et al.*, 2018). Moreover, trading involving middlemen is associated with higher likelihood of AI spread, as well as density of live-poultry markets (Sealy *et al.*, 2019; Gilbert *et al.*, 2014). Also, it has been shown that the prevalence and risk of infectious diseases, such as AI, differs per stage of the poultry supply chain (Wu *et al.*, 2019). In other regions of the world, such as Europe and the US, backyard farms and live animal markets are very uncommon, and poultry is often transported directly from farm to slaughterhouse. Therefore, risk profiles and set-up of surveillance differ greatly between farming and trading systems in different geographical areas, and detailed information on the local situation is crucial (Martin *et al.*, 2011; Delabougliuse *et al.*, 2017). This is not only important for livestock and poultry, but wildlife and wildlife product trading can also pose a significant risk of infectious disease introduction and spread (“see Relevant Websites section”) (Smith *et al.*, 2012).

Also, habits and behaviors of humans around animals matter. Live bird markets are not only a risk for AI transmission because of mixing of birds of different origins and species but also because of particular preferences in some regions for fresh poultry meat and on-site slaughtering (Zhou *et al.*, 2015). In-depth knowledge of (cultural) habits and their history, has proven to be extremely valuable in outbreak investigations of emerging diseases. Case investigations of a Nipah outbreak in humans in Bangladesh in 2004–2005 involved anthropological expertise that was used for in-depth interviews and questionnaires in local language to gain knowledge on possible exposures and risk behaviors. It became clear that drinking raw date palm sap was significantly associated with disease. Several interviews pointed towards fruit bats (*Pteropus giganteus*) as probable source of infection as they drink from the sap collection pots during the night, contaminating the sap with their infectious saliva. (Luby *et al.*, 2006; Halpin *et al.*, 2011). Infrared cameras captured fruit bats feeding on palm sap collection devices, and urinating when flying away, thus potentially contaminating the sap with viruses (Halpin *et al.*, 2011). Protecting the collection devices by a simple bamboo barrier rather than a ban on drinking palm sap was accepted by the local population as intervention (Nahar *et al.*, 2017).

MERS-CoV is another example of a disease where an inventory of the local situation revealed very specific traditions and behaviors around dromedary camels, the reservoir host of the virus. Camel racing and associated movement and mixing of camels is thought to be an important risk factor for spread (Farang *et al.*, 2018). Moreover, local customs involve kissing camels, and drinking raw camel milk and urine, all of which should be considered in the investigations of MERS-CoV (Farang *et al.*, 2018; Gossner *et al.*, 2016). Only with extensive knowledge about the history and background of specific risk behaviors, a strategy to discourage or reduce such behavior can be developed. Another clear example of high risk behavior that has proven to be very difficult to change, are burial rituals in Western Africa, that greatly increase the number of people infected with Ebola in times of an outbreak (Masumbuko Claude *et al.*, 2019). The family and community members of the deceased person touch and wash the bodies before the funeral, which has caused a large number of secondary infections because of their contact with Ebola infected bodily fluids (Nielsen *et al.*, 2015).

Sample Collection

Appropriate sample collection is essential for reliable surveillance and outbreak investigations. If human, animal or environmental samples are not collected and stored in a technically appropriate manner, subsequent laboratory analyses will not be reliable or will not generate the anticipated results. A deep understanding of kinetics of shedding of a pathogen and of the antibody response is important to decide on the optimal sampling protocol, the use of detection methods and the interpretation of results. Moreover, subject selection (especially in an outbreak situation), appropriate sample type and sufficient and timely metadata collections are all crucial for subsequent analyses. In addition, to be able to compare data between studies or between countries, laboratory analyses, information collection and study designs should be standardized. For example, comparing human serological data to assess zoonotic influenza exposure has proven to be very difficult because there are significant differences between studies when assessing the collection of epidemiological data, laboratory methods used and the study population, amongst other things (Sikkema *et al.*, 2016). Therefore, international organizations and laboratory networks are increasing their efforts to publish guidelines and training materials to stimulate a uniform approach to investigate infectious diseases and increase the comparability of surveillance and research.

Not only diagnostic testing methods and quality are carefully assessed and compared (Reusken *et al.*, 2015; Charrel *et al.*, 2017; Pas *et al.*, 2015) (“see Relevant Websites section”) but also the standardized collection of metadata is increasingly important in the era of big data and NGS, for correct interpretation and analysis of the large amount of data that is generated. Therefore, standardized epidemiological questionnaires are being developed and published alongside of the guidelines for infectious disease diagnosis. In practice, complete and timely collection of metadata proves to be challenging. When routine diagnostic data in the Netherlands was assessed for its use for surveillance of arboviral infection in travelers, researchers found that essential information such as vaccination history was only reported in 0.4%, and travel destination was completed in only 42% of patient dossiers

(Cleton *et al.*, 2014). Especially during outbreaks, medical records and associated epidemiological information is often incomplete or absent. This has been illustrated for example in Sierra Leone during the Ebola outbreak (Owada *et al.*, 2016).

Examples of efforts to standardize infectious disease surveillance and clinical research are the global Consortium for the Standardization of Influenza Seroepidemiology (CONSISE) that is aiming to standardize influenza sero-epidemiology and develop investigation protocols (“see Relevant Websites section”) and the International Severe Acute Respiratory and Emerging Infection Consortium (ISARIC), a federation of clinical research networks, providing tools and protocols for research response to outbreak-prone infectious disease (“see Relevant Websites section”). Moreover, the WHO, FAO and OIE publish extensive laboratory diagnosis guidelines and are involved in training and capacity building activities.

The Value of Non-Invasive and Bulk Samples

Although smart, risk-based strategies can be developed to optimize sampling efficiency, reliable disease monitoring, especially in the case of emerging diseases, requires a huge sample size to reach sufficient population and/or geographical representation. Traditional surveillance of humans and animals make use of invasive sampling, to screen blood samples or swabs for pathogens. However, the use of such samples needs medical-ethical approval that is increasingly difficult to obtain, as well as approval for animal population studies and experiments. Additionally, invasive sampling can cause significant discomfort, can pose an additional risk for infection of healthcare workers or animal care-takers and can only be executed by specialists in the human or veterinary field. Therefore, setting up and validating surveillance using non-invasive sampling can potentially be easier to execute and to scale up as well as better for human and animal welfare.

Feces or urine collection and testing can be a practical and animal friendly surveillance method. Especially in the case of wildlife, where catching and sampling animals can be particularly stressful for an animal, fecal or urine surveillance is very suitable. Feces, or even urine, can be collected without handling the animal or even be in the vicinity at the time of sample collection. This has been described for multiple pathogens, such as Lyssaviruses and Paramyxovirus in bats (Begeman *et al.*, 2020; Peel *et al.*, 2019) and tapeworms in foxes (Umhang *et al.*, 2016). In humans, there may also be a large number of pathogens that can be detected via saliva, urine or feces, although it is generally not included in standard diagnostic algorithms (Niedrig *et al.*, 2018).

Although alternative, non-invasive sample types increase the ease of sample collection and welfare of the sampled subject, the number of samples will not decrease. Therefore, validation of pooled samples or novel sample types that can be used to monitor groups or populations of humans, animals or a certain geographical area. In Asia, environmental surveillance of live animal markets is routinely implemented as main means of monitoring of Avian Influenza viruses (Bai *et al.*, 2019; Henning *et al.*, 2019; Khan *et al.*, 2018). Various surfaces, such as poultry cages, chopping boards and defeathering machines, are sampled and tested on a regular basis as an indirect measure of poultry infections and public health risk. Similarly, environmental sampling are also being used for the detection of pathogens in healthcare settings (Kim *et al.*, 2016; Kapetshi *et al.*, 2018). Additionally, air sampling may be promising, both in hospital settings, farms and even markets and airports (Scoizec *et al.*, 2018; Zhou *et al.*, 2016; Bailey *et al.*, 2018).

Sewage or wastewater monitoring is another example of such a sample type, that can be used to monitor infectious diseases of large numbers of humans. Sewage monitoring has already been used for many years to monitor polio (Asghar *et al.*, 2014) as well as the monitoring and detection of emerging Norovirus and Enterovirus strains (Mabasa *et al.*, 2018; Majumdar and Martin, 2018). However, sewage could have great potential to be used for virus discovery and emerging disease detection (Fernandez-Cassi *et al.*, 2018; Nordahl Petersen *et al.*, 2015). Other sample types, representing large numbers of animals, that can be used to monitor circulating of pathogens are: manure composting plants, bulk milk and ponds (Himsworth *et al.*, 2019; Garcia *et al.*, 2014; Balmer *et al.*, 2014).

However, the use of non-invasive sampling or pooled sample types may impact the sensitivity of pathogen detection. In the case of non-invasive sampling, each pathogen may have different shedding characteristics, making it impossible to know the optimal sample type to detect emerging diseases. This also impacts the use of sewage for emerging disease surveillance, for example, because not all pathogens are excreted via feces or urine, making it difficult to detect via sewage sampling.

Catch-All Detection Methods

A challenge for risk-based surveillance is the huge potential diversity of pathogens that could cause human disease when spilling over from an animal reservoir. Therefore, even if targeting detection efforts through the approaches described above would succeed, the choice of diagnostic method is a critical one. Depending on how the risk-based surveillance was organized, the choice of potential pathogens to target may be limited or more extensive. An interesting development is the use of unbiased third-generation metagenomic sequencing to characterize all genomic material (DNA and RNA) in a sample, without prior knowledge of possible etiologies. Clinical and environmental samples can be processed with procedures that either enrich for bacteria, parasites or viruses, and subsequently be subjected to sequencing (Wilson *et al.*, 2019; Takhampunya *et al.*, 2019; Zolfo *et al.*, 2018; Nieuwenhuijse and Koopmans, 2017; Hendriksen *et al.*, 2019).

Analysis generally takes place by assembly of sequence reads and annotating the resulting reads using reference databases of (publicly) known sequences. The metagenomics research field, studying and profiling genetic material abundance in diverse matrices and environments is rapidly growing, as well as the number of novel viruses that are being discovered and described (Simmonds and Aiewsakun, 2018). Often the aim of metagenomics studies of the environment is to map all micro-organisms in

potential reservoirs in order to identify potential human health threats (Carroll *et al.*, 2018). However, all viruses that have been characterized to date likely only make up a minor fraction (estimated to be around 0.005%) of the estimated total number of viruses on earth (Geoghegan and Holmes, 2017). This means that the number of new viruses and virus families will increase immensely in the coming years. Moreover, the lack of closely related reference virus genomes makes public health risk assessment of novel viruses very complicated (Geoghegan and Holmes, 2017). Moreover, even if viruses belong to a known virus family with known human viruses, this does not necessarily mean that there is a risk of spill-over.

From Genotype to Phenotype: Deriving Meaningful Information From Genomic Data

The pathogen genomic sequence alone will often give insufficient information on possible human health risks. Therefore, ideally, metagenomics or NGS approaches are supplemented with phenotypic data such as antigenic characteristics, pathogenicity, virulence, host-specificity and transmission characteristics. For novel variants of known viruses, some indications of phenotype or zoonotic risks can be derived from the sequence, based on experimental study outcomes. The impact of inferring phenotype traits from genotype data can be exemplified by the “H5N1 inventory” compiled by the United States Centers for Disease Control (“see Relevant Websites section”). This inventory summarizes all mutations that have been shown to affect virus replication, virulence, tissue or cellular tropism, host-range, transmission, antigenic properties, immune escape, and antiviral drug resistance.

However, in the case of an emerging virus that was previously unknown, novel phenotypic data needs to be generated. This data is important for risk assessment, but information on potentially relevant sequences or epitopes can also be used for development of diagnostics and preventive antiviral strategies. For example, one of the key components influencing ability to spread for an emerging pathogen from a spill-over event is the level of measured or predicted immunity in the population, as this impacts on the likelihood of infection of individuals (humans, livestock, wildlife) and their ability to shed and spread the infection.

In silico epitope prediction can predict B-cell epitopes based on sequence data (Potocnakova *et al.*, 2016). The predicted immunogenic virus proteins can then be used to set up serological assays to determine the prevalence and host range of the virus. For this, multiplex antigen arrays can be used to not only measure antibodies to the newly identified antigen, but also to (distantly) related variants of the same virus family, thus providing information on potential cross-protection or disease enhancing antibodies (Mina *et al.*, 2019; Cleton *et al.*, 2017; Freidl *et al.*, 2015). Possible resistance markers can be predicted when analyzing the sequences, for instance for drugs targeting the polymerase or protease genes. Host binding motifs can be predicted from their location on predicted protein structures. However, all such inferences need to be validated as the choice of *in vitro* systems and animal models can have a significant impact on their validity (Rothenburg and Brennan, 2020; Setoh *et al.*, 2019; Reyes-Ruiz *et al.*, 2019).

Conclusion

The risk of emergence of novel human pathogens has increased in the past decades. Early detection is becoming even more important due to the potential rapid spread and impact considering the ever increasing size of human and animal populations and their movements all over the globe. The unpredictable nature of emergence of diseases makes surveillance and preparedness a huge challenge. However, recent history has shown that outbreaks of emerging diseases will happen again, and all sectors involved in infectious disease surveillance and response need to be ready to detect and handle the next disease X. It has been argued that the design of infectious disease surveillance and response should therefore move from crisis response to true integration and evaluation of a strategy to detect and control emerging diseases (Bedford *et al.*, 2019). This involves a One Health approach, integrating not only the humans, animal and environmental health sectors, but also social sciences, bioinformatics and more. Technical developments in recent years, such as the use of Big Data and metagenomic sequencing will aid the rapid detection of novel pathogens on the human-animal interface.

Note Added in Proof: December 2020

SARS-CoV-2

In December 2019 several cases of pneumonia of unexplained etiology in patients in Wuhan city (China) linked to a seafood wholesale market were reported to the WHO (“see Relevant Websites section”). In the beginning of 2020 it became clear that this Disease X that had emerged was also a betacoronavirus, most closely related to SARS, that was already on the WHO Blueprint priority list in public health emergency contexts (“see Relevant Websites section”). In the following months the outbreak developed into a pandemic, with over 68 million human cases and 1,55 million deaths, as of 8 December 2020 (Dong *et al.*, 2020).

One Health and Animal Reservoirs

Bats are known to harbor a range of different coronaviruses (Cui *et al.*, 2019). Indeed, closely related SARS-like viruses have previously been detected in horse shoe bats, in China (Zhou *et al.*, 2020; Hu *et al.*, 2018). However, although the SARS-CoV-2 genome is 96% identical to the closest bat sequence, the genetic distance between the closest horseshoe bat SARS-like coronavirus

and SARS-CoV-2 likely reflects several years and even decades of virus evolution (Boni *et al.*, 2020). SARS-related coronaviruses are also found in pangolins, where specifically the RBD domain is closely related to SARS-CoV-2 (Boni *et al.*, 2020). Therefore, the role of bats as SARS-CoV-2 reservoir remains to be proven and other mammalian species are considered as possible intermediate hosts, as was previously the case for SARS, MERS and Nipah (Epstein *et al.*, 2006; Wang *et al.*, 2005; Reusken *et al.*, 2013). To date, an animal intermediate host of SARS-CoV-2 has not been found yet (“see Relevant Websites section”).

However, multiple animal species are found to be susceptible for SARS-CoV-2. Ferrets, raccoon dogs, cats and hamsters show infection and virus replication after experimental infection as well as the ability to transmit the virus (Shi *et al.*, 2020; Richard *et al.*, 2020; Sia *et al.*, 2020; Freuling *et al.*, 2020). Other animals that showed infection after experimental inoculation include rabbits, dogs and tree shrews (Shi *et al.*, 2020; Mykityn *et al.*, 2020; Bosco-Lauth *et al.*, 2020). Additionally, animal infections have been detected in the field, mainly in dogs, cats and mink (Sit *et al.*, 2020; Barrs *et al.*, 2020). Although there is evidence for efficient transmission between cats, infection in these animals is not considered a major concern given the small numbers of animals in households. This is different for the recent outbreaks in mink farms in Europe and the US (Cahan, 2020), with the first described SARS-CoV-2 animal-to-human transmissions (Oude Munnink *et al.*, 2020b). These outbreaks were the first large scale outbreaks in animal populations, and large scale mink passages have specifically sparked concern on the risk of specific mutations, affecting virus properties and possibly resulting in immune escape (Koopmans, 2020).

The multiple susceptible animal species and the search for the original animal reservoir, that was at the origin of the SARS-CoV-2 pandemic, clearly shows the need for a One Health approach. Introductions of SARS-CoV-2 into susceptible animal populations can continue to occur, possibly resulting in (additional) animal reservoirs and virus evolution and the risk of continuing evolution and spill backs into the human population (Koopmans, 2020; Olival *et al.*, 2020). Therefore, collaboration between different disciplines remains crucial in monitoring, understanding and containing the SARS-CoV-2 pandemic as well as many other (emerging) pathogens.

Emerging Disease Detection, Full Genome Sequencing and Rapid Data Sharing

The Chinese authorities officially announced the isolation of a novel coronavirus (2019-nCoV) as the causative agent on 7 January 2020 (“see Relevant Websites section”) and the full sequence was released in a publicly accessible discussion forum (“see Relevant Websites section”) 5 days later (“see Relevant Websites section”). Four other sequences were shared on 12 January in the Global Initiative on Sharing All Influenza Data (GISAID) database. A validated real-time RT-PCR assay was developed, validated and published online only 5 days later, on 17 January 2020, and published for PCR validation in a peer-reviewed journal on the 23rd of January (“see Relevant Websites section”) (Corman *et al.*, 2020). Validation panels were available on the European Virus Archive (“see Relevant Websites section”) shortly after. The first validated serological assay followed early April (Okba *et al.*, 2020). This clearly illustrates the technical progress that has been made in the last 17 years, as well as the value of virus sequencing and rapid data and sample sharing.

Samples of the first patients in Wuhan city were sequenced using an unbiased deep meta-transcriptomic sequencing method (Wu *et al.*, 2020). When the sequence was known, amplicon-based methods were developed to sequence the new virus in a timely and sensitive manner ((Oude Munnink *et al.*, 2020a) “see Relevant Websites section”) Whole genome sequencing was performed at unprecedented scale, with almost 250.000 SARS-CoV-2 whole genome sequences that had been shared on the GISAID platform as of 8 December 2020. The timely release of unpublished genomic information through GISAID was essential for fast track development of diagnostics, vaccines and therapeutics as well as the application of WGS in outbreak investigation and public health control measures (Oude Munnink *et al.*, 2020a; Voeten *et al.*, 2020).

With the ever-increasing numbers of sequences that are being generated, the need for rapid characterization of viruses with specific mutations remains high. A high number of papers are published describing the evolution and mutations in the SARS-CoV-2 genome, but assessing the relevance and effect on virus properties, and, consequently, public health, is still challenging (Grubaugh *et al.*, 2020).

Population Surveys and Sero-epidemiological Studies

Serologic studies can provide important information for understanding the extent of past transmission, the current state of the epidemic, and future transmission in an affected population. Moreover, serology is a very useful tool on the human-animal interface (Wernike *et al.*, 2020). It can be used to screen potential animal reservoirs, as has been used to determine the likely reservoir species for MERS-CoV, (Reusken *et al.*, 2013; Deng *et al.*, 2020). Serological surveys in several animal species did not point towards the SARS-CoV-2 animal reservoir species, but did show significant exposure of dogs and cats in Wuhan and Italy, which were severely affected by SARS-CoV-2 (Zhang *et al.*, 2020; Patterson *et al.*, 2020). Also, serological assays can be an additional tool to gain insight in the potential and scale of animal-to-human transmission, when combined with epidemiological information on exposure, as was done for mink farm employees on SARS-CoV-2 on infected mink farms (Oude Munnink *et al.*, 2020b; Sikkema *et al.*, 2016). However, it is important to realize that coronaviruses including betacoronaviruses are common in many animal species, and can result in cross reactivity and false positives (Franzo *et al.*, 2020; Nemoto *et al.*, 2019; Erles and Brownlie, 2008).

In addition to patient diagnostics and surveillance efforts in symptomatic and asymptomatic individuals, wastewater sampling can be used to monitor the circulation of SARS-CoV-2 in the population (Medema *et al.*, 2020; Hart and Halden, 2020). This approach is currently integrated in the national COVID-19 surveillance in multiple counties (“see Relevant Websites section”).

Concluding Remarks

With the emergence and worldwide spread of a novel coronavirus, the disease X scenario that many scientists had warned about came true. The SARS-CoV-2 pandemic led to drastic government measures worldwide, with massive economic and social consequences. The spread of the virus has proven to be difficult to contain, despite extensive lockdowns, information campaigns, travel bans and compulsory mouth masks. However, previous investments in surveillance, diagnostics, novel laboratory techniques, open data sharing and vaccine platforms did pay off. A cluster of pneumonia of unknown origin was detected in December 2019 in Wuhan, and at the end of January 2020, a set of whole genomes are publicly shared and a validated PCR assay has been set up which was implemented in 24 of 30 EU/EEA countries and many more worldwide (Reusken *et al.*, 2020). Moreover, in December 2020, the first COVID-19 vaccine was licensed ("see Relevant Websites section"). The speed of these key developments in the surveillance and control of the new virus is unprecedented. How the SARS-CoV-2 pandemic will evolve remains to be seen, but recent developments reinforce the call for preparedness research and a One Health approach, as highlighted in the current article.

Use of Immunoglobulins in the Prevention of Viral Infections

Leyla Asadi and Giovanni Ferrara, University of Alberta, Edmonton, AB, Canada

© 2021 Elsevier Ltd. All rights reserved.

Introduction

In the late 18th century, Emil von Behring and Shibasaburo Kitasato published their ground-breaking work showing that non-immune rabbits could be protected from developing tetanus if they were injected with sera obtained from rabbits infected with *Clostridium tetani*.

This was followed up one week later by another foundational work where Behring used inactivated *Corneybacterium diphtheriae* toxin to prevent diseases in guinea pigs (Kaufmann, 2017). At the same time, the studies of Paul Erlich contributed to understanding the foundations of humoral immunity and allowed the safe production of large volumes of high-quality anti-diphtheria serum from large animals (Graham and Ambrosino, 2015). These combined efforts led to dramatic success in reducing tetanus and diphtheria mortality and were followed by the development of similar therapies for a variety of other bacterial infections, including *Neisseria meningitidis*, *Haemophilus influenzae*, and *Streptococcus* sp. (Casadevall et al., 2004). This pre-antibiotic and pre-antiviral era was a golden age for “serum therapy” (Casadevall et al., 2004).

The first reported use of serum therapy for viruses appears to have been in 1907 when it was used to prevent roseola (Good and Lorenz, 1991). It was also used during the 1918 Spanish influenza pandemic. Indeed, a modern meta-analysis of studies published during the pandemic estimates that there may have been ~40% reduction in mortality in those who received Spanish influenza-convallescent human blood products early in the course of their disease (Luke et al., 2006).

Because early immunoglobulin products were often contaminated with animal proteins, serious adverse effects such as serum sickness and anaphylaxis remained a real and constant risk. By the 1930s, it was clear that immunoglobulin therapy could be safer and more effective if antibodies were isolated from pools of normal human sera. Furthermore, new methods of isolating and precipitating human immunoglobulin fractions from placental tissue extracts became available (Good and Lorenz, 1991). Despite these advancements, and also due to the cost and complexity of production, serum therapy for bacteria was supplanted by antibiotic therapy with sulfonamides, then beta-lactams.

After World War II, Dr. Edwin Cohn developed a technique that allowed for the purification of antibodies via ethanol fractionation of plasma (Graham and Ambrosino, 2015). His technique – which was further refined by J.L. Oncley (Barahona Afonso and Joao, 2016) – allowed the yield of immunoglobulin for intravenous and subcutaneous use. Since most viral infections remained without treatment, the focus shifted to the use of immunoglobulins for viral pathogens. From there, polyclonal immunoglobulins began to be used for measles, rabies, hepatitis A and B, varicella-zoster virus, and respiratory syncytial virus (RSV). Cohn and Oncley's techniques (with some additional steps) and the use of polyclonal immunoglobulins for these viruses remain in practice today (Barahona Afonso and Joao, 2016).

Since then, several variants of immunoglobulin products have been produced and investigated, in pace with the development of new molecular biology techniques allowing a higher grade of purity and specificity for different uses of the antibodies prepared for the immunoglobulin cocktails.

Polyclonal antibodies in the form of intravenous immunoglobulin or hyperimmune immunoglobulin remain the most commonly used form of immunoglobulins in viral infections. Hyperimmune globulins contain a higher proportion of immunoglobulins targeting a specific pathogen. They are produced either by identifying individuals with high titers of the antibody of interest or by vaccination of donors.

Given the increasing ease in identifying and manufacturing monoclonal antibodies, they have been the focus of intense research, particularly for the treatment of emerging infectious diseases such as viral hemorrhagic fevers. The hybridoma technique developed in the 1970s was a major advancement that allowed the in-vitro production of monoclonal antibodies. In this method, mice were exposed and immunized with antigens of interest, and the antigen-specific B-cells were harvested from the mice spleens: These cells were then immortalized by fusing them with immortal B-cell cancer cells, allowing expansion and production of the same monoclonal antibody (Marston et al., 2018; Salazar et al., 2017). However, newer and more direct methods of monoclonal antibody production are now available. For instance, if the antigen is known, it can be used to screen a phage display antibody library (Salazar et al., 2017) – with antibodies derived from naturally infected or immunized persons. Alternatively, memory B cells – again from infected or immunized persons – can be sorted by flow cytometry, based on the affinity of their B-cell receptor for defined antigens (Salazar et al., 2017). The identified antibodies can then be cloned. Alternatively, deep sequencing of the B-cell IgG repertoire enables the production of heavy and light chain paired mAbs (McDaniel et al., 2016). Once the antibody has been identified, further techniques are available to stabilize the final product and reduce the occurrence of side effects (e.g., the Fc receptor can be modified to prevent undesirable interactions while maintaining the neutralizing functions of the heavy and light variable chains) (Sapparapu et al., 2016).

The possibility to develop monoclonal antibodies targeted to neutralizing epitopes of viral and bacterial molecules enables the production of larger amounts of immunoglobulin without the need to obtain blood products from thousands of donors. It also enables precision medicine in the field, increasing the efficacy and safety of these products that would become “off the shelf” drugs with precise indications. Unfortunately, apart from the few indications already approved (that are reported at the end of the article), this reality is still far for most infectious diseases. Major limitations of this approach include the limited knowledge of the

humoral response against specific infectious agents (i.e., how to identify the right epitopes and their combination to achieve humoral protection) and the existing high cost of molecular techniques.

In this review, we will discuss disease-specific uses of polyclonal and monoclonal antibodies in the prevention of infection.

Polyclonal Immunoglobulins Used in the Prevention of Infectious Diseases

Hepatitis A

The hepatitis A virus (HAV) typically results in asymptomatic disease or a self-limited illness. It rarely causes fulminant hepatitis, chronic complications, or death; however, those with pre-existing chronic liver disease and those who are immunocompromised are at an increased risk for such complications. Transmission of hepatitis A occurs through the fecal-oral route, either via person-to-person contact or consumption of contaminated food or water (Bennett *et al.*, 2014).

Passive immunization against hepatitis began in the 1940s. After seeing the effectiveness of measles passive immunization, Dr. Joseph Stokes administered gamma globulin to children at a camp with an “icteric hepatitis” outbreak. He found that there was a 39% absolute reduction (90% relative reduction) in the development of hepatitis among gamma globulin recipients (Cuthbert, 2001). More recently, a 2009 Cochrane systematic review explored the efficacy of immunoglobulins for pre-exposure and post-exposure prophylaxis. For pre-exposure prophylaxis, they found that when compared with placebo, immunoglobulins reduced the risk of hepatitis A infection by 47%–72% (Liu *et al.*, 2009). No trials compared the clinical efficacy of immunoglobulin versus inactivated HAV vaccine; however, both resulted in similar HAV antibody development at four weeks. By 24 weeks, no one in the immunoglobulin group was still seropositive. Only one study looked at giving both agents; there was no benefit to giving both (albeit the study was of poor quality). Concerning post-exposure prophylaxis, they identified two trials. The more recent trial, completed in 2007, compared immunoglobulin to inactivated hepatitis A vaccine by randomizing 1,090 susceptible contacts of HAV cases to inactivated HAV vaccine or immune globulin within two weeks of exposure. There was no difference in disease incidence between the two groups (4.4% versus 3.3%, respectively) (Victor *et al.*, 2007).

Separately, studies have shown that the inactivated HAV vaccine is safe and, in healthy adults <40 years of age, confers 95% seropositivity for at least 25 years (Bovier *et al.*, 2010; Hens *et al.*, 2014). However, based on limited data, there may be reduced immunogenicity in older adults, particularly with early seroprotection (within 15 days of vaccination) (Link-Gelles *et al.*, 2018). The vaccine has also not been licensed for use in children <1 year of age and could theoretically interfere with passively acquired maternal antibodies. Nevertheless, due to the high immunogenicity of the HAV vaccine, its ability to induce active immunity, longer duration of protection, ease of administration, and greater acceptability and availability, the vaccine became the preferred method of HAV prevention. Immunoglobulin was primarily reserved for those <12 months of age, >40 years old, or those who are immunocompromised.

For the first time, in 2018, the Advisory Committee on Immunization Practice (ACIP) revised their recommendations (Nelson *et al.*, 2018). In contrast to previous recommendations, the vaccine is now preferred for those >40 years of age, and immunoglobulin is only added on a case-to-case basis. They justify this recommendation by pointing at the decreased potency of immunoglobulin, due to reduced HAV antibody titers in the general population from which the immunoglobulin is obtained. This has resulted in a higher volume of immunoglobulin being required for the prevention of HAV infection, making it even less easily available or acceptable. They also now recommend vaccine for pre-exposure prophylaxis in infants traveling internationally between six and 11 months of age (off-label use). This is because the measles, mumps, and rubella (MMR) vaccine and HAV immunoglobulin cannot be given simultaneously. Thus, clinicians should prioritize the prevention of measles, mumps, and rubella by vaccinating with the MMR vaccine and use an inactivated HAV vaccine, as opposed to the immunoglobulin, to try to achieve hepatitis A protection.

The remainder of the recommendations are unchanged and described in Table 1, modified from the 2018 MMWR report on HAV (Nelson *et al.*, 2018).

Measles

The measles virus is a highly contagious virus that produces a characteristic exanthem after a prodromal phase of conjunctivitis, cough, coryza, and fever. Serious complications include pneumonia, post-infectious encephalitis (one in 1000–2000 cases), subacute sclerosing panencephalitis (SSPE) (one in 100,000 cases), and death (~1–3 in 1000 cases) (Bennett *et al.*, 2014). In developing countries, pediatric mortality rates approach 2%–15%. Pregnant women and those with immunodeficiency are at higher risk of complications (Matysiak-Klose *et al.*, 2018).

Before the arrival of the measles vaccine in 1963, major epidemics causing millions of deaths were not uncommon (World Health Organization, 2019a). With the introduction of a highly effective vaccine, global measles rates have plummeted and measles was considered eliminated in most developed countries (World Health Organization, 2019a). One dose of the measles, mumps, rubella (MMR) vaccine provides ~93% protection (CDC, 2020). With two doses, effectiveness reaches ~97% (CDC, 2020). Measles vaccination is the only approach for pre-exposure prophylaxis and the mainstay of post-exposure prophylaxis (PEP) in immunocompetent individuals >6 months (Plotkin, 2012). The vaccine is approved for those >6 months of age and, because it is a live attenuated virus, its administration is contraindicated for those pregnant, with severe allergic reactions to

Table 1 Post-exposure and pre-exposure prophylaxis for hepatitis A virus for healthy individuals

Indication/age group	Hepatitis A vaccine	Immune globulin
< 12 months, healthy, post-exposure	No	0.1 ml/kg
< 12 months, healthy, pre-exposure		
• < 6 months	No	0.1–0.2 ml/kg ^a
• 6–11 months	1 dose ^b	None
12 months – 40 years, healthy, post-exposure and pre-exposure	1 dose ^c	None
> 40 years, healthy, post-exposure and pre-exposure	1 dose ^c	0.1 ml/kg ^d
≥ 12 mos, immunocompromised or chronic liver disease, post-exposure	1 dose	0.1 ml/kg
≥ 12 mos, vaccine contraindicated, post-exposure	No	0.1 ml/kg
All ages, immunocompromised or chronic liver disease, pre-exposure	1 dose	0.1–0.2 ml/kg ^{d,a}
> 6 months, vaccine contraindicated, pre-exposure	No	0.1–0.2 ml/kg ^a

^adose depends on the duration of travel.^bdose does not count toward routine 2-dose series, which should be started after one year.^conly one dose necessary for post-exposure prophylaxis, but two doses for long-term immunity.^drisk assessment (severity of exposure and potential for complications) undertaken to determine the need for immune globulin.

Note: Modified from Nelson, N.P., *et al.*, 2018. Update: Recommendations of the advisory committee on immunization practices for use of hepatitis A vaccine for postexposure prophylaxis and for preexposure prophylaxis for international travel. *Morbidity and Mortality Weekly Report* 67 (43), 1216–1220.

any component of the vaccine, and who are immunocompromised. Thus, immunoglobulins continue to play a role in PEP, particularly for those most vulnerable to complications of the disease. The MMR vaccine, a live vaccine, is not administered in conjunction with immunoglobulins as it results in the negation of each component.

In 1926, Zingher showed that convalescent whole blood, serum, or plasma could prevent measles, and in 1940, Janeway confirmed that early immunoglobulin administration could prevent measles in three out of every four people and attenuate disease in the fourth (Plotkin, 2012). Recently, a 2014 Cochrane systematic review examined the effectiveness of post-exposure immunoglobulins (Young *et al.*, 2014). Looking back to the 1920s, they identified 13 studies (3,925 patients), with only one being a randomized controlled trial. 11 studies predated widespread vaccine implementation (so high measles-specific titers in the immunoglobulin preparations would be expected). The studies were heterogeneous and of moderate quality. Nevertheless, the authors concluded that immunoglobulins within seven days of exposure reduces the risk of measles by up to 83% compared to no intervention. Due to high rates of immunity resulting from vaccination, modern PEP studies are challenging; however, since the publication of the Cochrane review, there are at least two new observational studies. A study of 121 contacts who received PEP showed that MMR vaccine effectiveness was at 83.4% (95% CI, 34.4%–95.9%) and immunoglobulin (dosed at 0.5 ml/kg) effectiveness was at 100% (approximately 95% CI, 56.2%–99.8%) (Arciuolo *et al.*, 2017). However, most immunoglobulin recipients were <6 months of age and so they may have had maternal antibodies that provided protection. A 2017 Canadian study of 55 self-reported susceptible individuals found that immunoglobulin effectiveness was ~69%; however, the dose administered in this study was only 0.25 ml/kg (Bigham *et al.*, 2017). Both studies excluded pregnant women or immunocompromised patients.

Based on these studies, there is consensus that immunoglobulin is beneficial and should be given as quickly as possible (ideally, within six days) if there is a contraindication to the MMR vaccine (Matysiak-Klose *et al.*, 2018). If intramuscular immunoglobulin is available, the dosage should be 0.5 ml/kg; otherwise, IVIg (400 mg/kg) is the agent of choice (Matysiak-Klose *et al.*, 2018; Tunis *et al.*, 2018). Given that individuals weighing 30 kg or more would not have complete protection with IM immunoglobulin at a dosage of 0.5 ml/kg and would therefore require multiple injections, IVIg is the preferred product for most immunocompromised individuals (Tunis *et al.*, 2018; Public Health England, 2020).

Given the reduced efficacy of the MMR vaccine when administered as PEP 72 h post-exposure, some jurisdictions (i.e., United States) recommended immunoglobulin for all susceptible individuals (including non-pregnant and immunocompetent hosts) if they present between 72 h and six days (McLean *et al.*, 2013). However, others (i.e., Canada) no longer recommended the use of immunoglobulin for immunocompetent individuals >12 months of age because the measles virus antibodies in immunoglobulin products may no longer be optimally protective (due to waning anti-measles titers in the general population) and because there is a low risk of disease complications in this group (Tunis *et al.*, 2018).

Hyperimmune Immunoglobulins Used in the Prevention of Infectious Diseases

Hepatitis B Hyperimmune Globulin

Depending on the age of acquisition, hepatitis B virus (HBV) infection may result in acute or chronic hepatitis. Infection in newborns can become chronic in 90% of cases. Chronic disease, in turn, may develop into cirrhosis or hepatocellular carcinoma, resulting in death. Perinatal transmission remains the main mode of HBV transmission but in adults, acquisition primarily occurs via intravenous drug use, sexual activity, or occupational exposure (Bennett *et al.*, 2014).

The HBV vaccine – a recombinant vaccine containing yeast-derived hepatitis B surface antigen (HBsAg) – is the cornerstone of HBV prevention (Schillie *et al.*, 2018). The only contraindication is anaphylaxis with having previously received HBV vaccine. The

seroconversion rate is ~95%–100% in children and ~90% in adults, with lower response rates in higher ages (Henry and Baclic, 2017). The vaccine's effect is blunted in the immunocompromised or those with underlying liver disease (Walayat *et al.*, 2015) and ~5% of individuals are vaccine non-responders.

Hepatitis B hyperimmune IG (HBIG) is administered at a standard dose of 0.06 ml/kg and is used in conjunction with the vaccine in post-exposure settings, in liver transplants and as prevention for maternal-to-child-transmission (MTCT). For known non-responders, HBIG is the only method of protection after an HBV exposure (Schillie *et al.*, 2018). Among susceptible individuals with a high-risk HBV exposure in occupational or non-occupational settings, one dose of HBIG is recommended as soon as possible and up to seven days post-exposure. HBIG provides protection until active immunity from vaccination develops. The evidence for this is from lower quality randomized trials from the 1970s or early 1980s where it appeared that among those given HBIG within seven days of percutaneous exposure to HBsAg positive blood, ~75% developed protective antibodies (Schillie *et al.*, 2018). No studies have compared the efficacy of HBIG and the HBV vaccine series or the combination of these two agents in post-exposure settings.

In addition to immunization of infants and treatment of highly viremic mothers with antiviral therapy, HBIG is also given to prevent vertical transmission. HBV vaccine is 75% effective and HBIG is 71% effective in preventing HBV transmission; when combined, their efficacy reaches 94% (Lee *et al.*, 2006; Schillie *et al.*, 2015; Beasley *et al.*, 1983). Therefore, in cases where the mother is HBsAg positive (and anti-HBe negative) or her hepatitis B status is unknown, vaccine and HBIG are to be administered within 12 h of birth. The addition of HBIG to the vaccine has an incremental cost-effectiveness ratio of \$6957 per quality-adjusted life-year (Fan *et al.*, 2016). Despite decreased efficacy after 48 h, HBIG may be given up to seven days post-birth (Henry and Baclic, 2017). A Cochrane review of ~30 randomized control trials from China looking at the use of HBIG during pregnancy (antenatal) to prevent MTCT was inconclusive due to very low to low-quality evidence (Eke *et al.*, 2017).

A subset of HBsAg-positive liver transplant recipients also require HBIG. As per the 2018 American Association for the Study of Liver Diseases (AASLD) Hepatitis B guidance, in HBsAg-positive liver transplant recipients at low risk of recurrence, "either no HBIG or HBIG for only 5–7 days combined with antivirals long term has been highly effective" (Terrault *et al.*, 2018). However, HBsAg-positive liver transplant recipients who are HIV- or hepatitis delta virus (HDV)-positive, have antiviral drug resistance, or high levels of HBV DNA at the time of transplantation may benefit from indefinite HBIG as they are at higher risk of virological breakthrough and have more limited rescue therapy options (Terrault *et al.*, 2018).

Cytomegalovirus Hyperimmune Immunoglobulin

In immunocompetent individuals, cytomegalovirus (CMV) infection is typically asymptomatic. However, in transplant recipients, CMV can cause both direct disease (a viral syndrome or tissue invasive disease) or may indirectly increase the risk of rejection (Bennett *et al.*, 2014). CMV also results in congenital infection and is a leading cause of sensorineural hearing loss and neurological disability (RCOG Scientific Impact Paper, 2018).

In the late 1980s, CMV hyperimmune immunoglobulin (CMVIG) was licensed for use in renal transplant recipients to prevent primary CMV disease (Snydman *et al.*, 1987, 1993). In a small randomized trial of renal transplant recipients (Snydman *et al.*, 1987) and then, subsequently, in a small, double-blind, randomized controlled trial (Snydman *et al.*, 1993) involving liver transplant recipients – both against a placebo arm – CMVIG was beneficial in reducing primary CMV disease and severity. However, with the advent of effective antivirals, CMV immunoglobulin use has decreased and there is limited evidence about its efficacy in combination with antivirals or with more modern immunosuppression. While there may be a role for combination therapy in high-risk lung or small bowel recipients (where the donor is CMV-positive and the recipient is CMV-negative) (Florescu *et al.*, 2014; Valantine *et al.*, 2001), the randomized trials supporting combination therapy have not been adequately powered. The latest consensus guidelines on the management of CMV disease in solid-organ transplantation no longer recommends routine use of CMVIG (Kotton *et al.*, 2018). That said, CMVIG has been used in patients who are intolerant of antivirals (i.e., due to prolonged neutropenia) (Kotton *et al.*, 2018) and there are case reports of its use as an adjunct in the treatment of tissue-invasive CMV disease (Schulz *et al.*, 2016).

Like its use in transplant recipients, the use of CMVIG in pregnancy has also waned. In the early 2000s, a series of non-randomized studies studying CMV-specific hyperimmune globulin in pregnant women with primary CMV infection found a decreased rate of mother-to-fetus transmission as well as a lower risk of congenital disease (Nigro *et al.*, 2005, 2012; Visentin *et al.*, 2012). However, in 2014, a placebo-controlled randomized trial of 124 pregnant women did not demonstrate a significant benefit (Revello *et al.*, 2014). In the Congenital Human CMV Infection Prevention (CHIP) trial, not only was there no difference in congenital infections, immunological, or virological parameters, but there was even a trend toward more adverse obstetric events in the immunoglobulin group. While it could be argued that this RCT was underpowered, CMV immunoglobulin is no longer routinely recommended in pregnancy (RCOG Scientific Impact Paper, 2018; Yinon *et al.*, 2018). A large, placebo-controlled, double-blinded, randomized trial of CMV immunoglobulin in pregnancy is currently underway (The George Washington University Biostatistics Center, 2020).

Finally, despite the waning use of CMVIG, studies are underway examining CMV monoclonal antibodies. A phase two double-blinded, placebo-controlled, randomized trial of RG7667, a combination Monoclonal Antibody in high-risk renal transplant recipients showed a reduction of CMV DNAemia and disease (Ishida *et al.*, 2017). A phase II clinical trial of CSJ148, another combination monoclonal antibody, was recently completed among hematopoietic stem cell recipients, but it did not achieve the primary efficacy endpoint (Maertens *et al.*, 2020).

Rabies Hyperimmune Immunoglobulin

After the appearance of clinical signs, rabies, a zoonotic encephalitis caused by a variety of different species of viruses in the Rhabdoviridae family, is almost universally fatal. Because 99% of human cases are caused by dog bites (WHO/Department of Control of Neglected Tropical Diseases, 2018), the primary method of rabies control has been through mass vaccination of dogs. Pre-exposure prophylaxis, with the highly effective rabies vaccine, is recommended only for those at occupational risk or those living in remote endemic settings (WHO/Department of Control of Neglected Tropical Diseases, 2018).

Once rabies exposure occurs, post-exposure prophylaxis (PEP) is essential to prevent fatality. PEP consists of thorough wound cleaning, rabies vaccine, and rabies hyperimmune IG (RIG) (WHO/Department of Control of Neglected Tropical Diseases, 2018). RIG is only given to those who have never been immunized. The WHO categorizes rabies exposures into three categories of severity and recommends RIG for severe category three cases. Some national guidelines use RIG in less severe exposure incidents (Human rabies prevention-United States, 2008). Because of the prolonged incubation (at least 45 days) and the latency period of the virus, PEP administration is only too late after the occurrence of clinical signs of rabies. When RIG is warranted, either human RIG (hHRIG), which is from pooled plasma of hyperimmunized donors, equine RIG (eRIG), or the rabies' monoclonal antibody (currently only approved in India) may be given. These products provide immediate virus-neutralizing antibodies and may partially suppress antibody production; therefore, only one dose is recommended and it should be given no more than seven days after the vaccine series is started (Khawplod *et al.*, 1996). Ideally, the full dose of RIG should be infiltrated into the bite wound and surrounding area.

The evidence for the addition of RIG to the vaccine series dates to a small study from the 1950s. In 1954, at the Pasteur Institute in Tehran, Iran, 29 rabid wolf bite victims were randomized to receive vaccine-only PEP or vaccine and anti-rabies serum. Among those with severe wounds, 3/5 in the vaccine group and 1/13 in the vaccine and serum group died. From there, RIG with vaccine became the standard of care (Sparrow *et al.*, 2019; Baltazard and Bahmanyar, 1955; Habel and Koprowski, 1955). A more recent study has corroborated these findings by showing significantly higher rabies antibodies at the end of the vaccine series in those who received rabies immunoglobulin (Navarrete-Navarro *et al.*, 1999).

Most rabies deaths occur in poor rural populations in Africa and Asia where rabies PEP is not affordable for the population; only 1%–10% of patients requiring RIG receive it (Sparrow *et al.*, 2019). Furthermore, blood-derived products have a short shelf-life and there are ethical issues around the use of animals in producing immunoglobulins. Given these issues, there have been global shortages of both hRIG and eRIG, and this has led to the interest and development of rabies monoclonal antibodies. The World Health Organization now recommends the use of monoclonal rabies immunoglobulin (where available) and is partnering with collaborating centers for rabies to facilitate rabies mAb cocktails (World Health Organization (WHO), 2017, 2016). There are currently multiple rabies mAbs in various stages of development (Sparrow *et al.*, 2019).

In 2016, Rabishield (SII RMAb), an IgG1 mAb was approved for use in India. In 2/3 phases of randomized controlled trial carried out in India, 200 patients with category three bites from presumed rabid animals were randomized to either vaccine and HRIG or vaccine and RMAb. SII RMAb was safe and demonstrated non-inferiority in the level of rabies virus neutralizing activity (Gogtay *et al.*, 2018).

Vaccinia Hyperimmune Globulin

Vaccinia immune globulin (VIG) is approved for the treatment of complications associated with the smallpox vaccine. It may also be of some benefit for post-exposure prophylaxis of smallpox. Smallpox, caused by the variola virus, was a highly infectious condition characterized by rash and fever and complicated by a myriad of systemic manifestations, including keratitis, encephalitis, and death. In the late 1960s, using the smallpox vaccine, a global mass vaccination campaign was initiated (Meyer *et al.*, 2020). By 1980, the disease was eradicated globally (World Health Organization, 1979). Despite the eradication of wild type smallpox, two variola virus repositories were maintained at official centers in the United States and Russia for research purposes. Some experts also contend that other countries or groups may also possess or aim to obtain virus samples for bioterrorist aims (Witteck, 2006).

The smallpox vaccine is composed of a live attenuated vaccinia virus. The vaccine itself may rarely result in serious complications (Cono *et al.*, 2003). Though historical rates of vaccine adverse effects were higher, after a round of smallpox vaccination of US service members following the September 11, 2001 terrorist attacks, only two serious complications occurred out of ~770,000 individuals (Poland *et al.*, 2005).

At this time, the only available immunoglobulin formulation for smallpox is an FDA-approved intravenous formulation, produced in Canada and available through the CDC. VIG is given at a dose of 2 ml/kg (100 mg/kg). Because vaccine-related complications are rare, the efficacy of VIG is difficult to study. The largest review on VIG efficacy is a 2004 review of 16 non-controlled studies (Hopkins and Lane, 2004). The studies included in the review were published between 1948 and 2003. These studies suggest that there is potential morbidity and mortality benefit with the use of VIG for progressive vaccinia (vaccinia necrosum) and eczema vaccinatum and severe generalized vaccinia. There is no benefit with post-vaccination encephalitis and VIG is contraindicated in vaccinia keratitis. The concern about keratitis is based in part on historical experimental data in rabbits showing that daily administration of VIG in vaccinal keratitis resulted in larger eye lesions with more persistent scarring, possibly due to immune complex disease (Fulginiti *et al.*, 1965). If the smallpox vaccine is given to people with contraindications to the vaccine (i.e., people with eczema, infants, pregnant women, or the immunosuppressed), prophylactic VIG may be of some benefit. However, its use is not approved for prophylaxis (Witteck, 2006).

Some have explored the use of VIG for post-exposure prophylaxis against smallpox (Hopkins and Lane, 2004). These studies did not meet modern criteria for randomized trials but did point to some benefits. Therefore, given its safety profile, VIG could be considered for individuals at high risk of smallpox complications.

Varicella Hyperimmune Immunoglobulin

Varicella-zoster virus causes varicella (chickenpox) and herpes zoster (shingles). Varicella is a self-limited illness characterized by fever and vesicular rash. Rarely, encephalitis, pneumonia, and death may occur. Pregnant women, neonates, and immunocompromised hosts are far more likely to suffer severe manifestations and multi-organ involvement. In neonates whose mothers developed disease five days before or 48 h post-partum, mortality can be as high as 30% (Bennett *et al.*, 2014). Congenital varicella, though rare, is associated with eye and skin abnormalities, hypoplastic extremities, and CNS impairment (Enders *et al.*, 1994).

The primary method of pre-exposure and post-exposure varicella prevention is vaccination. In the post-exposure setting, among immunocompetent children, the varicella vaccine is 86% effective against all forms and 100% effective against moderate-to-severe disease (Izurieta *et al.*, 1997). However, because it is a live-attenuated vaccine, it is contraindicated in precisely those at the highest risk of severe disease – neonates, pregnant women, and the severely immunocompromised. It is in this vulnerable group where passive immunization may be warranted.

Passive immunization against varicella was attempted as early as the 1940s (Funkhouser, 1948; Schaeffer and Toomey, 1948). In 1962, it was shown that non-specific human serum immunoglobulin limited varicella severity but did not prevent disease (Ross *et al.*, 1962). Then, in a small study with 12 participants, Zoster IG (ZIG), an immunoglobulin formulation produced from convalescent plasma of herpes zoster – appeared to prevent disease transmission (Brunell *et al.*, 1969). However, ZIG was difficult to obtain and was in short supply, and in the early 1980s, varicella-zoster IG (VZIG) – an immunoglobulin prepared from normal donor plasma selected for high titer of antibody to varicella-zoster virus (VZV) – came to market to meet supply shortages. In a double-blind randomized trial, outcomes with ZIG were comparable with outcomes with VZIG (Zaia *et al.*, 1983). The latest preparation of immunoglobulin, VariZig, is equivalent to VZIG in efficacy and safety (Koren *et al.*, 2002). No randomized trials have compared immunoglobulin to placebo. However, observational studies support a change in disease presentation and occurrence. For instance, an observational study from Italy showed that the risk of developing varicella was lower in VZIG recipients than those who did not receive it [42% (21 of 50) versus 72% (13 of 18); $p = 0.0263$] (Trotta *et al.*, 2018). Though methodologically suboptimal, comparison with historical controls (where IG was not administered) also suggests that IG administration alters the incidence of disease, particularly severe disease (Levin *et al.*, 1986).

There are no published data regarding the efficacy of VariZig in immunocompromised hosts nor are there trials comparing immunoglobulin prophylaxis with antiviral prophylaxis (either alone or in combination). However, according to the most recent iteration of the UK varicella PEP guidelines, the administration of VZIG to children with hematologic or oncology diagnoses is variable. This has allowed them to conduct an observational study comparing VZIG and acyclovir. Interim analysis of 73 recruited patients has shown acyclovir is at least equivalent to VZIG in preventing varicella (Public Health England, VZIG Expert Working Group, 2019).

National guidelines on PEP varicella immunoglobulin vary. In the UK, where VZIG is in short supply, immunoglobulin is recommended for neonates and women at <20 weeks gestation. Antivirals are preferred after 20 weeks gestational age and for the immunocompromised (Public Health England, VZIG Expert Working Group, 2019). On the other hand, Canadian and US guidelines recommend the use of VariZig after exposure to varicella-zoster virus (varicella or herpes zoster) for neonates, all pregnant women, at-risk premature infants, and immunocompromised children and adults who lack evidence of immunity (National Advisory Committee on Immunization, NACI, 2016; Bialek *et al.*, 2013).

VariZig administration is approved for up to ten days after exposure (Bialek *et al.*, 2013). There is limited but increasing evidence of its efficacy beyond 96 h (Levin *et al.*, 2019; Swamy and Dotters-Katz, 2019). The duration of protection is unknown but expected to be at least three weeks. VariZig might extend the incubation period of the virus from 10–21 days to ≥ 28 days.

Monoclonal Antibodies Approved by the Food and Drug Administration

Respiratory Syncytial Virus

Respiratory syncytial virus (RSV) is the most common cause of pediatric acute lower respiratory tract infections (Nair *et al.*, 2010). Only a small percentage of healthy, term infants develop severe complications; however, in high-risk infants, including those who are preterm or who have chronic lung diseases, congenital heart diseases, Down syndrome, neuromuscular conditions, or immunodeficiencies, the rate of hospitalizations increases to $\sim 10\%$ (Feltes *et al.*, 2003; Robinson *et al.*, 2016b; The Impact-RSV Study Group, 1998). There are no known treatments for RSV and antiviral therapy with ribavirin – which is of questionable efficacy – is reserved for severe cases in the immunosuppressed (American Academy of Pediatrics Committee on Infectious Diseases; American Academy of Pediatrics Bronchiolitis Guidelines Committee, 2014).

However, hyperimmune immunoglobulins and monoclonal antibodies have shown promise in the prevention of RSV in vulnerable groups. In the early 1990s, two randomized controlled trials carried out in high-risk infants showed that an RSV immune globulin (RSV-IGIV) infused monthly during the RSV season could reduce hospitalizations by 40%–65% (Groothuis and Simoes, 1993; PREVENT

Study Group, 1997). However, there were reports of an increased risk of morbidity and mortality in infants with congenital heart disease (Simoes *et al.*, 1998), and RSV-IGIV was then replaced by Palivizumab.

Palivizumab (Synagis) is a humanized murine monoclonal antibody to the RSV F glycoprotein, a highly conserved glycoprotein among the two serotypes of RSV (serotype A and B) (Resch, 2017). By binding to the F-protein, Palivizumab impairs the fusion of the viral envelope with the host cell membrane, preventing entry into the host cell. Palivizumab also prevents the fusion of the plasma membrane of infected cells, a process that results in syncytium formation. It was the first anti-viral monoclonal antibody approved by the FDA. In the original randomized controlled trial of 1,502 children with prematurity or bronchopulmonary dysplasia (BPD) who were randomized to placebo or monthly IM injections of Palivizumab, there was a 55% reduction in hospitalizations (The IMPact-RSV Study Group, 1998). Hospitalizations were decreased by 78% for children with prematurity without BPD and by 39% for children with BPD. Subsequent studies have also shown reduced hospitalization in infants with hemodynamically significant congenital heart disease (Feltes *et al.*, 2003). A 2014 systematic review of 20 observational studies (Nusrat Homaira *et al.*, 2014) was consistent with these benefits and a 2019 self-controlled case series of 24,329 infants, 1.1% of whom received at least one dose of Palivizumab and 6.2% of whom developed RSV, found that Palivizumab was associated with a 74% reduction in incidence of RSV infection (Moore *et al.*, 2019).

While results on the cost-effectiveness of Palivizumab have been inconsistent (Andabaka *et al.*, 2013), the most recent systematic review on the topic showed that, from a payer perspective, Palivizumab was cost-effective in preterm infants, infants with BPD or chronic lung disease, congenital heart disease, and infants in certain remote communities (Mac *et al.*, 2019). There is general agreement among national guidelines that Palivizumab is beneficial in these specific high-risk situations (American Academy of Pediatrics Committee on Infectious Diseases; American Academy of Pediatrics Bronchiolitis Guidelines Committee, 2014; Robinson and Le Saux, 2015; Public Health England, 2015). However, there is some disagreement about adopting its routine use in Down's syndrome, neuromuscular disorders, cystic fibrosis, or other lung diseases (Luna *et al.*, 2018).

In addition to Palivizumab, Motavizumab was a second-generation monoclonal antibody (mAb) derived from Palivizumab (Feltes *et al.*, 2011; Carbonell-Estrany *et al.*, 2010). It was withdrawn from the market after the FDA requested more information on the risks and severity of hypersensitivity reactions (see "Relevant Websites section"). Other monoclonal antibodies with extended half-lives and strong neutralizing activity are currently under investigation, with two entering phase two and three investigations (Aranda and Polack, 2019).

Human Immunodeficiency Virus

The emergence of antiretroviral therapies (ART) has helped halt the progression of the Human Immunodeficiency Virus (HIV) epidemic. Treatment with ART controls the progression of the HIV-1 virus among infected individuals and also helps prevent HIV acquisition when taken prophylactically by uninfected individuals. However, for those with multi-drug resistant HIV with limited treatment options, monoclonal antibodies may serve as a salvage therapy. Moreover, until an effective vaccine is found, other treatment modalities, such as broadly neutralizing monoclonal antibodies, may aid in controlling the epidemic.

Ibalizumab, a mouse-derived IgG4 monoclonal antibody, was approved by the FDA in 2018 for use in multi-drug resistant HIV (FDA, 2018). Ibalizumab does not act on circulating HIV-1 or cells already infected with HIV-1; instead, it blocks HIV entry into CD4 cells by binding to the CD4 extracellular domain 2 (Emu *et al.*, 2018). In phase three of an open-label study, 40 individuals with multi-drug resistance HIV (defined as triple-class resistance) were treated with at least one active antiviral agent as well as Ibalizumab. 83% of patients had an initial decrease in their viral load and at 25 weeks, 43% of patients had an undetectable viral load (Emu *et al.*, 2018). For patients with MDR-HIV, Ibalizumab may allow the construction of a life-saving treatment regimen.

The other antibodies being studied for the prevention and treatment of HIV are classified as broadly-neutralizing monoclonal antibodies (bnMAbs) that act directly on HIV (Caskey *et al.*, 2019). The site of action for these antibodies is the HIV-1 envelope spike (Env) – the only target on the surface of the virus (Caskey *et al.*, 2019). The observation that a small fraction of HIV-1-infected persons are able to produce antibodies that neutralize multiple circulating HIV-1 strains indicated the possibility to develop potent bnMAbs (Freund *et al.*, 2017). bnMAbs can both lead to the destruction of HIV-infected cells by engaging with Fc receptors and can boost the endogenous immune system through immune complex formation that increases B-cell and T-cell activation. These features have the potential to both control viral replication and lead to the reduction of viral reservoirs.

To date, the clinical information on bNAbs is primarily limited to phase one and phase two studies but holds promise for prophylaxis, maintenance therapy, and potentially even in eliciting prolonged remission or cure (Gruell and Klein, 2018). A recent phase two, randomized controlled trial of VRC01 enrolled 19 individuals with acute HIV infection who started and were well controlled on ART (Crowell *et al.*, 2019). These individuals then underwent an analytic interruption of ART and 14 received VRC01 infusions every three weeks for 24 weeks. However, only one VRC01 recipient achieved the primary efficacy endpoint of viral suppression after ART interruption. The authors postulated that, like antiviral therapy, a combination of bnMAbs may be required to achieved viral suppression.

Experimental Immunoglobulin Therapies

Seasonal Influenza

Both polyclonal immunoglobulin and monoclonal antibodies have been used in the treatment of seasonal influenza and remain active areas of research interest. A modern systematic review of the impact of early administration of convalescent plasma during

the 1918 Spanish influenza epidemic hypothesized that the use of the convalescent plasma resulted in a 21% absolute reduction in mortality (Luke *et al.*, 2006). Subsequently, a small cohort study of patients with severe H1N1 influenza suggested a ~30% reduction in absolute mortality with administration of H1N1 convalescent plasma (Hung *et al.*, 2011). The same research group followed up with a randomized trial of convalescent plasma-derived immunoglobulin involving 35 patients (Hung *et al.*, 2013). They found a reduced viral load among plasma recipients and on subgroup analysis, immunoglobulin within five days of symptom onset was the only factor independently associated with reduced mortality. A phase two randomized trial of convalescent plasma versus standard of care also demonstrated improvements in clinical parameters (Beigel *et al.*, 2017). These studies, however, had methodological issues including small sample sizes, higher-than-expected mortality levels among controls, or differing baseline characteristics between the study groups.

Thus, the findings of two phase III randomized trials were eagerly awaited. Unfortunately, both trials were disappointing and did not support the use of hyperimmune globulin in seasonal influenza. FLU-IVIG was an international double-blind, randomized trial of anti-influenza hyperimmune intravenous immunoglobulin vs standard of care (including neuraminidase-inhibitors) (Davey *et al.*, 2019). Among the 308 participants, there was no benefit with the use of the hyperimmune IVIG. That said, there was clinical benefit among the 27% of patients with influenza B. A randomized trial of high titer plasma (HAI antibody titers of $\geq 1:80$) vs low titer plasma (HAI $< 1:10$) in patients with severe influenza A also did not reveal any benefit with the use of high titer plasma (Beigel *et al.*, 2019).

However, mAbs may still hold some promise and there are currently multiple influenza-specific molecules being studied (Salazar *et al.*, 2017). MHAA4549A is a broadly neutralizing human IgG1 mAb that targets the highly conserved hemagglutinin stalk region of the influenza A virus. In one phase two study, it resulted in significant improvements in symptoms and viral (McBride *et al.*, 2017). However, though it was safe and well-tolerated, no such benefits were seen in two subsequent phase two trials (Genentech, 2018, 2019). The phase 2A study of another anti-influenza monoclonal antibody, VIS410, suggested that it was well tolerated and that there may be some clinical benefit; therefore, a phase 2B trial is now planned (Visterra, 2019).

Avian Influenza

Avian influenza viruses, such as H5N1 and H7N9, are associated with high mortality, with a case fatality rate of ~40%–70% in hospitalized patients (Cowling *et al.*, 2013). Neuraminidase inhibitors decrease mortality by ~50% (Adisasmito *et al.*, 2010; Kandun *et al.*, 2008) but there are reports of emerging neuraminidase inhibitor resistance (Someya *et al.*, 2005; de Jong *et al.*, 2005). Therefore, adjunctive and alternative therapies are still required.

In 2006, convalescent plasma from an H5N1 survivor was successfully used in combination with Oseltamivir to treat a new H5N1 case (Zhou *et al.*, 2007) and another case report described similar success (Kong and Zhou, 2006). Since then, a purified polyclonal immunoglobulin F(FBF001) raised against influenza A/Vietnam/1194/2004 virus (H5N1 subtype) showed activity in animal models and safety in a phase one trial (Bal *et al.*, 2015). H5-specific monoclonal antibodies have also been studied (Chen *et al.*, 2009; Zheng *et al.*, 2011).

Mers-Cov

Middle Eastern respiratory syndrome coronavirus (MERS-CoV) is a zoonotic disease (transmitted from camel and bat reservoirs) with occasional human-to-human transmission that emerged in Saudi Arabia in 2012 (World Health Organization, 2019b). Since then, there have been 2458 cases with a fatality rate of 34% (World Health Organization, 2019b). Though cocktails of antiviral therapies are under investigation, no treatment currently exists, and both polyclonal and monoclonal immunotherapies have been explored. MERS-CoV seropositive camel serum was beneficial in mice for both pre- and post-exposure prophylaxis (Zhao *et al.*, 2015), and a polyclonal human anti-MERS coronavirus antibody produced from transchromosomal cattle (SAB-310) was safe and well-tolerated in a phase one double-blind, placebo-controlled trial (Beigel *et al.*, 2018). Several human monoclonal antibodies against MERS-CoV have also been developed (Widjaja *et al.*, 2019). Most of these antibodies target the MERS-CoV S1B receptor-binding domain (RBD). Both RBD and non-RBD antibodies are protective against MERS-CoV in animal models (Widjaja *et al.*, 2019); however, no testing in humans has been initiated.

Ebola and Other Hemorrhagic Fevers

The first reported use of immunotherapy for the treatment of the Ebola virus (EBOV) was in 1995 in Kikwit, Democratic Republic of Congo (Mupapa *et al.*, 1999). The idea was explored further, with mixed results, in animal models (Jahrling *et al.*, 2007, 1996; Dye *et al.*, 2012; Sullivan *et al.*, 2011; Qiu *et al.*, 2014; Pascal *et al.*, 2018). Then, owing partly to the scale of devastation and the absence of any therapies, multiple investigational therapies were explored during the 2014 Ebola outbreak in West Africa. The use of convalescent plasma in a small non-randomized study did not improve survival (van Griensven *et al.*, 2016). However, ZMapp, a cocktail of monoclonal antibodies targeting the surface glycoprotein of Ebola, showed promise (Davey *et al.*, 2016). 72 patients were randomized in the PREVAIL randomized controlled study. While the pre-specified statistical threshold for efficacy was not met, there was a 15% absolute reduction in death among those receiving ZMapp (Davey *et al.*, 2016). This survival was sufficiently

beneficial that ZMapp was considered the standard of care and used in the control arm of the 2018 PAmoja TuLinde Maisha (PALM [together save lives]) Trial (Mulangu *et al.*, 2019).

The PALM [together save lives] study is a randomized controlled trial that was carried out as a component of the emergency response to the EBOV outbreak in the Democratic Republic of Congo in 2018. Spearheaded by WHO, this three-arm trial compared one antiviral, Remdesivir, and two monoclonal antibody-based regimens, mAb114 and REGN-EB3, to a ZMapp control. mAb114 was identified from a panel of memory B cells from a survivor of the 1995 Democratic Republic of Congo EBOV outbreak (Corti *et al.*, 2016; Gaudinski *et al.*, 2019). mAb114 binds to a highly conserved region of the EBOV envelope glycoprotein, preventing interaction with the NPC1 receptor, thereby preventing viral entry into the host cell cytoplasm (Corti *et al.*, 2016; Gaudinski *et al.*, 2019). REGN3470-3471-3479 is a cocktail of three fully human IgG1 monoclonal antibodies (REGN3470, REGN3471, and REGN3479 or REGN-B3; each antibody in the cocktail in a 1:1:1 ratio) (Pascal *et al.*, 2018). The three antibodies all act on separate epitopes on the EBOV glycoprotein but they can do so simultaneously (Sivapalasingam *et al.*, 2018). Overall, 53% receiving Remdesivir, ~50% of patients receiving ZMap, 35% receiving mAb114, and 33.5% receiving REGN-EB3 died. This study showed that monoclonal antibodies held great promise in reducing EBOV mortality.

Other filoviruses are also potential targets for the use of immunotherapies. For Junin Virus, the causative agent of Argentinian hemorrhagic fever, immune or convalescent plasma has been the standard of care since a seminal trial in 1979 showed significant mortality benefit. However, given the costs and challenges of administering immune plasma, recent studies have explored the use of mAbs (Maiztegui *et al.*, 1979). For instance, J199, a mouse-human chimeric mAb produced in *Nicotiana benthamiana*, administered to guinea pigs provided 100% protection against JUNV six days after infection (Zeitlin *et al.*, 2016).

Lassa virus, the causative agent of Lassa fever (LF), results in 100,000 to 300,000 infections annually, with approximately 5000 deaths (Center for Disease Control and Prevention, 2019). In a famous case of passive immunization, Dr. Jordi Casals, the virologist who first isolated and identified the Lassa virus, also inadvertently infected himself with it, but survived after receiving a blood transfusion from the first known survivor of LF, nurse Lilly Lyman Pinneo (Watts, 2012). However, the use of convalescent plasma was not subsequently shown to be beneficial (McCormick *et al.*, 1986). Since 2008, the Viral Hemorrhagic Fever Consortium (Viral Hemorrhagic Fever Consortium, 2020) has studied the protective role of B cells in LF (Robinson *et al.*, 2016a) and created the largest library of huMAbs from convalescent LF patients. Animal models of LF guinea pigs (Cross *et al.*, 2016) and non-human primates (Mire *et al.*, 2017) have confirmed the potential efficacy of mAbs in this disease.

Another cocktail of three different monoclonal antibodies, FVM04, CA45, and anti-MARV mAb MR191, provided 100% post-exposure protection in guinea pigs and non-human primates against Ebola, Sudan, and Marburg viruses (Brannan *et al.*, 2019).

Other Experimental Infections

West Nile virus (Hirota *et al.*, 2012), Zika virus (Marston *et al.*, 2018), Chikungunya (Jin and Simmons, 2019), and numerous other viruses are currently being studied and monoclonal antibodies are in the early phases of development. With the recent emergence of SARS-CoV-2 immunoglobulin therapy, polyclonal immunoglobulin therapy has specifically been considered. Not only have immunoglobulins, presumably IVIG, been administered to critically ill patients (Yang *et al.*, 2020), but there are also reports of immunoglobulin therapy with SARS-CoV-2 convalescent plasma (Bloomberg, 2020).

Glossary

Adjuvant A substance that enhances the body's immune response to an antigen.

Clinical trial A research study in which one or more human subjects are prospectively assigned to one or more interventions (which may include placebo or other control) to evaluate the effects of those interventions on health-related biomedical or behavioral outcomes.

Correlate of protection Correlates of immunity/protection to a virus or other infectious pathogen are measurable signs that a person is immune, in the sense of being protected against becoming infected and/or developing disease. For many viruses, antibodies serve as a correlate of immunity.

Herpes zoster Shingles, also known as zoster or herpes zoster, is a viral disease characterized by a painful skin rash with blisters in a localized area. Shingles is due to a reactivation of varicella-zoster virus (VZV) in a person's body. The disease chickenpox is caused by the initial infection with VZV.

Immunization The action of making a person or animal immune to infection, typically by inoculation with a nonpathogenic version of the infectious agent. Synonymous with vaccination.

Regulatory authority National regulatory agencies responsible for ensuring that products released for public distribution (normally pharmaceuticals and biological products, such as vaccines) are evaluated properly and meet international standards of quality and safety.

Introduction

The development of vaccines is closely linked to the need to protect increasingly larger populations. This started with the transition from populations consisting of hunter-gatherers to agricultural settlements. It went on when urbanization made man even more vulnerable to contagious diseases. Presently about 55% of the world population lives in cities, a situation that is only sustainable with vaccination. Stopping vaccination would result in epidemics. The medical need to prevent (viral) infections is still the major incentive for vaccine development. But whether a vaccine will be developed is also heavily influenced by commercial considerations.

The first vaccine against smallpox ended a disease that in the century before its eradication killed 500 million people ([Fig. 1](#)). Thanks to vaccination, the average life expectancy has gone up in many countries from about 40 years in 1900 to more than 80 years today. [Table 1](#) gives an overview of available viral vaccines for human use. Additionally, many vaccines for animals have been licensed. Thanks to vaccination, smallpox was eradicated by 1977. Rinderpest, a disease that killed up to 100% of cattle during outbreaks was eradicated by 2010 and polio is very close to eradication. Despite of these successes additional vaccines are needed, some urgently. [Table 1](#) lists these vaccines.

Although there have been several "golden ages of vaccines" with important scientific and technical advances bringing vaccine development from a trial-and-error approach to "reverse vaccinology" ([Delany et al., 2014](#)), development times of vaccines have only increased. This is especially worrying when we have to develop vaccines against new viral diseases, where pre-existing immunity is completely absent. This article aims to provide an overview of the history, current status, and future of viral vaccine development and use. A full description of all aspects of viral vaccines would require many hundreds of pages ([Plotkin et al., 2018](#); [Plotkin, 2011](#)). We have selected some recently developed vaccines to demonstrate the general principles of vaccine development and provide an overview of the long road from vaccine candidates towards market entry. Lastly, several new technologies and opportunities are discussed that are expected to change the vaccine development process for the better, especially by shortening development times.

The History of Vaccination

The realization that victims of a severe infectious disease remain immune to the same disease for the rest of their lives was the basis of the first vaccine against smallpox. Actually, a similar approach was already used from about 1570 in China ([Plotkin, 2011](#)). The procedure is called variolation and entailed introducing minute amounts of virus-containing pox material into the nostril of a child. This resulted in a light form of the disease. Already, in those times, the balance between efficacy and adverse effects was evaluated. Up to 1% of variolated children died. This was considered acceptable considering the larger risk of contracting smallpox.

Vaccination differs fundamentally from variolation in that vaccines are composed of viral antigens that produce protective immunity and immune memory without causing disease. There are three classes of licensed viral vaccines: (1) Live-attenuated

Fig. 1 Conquering smallpox. The smallpox virus (a) has been responsible for hundreds of millions of deaths. The virus was already present in ancient Egypt (b). It spread, by trade routes, wars and colonization, to all continents. Typically, 3 out of 10 people who got the disease died. Survivors were left with scars; some became blind. An eradication program organized by the WHO was successful by 1977 with the last case of naturally acquired smallpox (c). The virus is now confined to two laboratories. Eradication was possible with a vaccine discovered by Edward Jenner in 1796 (d). Sources: (a) CDC PHIL #1849, (b) and (c) WHO, (d) Wellcome Library no. 546000i.

Table 1 Overview of licensed viral vaccines and vaccines under development

<i>Licensed vaccines (Year of market introduction)</i>	<i>Vaccines that are needed (Estimated global death toll /year)</i>
Smallpox (1796)	HIV (770,000)
Rabies (1885)	Broadly protecting influenza vaccine (720,000)
Yellow fever (1930)	Hepatitis C (399,000)
Japanese encephalitis (1930)	Norovirus (200,000)
Influenza (1938) (efficacy 40%–60%)	Epstein-Barr (143,000)
Polio (1954)	Human respiratory syncytial virus (120,000)
Adenovirus (1956)	Hepatitis E (44,000)
Measles (1963)	Cytomegalovirus (N/A)
Mumps (1967)	Improved dengue vaccine (N/A)
Rubella (1969)	Herpes simplex
Varicella (1970)	Human metapneumovirus (N/A)
Hepatitis B (1981)	
Hepatitis A (1991)	
Rotavirus (2006)	
HPV (2006)	
Herpes Zoster (2006)	
Dengue (2015) (efficacy 44%, adverse events)	
Ebola (2019)	

vaccines, (2) Inactivated vaccines and (3) Non-replicating protein vaccines produced by recombinant DNA technology. An advantage of live-attenuated vaccines is that production is inexpensive and no adjuvants to boost immune responses are needed. Disadvantages are more adverse effects. These are usually mild, in rare cases severe. For example, smallpox and yellow fever vaccines result in respectively 1–8 and 1–2 deaths per million vaccinations. Another risk is that mutations may lead to regained virulence. This has been a problem for the oral polio vaccine (Amanna and Slifka, 2009). Inactivated and non-replicating vaccines

are very safe, but a downside is that alone they are often unable to generate robust immunity. These vaccines require adjuvants, substances added to vaccines to enhance the immunogenicity (Di Pasquale *et al.*, 2015). Traditionally aluminum salts, with a strong safety record, were used as adjuvant. Scientific advances have led to additional, more potent, adjuvants with a smaller safety database.

What has Happened When Vaccine Reaches the Market? The Development of Shingrix

Shingrix is the herpes zoster (shingles) vaccine. It was licensed in October 2017 in the USA and in 2018 in Europe and Japan. Licensing was based on two large clinical trials with almost 28,000 participants (Maltz and Fidler, 2019; Levin and Weinberg, 2020). Shingrix was the second herpes zoster vaccine. It addressed several limitations of Zostavax, the first vaccine. These limitations included limited protection, especially in individuals over 70 years old, a limited duration of protection, and safety risks for immunocompromised individuals (Dooling *et al.*, 2018).

The history of this successful vaccine dates back to basic research in the early 1990s. Researchers looked for promising viral antigens for a new vaccine. They opted for antigens that could induce cell-mediated immunity in addition to virus neutralizing antibodies elicited by Zostavax. Viral glycoprotein E (gE) was selected as the most suitable candidate (Vafai, 1993; Haumont *et al.*, 1996). Thus, at least 24 years passed between the beginning of research into this vaccine and its licensing.

Phases and Timelines in Vaccine Development: From Discovery to Product

A development time of several decades is typical for vaccine development which consists of separate phases that can only be carried out after each other. Fig. 2 summarizes this step-wise process.

Fig. 2 Timelines and success rates in vaccine development. The transition successes between the clinical phases are from (Wong, C.H., Siah, K.W., LO, A.W., 2019. Estimation of clinical trial success rates and related parameters. *Biostatistics* 20, 273–286). The data on duration from (Dimasi, J.A., Florez, M.I., Stergiopoulos, S., *et al.*, 2020. Development times and approval success rates for drugs to treat infectious diseases. *Clinical Pharmacology & Therapeutics* 107, 324–332) and the cost estimate up to phase 2 from (Gouglas, D., Le, T.T., Henderson, K., *et al.*, 2018. Estimating the cost of vaccine development against epidemic infectious diseases: A cost minimisation study. *The Lancet Global Health* 6, (e1386–e1396)).

Preclinical Studies

The starting point for vaccine development is the medical need to prevent disease. The development begins with basic research to identify the virus responsible for the diseases and, if possible, the antigen(s) that elicit a protective immune response. In addition, attempts are made to determine which immune responses are protective (antibodies, T cells, for example). This is all carried out in the laboratory. Blood samples are often used to study immune responses *ex vivo*. In those cases where an animal model is available, candidate vaccines can be tested for protection after challenge with virulent virus. Finally, toxicity data are collected. The preclinical stage ends with the establishment of a production process.

In Human Studies

After the preclinical studies have come to a satisfactory end, the vaccine is tested in humans (or animals for veterinary vaccines). ‘First-in-human’ studies and all other clinical studies are subject to strict rules to protect study participants and ensure quality. Clinical trials in humans are classified into three phases: phase I, phase II and phase III. Phase I studies are carried out on limited numbers, for example, 20 + healthy adults and are primarily concerned with safety. Phase II studies involve larger numbers of persons belonging to the target population with the aim of getting preliminary information about efficacy, usually immunogenicity and additional safety data.

Together, phase I and II trials should give sufficient confidence that a vaccine is efficacious and safe. The real test comes from phase III trials in which a vaccinated population is compared with a control group for protection against the target diseases, resulting in an estimate of vaccine effectiveness. Depending on the prevalence of the disease these studies may require 10,000 or more participants. After the completion of the phase III studies, all results are summarized in a dossier. This dossier also includes data on a consistent manufacturing process and assays to monitor the production and its end products. This dossier is submitted to the regulatory authorities (The Federal Drug Administration in the USA and the European Medicine Agency). After the regulatory authorities have decided that the vaccine is safe and effective, it is licensed and can be released to the market.

Exceptionally, a vaccine fails in the phase III stage. This happened in the 1960s with a vaccine against disease caused by respiratory syncytial virus. This vaccine was not efficacious and even unsafe, killing two participants of the trial (Hurwitz, 2011). Other problems that popped up in the past were due to the limited number of participants in the phase III trials. As a consequence, rare adverse effects *e.g.*, occurring 1 in 100,000 times will not be detected. Therefore, post-licensure safety surveillance (phase IV studies) is needed to detect adverse effects following immunization (AEFI).

Phase IV studies revealed that a rotavirus vaccine caused intussusception in one or two cases per 10,000 infants vaccinated. This vaccine was withdrawn from the market. Newer rotavirus vaccines are 10-fold safer, but not completely without AEFI (Di Pasquale *et al.*, 2016). Narcolepsy, a sleeping disorder, was identified as a possible AEFI associated with the AS03-adjuvanted influenza vaccine Pandemrix. Although there is a clear association between the receipt of Pandemrix and the development of narcolepsy the causality remains unproven. This incident has shown that there is a need for an internationally coordinated vaccine safety structure that can monitor the safety of the many doses of pandemic vaccines administered in a short period (Edwards *et al.*, 2019).

Costs and Duration of Vaccine Development

The exact data on the development of Shingrix are confidential to the developer and producer GlaxoSmithKline. Clinical studies are responsible for the major costs of vaccine development. Thus, costs will vary depending on the complexity of these studies. Estimates of vaccine development expenditure vary from 135 to more than 1000 million USD (Plotkin *et al.*, 2017; DiMasi *et al.*, 2016). An analysis reported a breakdown of the costs of the separate steps in vaccine development (Gouglas *et al.*, 2018). Analysis of databases with clinical trials on vaccines has yielded reliable data on the success rate of vaccine development. Two studies reported an identical success rate of vaccine development from phase I studies to licensing of 33% (DiMasi *et al.*, 2020; Wong *et al.*, 2019). A success rate of 48% in the transition from the preclinical phase to phase 1 studies (Davis *et al.*, 2011) results in a 16% overall success rate. Estimates for the median duration of phase I-III trials during vaccine development are 6.4–10.7 years (Davis *et al.*, 2011; Pronker *et al.*, 2013). A summary of the data is given in Fig. 2.

Vaccine Production

Coming back to the Shingrix example: this vaccine is produced by expression, via DNA-recombinant technology, of the antigen in Chinese hamster ovary (CHO) cells. The CHO cells are grown in bioreactors in dedicated production facilities. Typically, these production facilities contain stainless steel bioreactors controlled by sophisticated computer programs to ensure a reproducible production process. After this upstream processing the antigen has to be purified, usually, in various steps, a process called downstream processing. Assays are carried out to check (intermediate) products against the specifications (quality control [QC]) during all steps. At the same time, a quality assurance (QA) team follows the stream of accompanying documentation to ensure that all intended controls were carried out. Production, together with QC and QA, can be a long process of more than one year.

The decision to build production facilities is usually taken before the regulatory authorities approve the vaccine. This implies a considerable financial risk.

Shingrix is a successful vaccine and has reached blockbuster status with annual sales in 2019 of more than 1.5 billion USD. The demand was much higher than foreseen, resulting in the need to build additional production facilities. Since the production process is an integral part of the license, careful calibration of a new production facility and the demonstration of equivalence of the product are required. Alternatives for the traditional bioreactor-based production methods that can speed up production, are scalable and reduce costs are being intensively investigated. See Section “Emerging Viral Diseases”.

More About Vaccine Development

Clinical studies are time-consuming and expensive. It would be much easier to measure an immune response that is predictive for protection. Such correlates of protection (CoP) are available for many viral vaccines (Plotkin, 2010). CoPs can be used to license newer vaccines, but also to evaluate existing and new vaccination schedules for protection. Systems vaccinology is a more advanced method to predict the immunogenicity of vaccines. In essence, this links host gene expression (molecular signatures) to protection by vaccines. This approach was very successful for the live attenuated yellow fever vaccine and is, in principle, also useful to predict adverse effects. But more work is needed to move it from ‘promising’ to a standard approach (Raeven *et al.*, 2019).

The Licensing of Influenza Vaccines Follows a Different Procedure

The current influenza vaccines are mostly produced from an egg-grown virus. The vaccines have to be matched every year to the predominantly circulating virus strains. This requires a special procedure. The production process is licensed with the possibility to insert the circulating viruses, selected in the Northern hemisphere in February-March by the WHO. The current production process is capable to make the vaccine available in October (Soema *et al.*, 2015).

The Vaccine Industry

Over the past decades, the number of vaccine suppliers has decreased considerably due to mergers and acquisitions of pharmaceutical companies. Presently about 90% of global vaccine sales come from four large multi-national corporations: GlaxoSmithKline, Merck, Pfizer and Sanofi Pasteur (Shen and Cooke, 2019). In the 1980s emerging market manufacturers started to enter the vaccine market and assumed a significant role since then. Emerging manufacturers, represented by the Developing Countries Vaccine Manufacturers Network, play a critical role in the supply of vaccines of developing countries. They now supply about half of UNICEF’s vaccine procurement in a volume of doses, representing about 30% of the value of UNICEF’s total vaccine procurement. Even including producers from developing countries, there are relatively few vaccine manufacturers that meet international standards of quality. Many vaccine markets are monopolies or oligopolies. The limited number of vaccine suppliers and production capacities leads to a tenuous balance between demand and supply in many individual vaccine markets and regularly to vaccine shortages.

Taking Stock

Due to vaccination, viral diseases remain under control. Two vaccines, hepatitis B and human papillomavirus protect against cancer. Thanks to a functional vaccine industry, vaccines remain available for a largely stable market. In addition, the research-based vaccine industry is innovative and develops new vaccines to answer unmet medical needs. This also applies to influenza vaccines with a new composition every year. However, problems exist with vaccines against new viral diseases to combat epidemics. The duration of these epidemics is unknown and usually, there is no commercially attractive market. Market forces fail, but vaccines are urgently needed. This will be the topic of the second part of this article.

The Challenge of Emerging Viral Diseases

In March 2003, the WHO issued a global alert about a new viral disease, severe acute respiratory syndrome (SARS). In retrospect, the SARS epidemic started in 2002 in China. In several months, SARS spread to 37 countries where it caused 8098 cases with 774 deaths before it came under control. SARS coronavirus (SARS-CoV), the causative agent of the syndrome, was traced back to an intermediate host, the civet cat, which originated as a virus of the horseshoe bat. Small mutations in the viral genome expanded the host range to humans.

A new viral disease in an immune naïve population could cause a catastrophe with many fatalities. It is worrying that there are many animal viruses with unknown pandemic potential. The SARS epidemic was the first wake-up call.

The 2007 World Health Report of the WHO was dedicated to Emerging viral diseases (EVD) and stated that “It would be extremely naive and complacent to assume that there will not be another disease like AIDS, another Ebola, or another SARS, sooner or later” (WHO, 2007). The real wake-up call came only in 2013 after an outbreak of Ebola in West Africa (Guinea, Liberia and Sierra Leone). Ebolavirus had been discovered in 1976. Between 1976 and 2013 it regularly spilled over from its animal reservoir to humans. There were several outbreaks, but these remained small and were contained. In the 2013 outbreak, about 28,000 persons were infected and 11,000 died. In addition, there was transmission to other countries and loss in GDP in the three affected countries. Many discussions in the aftermath of the Ebola outbreak led to the conclusion that more investments in R&D to counter EVD were needed, together with a more active role involving the WHO. As a result, the WHO Blueprint for Action to Prevent Epidemics was developed. The 2018 Blueprint list of priority diseases contains the following viral diseases:

- Crimean-Congo hemorrhagic fever
- Ebola virus disease and Marburg virus disease
- Lassa fever
- Middle East respiratory syndrome (MERS-CoV) and SARS
- Nipah and henipaviral diseases
- Rift Valley fever
- Zika
- Disease X (caused by a pathogen currently unknown)

The coordination and execution of R&D are in the hands of the Coalition for Epidemic Preparedness Innovations (CEPI). CEPI is a public-private partnership that was established during the World Economic Forum Annual Meeting of 2017.

CEPI acquired access to 755 million USD and used the money to support work on priority diseases (Lassa, Nipah, MERS, Rift Valley Fever and Chikungunya), selected with the aid of the WHO Blueprint. Two requests for proposals involved priority viruses. The aim is to bring vaccines through phase II studies and have vaccine stockpiles available for at least two pathogens by the end of 2022.

Another request for proposals involved platform technologies. Please see the CEPI Business Plan 2019–2022 for more details. Platform technologies have the potential to speed up development and production drastically. The common property of platforms is that they can be used for multiple vaccine antigens. The safety of the platform is known, the only variable is the inserted antigen. This will save time and may lead to regulatory streamlining, comparable to the procedure for influenza virus vaccines. Based on reduced development and production times, the most promising platforms are DNA and RNA vaccines and neutralizing antibodies, as discussed below.

DNA vaccines date back to the early 1990s when it was discovered that plasmid DNA, delivered in muscle or skin induces an antibody response to the encoded protein. The DNA has to cross the membranes of the cell and the nucleus. Subsequently, the antigen is synthesized. The initial excitement diminished somewhat after it appeared that immune responses in man were weaker than in mice. However, this problem has been solved by more efficient systems for the delivery and formulations that protect DNA against degradation. In addition to antibodies, DNA vaccines elicit $CD4^+$ and $CD8^+$ T cells. Logistically DNA vaccines have many advantages, such as fast, inexpensive and scalable production and short development times. Also, no handling of infectious virus is required during vaccine development. This makes these vaccines ideal as protection against emerging viral diseases (Rauch *et al.*, 2018). Presently vaccine development against various diseases, including Ebola, MERS and Zika, is ongoing (Rauch *et al.*, 2018). A (theoretical) disadvantage of DNA vaccines is that they may integrate into the human genome and lead to undesired gene activation. Presently (2019) no DNA vaccines have been licensed for human use.

RNA vaccines consist of mRNA. They have the same advantages as DNA vaccines, but since mRNA has to cross only one membrane, immune responses are stronger. In addition to conventional mRNA, self-amplifying mRNA can be used. mRNA is extremely sensitive to degradation by endonucleases. Therefore, a formulation, e.g., liposomes, which protect the RNA is used. Many vaccines are presently under development and also in clinical trials. But although RNA vaccines are very promising, their development is still at an early stage (Maruggi *et al.*, 2019).

Neutralizing antibodies offer an alternative treatment for viral infections. This is what is referred to as passive immunization and was successful in the treatment of Ebola (Saphire *et al.*, 2018). Another new development is the use of broadly neutralizing antibodies directed against conserved viral structures. These antibodies are promising both for prophylaxis and therapy for a range of viruses (Walker and Burton, 2018).

Looking Forward

Existing vaccines will continue to play a key role in controlling (viral) diseases. Many vaccines come as a combination vaccine and it will be complicated and very expensive to modify these vaccines. Newly developed vaccines will probably be made using novel approaches (Mascola and Fauci, 2020). We expect that the establishment of CEPI will contribute to these innovations. Paving a regulatory path to the first registration of DNA and RNA vaccines for infectious diseases will be a

challenge. But nucleic acid vaccines are also a promising approach for the immunotherapy of cancer. This may help in paving this path.

Another challenge is the design of clinical trials to test EVD. During the 2013 Ebola outbreak, there was disagreement about the design of clinical studies, particularly on ethical aspects of a placebo group. However, without a placebo group, it is impossible to measure the safety and efficacy of a vaccine. During these discussions the incidence of the disease declined, making it more difficult to carry out the phase III study. Choices about the design of clinical studies have to be made before outbreaks.

The Development of COVID-19 Vaccines

Shortly after the completion of the manuscript for this chapter, SARS-CoV-2 was discovered. Its global spread led to an overburdening of health systems and a death toll of about 1.6 million by December 13, 2020. Measures aimed at controlling the disease disrupted daily activities. A widespread hope is that immunity provided by vaccination will be the key to a return to 'normal life'. The first vaccine, an mRNA vaccine, developed and produced by Pfizer/BioNTech has been approved by now in several countries and vaccination has begun or will so shortly. The approval of a second mRNA vaccine developed by Moderna is expected in January 2021. Vaccine development started on January 11, 2020 when the genomic sequence of the virus, determined by Chinese scientists, became available. According to the WHO, 214 vaccines were under development on December 10, 2020, of which 13 in phase III clinical trials. The approval of more vaccines is expected in the first months of 2021. Estimated efficacies of vaccines are high, more than 90%. Adverse effects are present. But they are of short duration and not categorized as serious. Three vaccine platforms contributed to the most promising COVID-19 vaccines: (1) mRNA vaccines, (2) Adenovirus-based vaccines and (3) Vaccines consisting of inactivated virus. In addition, there are promising results from protein subunit vaccines. The use of these platforms significantly cut the development timelines. Further factors were an abundance of funding, tight collaborations between vaccine developers, governments and regulatory agencies, and the parallelization of activities. Especially the construction of manufacturing facilities parallel to the clinical development saved a lot of time. Several new platforms and procedures were adopted in the development of the COVID-19 vaccines. Licensing of these vaccines will pave the way for more vaccines based on these technologies. This could lead to considerable changes in the development and production of future vaccines.

Glossary

Acute gastroenteritis An inflammation of the stomach and/or intestines, often characterized by symptoms of vomiting and diarrhea lasting less than 14 days.

Correlate of protection A measurable sign that a person is protected against becoming infected or developing illness from a disease.

Genogroup A group of related viruses within a genus, which can then be further broken down into genotypes.

Genotype Subclassification of related viruses within a genogroup based on shared genetic sequences.

Intussusception Intestinal obstruction that results when a part of the intestine folds into the section next to it.

Mono-/polyvalent Having specific immunologic activity against one or many antigens, viral strains, or diseases (e.g., bivalent, trivalent).

Reassortant Having a genome consisting of parts derived from the genomes of two (or more) different viruses.

Seroconversion The development of detectable antibodies in the blood that are directed against an infectious agent.

Vaccine effectiveness The percentage reduction of disease or outcome in a vaccinated group of people in comparison to an unvaccinated group under typical field or uncontrolled conditions.

Vaccine efficacy The percentage reduction of disease or outcome in a vaccinated group of people in comparison to an unvaccinated group under ideal conditions (e.g., a randomized control trial).

Introduction

Each year, an estimated 2 billion cases of acute gastroenteritis (AGE) occur worldwide, resulting in more than 1 million deaths. Nearly 40% of AGE cases occur among children <5 years of age. Numerous bacterial, parasitological, and viral pathogens cause AGE, but viruses cause the majority of these infections. Among viruses that cause AGE, rotaviruses and noroviruses contribute the largest burden. Rotavirus disease typically occurs in young children; in contrast, noroviruses causes illness across all age groups.

Currently, rotavirus vaccines are the only available preventive vaccines against viral gastroenteritis. Prior to rotavirus vaccine development and availability, rotavirus caused approximately 2 million hospitalizations and a median 440,000 deaths in children <5 years of age annually. By 5 years of age, nearly every child experienced an episode of rotavirus gastroenteritis. To reduce rotavirus burden, in 2006, two rotavirus vaccines were licensed: Rotarix and RotaTeq. In 2009, the World Health Organization (WHO) recommended rotavirus vaccines for priority inclusion in national immunization programs worldwide. Today, 4 WHO pre-qualified rotavirus vaccines have been introduced into the national immunization programs of over 100 countries, with several more in development. These vaccines have been associated with a median 59% reduction in rotavirus hospitalizations and 36% in AGE hospitalizations globally. However, rotavirus is still estimated to cause 258 million episodes of diarrhea and 128,500 deaths among children <5 years of age annually. Approximately half of all rotavirus deaths occur in just four countries: India, Nigeria, Pakistan, and the Democratic Republic of the Congo, while in high-income countries, deaths from AGE are uncommon.

With the dramatic decline of rotavirus gastroenteritis, norovirus has become recognized as a leading cause of severe pediatric AGE in some countries that have introduced the rotavirus vaccine. Noroviruses are a diverse group of viruses within the family *Caliciviridae* and cause an estimated 684 million illnesses and 212,000 deaths worldwide annually. Similar to rotavirus, low- and middle-income countries (LMICs) carry the largest burden, accounting for 82% of norovirus illnesses and 97% of norovirus deaths worldwide. In the United States, it is estimated that norovirus causes an average of 19–21 million illnesses, 1.7–2.9 million outpatient visits, and 650–1100 deaths every year. In June 2016, WHO's Product Development for Vaccines Advisory Committee identified norovirus as a priority disease for vaccine development. While several candidate vaccines are in development, there is currently no licensed norovirus vaccine.

Rotavirus Vaccines

Rotavirus genotypes follow a binary nomenclature describing G and P genotypes, which are based on two viral proteins (VP) expressed on the exterior of the viral capsid. Glycoprotein VP7 forms the outer capsid shell and determines the G genotype, while protease-sensitive VP4 forms spiked structures and determines the P genotype. These two proteins play critical roles in attachment to host cells, pathogenesis, and immune response. As such, these sites, or epitopes, are usually targets against which vaccines

generate neutralizing antibodies. Rotavirus vaccine development has used both human and reassortant genotypes in rotavirus vaccine formulations. Reassortant rotavirus genotypes arise when human and non-human strains rearrange and combine naturally or artificially (i.e., in a laboratory) due to their segmented genome structure.

Licensed Rotavirus Vaccines

In 1998, the first commercially available vaccine for viral gastroenteritis, RotaShield, a tetravalent, human-rhesus reassortant rotavirus vaccine, was licensed and introduced into the routine immunization program in the United States. Use of this vaccine was suspended in 1999 and it was subsequently withdrawn from the United States market due to an observed increased risk of intussusception, a rare condition characterized by an invagination of the intestine, among children who received the vaccine.

In 2006, two live, attenuated, oral rotavirus vaccines, Rotarix and RotaTeq were licensed for use. Rotarix is a human, monovalent vaccine comprised of the G1P[8] strain. It is given as a 2-dose series typically at 2 and 4 months of age. In contrast, RotaTeq is a pentavalent human-bovine reassortant vaccine. Each of its five components are made up of a bovine (WC3) backbone combined with either a G1, G2, G3, G4, or P1A[8] human surface protein. This vaccine is given as a 3-dose series at 2, 4, and 6 months of age.

After vaccine introduction, promising efficacy against rotavirus with subsequent reductions in rotavirus AGE were observed in randomized controlled trials (RCTs) in early adopting countries such as the United States, Australia, several Latin American countries, and several European countries (range: 85%–98% efficacy against severe rotavirus AGE). Modest efficacy of these vaccines against severe diarrhea was observed in subsequent clinical trials in Africa and Asia (range: 40%–48% efficacy against severe rotavirus AGE). These clinical trials did not find an increased incidence of severe adverse events (SAEs) nor an increase in incidence of intussusception in vaccine recipients compared to placebo recipients. In 2009, WHO officially recommended rotavirus vaccines for inclusion into national immunization programs worldwide.

In recent years, two new rotavirus vaccines manufactured in India have completed clinical trials and are joining the global vaccine market. In 2018, Rotavac (Bharat Biotech, India) and Rotasiil (Serum Institute, India) vaccines obtained prequalification from WHO and will soon be incorporated into national immunization programs in Africa and Asia. Rotavac is a live, oral, monovalent vaccine derived from a naturally occurring G9P[11] reassortant human-bovine strain and is given in a 3-dose regimen at 6, 10, and 14 weeks of age. The strain was chosen as a vaccine candidate as it appears naturally attenuated, causing asymptomatic infection among neonates. Rotavac has shown 56% (95% confidence interval [CI]: 37%–70%) efficacy against hospitalization or supervised rehydration for children <1 year of age and 49% (95% CI: 17%–68%) efficacy among children between 1 and 2 years of age. Phase III trials for Rotavac did not have sufficient sample sizes to detect an increased risk of intussusception, but a surveillance network has been set up in India to monitor post-introduction risk of intussusception associated with this vaccine. Rotasiil is a live, oral, pentavalent human-bovine reassortant vaccine comprised of G1, G2, G3, G4, and G9 strains and is also given in a 3-dose regimen at 6, 10, and 14 weeks of age. It is delivered in either a liquid or freeze-dried (lyophilized) form. The lyophilized product is thermostable at 40°C for up to 18 months and requires a liquid buffer to be reconstituted at point of use. In RCTs, Rotasiil has shown efficacy against severe rotavirus gastroenteritis of 67% (95% CI: 50%–78%) in Niger, and 36% (95% CI: 12%–54%) in India; neither trial was powered to detect increased risk of intussusception. Both Rotavac and Rotasiil have not shown evidence of interference with other childhood vaccines given concomitantly, such as oral polio vaccine (OPV).

Two other rotavirus vaccines have been used within individual countries but are not available globally. The Lanzhou lamb rotavirus vaccine (Lanzhou Institute of Biological Products, China) is a live, attenuated oral vaccine using a monovalent G10P[12] rotavirus strain isolated from lamb. It has been sold exclusively through the private market in China since 2000. In Vietnam, the internally developed Rotavin M1 (POLYVAC, Center for Research and Production of Vaccines and Biologicals, Vietnam) was first used in 2012. Rotavin M1 is a live, attenuated, frozen oral vaccine that includes a G1P[8] strain, sold exclusively to the Vietnamese private healthcare market. Neither of these vaccines are licensed outside of their respective countries or have been evaluated for further use by WHO.

Vaccine Effectiveness and Impact

Post-licensure studies which measure rotavirus vaccine effectiveness (VE) have consistently shown strong protection in upper and upper-middle income countries, and robust albeit lower protection in LMICs. A recent review of global rotavirus impact studies in children <5 years of age found that after rotavirus vaccines were introduced, rotavirus AGE hospitalizations in countries using vaccines were reduced by a median of 59%. Countries with rotavirus vaccine coverage above 85% demonstrated the greatest impact. Reductions also differed by child mortality levels, demonstrating a 66% reduction in low, 59% reduction in medium, and 50% reduction in high child mortality countries. Globally, Rotarix has demonstrated a median VE against any healthcare utilization of 84% in low child mortality countries, 75% in medium child mortality countries, and 57% in high child mortality countries; RotaTeq demonstrated a median VE of 90% in low child mortality countries and 45% in high child mortality countries. Potential explanations for disparity in VE and impact between high and low child mortality countries include differences in nutritional status, gut microbiota, and interference by other childhood vaccinations such as OPV that reduce seroconversion. Despite a lower VE, due to high rotavirus burdens in LMICs, rotavirus vaccines do still prevent and mitigate the impact of rotavirus illness, preventing severe diarrhea, healthcare visits, and deaths in these countries.

Both Rotarix and RotaTeq are used in the United States where overall rotavirus vaccine coverage was estimated at 73.2% (95% CI: 71.8%–74.6%) in 2015, notably lower than other routine childhood immunizations. In the United States, rotavirus vaccines are associated with a median 80% decline in rotavirus-associated hospitalizations and 57% in rotavirus-related emergency department visits along with indirect protection of unvaccinated age groups and a decrease in health-care costs. Biennial peaks of rotavirus detection have emerged since rotavirus vaccines were introduced into the U.S. immunization program.

Protection from rotavirus infection does not require an exact match between wild-type and vaccine genotypes. Studies have demonstrated that both the monovalent vaccine Rotarix and pentavalent vaccine RotaTeq show cross-protection against dissimilar genotypes. Prior to vaccine introduction, the G1P[8] strain was the most common rotavirus genotype in humans. A recent systematic review showed that the most common strains after vaccine introduction were G2P[4] (50%) and G1P[8] (22%) in countries using Rotarix, and G1P[8] (33%) and G2P[4] (30%) in countries using RotaTeq, although dominant subtypes vary by time and location.

Vaccine performance may also be modulated by the presence of maternal antibodies against rotavirus transferred through the placenta or present in breast milk. These antibodies typically lessen severity and reduce incidence of disease in newborns up to approximately 2 months of age. It has been hypothesized that these maternal antibodies may also neutralize rotavirus vaccine particles before the child can initiate an immune response and thus lower their effectiveness. Further studies are required at this time, as different studies have shown either reduced vaccine seroconversion when high levels of rotavirus-specific IgG were present or no impact on vaccine response when breastfeeding was withheld.

Rotavirus Vaccines in Development

Several rotavirus vaccine candidates are currently in development. RV3-BB is a vaccine that aims to confer immunity in the neonatal period even in the presence of maternal antibodies; it recently completed Phase IIb trials in Indonesia. Other vaccines in development are parenterally administered, non-replicating vaccines, which potentially bypass issues of maternal antibody interference, intestinal replication (potential risk of intussusception), and interference with other childhood vaccines such as OPV. The P2-VP8-P[8] and VAC 041, P2-VP8-P[4]P[6]P[8] subunit vaccines have completed dose escalation trials and Phase I/II trials are currently underway in South Africa. Other non-replicating candidates in early development stages include a VP6 subunit that uses norovirus virus-like particles (VLP) in a combination vaccine; two inactivated rotavirus vaccines (IRV) using the G1P[8] strain; a truncated VP4 vaccine derived from the Lanzhou Lamb vaccine; and an inactivated polio vaccine (IPV)-IRV combination using the G1P[8] strain.

Rotavirus Vaccine Safety Monitoring

After a decade of recommendation by WHO, Rotarix and RotaTeq have demonstrated substantial impact on reducing the global burden of rotavirus disease; the largest effect has been observed on severe disease and hospitalization. Post-licensure safety evaluations have detected a low-level risk of intussusception in some high- and middle-income countries, although the risk-benefit ratio remains favorable towards rotavirus vaccinations due to their substantial impact on disease burden. Additionally, no increased risk of intussusception has been observed in low-income countries to date; however, current safety data are limited and additional studies are on-going. WHO continues to recommend rotavirus vaccine use in all countries as the small increased risk in intussusception remains greatly outweighed by the benefits of rotavirus vaccination.

Norovirus

In 2016, WHO identified norovirus as a priority disease for vaccine development. While there is currently no vaccine available to prevent norovirus disease, many candidate norovirus vaccines exist, including those in Phase I and Phase II trials, as well as many others in preclinical stages. The wide diversity of noroviruses and the limited understanding of naturally acquired norovirus immunity have complicated vaccine development. In addition, there is no single, established correlate of protection, although many candidates have been explored, including serum histo-blood group antigen (HBGA)-blocking antibodies, serum hemagglutination inhibition antibodies, salivary, serum, and fecal IgA, and virus-specific IgG memory B-cells.

Noroviruses are an extremely diverse group of viruses. Based on the phylogenetic clustering of the major capsid protein VP1, there are 10 genogroups, of which GI, GII, and GIV infect humans. Genogroup GII is the predominant norovirus genogroup circulating worldwide; within that genogroup, genotype GII.4 is the most common genotype in many parts of the world, with a new GII.4 strain typically emerging every 2–4 years, sometimes associated with an increase in norovirus activity. Recently, norovirus genotyping expanded to include simultaneous typing of both the capsid and polymerase genes, allowing surveillance to monitor for recombinant strains.

Individual susceptibility to norovirus infection varies based on the fucosyltransferase-2 (FUT2) gene, which controls the expression of HBGAs to which norovirus binds. Individuals with polymorphisms in the FUT2 gene are known as “non-secretors” and make up 20%–30% of African and European populations. Non-secretors are less susceptible (but not completely immune) to norovirus GII.4 infection than secretors; however, they can still become infected with non-GII.4 norovirus strains.

Naturally acquired immunity to norovirus post-infection is not well understood. Challenge studies in adults have shown short-term, strain-specific immunity, lasting from 6 months to 2 years, while modeling studies have estimated immunity lasts 4–8 years. Immunity is thought to be homotypic, with greater protection from strains in the same genogroups compared to other genogroups. Repeat infections by the same genotype are rare, but repeated infections by the same genogroup have been observed, suggesting that immunity is genotype specific. Since norovirus immunity is thought to be genogroup- or genotype-specific, determining which genotypes to include in vaccine formulations is an important consideration. Current vaccine candidates have used both GII.4 as well as GI.1 genotypes; however, norovirus vaccine candidates may need to consider the addition of other genogroups, or update formulations periodically as new strains emerge.

Norovirus Vaccine Development

Norovirus candidate vaccines utilize a variety of different technologies, including non-replicating VLPs, P particles, and recombinant adenoviruses. VLPs are multi-protein structures that have no genetic material and are therefore noninfectious. However, they can interact with cellular receptors and elicit an immune response. P particles resemble the P domain of norovirus, which is the domain that binds to HBGAs. Recombinant adenoviruses expressing the major norovirus capsid protein VP1, through which they are able to elicit an immune response. Due to the lack of a cell culture system prior to 2016, whole killed or live-attenuated viruses have not been previously pursued for norovirus vaccine development. The recently developed human intestinal enteroid (“mini-gut”) system for in vitro norovirus replication is expected to provide many new avenues of norovirus research and enhance norovirus vaccine development.

Norovirus Vaccines in Human Clinical Trials

There are currently four single- and multi-dose norovirus vaccine candidates in human clinical trials. A bivalent intramuscular GI.1/GII.4 VLP vaccine being developed by Takeda Pharmaceutical Company Limited is in Phase IIb trials; an oral vaccine being developed by Vaxart, Inc. is in Phase I trials; a tetravalent vaccine is being developed by the Chinese Academy of Sciences; and a bivalent GI.1/GII.4 vaccine is being developed by the National Vaccine & Serum Institute in China.

Takeda’s GI.1/GII.4 vaccine was initially developed as a monovalent GI.1 VLP vaccine. In Phase I trials, two GI.1 vaccine doses 21 days apart induced a 4.8-fold increase in norovirus-specific IgG and a 9.1-fold increase in norovirus-specific IgA, while also increasing norovirus-specific IgG and IgA memory B-cells in 92%–100% of participants. When challenged with a homologous GI.1 strain, vaccinated participants had a 47% reduction in norovirus illness and a 26% reduction in norovirus infection. In pre-clinical trials in rabbits, the reformulated bivalent vaccine containing GII.4 and GI.1 VLPs induced broadly reactive antibodies to heterologous GI.1, GII.1, GII.3, and GIV noroviruses.

Phase II studies have focused on the bivalent GI.1/GII.4 formulation and have trialed both single-dose and multi-dose vaccines. The bivalent vaccine has demonstrated a rapid immune response, including higher pan-Ig, IgA, and HBGA-blocking antibodies. While the duration of elevated immune responses is unknown, antigen-specific IgG memory B-cells persist until at least 180 days post-vaccination, while other responses have lasted over a year. In a GII.4 norovirus challenge study, two intramuscular injections of the bivalent vaccine did not significantly decrease the incidence of pre-defined norovirus disease compared to placebo. However, reductions in mean viral shedding and illness severity were observed among vaccinated participants. No SAEs related to vaccination were reported in any of the aforementioned studies.

Data from a Phase IIb field efficacy study in military recruits (NCT02669121) were recently reported. Recruits were randomized to receive a placebo or single intramuscular injection of bivalent GI.1/GII.4 vaccine and followed for 45 days afterwards. Vaccine efficacy against moderate or severe AGE caused by any norovirus strain was 61.8% (95% CI: 20.8–81.6); however, due to the low number of norovirus infections in recruits, vaccine efficacy against homotypic infection could not be calculated. Multiple other Phase II trials have recently been completed, including a trial in infants 6 weeks to children 8 years old (NCT02153112), and an evaluation of safety and immune responses in those older than 60 years (NCT02661490), as well as a 5-year Phase II trial in adults and the elderly (NCT03039790).

A second norovirus vaccine currently in human clinical trials is an oral vaccine being developed by the biotechnology company Vaxart, Inc. This single dose vaccine formulation would be delivered as an oral tablet for adults or as a liquid for children and is stable at ambient temperature, an advantage over other vaccines. The vaccine uses a recombinant adenovirus expressing the norovirus GI.1 major capsid protein (VP1). Two Phase I trials have been completed. A Phase I trial testing the safety and immunogenicity of both low- and high-dose formulations found they were well tolerated and no SAEs were reported. After one administration of the high dose vaccine, 78% of participants showed a significant immune response with a 2-fold increase in HBGA-blocking assays (BT50s), increased IgA and IgG memory B-cells, and increased fecal IgA. Vaxart has reported that the vaccine has been well tolerated with no SAEs reported.

Vaxart has also trialed a bivalent GI.1/GII.4 VP1 vaccine in a Phase Ib trial, alongside monovalent GII.4 and GI.1 formulations. The trial reported no SAEs and demonstrated robust immunogenicity. It was also reported that the study met all primary endpoints with no SAEs reported. A Phase II dose confirmation study is planned to begin in 2020.

The two other vaccines are beginning clinical trials. The tetravalent GI.1/GII.3/GII.4/GII.17 vaccine being developed by the Institut Pasteur of Shanghai under the Chinese Academy of Sciences received a permit in May 2019 to begin clinical trials. In

addition, at its National Vaccine & Serum Institute, China is recruiting participants aged 6 months to 59 years in a Phase I clinical trial for a bivalent intramuscular GI.1/GII.4 VLP vaccine.

Norovirus Vaccines in Pre-Clinical Development

An intramuscular, trivalent norovirus GI.3, GII.4, and rotavirus VP6 vaccine is being developed by the University of Tampere, Finland, the Daiichi Sankyo Company Limited, & UMN Pharma Inc., Japan. When vaccinated with the trivalent vaccine, mice showed an immune response that persisted for 24 weeks post-vaccination. The addition of rotavirus VP6 protein showed an adjuvant effect, increasing cross-reactive IgG and norovirus-specific blocking antibodies. Recently, research has evaluated the impact of including CVB1 VLPs to the vaccine to protect against coxsackievirus B (CVB), an enterovirus that can cause severe disease in infants. Addition of CVB1 VLPs did not interfere with immune responses to the norovirus or rotavirus VLPs.

A trivalent vaccine containing a fusion of hepatitis E, norovirus GII.4, and astrovirus P particles has been designed by the Cincinnati Children's Hospital Medical Center, University of Cincinnati, and Virginia Polytechnic Institute and State University. This candidate vaccine has been shown to produce a 1.9-fold higher norovirus IgG titer than immunization with norovirus P particle alone in mice and demonstrates the potential for a P particle vaccine to vaccinate against multiple diseases.

The Ohio State University recently published the results of a pre-clinical trial of an oral, lactic acid bacteria based GII.4 norovirus vaccine candidate on gnotobiotic piglets. Vaccination was found to induce a norovirus-specific immune response and prevent norovirus infection in pig intestines when challenged.

The Chinese Academy of Sciences in Shanghai has tested a VLP-based bivalent vaccine against norovirus GII.4 and enterovirus 71 (one of the viruses that causes hand, foot, and mouth disease) in mice. Vaccination produced significant increases in both enterovirus 71- and norovirus GII.4-specific antibody responses for up to 14 weeks.

Using a recombinant adenovirus expression system, a candidate vaccine expressing the norovirus GII.4 major capsid protein VP1 has been developed by the Chinese Center for Disease Control and Prevention. One study in mice found that this intranasal vaccine increased norovirus IgG and IgA immune responses. The researchers found that administering the recombinant adenovirus expressing norovirus GII.4 capsid protein vaccine before norovirus VLP vaccination produced higher norovirus-specific antibody levels in mice when compared to previous administration of the VLP or multiple VLP vaccinations. These studies show that a recombinant adenovirus expressing norovirus proteins may be able to produce a comparable immune response to norovirus VLP formulations.

Future Considerations for Norovirus Vaccines

While norovirus causes a tremendous morbidity burden worldwide, factors such as the vaccine's cost, effectiveness, and duration of protection will all end up impacting a vaccine's viability. A modeling study of the potential impact of a norovirus vaccine in the United States found that a vaccine with 50% efficacy and a 12-month duration would avert 1.0–2.2 million illnesses per year but cost \$400 million to \$1 billion annually; in contrast, one that conferred protection for 48 months could save up to \$2.1 billion annually. It is also currently unclear who the target population will be for norovirus vaccination. Modeling studies have shown vaccination would have the greatest impact if it targeted the young (under 5 years old) or the elderly (over 65 years old). Additional potential target populations include those working in health care, childcare, and food service.

Nomenclature

AAHS Amorphous aluminum hydroxyphosphate sulfate
AS04 Aluminum hydroxide and 3-O-desacyl-4'-monophosphoryl lipid A
CFS Chronic Fatigue Syndrome
CIN Cervical intraepithelial neoplasia
CRPS Complex regional pain syndrome
DNA Deoxyribonucleic acid
GACVS Global Advisory Committee for Vaccine Safety
GMTs Geometric mean titers

HIV Human immunodeficiency virus
HPV Human papillomavirus
hr High-risk
IARC International Agency for Research on Cancer
IgG Immunoglobulin G
POTS Postural orthostatic tachycardia syndrome
RRP Recurrent respiratory papillomatosis
VLPs Virus-like particles
WHO World Health Organization

Glossary

Herd immunity Herd immunity is a form of immunity that occurs when a sufficient proportion of a population (or herd) is immune, through disease or vaccination, conferring indirect protection for individuals who have not developed immunity.

Vaccine effectiveness Vaccine effectiveness is the ability of the vaccine to prevent outcomes of interest in the 'real world'.

Vaccine efficacy Vaccine efficacy is the percentage reduction of disease in a vaccinated group of people compared to an unvaccinated group, using the most favorable conditions (= clinical trial conditions).

Vaccine immunogenicity Immunogenicity refers to the ability of a vaccine to induce an immune response (antibody- and/or cell-mediated immunity) in a vaccinated individual.

HPV and HPV-Related Diseases

Human papillomaviruses (HPV) are the most common viral infections of the reproductive tract. These viruses are easily transmitted. Most sexually active women and men will be infected by HPV at some point in their lives. The peak time for acquiring infection for both women and men is shortly after becoming sexually active (Moscicki, 2007). HPV infections are primarily transmitted by mucosal contact, usually during sexual intercourse. However penetrative sex is not required for transmission, also manual-genital and oral-genital contact is a recognized mode of transmission (Liu *et al.*, 2016).

Although most infections with HPV do not cause symptoms or disease, persistent HPV infection with certain high-risk genotypes can lead to precancerous lesions that may progress to become cancerous (zur Hausen, 1977). Cancers caused by HPV include virtually all cancers of the cervix, most anal cancers (88%), and for a substantial fraction vaginal (78%), vulvar (15%–48% depending on age), penile (51%), and oropharyngeal (13%–60% depending on region) cancers (Bray *et al.*, 2018; World Health Organization, 2017). Worldwide, HPV causes up to 4.5% (643,000 cases) of all new cancer cases worldwide (8.6% females and 0.9% males). The global burden of cervical cancer (530,000 cases) is substantially higher than other HPV-related cancers (113,000 cases) (de Sanjose *et al.*, 2018).

HPV types 16 and 18 account together for about 70% of cervical cancers in every world region, and HPV31/33/45/52/58 for another 20% (de Martel *et al.*, 2017). In HPV-positive cancers of other anogenital sites, HPV16 is the most common HPV type. HPV6 and 11 have been classified as Group 3 agents (i.e., "not classifiable as to its carcinogenicity to humans") by the IARC Monographs Program (IARC Working Group on the Evaluation of Carcinogenic Risks to Humans, 2012), but are responsible for almost 100% of anogenital warts and recurrent respiratory papillomatosis (RRP) (Gillison *et al.*, 2012). RRP is a rare disease in children and young adults that causes wart-like growths in the upper aero-digestive tract with the risk of airway obstruction (Fortes *et al.*, 2017).

HPV Vaccines

Three prophylactic HPV vaccines are currently in use to prevent HPV infection and HPV-related diseases, a bivalent, a quadrivalent, and a nonavalent vaccine (summarized in Table 1). The bivalent (HPV16/18) and quadrivalent (HPV6/11/16/18) vaccines were licensed in 2006–2007 and the nonavalent vaccine (HPV6/11/16/18/31/33/45/52/58) in 2014. Currently available HPV vaccines are made from the purified HPV L1 structural protein that self-assembles to form HPV type-specific empty shells, called virus-like

particles (VLPs) (Lowy and Schiller, 2006). The VLPs are structured geometrically and antigenically almost identical to the actual virus but contain no viral DNA, and therefore cannot reproduce or cause disease. HPV vaccines are not therapeutic and are not indicated for the treatment of HPV infection or HPV-related disease (Schiller and Lowy, 2018). Hence, all vaccines against HPV are most effective when administered to individuals not yet exposed to HPV, i.e., before sexual debut (Arbyn *et al.*, 2018; Xu *et al.*, 2019). Most countries offer HPV vaccines to girls aged 9–14 years. HPV vaccines are mainly targeted towards girls because cancer of the cervix is the most common HPV-associated cancer. In addition, some countries also offer routine or catch-up vaccination in boys, older adolescent females and young women. The vaccination schedule depends on the age of the vaccine recipient (<15 years = 2-dose schedule, ≥15 years = 3-dose schedule). By October 2019, 98 countries (global 51%) had introduced the HPV vaccine in their national immunization program for girls and 16 countries for boys (global 8%) (WHO, 2017).

Vaccine Immunogenicity

HPV vaccines prevent HPV-related disease by preventing infection. The mechanism of protection by HPV vaccines is assumed to be mediated by neutralizing antibodies against the major HPV coat protein, L1 (Schiller and Lowy, 2018). Possibly due to better immune activation by parental vaccination than by mucosal infection, and by the use of adjuvants, serological response after vaccination is much stronger (10- to 100-fold higher) than the response after natural HPV infection (Stanley, 2010). Furthermore, long-lived plasma cells continuously generate antibodies and are responsible for long-term HPV-specific antibody persistence shown in several clinical trials (Einstein *et al.*, 2014; Joura *et al.*, 2015; Schwarz *et al.*, 2017). Systemic antibodies generated by HPV immunization are thought to reach the site of infection by active antibody transudation at least in the female genital tract, and by passive exudation at sites of trauma that are supposed to be required for initiation of HPV infection (Pattyn *et al.*, 2019).

With HPV vaccines, practically all adolescent and young vaccinees who were initially naïve to vaccine-related HPV types develop an antibody response after vaccination (Einstein *et al.*, 2014; Joura *et al.*, 2015; Schwarz *et al.*, 2017). Data have shown that these vaccine-induced antibody titers peak after the final dose, decline within the first year, then stabilize at a plateau titer (Schiller and Lowy, 2018). Antibody titers after HPV immunization remain high for at least 10 years for the bivalent vaccine with 100% seropositivity (Schwarz *et al.*, 2017; Naud *et al.*, 2014), for at least 9.9 years (Nygard *et al.*, 2015) for the quadrivalent vaccine and at least 5 years for the nonavalent vaccine (World Health Organization, 2017; Joura *et al.*, 2015).

The immunogenicity of the bivalent and quadrivalent vaccines was compared in a head-to-head trial. After 60 months, geometric mean titers (GMTs) were consistently higher in those receiving the bivalent vaccine across all age strata (18–45 years) (Einstein *et al.*, 2014). However, the clinical relevance of these findings is unclear as vaccine failures have not yet been unequivocally identified in clinical studies, and so no antibody threshold or other immune measurement that correlates with protection has been defined. In general, the different choices of placebo recipients or control subjects, immunological assays and populations analyzed precluded the most direct comparison of results among the trials with the different HPV vaccines.

HPV Vaccine Impact

As the development of cervical cancer may occur decades after HPV infection, regulatory authorities have accepted the use of vaccine-related persistent HPV infections and cervical intraepithelial neoplasia (CIN) grade 2 or 3 (CIN2–3) as virologic and clinical endpoints in vaccine efficacy trials instead of invasive cervical cancer (Group, 2014). Moreover, using cervical cancer as the outcome in those trials was precluded for ethical reasons. HPV vaccines were licensed based on the demonstration of their clinical efficacy in young adult women. Collecting cervical specimens from girls or young adolescents is generally considered unethical. Results of immunobridging studies comparing vaccine immunogenicity in females aged 9–14 years with that in females aged 15–26 years were therefore used to infer clinical efficacy in the younger age group (World Health Organization, 2017).

Impact on HPV Infection and Precancerous Lesions

A meta-analysis by (Drolet *et al.*, 2019) provided updated data on more than 100 studies investigating HPV vaccination impact (Drolet *et al.*, 2019), an impact that was far beyond initial expectations. Clinical trials and post-marketing surveillance of the licensed prophylactic HPV vaccines have demonstrated high efficacy against new persistent high-risk HPV types contained in the vaccine and precancerous cervical abnormalities (Arbyn *et al.*, 2018). Notably, the bivalent vaccine demonstrated a high degree of cross-protection against types 31, 35, and 45 (Lehtinen and Dillner, 2013; Palmer *et al.*, 2019). While the quadrivalent vaccine established more restricted cross-protection, most notably against type 31 (Brown *et al.*, 2009). From a public health perspective, current evidence suggests that the 3 licensed HPV vaccines have relatively similar effectiveness in preventing cervical cancer, mainly caused by HPV16 and 18 (Arbyn *et al.*, 2018). At non-cervical sites, HPV vaccines have been shown to prevent the majority of anal, vulvar and vaginal HPV infections and lesions associated with HPV16 and 18 (Xu *et al.*, 2019). Importantly, reported data on the impact of HPV vaccines is thoroughly consistent across different regions and settings. The protective efficacy of the three vaccines has been maintained throughout their respective observation periods and protection in the long term is likely (Stanley, 2017).

Impact on HPV-Related Cancer

Due to the long latency period between infection and HPV-related cancers, it is still too early to observe a clear vaccination effect on the existing HPV-related cancer incidences. Nevertheless, some indicative observations of a reduced incidence of cervical cancer in vaccinated populations exist (Guo *et al.*, 2018; Luostarinen *et al.*, 2018; Scotland, 2019). Generally, it is expected that the existing HPV vaccines could prevent up to 90% of precursor cancer lesions and HPV-associated cancers (Hartwig *et al.*, 2017).

Impact on Anogenital Warts

HPV vaccination programs have also shown to effectively reduce the incidence of anogenital warts (Drolet *et al.*, 2019). The quadrivalent and nonavalent vaccine, which include HPV6 and HPV11, provides a high-level protection against anogenital warts in men and women. In several countries, the introduction of the HPV vaccine was followed by a rapid drop in the prevalence of genital warts. Furthermore, in countries with even moderate vaccination coverage ($\geq 50\%$), there was evidence of vaccine herd effects, with significant reductions in anogenital wart diagnoses among unvaccinated boys and older women (World Health Organization, 2017; Drolet *et al.*, 2019). Australian active surveillance of pediatric reports suggests a continuous decline in juvenile-onset recurrent respiratory papillomatosis, a disease caused by the perinatal transmission of HPV6/11 infection from an infected mother to her infant, likely due to a very low post-vaccination prevalence of maternal HPV 6/11 infection in Australia (Novakovic *et al.*, 2018; Brotherton, 2019).

Current Status and Future Directions

At least 15 countries now have data demonstrating vaccine effectiveness and/or showing falls in vaccine-targeted types, and cross-protective types especially for the bivalent vaccine, following HPV vaccination (Brotherton, 2019). Falls are the largest with higher coverage and multiple cohorts vaccinated (World Health Organization, 2017). These results reinforce the need for vaccinating a high proportion of the targeted population to maximize and accelerate the direct and herd effects of HPV vaccination (Drolet *et al.*, 2019), such as successfully demonstrated in the Australian mass catch up program (Drolet *et al.*, 2019). Notably, HPV vaccines can be used in persons who are immunocompromised and/or HIV-infected. Nevertheless, although the evidence base to support the immunogenicity of HPV vaccines in immunocompromised and/or HIV-infected persons is reasonable, the evidence base to support the efficacy of HPV vaccines in these populations remains inconsistent (Lacey, 2019).

Recently, studies found high vaccine effectiveness following a single dose of bivalent or quadrivalent vaccine (Kreimer *et al.*, 2018; Safaeian *et al.*, 2018; Sankaranarayanan *et al.*, 2018; Stanley and Dull, 2018). However, the interpretation of trials, which included women with incomplete vaccination schedules, is limited by several factors including that women were not randomized by the number of doses, the sample size, and the low number of incident or persistent infections. Several randomized controlled trials are ongoing to evaluate the efficacy of a one-dose regimen. If effective, a reduction in program costs achieved by implementing a one-dose schedule would make it a very attractive option to public health authorities and governments. Some other prospects to improve immune-based prevention of HPV-associated cancers include: Delivery of HPV vaccination as part of childhood immunization, development of lower-cost locally manufactured vaccines (WHO, 2019), and L2- vaccines, which might have potential for broad HPV coverage since the minor capsid protein L2 contains type-common epitopes (Brotherton, 2019).

Of importance, HPV vaccination does not eliminate the need for effective cervical cancer screening in the HPV-vaccinated cohorts, mainly because the vaccines do not protect against all oncogenic HPV types. However, vaccination has the potential to greatly decrease the intensity, cost, and morbidity associated with screening. It is clear that, together, HPV vaccination (the ultimate long-term preventive strategy) and screening using more sensitive HPV tests could dramatically alter the landscape of HPV-related cancers. However, the effective implementation of HPV vaccination and screening globally remains a challenge, as well as vaccine-impact evaluations (Wong *et al.*, 2011).

Vaccine Safety and Confidence

Data from clinical trials and post-licensure surveillance conducted in several continents are reviewed on a regular basis. Data from all sources continue to be reassuring regarding the safety of HPV vaccines. Over 12 years of research and monitoring have shown that HPV vaccines are very safe (Arbyn *et al.*, 2018; Suragh *et al.*, 2018; Bonaldo *et al.*, 2019). The side-effects of the licensed HPV vaccines are comparable with those of other vaccines. These include predominantly mild and transient local reactions at the site of injection (erythema, pain or swelling). Reported systemic adverse events of minor nature included headache, dizziness, myalgia, arthralgia, and gastrointestinal symptoms (nausea, vomiting abdominal pain). No patterns of serious adverse events were reported in trials or post-licensure surveillance suggesting a causal relation to the vaccine (World Health Organization, 2017; Arbyn *et al.*, 2018). Although case reports have identified a range of new-onset chronic conditions occurring after vaccination, including autoimmune diseases, a well-conducted population-based study on post-licensure safety surveillance showed no association between HPV vaccine and such conditions. Concerns have been raised about complex regional pain syndrome (CRPS), postural orthostatic tachycardia syndrome (POTS) and Chronic Fatigue Syndrome (CFS) following HPV vaccination (World Health Organization, 2017; Arbyn *et al.*, 2018). Despite the

difficulties in diagnosing these disorders, reviews of pre-and post-licensure data provide no evidence that there is a causal association with HPV immunization. The safety of the HPV vaccine has been also regularly reviewed by the Global Advisory Committee for Vaccine Safety (GACVS) of the World Health Organization (WHO) who have not identified any safety concerns and classified HPV vaccines as “extremely safe”, which is encouraged by the statements of many other national agencies.

Unfortunately, misinformation, insufficient preparedness and inadequate crisis response have led to controversy about the safety of HPV vaccines (Vorsters and Damme, 2018). Although the benefits of HPV vaccines are already very apparent in countries where the HPV vaccination programs have been implemented effectively, and despite robust evidence of HPV vaccine safety, uptake has remained low, also in many high-income countries (Bloem and Ogbuanu, 2017). To increase uptake, the lack of HPV vaccination confidence among families and healthcare providers needs to be overcome and decision-makers need to be up to date with the impact and importance of HPV vaccination.

Models on Impact and Cost-Effectiveness of HPV Vaccination

HPV vaccination programs have been shown to be cost-effective in a wide range of settings worldwide (World Health Organization, 2017). Nevertheless, assessment of the cost-effectiveness of HPV vaccines is heavily influenced by parameters including vaccine price, operational costs, HPV prevalence, number of vaccine doses, and uptake of cancer screening and treatment, especially in resource-constrained settings. Global cost-effectiveness analysis informed by country-based evidence suggests that vaccinating preadolescent girls is usually cost-effective, particularly in resource-constrained settings where alternative cervical cancer prevention and control measures often have limited coverage (World Health Organization, 2017). Although extending vaccination to older ages (known as HPV-FASTER (Bosch *et al.*, 2016)) or vaccinating boys as well as girls, could increase the speed and extent of the impact on HPV-related cancer outcomes, the cost-effectiveness of such strategies need to be established by public health authorities in the context of their own disease burden, economic and social priorities.

Influenza Vaccination

Topi Turunen, Infectious Disease Unit, Espoo, Finland and Finnish Institute for Health and Welfare, Helsinki, Finland

© 2021 Elsevier Ltd. All rights reserved.

Introduction

Influenza is of great public health significance. The yearly epidemics and occasional pandemics of this respiratory illness give rise to a considerable burden of disease worldwide. Seasonal influenza vaccines are the principal method of preventing influenza infection and complications in humans.

Full coverage from the influenza virus and its epidemiology is covered elsewhere in the encyclopedia. Here, the characteristics and epidemiology of influenza viruses are discussed mainly as they relate to vaccination. The bulk of this chapter focuses on seasonal influenza vaccines; vaccination against pandemic influenza is described in the end.

Influenza as a Disease

The symptoms of influenza illness include fever, myalgia, headache, chills, sore throat, general malaise, and cough, although children and the elderly may present with less specific symptoms. People at both extremes of age are also more prone to developing complications of influenza such as secondary bacterial pneumonia or exacerbation of an existing pulmonary or cardiovascular condition.

Understanding the transmission of influenza is crucial to preventive efforts. The illness is spread by aerosols and droplets when infected people cough or sneeze, as well as by fomites. Notably, viral shedding in infected individuals begins before symptoms appear, and viruses can be transmitted to others during this period as well as during asymptomatic infections that may comprise a large part of all influenza infections.

In clinical settings, the diagnosis of influenza illness is typically based on symptoms, possibly aided by laboratory tests. Real-time reverse-transcription polymerase chain reaction (RT-PCR) is often considered the gold standard but antigen tests, serology, and viral culture diagnostic methods are also available. The sensitivity and specificity of tests used for diagnosis are relevant not only for the correct diagnosis and treatment of the patient but also for estimating influenza vaccine effectiveness (discussed in more depth below).

Epidemiology of Influenza

Influenza viruses are divided into types A, B, and C – as well as subtypes and lineages – based on their genetics and surface antigens. Typically, there are several types and subtypes of influenza A and B viruses cocirculating during any given season, necessitating the inclusion of several viral strains in each seasonal vaccine. Circulating viruses since the 2009 pandemic have included the A(H1N1)pdm09, A(H3N2), B/Victoria, and B/Yamagata viruses.

Influenza viruses cause annual global epidemics. In the temperate regions of the northern and southern hemispheres, influenza activity is typically pronounced in the fall and winter seasons while in the tropics, influenza activity can occur around the year.

Influenza viruses possess the capacity for antigenic drift: A constant change in their surface antigens. This gives circulating influenza viruses an evolutionary edge because the changed viruses may not be recognized by immune systems based on previous exposure (whether natural infection or vaccination). Antigenic drift, combined with waning immunity post-vaccination, necessitates annual reformulation and administration of seasonal influenza vaccines.

Occasionally, antigenic shift between different viruses (such as human and animal influenza viruses) occurs and results in a completely novel type of virus. Such viruses, if transmitted easily between humans, can give rise to global pandemics of varying severity. While seasonal influenza vaccines may sometimes provide cross-protection against pandemic influenza strains, the prevention of pandemic influenza will typically require a specifically developed pandemic vaccine.

Brief History of Influenza Vaccines

Influenza viruses were first isolated in 1933 and the development of the first influenza vaccines began shortly thereafter. The first commercial vaccines were developed and tested in the United States in the shadow of the Second World War and approved for use in 1945.

The first vaccines were composed of whole viruses. Other forms of vaccines (variations of split virion, subunit, and live attenuated vaccines) have been introduced over the years. For most of the time, eggs have been used as a growth medium for vaccine viruses; cell culture became available later. Production methods have been refined over the years; for example, purification steps have been added to reduce the number of unwanted proteins and other substances in the finished product.

Production of Influenza Vaccines

Timeline of the Production Process

Due to the epidemiology of influenza – in particular, its seasonal nature – the strain composition of the vaccines is updated annually for both northern and southern hemispheres. The strain selection and the ensuing production process take place according to a certain schema each year.

The choice of virus strains is based on an international surveillance effort. National influenza centers in various countries around the world monitor the circulating viruses and send representative samples to the World Health Organization's (WHO) collaborating centers. The surveillance system aims to detect patterns in genetic and antigenic changes of the viruses that would be the most relevant for protection in the next influenza season. Viral isolates thought to represent the best candidates for the vaccine strains are collected, grown in culture media, and distributed to vaccine manufacturers for scaling up production.

The production (notably, the growth of viruses in eggs) takes several months and needs to be finished in time for the produced vaccines to be distributed and administered before the next seasonal epidemic. As a result, the consultation to select vaccine strains usually takes place in February for the northern hemisphere and in September for the southern hemisphere. The production delay sometimes gives rise to antigenic mismatch if the circulating strains' evolution unfolds in an unexpected way through antigenic drift and shift. This may have a negative impact on vaccine effectiveness.

Production Steps

Production capacity for influenza vaccines exists in several countries but is mostly centered in the global North and in a handful of private companies. However, nationally manufactured influenza vaccines are also used in many parts of the world.

Each manufacturer of influenza vaccines uses its own proprietary process. While production processes differ in some details, all share certain key steps and result in vaccines of comparable safety; immunogenicity can be verified using standardized methods.

The key production steps are as follows (please note that recombinant, cell-based, and live-attenuated vaccines do not necessarily share all of these):

- Propagation in hen eggs (or other media);
- Disruption of viral lipid envelope using one of several possible detergents;
- Purification steps;
- Establishing the immunogenicity of monovalent vaccine components and combining them in a multivalent (typically, tri- or quadrivalent) formulation; and
- Insertion in vials, labeling, packaging, allocation of lot numbers.

Dependence on hen eggs for growing the viruses leads to several potential problems. Most obviously, the large number of eggs required presents a limit to how many vaccine doses may be produced. A surprising unavailability of eggs, due to, say, an outbreak of avian influenza, may halt production. On the other hand, a problem of "egg adaptation" – where egg-grown viruses change in a way that does not resemble the circulating ones – has been suspected to partially account for lower vaccine effectiveness against some strains – A(H3N2), in particular.

The production of live-attenuated influenza vaccines (LAIV) is somewhat different. LAIV is based on attenuated master donor strains that are cold-adapted (i.e., can replicate in the relatively cooler temperature of human upper airways but not the lower airways) and thus, should not cause significant illness in humans. The production process makes use of the segmented genome of the virus that permits genetic reassortment. Surface antigen-encoding genes of newly emergent wild-type viruses are inserted into master donor viruses; the resulting virus passes the attenuation characteristic to its progeny but expresses the relevant antigens for the season.

Influenza Vaccine Composition

All influenza vaccines contain viral proteins, of which hemagglutinin (HA) is thought to be the main immunogen. Standardization processes aim to keep HA levels in vaccines constant. Other influenza surface and structural viral antigens present in vaccines include neuraminidase (NA), matrix protein, and nucleoprotein. They may contribute to the vaccine-elicited immune response but their levels are typically not quantified.

Adjuvants are used in certain vaccine formulations to increase the immunogenicity and effectiveness of the vaccine. Commercially-used adjuvants include emulsions of oil and water (AS03 and MF59), aluminum compounds, and influenza virosomes (where the presence of influenza viral lipids is thought to contribute to a greater immune response).

Modern vaccine production techniques use sequential purification steps to reduce the number of unnecessary or unwanted substances in the vaccine. However, depending on the specific production method of the vaccine in question, trace amounts of the following may be detectable:

- Egg proteins: In vaccine products grown in hen eggs, trace amounts of proteins, such as ovalbumin, may be present. The amount is typically low enough to be insignificant even in most cases of egg allergy, but may be relevant if past anaphylactic reaction (see Section "Safety and Contraindications" below).
- Antibiotics are sometimes used to prevent bacteria from growing in the virus cultures. In the case of influenza vaccines, these are typically aminoglycosides such as gentamicin or neomycin. Penicillins, cephalosporins, and sulfonamides are not used in vaccine production.
- Detergents used to disrupt viruses (largely removed in purification stage).
- Formaldehyde, from formalin used to inactivate viruses in inactivated vaccines. While toxic in larger quantities, the trace amounts per vaccine dose are insignificant compared to formaldehyde production in human metabolism and environmental exposure.

- Gelatin may be used as a stabilizer (i.e., to keep the vaccine effective during storage until use). While gelatin is derived from pigs, the form used in vaccines has been purified and hydrolyzed, therefore different from gelatin found in foodstuffs. Muslim and Jewish religious communities have generally accepted the administration of gelatin-containing vaccines.
- Thiomersal is a mercury-based compound used earlier to prevent the growth of microbes during the production process or in multi-dose vaccine vials. There is no evidence that thiomersal in vaccines cause harm, but it has largely been removed from vaccines in the US and Europe as a precaution. Consequently, most current vaccine products contain no thiomersal even in trace amounts.

Valency

Influenza vaccines can be characterized by their valency, or how many viral components they contain. In the history of seasonal influenza vaccines, as little as one (monovalent) and many as five (pentavalent) components have been used, but most seasonal vaccines are nowadays tri- or quadrivalent – that is, they contain both circulating influenza A components (currently, H1N1 and H3N2) and either one or both of the two influenza B components (B/Victoria and B/Yamagata). Pandemic vaccines are usually monovalent.

The valency of the vaccine has practical implications if the circulating strains turn out to be different from the ones included in the vaccine. Choosing the “correct” influenza B lineage to be included in trivalent influenza vaccines prove difficult at times. In some influenza B-mismatched seasons, this has resulted in suboptimal vaccine effectiveness but in some seasons, even the trivalent vaccine has demonstrated cross-protection to both influenza B lineages. On the other hand, in seasons with low influenza B activity or a good match to vaccine lineage, the valency of the vaccine has mattered little.

Dosage

The HA content of current vaccines is standardized and quantified through a process called single radial immunodiffusion (SRID). The HA level measured by SRID correlates with the immunogenicity of the vaccine.

Standard-dose vaccines contain 15 µg of HA per viral strain included in the vaccine (generally three or four for the seasonal trivalent and quadrivalent vaccines, respectively). More recently, high-dose vaccines that contain 60 µg of each strain’s HA have been licensed. The high-dose vaccines are discussed in more depth below.

Formulations of Seasonal Influenza Vaccines

Nowadays, many different forms of influenza vaccines exist; others are in development. Many products seek to improve the efficacy and effectiveness of the vaccines, especially in key target groups such as the elderly where the effectiveness of traditional vaccines may be suboptimal.

It would be of great interest to public health decision-makers to know if some vaccine products are better than others and which represent the best effectiveness-safety profile for the various target groups of vaccination. However, as of now, few head-to-head comparisons have been made, and drawing too many conclusions from individual studies is problematic for reasons explored in Section “Evaluating the Impact of Influenza Vaccines”.

Traditional Inactivated Vaccines

These are the most commonly used influenza vaccines worldwide: egg-based, nonadjuvanted, standard-dose inactivated vaccines. All the other vaccines discussed below differ from these “traditional” vaccines regarding one or more of the above attributes. Most available evidence of influenza vaccine efficacy, effectiveness, and safety derives from studies with these “typical” inactivated vaccines.

Even inside this group, inactivated vaccines differ by their valency (see Section “Production of Influenza Vaccines”). Trivalent and quadrivalent seasonal influenza vaccines are most commonly used today; many countries are shifting towards using quadrivalent vaccines.

Recombinant and Cell-Based Influenza Vaccines

These vaccine types circumvent the egg-growing phase; all other influenza vaccines are currently grown in hen eggs. This approach is presumed to avoid some of the pitfalls with using eggs (see Section “Production of Influenza Vaccines”).

A trivalent recombinant vaccine was licensed in the US in 2013 and has since been replaced by a quadrivalent version. In preparing recombinant vaccines, the virus nucleic acid encoding the surface protein HA is combined with a baculovirus vector that transports the gene into a host cell line to produce the antigen, then collected and purified. Recombinant vaccines have been licensed for people aged 18 and above. There is limited evidence on the comparative efficacy or effectiveness of recombinant vaccines, but one randomized controlled trial (RCT) conducted in the A(H3N2)-predominant 2014-2015 season found a 30% lower probability of influenza infection (in relative terms) in recombinant versus egg-based vaccines.

Cell-based vaccines are grown in mammalian cells. A cell-based influenza vaccine production method was first approved by the US Food and Drug Administration (FDA) in 2012. At the time, it still involved egg-grown candidate vaccine viruses but since 2016,

the process has been changed to be completely egg-free. As with recombinant vaccines, evidence of comparative effectiveness is limited. One observational study looking at the A(H3N2)-dominated 2017–2018 influenza season found a quadrivalent cell-based vaccine to have a relative vaccine effectiveness of approximately 10% points higher than a quadrivalent egg-based vaccine.

Live Attenuated Influenza Vaccines

LAIV use cold-adapted weakened live influenza viruses and are administered through an intranasal spray. Because of the cold-adaptation, the viruses can replicate in the upper respiratory tract and cause an immune response similar to that evoked by a natural infection. They do not replicate in the lower airways (thus, limiting the risk of vaccine-induced lower respiratory infection). Live attenuated influenza vaccines have been used in countries of the former Soviet Union since the 1980s. In 2003, another type of LAIV was licensed in the US in a trivalent formulation that has since been replaced with a quadrivalent version.

The effectiveness of LAIV seems generally the best in younger age groups, and in the EU, the vaccines are only indicated for people aged 2–17 years (in the US, 2–49 years). Being live virus vaccines, they have somewhat different contraindications than inactivated vaccines.

The effectiveness has generally been comparable to that of inactivated vaccines. After the 2009 pandemic, some studies showed reduced effectiveness against A(H1N1), leading US authorities to temporarily recommend against its use in 2016. This recommendation was eventually dropped after the A(H1N1) component of the vaccine was changed.

Adjuvanted Vaccines

Adjuvants have been used to increase the immunogenicity of vaccines and result in increased post-vaccination antibody titers. Besides increased immunogenicity, a potential benefit of adjuvanted vaccines is dose-sparing in the face of a large global demand for vaccines such as in the event of a pandemic. However, injection site reactions may be more pronounced with adjuvanted vaccines.

The clinical efficacy and effectiveness of adjuvanted vaccines have compared favorably to nonadjuvanted inactivated vaccines, but evidence from direct head-to-head comparisons is scarce. The use of adjuvanted seasonal influenza vaccines focuses on the elderly population. Studies have also been performed in pediatric populations. AS03 and MF59 -adjuvants were used in the 2009 H1N1 pandemic vaccines which were widely used across age groups.

High-Dose Influenza Vaccines

A high-dose vaccine resembles the standard-dose inactivated vaccine in composition but contains four times the antigen per viral strain. The higher dose antigen dose is intended to evoke a stronger immune response in the elderly, for whom the vaccine is indicated. To date, available evidence of comparative efficacy/effectiveness is limited, but high-dose vaccines have been associated with better immunogenicity (higher antibody titers post-vaccination) and somewhat better efficacy against laboratory-confirmed influenza (LCI) and hospitalizations.

A trivalent high-dose vaccine was licensed for use in the United States in 2009. A quadrivalent formulation has since been developed and FDA approved in 2019. The vaccines are indicated for use in adults aged 65 years and older.

Intradermal Vaccines

When a vaccine is injected intradermally (into the dermal layer of skin instead of the muscle), similar immunogenicity can be achieved using less antigen. The vaccination process uses a smaller needle, which some vaccinees will perceive as an upside but may generate more localized redness and swelling.

In the United States, intradermal vaccines are available for use in adults aged 18–64 years. A trivalent form has been in use since 2012 and a quadrivalent formulation was approved in 2014.

The Future of Influenza Vaccines

The need for annual revaccination and the occasionally suboptimal vaccine performance due to mismatch and other reasons have led to hopes of “universal” influenza vaccines. These would be broadly cross-protective vaccines against conserved antigenic targets on influenza viruses such as the HA stalk domain and other surface components. The idea is that one vaccine could protect against several types of influenza across several seasons, and possibly even pandemic strains.

In a universal vaccine, a conserved antigenic target could be presented to the immune system conjugated to another molecule or in a carrier system such as a virus-like particle. Virus-like particles contain viral lipid membrane-anchored proteins in their native state but lack the virus nucleic acid for safety reasons.

Some universal vaccine candidates have shown some promise in preclinical and clinical studies but currently, public health professionals must accept that universal vaccines will not be available for some time. Meanwhile, further development of existing vaccines can take place as well as research to identify the vaccine products that have the best safety-effectiveness profile for each of the various target groups.

New administration methods such as a microneedle patch have been investigated. Patches with small dissolvable needles have demonstrated good immunogenicity and safety in studies. Such a vaccine, much like the current LAIV, could be self-administered, potentially reducing the need for health care personnel in vaccination campaigns. How to address the rare but possible severe allergic reactions should be addressed before launching such campaigns.

Vaccination in Practice

Administration Routes

Inactivated influenza vaccines are most commonly given by intramuscular, subcutaneous, or intradermal route. Also, intranasal and oral routes have been studied. Live attenuated vaccines are given intranasally.

Timing of Programs

Influenza vaccination programs typically begin between October and December in the northern hemisphere and between April and July in the southern hemisphere. In some years, programs may be delayed due to holdup in vaccine production.

Vaccine Uptake

Vaccine uptake varies widely between countries and vaccination target groups but is seldom as high as recommended. Efforts beyond the mere biomedical domain are needed to understand why some people at high risk for severe influenza choose to remain unvaccinated even when offered vaccination.

Duration of Protection

Most vaccinees develop protective serum antibody levels around two weeks post-vaccination. In principle, the duration of protection is dependent on at least two aspects: changes in the circulating viruses and whether existing antibodies are still protective against the drifted viruses, and waning immunity or reduced antibody levels over time.

Protection against influenza for longer than one year has been documented both post-vaccination and after natural infection with influenza virus. Based on evidence from past epidemics and pandemics, natural infection in childhood or young adulthood may provide protection to antigenically similar viruses even several decades later. However, annual immunization is recommended because of reductions in serum antibody levels and because one or more vaccine antigens are usually updated each year.

Concerns have been raised that protection conferred by the vaccine might wane even during a given season. This has sometimes been observed in studies that track vaccine effectiveness (VE) at several points during a season. Potential explanations include intra-seasonal evolving mismatches between circulating viruses, waning immunity (especially in the elderly), and methodological bias. Regarding the latter, the unvaccinated may develop symptomatic or asymptomatic influenza infections during the season and gain protection from these natural encounters. Cumulative natural encounters in the population may therefore bias VE towards null.

Safety and Contraindications

Overview

Seasonal influenza vaccines have been prepared in similar ways for decades and their safety is well established. Adverse effects tend to be mild and benign, and serious adverse events are rare. This chapter includes both safety and contraindications of influenza vaccines.

Local and Systemic Inflammatory Reactions

The most frequent adverse events of influenza vaccines are local reactions. Characteristic signs of inflammation (pain, redness, swelling) can be observed in up to 65% of vaccinees. The local reactions rarely affect daily activities and generally do not persist for more than one or two days.

Systemic inflammatory reactions (fever, myalgia, headache) occur less frequently, in < 15% of vaccinees. They are more common in children than adults. Febrile seizures have occasionally been reported in small children, mostly in children under five years of age.

The occurrence of local and systemic inflammatory reactions is dependent on vaccine dosage and the presence of adjuvant.

Allergic Reactions

Allergic reactions to influenza vaccines may be immunoglobulin E (IgE)-mediated or non-IgE-mediated. Potential antigens that can lead to allergic reactions include egg proteins (such as ovalbumin), trace amounts of the preservative thiomersal (increasingly rare), and possibly – though unlikely – latex or other rubber compounds found in the vaccine vial and introduced in tissue through the needle, puncturing the vial seal.

Anaphylaxis, a potentially life-threatening but rare serious adverse event of influenza vaccines, is an example of an IgE-mediated reaction and may take place in approximately one per 1,000,000 vaccinations. Persons with a history of anaphylaxis following the administration of an influenza vaccine should not be revaccinated with a similar vaccine. It is, however, important to note that most allergic reactions are not anaphylaxis and rarely prevent revaccination when the vaccine is otherwise indicated. If needed, the vaccine can be given under the physician's observation, or with sufficient follow-up time.

Rare Adverse Events: Neurological Syndromes

Guillain-Barré syndrome (GBS) is a rare condition that has been associated with many infections of the respiratory and gastrointestinal tracts, including naturally-occurring influenza infection. Its symptoms include ascending muscle paralysis and paresthesia – which, when not treated with assisted ventilation, can be fatal. However, most GBS patients do recover. During the 1970s, an increased incidence of GBS (of roughly 1:100,000) was reported in vaccines. This finding was not replicated for several years until, in the 1990s, a small increase (incidence of 1:1,000,000) was observed in vaccinees. In some studies, a protective effect of seasonal influenza vaccines on GBS has been seen. The exact relationship between seasonal influenza vaccination and GBS has been difficult to untangle because of the very low incidence of GBS. It should be noted that even if the one-in-a-million risk of GBS was consistently observed, it would still be outweighed by the protective effect of the vaccine on influenza illness and its severe complications.

Evaluating the Impact of Influenza Vaccines

Studies of influenza vaccines' impact apply various outcome measures. These include immunogenicity, real-life prevention of LCI, and various less specific outcomes such as acute respiratory illness (specifically defined influenza-like illness or any medically-attended respiratory infection), hospitalization, overall mortality, or seroconversion to circulating influenza strains.

Immunogenicity

Vaccination induces the production of protective antibodies targeted at influenza virus antigens, most notably HA. The level of HA antibodies can be detected by various methods. In addition to the humoral immune response, the cellular T cell response plays a role in influenza immunity. The strength of the immune response depends on age and previous exposure to influenza viruses and influenza vaccines, as well as underlying health conditions and the formulation of the vaccine (such as dosage and presence of an adjuvant). Usually, antibody levels peak at around two weeks after vaccination but the response may take longer to form and be less pronounced in the elderly. The same is true of persons without any previous exposure; this is why two doses are recommended for vaccine-naïve children.

While HA antibodies generally correlate with protection from influenza illness, the correlation between antibody levels and clinically significant protection from influenza illness are not always clear. Therefore, vaccine efficacy and effectiveness are more relevant for vaccination policy-makers, something that has been recently reflected in the regulatory field.

Vaccine Efficacy

Vaccine efficacy refers to the percentage reduction of clinical illness between the vaccinated and unvaccinated groups under favorable conditions. This type of information is typically collected in RCTs where the investigators set up an unvaccinated (or vaccinated with a non-influenza vaccine) control group and have control over many variables of the study design.

In the presence of vaccination policies recommending annual influenza vaccines to various target groups, running placebo-controlled RCTs on influenza vaccine efficacy has become increasingly rare and the role of real-life vaccine effectiveness studies is becoming more and more important.

Vaccine Effectiveness

VE refers to the percentage reduction of clinical illness between the vaccinated and unvaccinated groups under conditions considered typical – or “real-world” situations. This type of information is obtained from observational studies where the vaccinated and unvaccinated groups are not assigned by investigators.

Observational study designs used to measure influenza vaccine effectiveness include:

- Cohort studies, where groups of vaccinated and unvaccinated people are followed (either prospectively or retrospectively) and those ill with influenza are identified.
- Case-control studies, where the vaccination status of people ill with influenza (cases) is compared to those who were not ill (controls). A popular variant is the test-negative design, where people with influenza-like symptoms are screened for the virus and assigned as cases or controls depending on the test result.
- Screening method, which combines the influenza-positive cases' individual vaccination status and ecologic data on vaccine coverage in the population where the individual came from.

Observational study designs have strengths and weaknesses compared to RCTs. RCTs are, by design, better at managing bias and confounding than observational study designs. However, proper choices at study planning, execution, and data analysis stages can considerably mitigate the risk of bias in observational studies. Considering also the cost and feasibility as well as ethical issues, data from observational studies are widely used as a basis for public health policy and are increasingly recognized by regulators.

To be informative, observational studies need to obtain the necessary sample size and statistical power. Failure to recruit enough patients is compounded when studying VE in various individuals (e.g., children, adults, elderly) or the VE of several vaccine products to assess brand-specific effectiveness. Multicenter studies with compatible protocols are one way to circumvent this problem. Another approach is to use the comprehensive registers for vaccinations, laboratory findings of influenza, and other covariates needed for analysis that many countries and regions have nowadays.

Understanding Vaccine Efficacy and Effectiveness

Influenza vaccines, unlike any other vaccines, need to be administered annually and have variable efficacy and effectiveness. The effectiveness varies across several dimensions – from year to year and between groups of vaccine recipients. Before delving deeper into available evidence on vaccine effectiveness, it is important to recognize some determinants that may influence the results of the studies. Both naturally-occurring variations in vaccine efficacy and effectiveness and topics related to study design and analytical methods must be considered.

First, there are biological factors that influence the actual vaccine efficacy or effectiveness:

- Level of match/mismatch between circulating and vaccine viruses.
- Population studied: Immune responses are typically better in children and healthy adults than with the elderly and the chronically ill.
- Vaccine type used: Valency, dose, presence of adjuvant, and other topics (see Section “Formulations of Seasonal Influenza Vaccines”) may affect the immune response.
- Waning protection (see Section “Duration of Protection”).
- Repeated vaccinations: It has been postulated that vaccinations repeated in subsequent years can cause positive or negative interference with an increased or decreased immune response. Some studies have observed signals of negative interference with certain seasons and viral strains; however, a meta-analysis found no overall evidence that prior season vaccination would impact current-season VE negatively. An increasing number of studies now include vaccination in one or more previous seasons as a covariate in order to better understand this phenomenon.

Second, there are factors related to study design and execution that may explain why studies sometimes yield different results:

- Outcome studied: Vaccine effectiveness against LCI is different from vaccine effectiveness against influenza-like illness or overall mortality (only a fraction of which is attributable to influenza).
- Study power: The optimal sample size depends on the chosen study design, influenza attack rate, vaccine coverage, and expected vaccine effectiveness. Lack of statistical power leads to uncertainty represented by wide confidence intervals which mean the results should be interpreted with caution.
- Bias that may arise from many different sources and cause the perceived VE to be different from true VE. Are the data on influenza and vaccination status accurate and complete, or can there be misclassification? Are the subjects selected in a representable way? Are vaccinated people on average healthier or more frail than unvaccinated? Are they more or perhaps less likely to seek healthcare services?.
- Confounding and its adjustment in study design and statistical analysis process. In influenza vaccine studies, typically “crude” and “adjusted” figures are given, with the latter representing correction for confounding and thus likely more representative of a true causal relationship between vaccination and influenza (rather than mere statistical correlation).
- Multi-center studies and pooling. Often, data from several smaller studies are pooled together in a meta-analysis. This increases the probability to detect an effect of vaccination but requires the individual studies to be sufficiently heterogeneous.

Vaccination of Specific Population Groups

As an annually recurring epidemic that routinely attains attack rates of 10% or more and results in many hospitalizations and deaths, influenza is of great public health importance. Effective preventive measures to lessen its impact on the population and health systems are therefore valuable. Among preventive measures, annual seasonal influenza vaccination is likely the single most important one.

Who, however, should be vaccinated against influenza, and how effective are the vaccines in the different population groups? Vaccination policy varies between different countries. The United States has recommended annual influenza vaccination of all persons aged six months and above since 2010, but such universal vaccination recommendations are globally rare. Many countries have implemented vaccination programs that address specific risk groups. In the global south, influenza vaccines are seldom prioritized among public health measures and generally utilized less.

Vaccination policy is a varied and evolving topic. It is not practical to list here all vaccination recommendations around the world; instead, some target groups for vaccination and the rationale for vaccinating them will be discussed. There are some unique challenges related to estimating and communicating the impact of influenza vaccines, but it is crucial to understand that even a suboptimally effective vaccine can provide a large public health impact because of the high incidence of influenza and the potential decrease in disease severity and complications, even when the vaccine does not completely prevent the clinical illness.

Elderly

The elderly (often defined as people aged 65 years and above) have long been recognized as a high-risk group for severe influenza and influenza complications. They are among the most universally recommended target groups to receive the annual influenza vaccination. However, antibody responses to vaccination are decreased with age and decreased protective VE has been shown in studies. This puts the elderly in a seemingly paradoxical situation: They are among the ones that would benefit the most from vaccination and also the ones who seem to get the least protection. Because annual influenza vaccination has been recommended to the elderly for a long time, there are few recent placebo-controlled trials. Annual data of vaccine effectiveness are gathered from observational studies.

The elderly generally benefit from annual influenza vaccination. Vaccine efficacy or effectiveness against symptomatic LCI has been investigated in many studies and is commonly in the 20%–60% range with considerable season-to-season variation. However, in some seasons, especially when a significant mismatch occurs, statistically significant effects of influenza vaccines have not been found for this age group. Influenza vaccination might also reduce the risk for influenza-related hospitalizations. Some studies have looked into less specific outcomes such as all-cause mortality or any hospitalizations, but these studies run a high risk of bias and should generally be interpreted with caution.

The desire to improve vaccine effectiveness among the elderly has led to the development of vaccines intended to promote a better immune response in this population. Besides traditional inactivated vaccines, some vaccines of interest in the elderly group are adjuvanted, recombinant, and high-dose vaccines described more in Section “Formulations of Seasonal Influenza Vaccines”. Still, most effective data in the elderly population are derived from traditional inactivated vaccines.

Underlying Conditions

Underlying conditions such as chronic pulmonary, cardiovascular, metabolic, renal, hepatic, neurologic, malignant, and immunosuppressive conditions (due to illness or iatrogenic) are risk factors for complications with influenza and often considered indications for influenza vaccination. However, data on which conditions pose the greatest risk and where might the influenza vaccination be especially important are sometimes sparse and often heterogeneous.

Influenza can trigger exacerbations of asthma and chronic obstructive pulmonary disease (COPD). Evidence of the protective effect of influenza vaccines against chronic pulmonary conditions focuses on asthma, where some studies have shown protection against hospitalization and decreased use of bronchodilators and systemic steroid medicines commonly used to alleviate exacerbations of asthma and, therefore, a proxy of clinical benefit.

Respiratory infections may also trigger acute vascular events in persons with coronary artery disease, and several studies have suggested a protective effect of influenza vaccination against “heart attacks”. The effect is more pronounced the more severe the underlying atherosclerosis. In some studies, the statin medicines used to improve lipid profiles and decrease coronary event risk have been associated with poorer VE, but data are ambiguous and more research on the topic is needed.

Influenza vaccine immunogenicity, efficacy, and effectiveness in patients with renal and hepatic conditions as well as autoimmune conditions such as rheumatic arthritis and inflammatory bowel disease have generally been comparable to that of healthy controls. However, immune responses to vaccination in patients with the latter conditions can be reduced if they are receiving concomitant immunomodulatory therapies. Malignancies are a very heterogeneous group of diseases where the response to the influenza vaccine is greatly dependent on the level of immunocompromise. In conditions such as HIV infection, vaccine immunogenicity correlates with CD4 + T-lymphocyte cell counts.

Pregnancy

In their 2012 position paper, the WHO recommended that countries considering the initiation or expansion of seasonal influenza vaccination programs would give the highest priority to pregnant women. The basis of the recommendation is two-fold: First, pregnancy is an immunosuppressive condition and severe influenza infections can occur during this time, and second, newborns are a risk group for severe influenza but are not eligible to receive influenza vaccine; passive transfer of influenza antibodies from vaccinated women as well as the “cocooning” (i.e., when the child is protected by not having their mother fall ill with influenza) provide the newborns with protection. Both RCTs and observational studies have demonstrated significant protection of mothers and their newborn children against LCI, with vaccine efficacy or effectiveness of 40%–60% VE and above in the infants when the mother is vaccinated.

Healthy Children

During influenza epidemics, higher attack rates have often been observed in children than in adults. It has been postulated that children might be “super spreaders” who drive influenza epidemics in a population. On the other hand, while many children’s influenza infections are mild and self-limiting, influenza can be severe and even life-threatening in small children. For these reasons, some countries such as the United Kingdom and Finland have adopted universal influenza vaccination programs for healthy children (e.g., all children from six months to six or ten years). In the position paper referenced above, the WHO included children aged 6–59 months in additional risk groups to be considered for vaccination.

Besides traditional inactivated vaccines, LAIV is relevant in this target group. Where multiple vaccine types are available, vaccination recommendations are sometimes preferential to one particular type of vaccine and sometimes non-preferential (i.e., parents may choose).

When a child is vaccinated for the first time with a seasonal influenza vaccine, two doses are recommended to ensure sufficient protection. This is particularly true of inactivated vaccines, where vaccine effectiveness has been shown to be lower among children who received only one dose in their first year of vaccination compared to children who received two doses. With the Ann Arbor-backbone LAIV, one dose has been shown to provide roughly 90% of the protection observed after two doses.

Healthy Adults

Few countries prioritize non-pregnant healthy adults as a target group for influenza vaccination. However, this is not to say the vaccine does not work (indeed the vaccine effectiveness is typically higher in adults aged <65 years than in the elderly). Healthy adults can be vaccinated especially if they want to protect themselves from influenza (e.g., because they have a close contact whose age or health condition requires protection from influenza, because of a holiday trip, or if falling ill with influenza would be particularly bad for their work or social situation).

Among adults, healthcare workers are an important target group for vaccination, again prioritized by the WHO. The rationale for vaccinating medical personnel is two-fold: Through clinical work, they become exposed to influenza more than the general population, and may also transmit influenza to their patients, some of whom may be frail and at risk of serious infection.

Pandemic Influenza Vaccines

Influenza viruses have a considerable pandemic potential because of their capacity for antigenic shift, adaptation to infect multiple species, and their mode of transmission. The occurrence of pandemics is inherently unpredictable but in recent history, influenza pandemics have been observed every couple of decades: 1918, 1957, 1968, and 2009.

Much of what is said above about seasonal influenza vaccines applies to pandemic influenza vaccines. A key point to understand regarding vaccine production is that especially in the age of air travel, pandemics may spread very rapidly, and without proper forward planning and production capacity, vaccines may not be available until it is too late (though with several waves of pandemic influenza activity spread over some time, the vaccine may be available for the second wave if not the first one). Ways to enhance preparedness between pandemics include the preparation of collections of candidate vaccine viruses such as H5, H7, and H9 viruses. Regulators such as the FDA and the European medicines agency (EMA) have developed procedures for fast-track licensure of pandemic vaccines.

Among other hurdles, pandemic vaccine producers face increased safety concerns. A high-pathogenicity donor virus would have to be grown under high-containment conditions, so manufacturers have turned to other methods, including recombinant techniques and baculovirus vector-expressed vaccine antigens in cell cultures. The use of aluminum or lipid emulsion adjuvants has often been deemed necessary to achieve sufficient immunogenicity. Another appealing aspect of adjuvants is dose sparing (i.e., extending the supply and availability of vaccine doses through less requirement of viral protein per dose).

At the time of writing, the most recent pandemic vaccine preparation effort was in the 2009 A(H1N1) pandemic. Here, a vaccine was developed, produced, and administered over only 8 months – though large-scale production was not attained as quickly as initially hoped. The pandemic itself turned out to be relatively mild, though in some cases (especially in clinical risk groups) resulted in severe viral pneumonitis, bacterial sequelae, and death. Compared to seasonal epidemics, there were relatively more severe infections in children and young adults than in the elderly.

The adjuvanted vaccines during the 2009 pandemic attained very good effectiveness in many studies. In general, the pandemic vaccines of 2009 had a safety profile comparable to seasonal vaccines and unusual safety issues were not observed in most countries. However, others experienced an increase in narcolepsy, a rare condition characterized by impaired ability to regulate sleep-wake cycles leading to daytime sleepiness and involuntary sleep episodes. Cases of narcolepsy appeared to be associated with the AS03-adjuvanted pandemic H1N1 vaccine in Finland, Sweden, and Iceland. For reasons currently unknown, this was not observed in other countries using that vaccine. Notably, narcolepsy has never been linked to seasonal influenza vaccines.

Overall, the experience with the 2009 pandemic demonstrated that adjuvanted pandemic influenza vaccines are immunogenic, effective, and have an acceptably low rate of adverse events. The pandemic response may have contributed to improved preparedness for influenza pandemics in general and reduced barriers to large-scale vaccine manufacture and vaccination program implementation.

Polio Eradication

Background

An ancient disease first documented in the 2nd millennium BCE and feared worldwide through much of the modern 20th century, polio is nearing eradication. Derived from the Greek words *polio* (gray) and *myelon* (marrow), poliomyelitis describes the predilection of poliovirus (genus *Enterovirus*, family *Picornaviridae*) to target motor neurons within the gray matter in the anterior horn of the spinal cord, leading to the classic manifestation of poliovirus-induced acute paralysis. Poliovirus is highly infectious, with replication primarily occurring in the intestinal tract of infected individuals. Humans are the only reservoir for poliovirus, with transmission occurring from person-to-person mainly through the fecal-oral route. Over 70% of poliovirus infections in children are asymptomatic, though even infected individuals without symptoms shed virus in stool and can transmit the virus to others. Approximately 24% of infected children develop minor, nonspecific illness without evidence of central nervous system invasion. Aseptic meningitis occurs in 1%–5% of poliovirus-infected children, typically followed by complete recovery. Less than 1% of all poliovirus infections result in acute flaccid paralysis (AFP) and these are classified into three types. Spinal poliomyelitis is most common, characterized by asymmetric paralysis most often involving the legs. Bulbar polio describes the weakness of muscles innervated by cranial nerves. Bulbospinal polio is a combination of bulbar and spinal paralysis.

In 1988, wild poliovirus (WPV) was present on all continents except Australia, and estimates of case burden exceeded 350,000 annually. That same year, the Global Polio Eradication Initiative (GPEI) was launched following the early successes of polio eradication efforts in the Americas (initiated by the Pan American Health Organization in 1985) where the last case occurred in 1991. GPEI is a public-private partnership driven by the objective to eradicate polio worldwide, led by national governments and other key partners including the World Health Organization (WHO), US Centers for Disease Control and Prevention, UNICEF, and Rotary International. These initial spearheading partners were later joined in 2007 by the Bill and Melinda Gates Foundation and by GAVI in 2019. By 2011, the number of countries with WPV circulation was only 16, and by 2014 the regions of the Americas, Europe, Southeast Asia and the Western Pacific were certified to be free of WPV. The only countries with endemic WPV cases in 2019 were in South Asia (Pakistan and Afghanistan). The African Region reported its last case of WPV in 2016, and Africa was declared free of WPV in 2020. It is estimated that the efforts of the GPEI in combination with the use of two highly effective poliovirus vaccines have prevented over 16 million cases of paralytic poliomyelitis over the past 30 years.

Polioviruses comprise three antigenically distinct serotypes, types 1, 2, and 3. Infection with one serotype confers protection only against viruses of that same serotype. Type 2 wild poliovirus (WPV2) was last detected in 1999 and was declared eradicated in 2015. Type 3 wild poliovirus (WPV3) was last detected in 2012 and it was declared eradicated in 2019. Since 2012, the only WPVs detected have been of type 1 (WPV1).

Initial eradication efforts focused on WPVs (i.e., those that circulated naturally in human populations). While GPEI focused on the eradication of WPV, it later became clear that the live, attenuated Sabin oral vaccine strains (see Section “Vaccines”) could very rarely revert and reacquire neurovirulence and transmissibility. For all three serotypes, key sites of reversion include attenuating mutations in the 5′ untranslated region as well as additional sites of reversion within the capsid. Reversion can happen quickly during replication within the human gut. These reverted vaccine viruses, termed vaccine-derived poliovirus (VDPV) can emerge in areas with very low vaccine coverage, causing paralytic disease indistinguishable from WPV. A VDPV was originally defined operationally as a poliovirus that was derived from the oral vaccine strains and that diverged >1% from the parental strain in the nucleotide sequence encoding the VP1 capsid protein (i.e., ≥10 changes in the ~900 nucleotide VP1 region). The threshold of 1% is somewhat arbitrary but is consistent with prolonged replication of the virus. Based on genetic information from several large VDPV2 outbreaks, the threshold for the definition of VDPV2 was modified to a nucleotide divergence >0.6% from the parental OPV strain (≥6 changes in VP1). VDPV are classified as circulating VDPV (cVDPV) when there is evidence for person-to-person transmission; immunodeficiency-associated VDPV (iVDPV) if isolated from a person with primary immune deficiency (primarily deficiencies in humoral immunity, such as hypogammaglobulinemia, combined variable immunodeficiency, or severe combined immunodeficiency); or ambiguous VDPV when the virus cannot be conclusively classified as either cVDPV or iVDPV. To fully eradicate polio, all sources of the virus (wild and vaccine-derived) must be eliminated. Surveillance and vaccination continue to be the most important pillars in efforts toward ensuring poliovirus becomes the second human virus to be eradicated.

Vaccines

Two key tools, Sabin live oral poliovirus vaccine (OPV) and Salk inactivated poliovirus vaccine (IPV), have been central to the global eradication effort. Both IPV and OPV contain a representative strain for each of the three poliovirus serotypes (though the type 2 component was removed from OPV in 2016; see below), with vaccination resulting in the production of neutralizing

antibodies that protect recipients from the disease. Each vaccine has advantages and disadvantages, and appropriate circumstances exist for the use of each.

IPV consists of WPV strains that have been chemically inactivated. It provides excellent systemic immunity and is very safe since no infectious virus is present. First licensed in 1955, IPV reduced the number of polio cases by over 99% in the US. IPV has been shown to be capable of eradicating poliomyelitis in settings where the overall burden of viral exposure is low, and the rate of immunization coverage is high (> 90%). However, IPV does have disadvantages. It is more expensive to produce than the live vaccine and the use of large amounts of wild seed virus in production comes with potential hazards. In addition, while IPV protects vaccinees from disease, it does not induce the intestinal immunity required to prevent person-to-person transmission of poliovirus.

In developing countries where viral exposure is more intense, live-attenuated vaccines imitating natural infection often provide better protection. Accordingly, Sabin OPV was introduced in the early 1960s, containing live strains of poliovirus that have been attenuated via passage in animals and cell cultures. OPV provides strong systemic immunity, limiting poliovirus infection and disease in vaccinees. Unlike IPV, OPV also induces the mucosal immunity necessary to interrupt person-to-person transmission. Since recipients excrete vaccine virus into the environment, OPV expands community protection by secondary infection of contacts of vaccinees. OPV is inexpensive, easy to administer, and has been the cornerstone of the global eradication program. It has been demonstrated as an effective vaccine tool to interrupt polio epidemics and break transmission, resulting in the eradication of the virus from entire regions across the world.

While vaccination has played a central role in the dramatic decline of poliomyelitis cases, unexpected challenges have become apparent during the final articles of eradication, particularly those associated with the use of Sabin OPV. Much is now known regarding the key mutations underlying the attenuation of Sabin OPV strains and their inherent genetic instability. During replication in the human gut, the attenuated strains are under pressure to adapt and evolve. In rare instances, reversion of key attenuating “gatekeeper” mutations restores virulence to OPV strains, resulting in one case of vaccine-associated paralytic poliomyelitis (VAPP) for approximately every 2.4 million doses of OPV administered, with the highest rate after the first dose. A fundamental piece of the poliovirus eradication strategy is achieving and maintaining high levels of routine immunization. Within that context, VAPP cases are not associated with outbreaks of poliomyelitis. However, in areas of low-vaccine coverage and poor sanitation, where OPV strains have the opportunity to replicate unchecked and transmit for longer durations, the genetic instability of OPV strains can lead to transmission of circulating vaccine-derived polioviruses and spur outbreaks, the most prevalent being type 2 VDPVs. Accordingly, WHO coordinated a synchronized global withdrawal of the type 2 component of OPV in April 2016, replacing trivalent OPV with a bivalent formulation containing only the Sabin type 1 and 3 strains. Prior to the switch, WHO recommended that all countries introduce at least one dose of IPV into their routine immunization program to provide immunity to type 2, which has, in turn, strained the global supply of IPV. Recent clinical trials highlighting the efficacy of using fractional doses (one-fifth the typical amount) of IPV (fIPV) have offered a way forward that may help alleviate both the supply and cost issues for IPV used in this manner. Several countries have already begun to use fIPV for routine immunization. After global eradication of all three serotypes has been certified, all use of OPV in routine immunization is expected to cease. OPV cessation is considered an essential step to eliminate the risk of VAPP and remove the source of potential future VDPV emergence. At that point, continued immunization with IPV will be critical to maintaining eradication.

Poliovirus Surveillance

Essential to the eradication program is surveillance for cases of AFP, defined for the purpose of polio surveillance as sudden onset of paralysis or weakness in any part of the body in a child less than 15 years of age. There are multiple etiologies of AFP, including poliovirus, other infectious agents, toxins, autoimmunity, trauma, and congenital conditions. While all these etiologies are medically important and approaches to patient care must consider the cause (or suspected cause) of the illness, GPEI is focused specifically on paralytic cases associated with poliovirus infection.

Virologic surveillance (laboratory confirmation that poliovirus is associated with an AFP case) is essential to identifying WPV reservoirs, directing vaccination campaigns, assessing overall program progress, and global certification of eradication. Surveillance quality indicators include timely case detection, notification, and investigation, as well as adequate stool collection and timely transport to the laboratory. The Global Polio Laboratory Network (GPLN) was launched in 1989 to ensure laboratory support for every country's surveillance system. The GPLN currently consists of 146 laboratories in 92 countries; some large countries have multiple polio laboratories and some laboratories serve neighboring countries that do not have a polio laboratory of their own. Stool specimens collected from children with AFP are tested for the presence of poliovirus by virus isolation in cell cultures and any viruses detected are characterized by poliovirus-specific polymerase chain reaction assays and genomic sequencing. In a typical year, GPLN laboratories test approximately 200,000 stool specimens from AFP cases. Quality of laboratory results is assured through standardized protocols and reagents, annual proficiency testing, ongoing training, and a WHO-led accreditation program. Methods to detect and characterize poliovirus are constantly evolving.

Environmental surveillance (detection of poliovirus in sewage-affected waters) is an important adjunct to AFP surveillance, permitting virologic surveillance of a relatively large population (usually tens of thousands to a few million). While environmental surveillance has played a key role in the detection of poliovirus transmission, especially in the latter stages of eradication, it cannot identify the individuals who are shedding the virus. Its main advantage is its ability to detect virus from asymptomatic virus excretors because those individuals would not be identified through AFP surveillance. Environmental surveillance expanded dramatically from

Fig. 1 Global wild and circulating vaccine-derived poliovirus cases with onset of paralysis from 1 January to 31 December 2019. Red, WPV1 ($n = 143$, in 2 countries); orange, cVDPV1 ($n = 8$, in 3 countries); green, cVDPV2 ($n = 241$, in 15 countries). Not shown: Viruses detected from environmental surveillance. Data from the World Health Organization, as of 31 December 2019.

2013 to 2019. Environmental surveillance is currently conducted in hundreds of sites in more than 50 countries, and expansion to additional countries is planned for 2020–2022. Continued environmental surveillance, especially in high-risk areas prone to VDPV emergence, will be needed to assure final eradication.

Status of Eradication

The number of WPV1 cases globally had declined to less than 50 per year in 2016–2018 but the 2019 global total was more than 150 cases, in Pakistan and Afghanistan (Fig. 1). As noted, no WPV has been detected anywhere in Africa since 2016. WPV2 and WPV3 were declared eradicated in 2015 and 2019, respectively. Polio eradication has been difficult to accomplish in countries with environments conducive to poliovirus replication and spread (a high biological infectivity index) and weak routine immunization programs. In recent years, however, the primary barriers have not been biological or environmental. Rather, the difficulties encountered by GPEI have largely been man-made. Some of these include the inability to immunize children in areas under the control of rebels or other anti-government elements, the spread of misinformation regarding vaccine safety, violence against vaccinators and their accompanying security teams, corruption and dishonest practices, as well as simple poor-quality of immunization campaigns. In 2018–2019, immunization was again prohibited by the Taliban in parts of Afghanistan after several years of cooperation. The targeting of polio immunization staff by violence, starting in 2011 in Pakistan, impeded eradication progress, forcing the GPEI to change strategies for advertising immunization campaigns and delivering vaccines. Despite these challenges in the immunization side of the program, AFP surveillance quality in Pakistan and Afghanistan has generally been high since 2015, although there are pockets of lower quality surveillance in areas of insecurity and civil unrest.

In 2018 and 2019, there were significantly more paralytic polio cases associated with VDPV than with WPV (Fig. 1). There were 104 cVDPV cases in 2018 and ~250 cVDPV cases in 2019, compared to 33 and ~150 WPV cases in the two years, respectively. The number of cases associated with VDPV still pales in comparison to the >16 million cases of paralytic polio that have been prevented by GPEI over the past 3 decades. After the switch from Trivalent oral polio vaccine (tOPV) to Bivalent oral polio vaccine (bOPV), cVDPV2 from an ongoing outbreak was detected in Nigeria. Other cVDPV2 outbreaks originating prior to the switch were detected in 2017 (Horn of Africa) and in 2019 (Philippines). Since late 2016, Monovalent type 2 oral polio vaccine (mOPV2) from a global vaccine stockpile has been used on an emergency basis in response to cVDPV2 outbreaks. The WHO Director-General must approve use of mOPV2 in order to limit the exposure to the population of a live OPV strain that would have the potential risk of creating new circulating VDPV2. New emergences were apparently seeded by the use of mOPV2 in outbreak responses, and the cycle continued to increase the number of cVDPV2 outbreaks in African countries, including Nigeria and the Democratic Republic of Congo, which each experienced

several concurrent outbreaks. After the switch, the number of emergences of cVDPV2 increased each year. Although some cVDPV2 outbreaks were stopped in countries such as the Democratic Republic of Congo, other outbreaks continued. In 2019, cVDPV2 was detected in 12 countries in Africa. Nigeria, the Democratic Republic of the Congo, Somalia, and the Philippines exported cVDPV2 to surrounding countries. Three years after the switch, over 250 million doses of mOPV2 have been used in cVDPV2 outbreak responses. In addition to type 2 cVDPV outbreaks, separate cVDPV1 outbreaks were detected in Papua New Guinea and Indonesia in 2018, and in Myanmar and the Philippines in 2019. Late in 2019, cVDPV1 genetically linked to the cVDPV1 outbreak in the Philippines was detected in Malaysia.

New Vaccines

When the poliovirus eradication program began, it was assumed that OPV and IPV would be sufficient for the successful achievement of the goal. Indeed, the use of OPV has reduced poliomyelitis cases by more than 99% worldwide. However, with the growing knowledge of the current risks associated with OPV, and the inability of IPV use alone to fully achieve global eradication, the availability of additional novel vaccine options has become highly desirable. In recent years, efforts to develop novel vaccine platforms have included noninfectious DNA-based vaccines, virus-like particles, and immunogenic peptides, among others. Additionally, to more safely produce IPV, some manufacturers have replaced the traditional wild seed strains used in the production of IPV with attenuated Sabin strains.

More recently, the knowledge gained about poliovirus biology over the last half-century has led to the development of novel OPV (nOPV) strains engineered to be safer and more genetically stable than traditional Sabin strains. These rationally redesigned nOPV strains stabilize known reversion hotspots within the Sabin virus genome, while also offering new attenuating strategies targeting replicative fitness, polymerase fidelity, and recombination. The development of these nOPV strains has been deemed necessary by global eradication partners, with a particular interest in using monovalent nOPV2 in outbreak settings, to reduce the risk of spurring additional VDPV emergences. Clinical testing of these nOPV strains is currently underway, with initial results demonstrating nOPV2 is viable, immunogenic, and safe in human recipients. In November 2020, WHO granted provisional emergency use listing to nOPV2, permitting its initial use in outbreak responses.

Antivirals

In countries where prophylactic immunoglobulin therapy is available, patients with a primary immune deficiency are generally protected from paralytic disease even if they become infected with a poliovirus vaccine strain. However, an iVDPV can replicate for years in some immunodeficient persons and the virus can revert to a virulent phenotype (iVDPV) and continue to evolve, accumulating additional nucleotide substitutions throughout the genome. One such patient has excreted virulent poliovirus for over 30 years. Continued replication of virulent iVDPV puts the patient at risk for paralysis, even in the face of immunoglobulin therapy, and excretion of iVDPV into the environment poses a risk of transmission in the community, especially in areas of low vaccine coverage or in the post-eradication era when OPV will no longer be used. To minimize the risks to both the patient and the community, antiviral drugs are being developed to treat chronically infected primary immune deficiency patients. One drug, pocapavir, has completed a Phase II trial with positive results, and a second drug is being developed to provide a safeguard against the development of drug resistance, in the form of a combination product.

Containment

Once complete eradication of all three serotypes is achieved and vaccination campaigns are no longer implemented, population immunity to polioviruses will decrease. At that point, live poliovirus will exist only in settings such as laboratories and vaccine manufacturing facilities. Therefore, the consequences of any poliovirus introduction into communities from a facility containment breach, even if unlikely, would be severe. This is the case for WPV2 now, in 2020, apart from ongoing cVDPV2 circulation. As a result, WHO has developed a “Global Action Plan to minimize poliovirus facility-associated risk after type-specific eradication of WPVs and sequential cessation of oral polio vaccine use” (GAPIII) to provide guidance for facilities that need to retain live polioviruses for essential functions such as vaccine production and critical research. Currently, all type 2 polioviruses must be contained in facilities that comply with GAPIII, with slightly different requirements for vaccine virus compared to WPV2 and VDPV2. Now that WPV3 has been declared eradicated, it also falls under GAPIII containment requirements. At present (in 2020), Sabin 3 is still included in the oral polio vaccine, so the vaccine strain is not yet subject to containment. In recent years, there have been several known breaches of containment in vaccine manufacturing facilities, underlining the risks associated with retaining live poliovirus materials post-eradication. Fortunately, none of the incidents resulted in community transmission. To limit the risk involved in the use of WPV seed strains for IPV production, multiple manufacturers are developing IPV products based on live-attenuated vaccine strains. As of the end of 2019, Japan was the only country with a licensed Sabin IPV product.

Transition of Global Polio Eradication Initiative Assets Post-Eradication

Once global eradication has been achieved, certain GPEI activities and functions will still be needed to ensure the world remains polio-free for the long term. Four key activities that must continue are containment, disease surveillance, outbreak response capacity, and vaccination (with IPV only once OPV use has ceased). Vaccination with IPV is expected to continue for the foreseeable future, as a barrier to disease caused by VDPVs (e.g., from an immunodeficient chronic excreter) or transmission of WPV that could result from exposure in a facility that retains live virus, such as a vaccine manufacturing facility. Even with heightened awareness and effort, it is expected that maintaining high vaccine coverage will be challenging, especially in resource-limited settings where GPEI has already faced difficulties in achieving levels of population immunity sufficient to interrupt transmission. Poliovirus containment has been described in some detail above; it will be increasingly important as the years pass after eradication given that reintroduction of WPV into a population with reduced immunity would be catastrophic. The capacity to detect polio cases or outbreaks should they occur will need to be integrated into the existing community- and event-based surveillance systems to trigger appropriate investigations and outbreak responses. Vaccine stockpiles will need to be generated and maintained to supply outbreak response vaccination campaigns.

While significant capacity in all these areas has been built over more than three decades and the program's assets have been used to support many other high-priority public health programs, GPEI as a stand-alone program is not sustainable post-eradication. This polio infrastructure – notably the trained global public health workforce that includes field surveillance officers, laboratory scientists, communications and logistics experts, and others, at local to global levels – will be invaluable to other public health programs. Integrating polio assets into other health programs will help maintain the capacity to detect and respond to a polio outbreak while also enhancing the capacity to investigate and respond to other priority health threats.

Acidianus filamentous virus 1 (AFV1) 1:368, 4:363, 1:435–436
Acidianus tailed spindle virus (ATSV) 1:370f
Acidianus two-tailed virus (ATV) 4:361, 4:422
acidic hot springs, viruses of 4:422
acidophilic, defined 4:359
AcMNPV *see* *Autographa californica* multiple nuclear polyhedrosis virus (AcMNPV)
AConSLA *see* *Ageratum conyzoides* symptomless alphasatellite (AConSLA)
acquired immune deficiency syndrome (AIDS) 5:190, 2:56, 1:567–568
actin filaments (microfilaments), defined 3:32
active surveillance 5:250
acute bee paralysis virus (ABPV) 4:771, 4:772, 4:773
acute flaccid paralysis (AFP) 5:310
 defined 2:245
acute gastroenteritis, defined 5:289
acute lower respiratory tract infections (ALRI) 2:747–748
acute otitis media (AOM) 2:761
 defined 2:757
acute respiratory distress syndrome (ARDS) 2:559
 defined 2:551, 2:825
ACV, *see* *Aeropyrum* coil-shaped virus (ACV)
acyclovir 5:183, 5:179
adamantanes/M2 blockers 5:161–162
adaptation vs. evolution, defined 1:71
ADCC *see* antibody-dependent cellular cytotoxicity (ADCC)
ADCP *see* antibody-dependent cellular phagocytosis (ADCP)
additional strand, conserved E (ASCE) 4:160
additional strand conserved glutamate (ASCE) 4:148–149, 4:149
 defined 4:148
adefovir dipivoxil (ADV) 5:218
Adelaide River virus (ARV) 2:875
adeno-associated parvoviruses (AAV-2) 1:268–269
adeno-associated virus (AAV) 1:411–412, 1:211, 1:533, 1:536
 AAV2 4:845
adenosine triphosphate (ATP) 1:495, 1:488
Adenoviridae
 adenoviruses as vectors 2:15
 classification 2:3–6
 clinical features 2:10–11

 HAdV-F 2:11–12
 HAdV-G 2:12
 diagnosis 2:14–15
 epidemiology 2:9–10
 epizootiology 2:12
 avian adenoviruses 2:13
 bovine, ovine, caprine, and other ruminant adenoviruses 2:13
 canine and other carnivoran adenoviruses 2:12
 equine adenoviruses 2:12–13
 frog and fish adenoviruses 2:14
 porcine adenoviruses 2:12
 reptilian adenoviruses 2:13–14
 simian adenoviruses 2:12
 genome 2:8
 life cycle 2:8–9
 pathogenesis 2:14
 prevention 2:15
 taxonomy of 2:4t–6
 treatment 2:15
 virion structure 2:6–8
adenovirus 26 (Ad26) 2:243
adenovirus death protein (ADP) 4:761
adenoviruses (ADVs) 1:401, 2:3, 5:109, 5:105, 5:239, 1:660
 external minor coat protein in 1:340f
 general features of 1:329
 human adenovirus type 5, structure of 1:329–331
 core proteins 1:335
 fiber 1:331–333
 hexon 1:331
 penton base protein 1:331
 protein IIIa 1:333
 protein VI 1:333
 protein VIII 1:333
 protein IX 1:333–335
 structural relatives 1:337
 asymmetric features 1:340
 capsid size determination in DJR lineage 1:340–342
 double jelly roll fold, variants of 1:337–339
 double jelly roll lineage 1:337
 double jelly roll lineage, genomes in 1:340

- adenoviruses (ADVs) (*continued*)
 double jelly roll lineage, vertex structures in 1:339
 membranes and membrane proteins 1:339–340
 polintons and evolutionary pathway of DJR viruses 1:342–343
 variants 1:335–337
 external minor coat proteins 1:337
 fiber shafts and heads 1:335–337
 as vectors 2:15
- adenovirus fiber 1:331–333
- adenovirus infections, management of
 clinical description of infection 5:199
 animal adenoviruses 5:202
 diseases and human adenoviruses infections 5:200–201
 gastroenteritis 5:200
 genitourinary diseases 5:200
 immunocompromised patients, adenovirus infections of 5:201–202
 incubation period 5:199
 lower respiratory tract infections 5:200
 ocular infections 5:200
 upper respiratory tract infections 5:199–200
- diagnosis 5:202–203
 adenovirus differentiation and typing 5:203–204
 diagnostic methods 5:203
 polymerase chain reaction (PCR) for human adenoviruses DNA detection 5:202–203
 quantitative human adenoviruses PCRs and screening of high-risk patients 5:203
- epidemiology 5:199
 structure 5:198–199
 taxonomy 5:197
 family and genus 5:197
 types and subtypes 5:197–198
 treatment and prevention 5:204–205
 antivirals 5:204–205
 germicides 5:205
 vaccines 5:205
- adenovirus vaccine 2:216
 adjuvant, defined 5:281
- ADP *see* adenovirus death protein (ADP)
- adsorption, defined 1:402, 4:53
 adsorption rate, defined 4:387
- adult T-cell leukemia (ATL) 2:532–533
- ADV *see* adenofovir dipivoxil (ADV); adenoviruses (ADVs)
- advanced light microscopy approaches 1:210–211
 multiphoton imaging 1:211–213
 quantitative spectral imaging 1:211
 real-time single virus tracking (SVT) in live cells 1:211
- adverse effects following immunization (AEFI) 5:283

 DNA-filled head, energetics of 4:167
 intra-capsid DNA
 equilibrium energy and structure of 4:167–169
 metastability of 4:169–170
 mobility of packaged genome controls
 ejection dynamics 4:170–171
 pressure-driven release of viral genome into a host cell 4:171–172
 DNA injection 4:48
 DNA microarrays 5:92
 DNA mycovirus 4:493
 DNA packaging 4:136–137, 4:160, 4:148
 characteristics 4:161–162
 force generation 4:162–163
 packaging speed 4:161–162
 pausing and slipping 4:163
 conformational variation of DNA 4:139f
 defined 4:36, 4:45
 and DNA binding protein 4:18–19
 DNA "crunching" or "compression" translocation model 4:155
 DNA wrapping/bending 4:146
 future studies 4:157–159
 genome replication and selection mechanisms 4:137
 concatemeric replication products 4:137–138
 monomeric replication products 4:137
 "inchworm" translocation model 4:153–154
 "lever" translocation model 4:154–155
 mechanisms 4:163–164
 force generation 4:164–166
 mechanochemical coupling 4:163–164
 motor coordination 4:166
 motor-substrate interactions 4:164
 molecular structure 4:160–161
 Phi29 motors 4:151–152
 protein-DNA binding 4:139–140
 DNA binding domains (DBDs) 4:140–141
 multiple binding events regulate complex assembly 4:141
 sequence specific and non-specific binding 4:140
 shape of DNA 4:138–139
 terminase and Phi29 motors 4:148–151
 terminase motors 4:152–153
 termination of packaging 4:155–157
 viral genomic DNA, recognition of 4:141
 concatemeric DNA and terminase proteins 4:141–142
 monomeric genomes and terminal proteins 4:141
 DNA phosphorotioation (DPT) system 1:610
 DNA polymerase gene 5:185
 DNA portals, symmetry mismatch in 1:235–236
 DNA repair enzymes 4:238
 DNA replication 4:15
 of 29-like viruses 4:66–67
 of SPO1-like viruses 4:63–65
 of SPP1-like viruses 4:65–66
 DNA sequencing 1:178–179
 DNA synthesis, defined 4:61
 DNA vaccines 2:215, 5:286
 double-stranded 1:43–44
 single-stranded 1:43
 DNA viruses
 origin of 1:19–20
 recombination in 1:460–462
 DNA virus evolution, mechanisms of 1:71–72
 co-divergence with hosts as a driver of DNA diversification 1:74
 contributions of DNA virus persistence and chronic infections 1:73–74
 DNA virus genome types, diversity of 1:72
 DNA virus hosts vary from single cells to complex multi-cellular organisms 1:73
 duplication and deletions of genes and genome segments 1:76–77
 fluctuations in tandem repeat copy number as a mechanism of evolution 1:75
 host cell biology and availability of host enzymes constrains virus evolution 1:72–73
 host-virus exchange via horizontal gene transfer and transposable elements 1:77
 in vivo observations of within-host diversity and adaptation of DNA viruses 1:75
 large DNA viruses undergo frequent recombination 1:75–76
 recombination at different frequencies for small DNA virus genomes 1:76
 single nucleotide differences as a measure of evolutionary change 1:74–75
 time frames 1:73
 DND *see* DNA degradation (DND)
 dNTP *see* deoxynucleotide triphosphate (dNTP)
 DNVs *see* denonucleosis viruses (DNVs)
 docosanol 5:124–125
 document control 5:65–66
 dolutegravir 5:149–150
 clinical trials
 dual therapy 5:150
 therapy-naïve with 2 NRTI 5:149–150
 treatment-experienced 5:150
 resistance 5:150
 domestic pigs, control of classical swine fever in 2:162
 dominant allele, defined 3:69, 3:554
 Donnan's effect, defined 4:105
 doravirine 5:136
 double antibody sandwich, defined 3:539
 double jelly roll (DJR) 1:329
 capsid size determination in DJR lineage 1:340–342
 DJR lineage 1:337
 genomes in 1:340
 vertex structures in 1:339
 polintons and the evolutionary pathway of DJR viruses 1:342–343
 variants of DJR fold 1:337–339

- double jelly roll (DJR) (*continued*)
double-layered particle (DLP) 1:309
double-membraned bodies, defined 3:396
double membrane vesicles (DMVs) 1:498–499, 1:499, 2:388–389, 2:390, 2:262, 2:201–202, 2:198
double-stranded DNA (dsDNA) 2:855, 1:385, 1:235, 1:501–502, 1:318, 1:319, 3:158, 1:257, 4:160, 1:19, 1:43–44, 1:386
dsDNA recombineering 4:298, 4:295–296
double-stranded RNA (dsRNA) 1:444–445, 1:385, 4:26, 1:499, 1:492–493, 1:303, 1:310f, 1:312f, 3:555
cell entry of 1:307–309
classification and host range 4:26–27
Cystoviridae family 4:26
dsRNA mycoviruses 4:433–437
recombination and reassortment 4:33–34
applications and intellectual property 4:34
carrier state 4:33–34
reverse genetics and self assembly 4:34
replication cycle 4:31–32
membrane acquisition and host cell lysis 4:33
NC maturation 4:33
PC assembly and packaging 4:33
plasma membrane penetration and NC entrance into the cytoplasm 4:31–32
transcription 4:32–33
structures of 1:304f
virion structure and properties 4:27
architecture of the polymerase complex and the nucleocapsid 4:27–28
genome organization and sequence similarity 4:31
host cell attachment complex 4:30–31
membrane envelope 4:30
P1 protein 4:28
P2 protein 4:28–30
P4 protein 4:30
P7 protein 4:30
P8 protein 4:30
physico-chemical properties 4:27
protein components of the cystovirus portal complex and nucleocapsid 4:28
double-stranded RNA (dsRNA) mycoviruses, structure of 4:504
chrysovirus 4:505–506
evolutionary relationships based on structural comparisons 4:509
future perspectives 4:511–512
megabimaviruses 4:508–509
partitiviruses 4:508
quadriviruses 4:506–508
RdRp and dsRNA organization within mycovirus capsids 4:509–511
totiviruses 4:504–505
double-stranded RNA (dsRNA) virus core and endogenous transcription 1:309
viral innermost capsid layer that encloses the genome 1:309
viral RNA capping 1:311–313
viral RNA-dependent RNA polymerase (RdRp) 1:309–311
double-stranded RNA (dsRNA) virus families 1:314–315
dPCR *see* digital PCR (dPCR)
DpIRV-1 *see* Diadromus pulchellus idnoreovirus 1 (DpIRV-1)
DpIDV *see* dysaphis plantaginea densovirus (DpIDV)
DPT system *see* DNA phosphorotioation (DPT) system
DQ *see* design qualification (DQ)
DQE *see* detective quantum efficiency (DQE)
dRIT *see* direct “rabies immunoperoxidase test” (dRIT)
droplet transmission, defined 1:559
Drosophila C virus (DCV) 4:768, 4:772, 4:773, 1:549
Drosophila melanogaster 4:772
Drosophila melanogaster idnoreovirus-5 (DmIRV-5) 4:875
drug hypersensitivity syndrome (DHS) 2:786
drug-induced hypersensitivity syndrome (DHIS) 2:786
drug repurposing 1:499
drug resistance 1:60
drug susceptibility, defined 5:121
DRV *see* Diaporthe RNA virus (DRV)
dsDNA *see* double-stranded DNA (dsDNA)
dsRNA *see* double-stranded RNA (dsRNA)
duck adenovirus 1 (DAdV-1) 2:13
duck enteritis virus (DEV) 2:113
duck hepatitis B virus (DHBV) 2:100, 2:100–101, 2:102–103
DNA synthesis 2:105f
genome organization 2:103f
duck plague *see* duck viral enteritis (DVE)
duck viral enteritis (DVE) 2:113
Duplodnaviria 1:20
dUTPase *see* deoxyuridine triphosphatase (dUTPase)
Duvénhage lyssavirus (DUVV) 2:738, 2:740–741
DUVV *see* Duvénhage lyssavirus (DUVV)
DVE *see* duck viral enteritis (DVE)
DVs *see* densoviruses (DVs)
DXT *see* diffracted X-ray tracking (DXT)
dye-terminator sequencing 5:28
dynamins, defined 1:529
dysaphis plantaginea densovirus (DpIDV) 4:835, 4:845
dysbiosis, defined 1:552, 4:283
dysplasia, defined 2:316
dystocia, defined 2:34
- E**
E1 glycoprotein 1:266–267
E1 protein 2:497–498
E1^E4 protein 2:498
E2 protein 2:498, 1:266–267
E5 protein 2:498
E6 Associated Protein (E6AP) 2:498
E6 protein 2:498
E7 protein 2:498–499
E8^E2 protein 2:498
early gene, defined 2:441
early taxonomic developments (1886–1971) 1:28–29
Eastern equine encephalomyelitis virus (EEEV) 1:66, 1:263, 2:40, 2:43–44, 2:44, 2:45, 2:46
EAV *see* equine arteritis virus (EAV)
EBHSV *see* European brown hare syndrome virus (EBHSV)
ebola and other hemorrhagic fevers 5:274–275
Ebola hemorrhagic fever (EHF) 2:232
Ebola virus (EBOV) 1:399, 1:401, 2:610, 1:121, 2:232, 2:233t, 1:367f
classification 2:232
clinical features 2:239
early disease 2:239
peak disease 2:239
recovery 2:239
virus persistence 2:239
diagnosis 2:241
epidemiology 2:232–234
genome 2:234–235
genome structure and morphology 2:234f
pathogenesis 2:240f
pathogenesis 2:239–241
prevention 2:232–234
adenovirus 26 (Ad26) and modified vaccinia ankara (MVA) 2:243
vesicular stomatitis virus 2:243
replication cycle 2:236–237, 2:237f
assembly and budding 2:238
immune evasion 2:238–239
primary transcription and translation 2:237–238
replication 2:238
virus attachment and fusion 2:236–237
treatment 2:241–242
monoclonal antibody therapy 2:241–242
small interfering RNAs (siRNAs) 2:242
small-molecule compounds 2:242
virion structure 2:235–236
Ebola virus disease (EVD) 1:591, 2:232
EBOV *see* Ebola virus (EBOV)
EBV *see* Epstein–Barr virus (EBV)
EC50, defined 2:561
ecdysteroids, defined 4:858
Echovirus 30 (E30) 1:284
ECMO *see* extracorporeal membrane oxygenation (ECMO)
ecology and global impacts of viruses 1:621–622
viral community composition, drivers of 1:625
viral community ecology, methods for studying 1:622–623
viral impacts on carbon, nutrient, and biogeochemical cycling 1:623–625
virus-host linkages and ecology 1:623
ECRA vaccines *see* Entry Competent Replication Abortive (ECRA) vaccines
ecthyma contagiosum 2:667–668
ectoenzymes 1:397

- CoV-ectoenzyme interactions 1:397
 ectotherm, defined 2:306
 EDS *see* egg drop syndrome (EDS)
 EEV *see* Eastern equine encephalomyelitis virus (EEEV)
 eel virus American (EVA) 2:325
 eel virus European X (EVEX) 2:325
 EEV *see* extracellular enveloped virion (EEV); external enveloped virions (EEVs)
 EFC *see* entry fusion complex (EFC)
 EFF-1 *see* epithelial fusion failure 1 (EFF-1)
 efficiency of plating (EOP) 1:162

 EGCG *see* epigallocatechin-3-gallate (EGCG)
 EGFR *see* epidermal growth factor receptor (EGFR); epithelial growth factor receptor (EGFR)
 egg drop syndrome (EDS) 2:13
 egg proteins 5:301
 E glycoprotein 2:891–892
 egress, defined 2:441
 EGTA *see* ethylene glycol tetraacetic acid (EGTA)
 Egyptian rousette bats (ERBs) 2:609
 EHF *see* Ebola hemorrhagic fever (EHF)
 EHM *see* equine herpesvirus myeloencephalopathy (EHM)
 EIA *see* enzyme immunoassay (EIA)
 EIAV *see* equine infectious anemia virus (EIAV)
 EID *see* emerging infectious diseases (EID)
 eIF4E binding proteins (eIF4E-BPs). 1:445
 eIF4E-BPs. *see* eIF4E binding proteins (eIF4E-BPs).
 eIF4E-mediated recessive resistance
 characteristics of 3:74–76
 molecular mechanisms of 3:76–77
 eIF4E phosphorylation 1:444
 eIFs *see* eukaryotic translation initiation factors (eIFs)
 EIOS *see* Epidemic Intelligence from open sources (EIOS)
 ejection/E protein, defined 4:219
 electron microscopy (EM) 3:629, 5:3, 1:497, 1:498–499
 for viral diagnosis 5:6
 biological EM challenges and sample preparation 5:9–10
 cryo electron microscopy 5:12–13
 diagnostic transmission electron microscopy 5:6–9
 negative staining, general protocol for the study of viruses by 5:10–11
 negative staining for diagnosis of fecal samples 5:11
 scanning electron microscopy, advances in 5:13–14
 traditional processing techniques, limitations of 5:11–12
 Electron Multiplied Charged Coupled Device (EM-CCD) sensor 1:208
 electron tomography (ET) 1:496–497, 1:499
 electron tomography (ET), analysis of viruses in the cellular context by 1:242–243
 cryo-electron tomography (cryo-ET) 1:244–245
 of cell lamellae or vitreous sections 1:245–246
 of cell periphery 1:244–245
 room temperature-electron tomography (RT-ET) 1:244
 sample preparation 1:243
 chemical fixation 1:243
 cryo-immobilization 1:243–244
 electron transport chain (ETC) 1:212
 electrophoretic mobility shift assay (EMSA) 4:392
 elegant-crested tinamou hepatitis B virus (ETHBV) 2:100
 elimination program, defined 2:797
 ELISA *see* enzyme-linked immunosorbent assay (ELISA)
 ELISpots *see* enzyme-linked immunosorbent spots (ELISpots)
 elvitegravir 5:146–149
 clinical trials 5:149
 resistance 5:149
 E lysis 1:515
 EM *see* electron microscopy (EM)
 EMBL Nucleotide Sequence Data Library 5:33
 EMCV *see* Encephalomyocarditis Virus (EMCV)
 emergence, defined 3:8
 emergent viruses 1:569
 Emerging disease, defined 3:411
 emerging infectious diseases (EID) 5:256, 5:257
 emerging viral diseases (EVD) 5:285–286
 challenge of 5:285–286
 emerging viruses, prevention and control of 1:572–574
 diagnosis 1:573–574
 mosquito vectors, control of 1:575
 treatment 1:574–575
 vaccination 1:575
 EMSA *see* electrophoretic mobility shift assay (EMSA)
 ENA *see* enzootic nasal adenocarcinoma (ENA)
 enation, defined 3:200
 encapsidation, defined 2:441
 encapsulation
 defined 4:849
 loading of virus-like particles by 1:667–668
 encephalitis 2:812
 alphaviruses causing *see* alphaviruses causing encephalitis
 defined 2:40, 2:778, 2:404, 2:884, 2:675
 encephalomyelitis, defined 2:34
 Encephalomyocarditis Virus (EMCV) 1:445
 endemic, defined 2:218, 1:569, 5:247
 endemicity, defined 2:654
 endocytosis, defined 1:529, 1:417
 endogenisation 1:79, 1:79–80, 1:80f
 endogenous avian hepadnavirus elements 2:109–111
 endogenous bornavirus-like elements 2:141
 endogenous lentivirus 2:64
 defined 2:56
 endogenous retroviruses (ERVs) 1:628, 1:630–631, 1:627, 2:122, 2:64
 evolutionary impact of 1:81–83
 exaptation of 1:630–631
 ERV-derived non-coding elements 1:631–632
 ERV-derived proteins 1:632
 ERV-encoded envelope glycoproteins 1:630–631
 origin of 1:631f
 endogenous viral element (EVE) 4:792, 3:158, 4:835
 endogenous virus, defined 2:643
 endolysin, defined 4:276
 endoparasitic wasps, defined 4:724
 endophyte, defined 3:388
 endoplasmic reticulum (ER) 2:386–387, 1:268, 2:463, 2:554–555, 1:411–412, 1:444, 1:603, 1:498–499, 1:499, 1:664, 2:399, 3:140
 endoplasmic reticulum-Golgi intermediate compartment (ERGIC) 2:201–202, 2:196, 2:452, 2:441
 endoreduplication, defined 3:200
Endornaviridae 3:388
 endornaviruses (*Endornaviridae*) 3:388
 fungal 3:389
 gene products 3:391–392
 genome organization 3:390–391
 horizontal transmission 3:393
 from other eukaryotic kingdoms 3:389–390
 pathogenesis 3:394
 plant 3:388–389
 regulation of copy number 3:393–394
 replication (RdRp Activity) 3:392–393
 vertical transmission 3:393
 virus-host relationship 3:394–395
 endosomal sorting complexes required for transport (ESCRT) 2:511, 1:282, 3:32, 2:238, 2:879–880, 2:132, 1:529, 1:539
 -dependent budding 1:522–523
 endosomes, defined 3:32
 endothelial cell, defined 1:529
 energy-driven genome packaging in double-stranded DNA and giant viruses 1:493
 energy-independent genome packaging 1:488
 in larger (ss)RNA viruses 1:490–492
 in small single-stranded viruses 1:488–490
 enfuvirtide 5:152
 enhanced RSV disease (ERD) 2:754
 Enhanced Surveillance 5:250
 enhancer, defined 2:56
 EnMBV1 *see* Entoleuca megabirnavirus 1 (EnMBV1)
 enrichment strategies 1:179
 negative selection-based enrichment 1:179–180
 positive selection-based enrichment 1:179
 entecavir (ETV) 5:218
Enterobacteriales, phage cluster-host species relationships with 4:272–273

- Enterobacteriales* tailed phage example 4:269–270
- enterovirus 71 (EV-A71) 1:284, 1:599–600
- enteroviruses (EVs) 1:530, 1:284, 1:392
- classification (compact) 2:245–246
- clinical features 2:250–252

- genomes and genomics (*continued*)
 diversity in genome size and organization 4:50
 horizontal exchange of genes is widespread 4:51
 genome structure 4:601–602, 1:237–238
 genomic architecture, defined 1:62
 genomic precursor, defined 4:26
 genomics-based taxonomy of viruses, emergence of 1:50–51
 genomic segment, defined 4:26
Genomoviridae 4:718
 genotype, defined 1:62, 5:289, 2:789, 2:22
 genotyping 5:186
 geodesic polyhedra 1:250
 geometric mean titers (GMTs) 5:296
 germicides 5:205
 germline insertions 1:630–631
 endogenous retroviruses (ERVs), exaptation of 1:630–631
 ERV-derived non-coding elements 1:631–632
 ERV-derived proteins 1:632
 ERV-encoded envelope glycoproteins 1:630–631
 GE sequence *see* gene end (GE) sequence
 GFP *see* green fluorescent protein (GFP)
gfp gene, defined 4:858
 G glycoprotein 2:750–752
 GI *see* gastrointestinal infections (GI)
 giant viruses 1:493, 1:372
 diversity and distribution of 1:373–375
 genomics and proteomics of 1:376–377
 life style of giants 1:375–376
 origin and evolution 1:377–379
 origin of 1:20–22
 parasites of viruses 1:379–381
 serendipitous discovery of 1:372–373
Giardia canis virus (GCV) 4:582, 4:583, 4:584
Giardia intestinalis/duodenalis 4:582
Giardia lamblia 4:582
Giardia lamblia virus (GLV) 4:582, 4:582–583, 4:584, 4:585, 4:586
 giardiaviruses
 history 4:582
 host range and geographic distribution 4:582–583
 infection and replication 4:586–587
 organization and molecular biology of GLV and GCV dsRNA genomes 4:585–586
 physical and biochemical characteristics 4:583–585
 taxonomy, classification and evolution 4:582
 gill-associated virus (GAV) 2:256
 Gillespie-type algorithms, defined 1:248
 gingivostomatitis 5:175, 2:404
 GISAID *see* Global Initiative on Sharing All Influenza Data (GISAID)

 head, dealing with 4:219–221
 capsids with large numbers of co-localized E proteins 4:223–224
 capsids with large numbers of E proteins distributed throughout the DNA 4:222–223
 E proteins, enigmas of 4:224–225
 encapsulation of E proteins 4:225–226
 impacts of E proteins on capsid DNA packaging and ejection 4:226
 impacts of E proteins on DNA ejection 4:226–227
 phages with yet to be identified E proteins 4:224–225
 potential of E protein delivery from capsid derived nanocontainers 4:227
 tailed phage capsids with low numbers of E proteins in specific locales 4:220–221
 low copy number E proteins with specific locales in the capsid 4:221
 podoviral E proteins 4:221–222
 headful packaging, defined 4:61, 4:368
 headful termination, defined 4:136
 head-tail connector, defined 4:105
 heartland banyangvirus (HRTV) 2:775–776
 heating, ventilation, and air conditioning (HVAC) systems 5:69
 heat therapy, defined 3:430
 HEF protein *see* hemagglutinin-esterase-fusion (HEF) protein
 helical and filamentous phages 4:53
 biotechnological applications of filamentous phage 4:59–60
 biotopes 4:53–55
 infection process 4:56
 M13 (fd, f1), biosynthesis of 4:56
 assembly and secretion 4:58–59
 coat proteins 4:56
 major coat protein gp8 4:56–57
 minor coat proteins gp3 and gp6 4:57–58
 minor coat proteins gp7 and gp9 4:57
 replication by the rolling circle mechanism 4:56
 structure of filamentous phages 4:55–56
 helical symmetry 1:261, 1:362, 3:229
 helical viruses, structure of 1:362, 1:364t
Archaea, *Rudiviridae* and *Lipothrixviridae*, viruses of 1:367–369
 atomic structure 1:475–476
Claviviridae 1:369
 filamentous bacteriophage 1:365–366
 flexible, filamentous plant viruses 1:364–365

- helical viruses, structure of (*continued*)
 hemorrhagic filoviridae 1:366–367
 rod-shaped helical plant viruses 1:362–364
 spindle-shaped viruses 1:369–370
- helicase-primase, defined 2:441
- helicoverpa armigera stunt virus (HaSV) 4:897, 4:901–902
- Heliothis zea nudivir* 4:827–828
- heliolthsi zea nudivir 1 (HzNV-1) 4:710
- 4-Helix bundle 1:362
- 6-helix bundle (6HB) 2:750
- Helminthosporium victoriae* 4:432
 hypovirulence in 4:476–477
- helper component, defined 3:703, 3:106
- Helper component proteinase, defined 3:293
- helper phage, defined 4:98
- helper strategy 3:112
 aphid-transmitted caulimoviruses, case of 3:112
 aphid-transmitted potyviruses, case of 3:112

 NDV *see* Newcastle disease virus (NDV)
 near-atomic resolution, cryo-EM at 1:233–235
 data collection and image reconstruction 1:233–235
 near-atomic resolution maps, interpretation of 1:235
 side chain interactions and virus assembly 1:235
 NEAR technology *see* nicking enzyme amplification reaction (NEAR) technology
 necro-like viruses (*Tombusviridae*)
 cytopathology 3:484
 genome organization and expression 3:481–483
 intraspecific relationships 3:483
 satellites 3:483–484
 taxonomy and classification 3:481
 transmission and host range 3:484
 virion properties, structure and composition 3:481
 necrotic syndrome of lettuce, defined 3:833
nef gene 2:61t
 negative-contrast electron microscopy, defined 4:632
 negative predictive value (NPV) 5:74
 negative selection-based enrichment 1:179–180
 Negative sense (–) strand, defined 1:429
 negative sense genome, defined 3:507
 negative-sense RNA viruses 1:499, 3:567
 negative single stranded RNA viruses (NSRVs) 1:345–346
 classification of NSRVs and genome organization 1:346
 general features of NSRV virion structures 1:346
 inside the virion 1:348–349
 matrix proteins 1:349
 nucleoproteins 1:349–350
 phosphoproteins 1:350–351
 polymerase 1:350
 viral ribonucleoproteins/nucleocapsids assemblies 1:349
 virion surface, structure of 1:346–348
 accessory proteins in the virion surface 1:348
 structure and function of virion glycoproteins 1:347–348
 Negative Stain 5:5
 negative staining (NS) 5:9, 5:9–10
 for diagnosis of fecal samples 5:11
 agarose slides, preparation of 5:11
 general protocol for the study of viruses by 5:10–11
 neighbor-joining (NJ) method 1:118–119
 nematodes, plant viruses transmission by 3:113
 NendoU function 2:264
Neodiprion sertifer 4:704
 neonatal herpes simplex virus infection 5:178–180
 neoplasia, defined 2:316

- neotope, defined 3:727
 NEP *see* nuclear export protein (NEP)

 programmed death receptor ligand-1 (PD-
 L1) 1:660
 progressive multifocal leukoencephalopathy
 (PML) 5:109, 1:74
 prohead 4:115–117
 assembly 4:117–118
 assembly parasites 4:123
 defined 4:219, 4:105
 major capsid protein before capsid
 assembly 4:117
 portal 4:120–121
 scaffolding protein 4:118–119

- accelerating assembly 4:119
 delay MCP transformation 4:119–120
 exclude host factors 4:120
 promote correct geometry 4:119
 scaffold involvement in portal incorporation 4:120
 stability of 4:123
 structure of 4:121–123
 prokaryotes, defined 4:242
 prokaryotic Argonaute (pAGO) 1:608
 prokaryotic cells, release of phages from 1:501–502
 cell envelope 1:503–504
 multigene lysis (MGL) systems 1:504–505
 lambda lysis, looking under the hood of 1:505–507
 lambda lysis cassette 1:505
 lambda MGL, operational outline of 1:505
 lambda prophage as a lysis platform 1:504–505
 phage lysis, definition of 1:502–503
 pinholins and SAR endolysins 1:507–508
 endolysin diversity 1:512–513
 holin diversity 1:512
 lysis in mycobacteria 1:514
 MGL diversity 1:512
 MGL in gram-positive hosts 1:513–514
 regulation of MGL 1:509–510
 second type of spanin 1:508–509
 spanin diversity 1:513
 single gene lysis (SGL) systems 1:514–515
 Archaea, phage egress in 1:517–518
 extrusion 1:517
 of *Leviviridae* 1:515–516
 mysterious L 1:516–517
 X174 E 1:514–515
 prokaryotic dsDNA viruses, genome replication of 1:429–430
 prokaryotic RNA viruses, genome replication of 1:437
 prokaryotic ssDNA viruses, genome replication of 1:436
 prokaryotic viruses 1:165–166
 classification of 1:430*t*
 genomes of 1:429
 proliferating cell nuclear antigen (PCNA) 4:390–391, 4:366
 proliferation, defined 2:528
 promoter, defined 2:442, 2:56, 4:69
 promoters, viral 1:652
 use 1:655–657
 viral examples 1:653–655
 prophage 4:291, 4:265, 1:552, 4:276, 4:242, 4:77, 4:88, 4:368, 4:283, 4:342
 prophage induction 4:84–85, 4:77
 prophage remnants 1:640–641
 prophage reservoir, defined 4:283
 prophages 1:636
 pro-retroviruses, defined 3:653
 protease, defined 4:776
 protease activation, cell entry targeting by 5:238
 protease inhibitors (PIs) 5:139, 2:473
 -based regimens 5:140
 atazanavir 5:141
 darunavir 5:140–141
 dual therapy 5:140
 lopinavir 5:141
 new PIs 5:141
 triple therapy 5:140
 classes of 5:140*t*
 in combination with other ART classes 5:140
 drug–drug interactions 5:141
 mechanism of action 5:139
 pharmacodynamics and pharmacokinetics in 5:139–140
 protease inhibitors in clinical practice 5:143
 protease inhibitors in low resource settings 5:142–143
 sub-Saharan Africa 5:142–143
 resistance to PIs 5:141–142
 side effects 5:141
 cardiovascular 5:141
 dyslipidemia, lipodystrophy and insulin resistance 5:141
 gastrointestinal 5:141
 hepatotoxicity 5:141
 kidney stones 5:141
 tolerability of 5:141
 protease protein, defined 3:96
 protease/reverse transcriptase (P5) 3:318
 protective antigen (PA) 4:262
 protein antibiotics (PA) 1:515, 1:501–502
 protein cluster, defined 4:265
 protein-coding genes 2:457
 protein-coding regions 2:444*f*
 Protein Data Bank (PDB) 1:141, 1:153
 protein–DNA binding 4:139–140
 DNA binding domains (DBDs) 4:140–141
 multiple binding events regulate complex assembly 4:141
 sequence specific and non-specific binding 4:140
 protein domain, defined 1:345
 protein ejection and trans-envelope channel formation 4:206–207
 protein glycosylation 4:387, 4:359
 protein IIIa 1:333
 protein injection 4:48
 Protein IX 1:337, 1:333–335
 protein kinase R (PKR) 2:857–858, 1:444–445
 protein loops, defined 1:345
 protein-only hypothesis, defined 2:707
 protein-primed DNA replication 1:433–434, 4:36, 1:429, 4:368
 protein receptors 1:394–396
 complement control proteins 1:396–397
 ectoenzymes 1:397
 CoV-ectoenzyme interactions 1:397
 immunoglobulin superfamily proteins 1:394–396
 virus interactions with IgSF receptors 1:395–396
 Protein V 1:335
 protein VI 1:333
 protein VIII 1:333
 proteomics 1:498
 protist, defined 3:106
 protohelix, defined 3:734
 proton-motive force (PMF) 1:504, 4:206
 proto-oncogene, defined 2:316
 protoparvoviruses 2:684*f*
 clinical features 2:425
 epidemiology 2:424
 protoplast, defined 4:601, 4:607, 3:456, 3:507, 4:648
 protospacer adjacent motifs (PAM) 4:398
 protospacer-flanking site (PFS) 4:248
 prototype virus, defined 4:776
 proventricular dilatation disease (PDD) 2:137, 2:140–141
 providence virus 4:898, 1:250
 proviral DNA 2:62
 proviral load, defined 2:528
 proviophage 1:380
 proviophage, defined 1:372
 provirus, defined 1:162, 2:643, 2:144, 4:387, 1:627, 2:528, 2:56, 4:359
 PrP, defined 2:707
 PrP^C, defined 2:707
 PrP^{Sc}, defined 2:707
 PRRs *see* pathogen recognition receptors (PRRs); pattern recognition receptors (PRRs)
 PRRS *see* porcine reproductive and respiratory syndrome (PRRS)
 PRRSV *see* porcine reproductive and respiratory syndrome virus (PRRSV)
 PRSV *see* papaya ringspot virus (PRSV)
 prunevirus, defined 3:805
 pruritis, defined 2:738
 PRV *see* perch rhabdovirus (PRV)
 P-selectin glycoprotein ligand-1 (PSGL-1) 1:410, 1:284
 Pseudaletia separata EPV (PSEV) 4:859
 pseudocowpox 2:668
 pseudocowpox virus (PCPV) 2:666, 2:171
 pseudoknot, defined 3:447, 3:818, 4:648, 3:734
 pseudolysogeny, defined 4:314
Pseudomonas aeruginosa 1:640–641
 pseudomurein endoisopeptidase, defined 4:387
 pseudorabies virus (PrV) 2:715*f*
 classification 2:714
 clinical features and pathogenesis 2:720–721
 epidemiology and prevention 2:722–723
 future perspectives 2:723

Q

QA *see* quality assurance (QA)
 QMS *see* quality management system (QMS)
 qPCR *see* quantitative polymerase chain reaction (qPCR)
 Q protein 4:89–90
 quadriparticulate virus, defined 4:642
 quadripartite genome, defined 4:642
 quadriviruses (*Quadriviridae*) 4:642, 4:506–508
 genome organization and expression 4:644–645
 molecular and biological properties 4:645–646
 phylogenetic and evolutionary relationships of RnQV1 to other dsRNA mycoviruses 4:646–647
 virion structure and composition 4:642–644
 qualitative studies 1:565
 quality assurance (QA) 5:55–57
 quality assurance (QA) and quality management (QM), principles of 5:64
 document control 5:65–66
 laboratory specimen retention times 5:67
 personnel training, competency, and continuous professional development (CPD) 5:67–68
 quality management documentation 5:64–65
 quality management system (QMS) 5:64, 5:65f
 specimen management 5:66
 transportation and storage of specimens 5:66–67
 quality assurance (QA) in the clinical virology laboratory
 assay verification and validation 5:70–72
 accuracy 5:72
 linearity/analytical measurement range (AMR) 5:72–73
 precision 5:72
 reportable range and limit of detection (LoD) 5:72
 EQA design and objectives 5:76–78
 equipment calibration 5:69
 equipment maintenance and monitoring 5:69–70
 equipment qualification 5:69
 external quality assessment and performance criteria 5:76
 future aspects of QA to virology laboratory 5:78–81
 internal and external audits 5:70
 internal quality assessment (IQA) 5:74
 internal quality control procedures and monitoring assay performance over time 5:74–75
 laboratory facilities and equipment 5:68
 sensitivity, specificity, and clinical utility 5:73–74
 suitable standards, reference materials and controls to support quality assurance in virology 5:75–76
 quality management documentation 5:64–65
 quality management system (QMS) 5:56–57, 5:64, 5:65f
 quantitative polymerase chain reaction (qPCR) 2:651
 quantitative spectral imaging 1:211
 quantitative trait loci, defined 3:69, 3:554, 3:555
 Quantum Dot, defined 1:208
 quasi-enveloped viruses 1:524
 quasi-enveloped virus particles, defined 2:397
 quasi-equivalence, defined 1:248, 1:278, 4:115
 quasi-equivalence theory 1:249–250
 predictions and limitations of 1:250
 quasi-equivalent conformers, defined 4:21
 quasispecies
 concept 1:68–69
 defined 2:373
 theory 1:58
 viral 1:58
 quasispecies-like populations, evolution as 3:100
 quiescent infection 2:456–457
 quinviruses (*Betaflexiviridae*) 3:642
 diagnosis 3:652
 epidemiology and control 3:651–652
 genome organization 3:643–648
 properties and functions of gene products 3:648–649
 replication and propagation 3:649
 taxonomy and phylogeny 3:642–643
 transmission and host range 3:649–651
 virion structure 3:643

R

rabbit hemorrhagic disease virus (RHDV)
 1:665–666, 1:669, 1:648
 classification 2:724
 clinical features 2:726
 diagnosis 2:728
 epidemiology 2:726
 genome 2:725–726
 pathogenesis and host immunity 2:726–728
 prevention and control 2:728–729
 treatment 2:729
 virion structure 2:724–725
 rabbit myxoma virus and fibroma viruses 2:730
 Californian myxoma virus 2:731–732
 classification 2:730
 clinical disease in European rabbits 2:732–733
 diagnosis 2:734–735
 epidemiology 2:731
 genome 2:730
 life cycle 2:730–731
 myxomatosis in European rabbits 2:732
 myxoma virus 2:731
 pathogenesis of myxomatosis in European rabbits 2:733–734
 prevention of myxomatosis 2:735
 treatment 2:735
 virion structure 2:730

- rabies and lyssaviruses
 classification (compact) 2:738
 clinical features 2:740–741
 diagnosis 2:742–743
 epidemiology 2:739–740
 genome 2:738
 life cycle 2:738–739
 pathogenesis 2:741–742

- RDV *see* rice dwarf virus (RDV)
- reactivation, defined 2:442
- reactive oxygen species (ROS) 3:420
- read, defined 4:322
- read of insert (ROI) 1:181
- readthrough, defined 3:788, 3:481, 3:285
- readthrough protein, defined 3:106
- real-time PCR assays, validating 5:35, 3:629
 analytical specificity and sensitivity 5:40
 analytical verification stage 5:38
 reference materials and sample numbers 5:38
 template, primers and probes 5:38–39
 clinical validation stage 5:42
 precision, accuracy and trueness 5:42
 commercial assays 5:36–37
 consultation stage 5:37
 experimental optimization 5:40
 gold standard comparative study 5:42–43
 inhibition study 5:40–41
 inter-laboratory testing 5:43
 linear dynamic range or reportable range 5:41–42
 maintaining the validated status and re-validation 5:43–44
 normalization 5:40
 PCR efficiency 5:41
 preliminary considerations 5:37
 quantification standards, choice of 5:39
 reaction controls 5:39
 reverse transcription PCR 5:39
 study without a gold standard 5:43
 validation, need for 5:35–36
 in-house assays 5:35–36
 validation plan 5:37–38
 Westgard rules 5:39–40
- real-time polymerase chain reaction (RT-PCR) 1:497
- reassortant, defined 5:289, 2:349, 3:371
- reassortment, defined 1:62, 1:569, 3:516, 4:607, 2:654
- receptor, defined 1:402, 1:382, 4:380, 2:518
- receptor binding domain (RBD) 2:70–71
- receptor-binding proteins (RBPs) 1:129, 5:237, 1:402
- receptor-binding site (RBS) 1:525
- receptor-mediated, clathrin-dependent endocytosis 1:533
- receptor-mediated endocytosis 1:389
- receptor-mediated virus uncoating 1:389
- receptors, viral 1:388–389
 attachment factors 1:399–400
 co-receptors for infection 1:397–399
 evolution of virus-recept or interactions and viral tropism 1:400–401
 glycan receptors 1:390–391
 enteroviruses (EVs) 1:392
 glycan-based antiviral strategies 1:393–394
 glycosaminoglycan receptors 1:393
 histo-blood group antigen receptors (HBGAs) 1:392–393
 influenza viruses 1:391–392
 polyomaviruses (PyVs) 1:392
 sialic acid receptors 1:390–391
- identification of 1:389–390
- protein receptors, interactions with viruses 1:394–396
 complement control proteins 1:396–397
 ectoenzymes 1:397
 immunoglobulin superfamily proteins 1:394–396
 in virus cell entry 1:389
 attachment 1:389
 receptor-mediated endocytosis 1:389
 receptor-mediated virus uncoating 1:389
- recessive allele, defined 3:69, 3:554
- RecET, defined 4:291
- recombinant and mutant virus particles 1:223
- recombinant nematode anticoagulant protein c2 (rNAPc2) 2:616
- recombinant vesicular stomatitis virus (rVSV)-based Ebola vaccine 2:616
- recombinase, defined 4:291
- recombination 2:63–64, 1:56, 1:62, 1:569, 4:291, 1:71, 3:411, 2:245
 computational estimation of 1:108–109
 analyzing recombination in sequences derived from next generation sequencing 1:111–112
 estimation of recombination rates 1:111
 identification of recombination breakpoints 1:109–111
 phylogenetic recombination networks, reconstruction of 1:111
 rapid tests to detect the presence of recombination 1:108–109, 1:110f
 defective-interfering RNAs 1:465–467
 in DNA viruses 1:56–57
 homologous and non-homologous, defined 4:276
 reassortment 1:56
 recombination in DNA viruses 1:460–462
 recombination in RNA viruses 1:462–465
 template switching 1:56
- recombination-dependent replication (RDR) 4:62–63, 3:753–754
- recombination directionality factor (RDF) 4:77–78
- recombination in virus genetic data 1:112
 hepatitis B virus genotypes, recombination among 1:112–113
 HIV-1 centralized vaccines, recombination in the design of 1:112
 HIV-1 fitness recovery, influence of recombination on 1:112
 HIV-1 gp120, analyzing adaptation of 1:113
- recombineering
 combining with other gene modification technologies 4:299
 development of 4:294–295
 with dsDNA 4:295–296
 dsDNA recombineering, mechanism of 4:298
in vivo cloning 4:297
 markerless gene deletions and counterselection schemes 4:296

- recombineering (*continued*)
 oligo-mediated recombineering,
 mechanism of 4:297–298
 recombinase-independent recombination
 4:299–300
 recombineering in pathogenic bacteria
 4:298–299
 with ssDNA 4:296–297
 recombineering, defined 4:291
 recycling endosome pathway (REP) 2:72
 red deer, parapox of 2:668
 regulators of complement activity (RCA)
 1:396
 regulatory authority, defined 5:281
 regulatory T cells (Tregs) 1:588
 reinfection, defined 2:442
 release, defined 1:382
Reoviridae 3:545
Reoviridae family viruses, overall structure of
 1:303
 Sedoreovirinae 1:303
 orbivirus 1:303
 phytoreovirus 1:303
 rotavirus 1:303
 Spinareovirinae 1:303–306
 aquareovirus 1:306
 cypovirus 1:306
 orthoreovirus 1:305–306
 viral genome, general features of 1:306
 reoviruses 1:303, 4:867, 4:714
 capsid layers, structural organization of
 1:306–307
 cell entry of dsRNA viruses 1:307–309
 outer capsid layer 1:306–307
 double-stranded RNA (dsRNA) virus core
 and endogenous transcription 1:309
 viral innermost capsid layer that
 encloses the genome 1:309
 viral RNA capping 1:311–313
 viral RNA-dependent RNA polymerase
 (RdRp) 1:309–311
 double-stranded RNA (dsRNA) virus
 families 1:314–315
 genome replication and packaging 1:313
 replication and packaging 1:313–314
 viroplasm/replication factories 1:313
Reoviridae family viruses, overall structure
 of 1:303
 general features of the viral genome
 1:306
 Sedoreovirinae 1:303
 Spinareovirinae 1:303–306
 reoviruses of invertebrates 4:713–715
 Sedoreovirinae 4:877–879
 cardoreovirus 4:878–879
 phytoreovirus 4:879–881
 seadornavirus 4:881
 Spinareovirinae 4:868–870
 antigenic and genetic relationships
 4:876–877
 historical overview 4:870
 host range, diseases, transmission, and
 distribution 4:870–871
 virion properties, genome, and
 replication 4:871–875
 taxonomy 4:867
 REP *see* recycling endosome pathway (REP)
RepA gene 3:465
 repeat region 2:58–59
Rep gene 3:465
 Rep/Helicase, defined 4:849
 replicase-associated protein (RAP) 3:792–
 793
 replicase proteins 3:265
 replication, defined 4:136, 2:442
 Replication and Transcription Activator
 (RTA) 2:601
 replication cycle, defined 1:162
 replication initiation endonucleases (RCRE)
 4:390–391, 4:391
 replication initiator protein, defined 3:470
 replication of viruses
 assembly 1:386
 attachment 1:383–384
 double-stranded DNA 1:385
 double-stranded DNA with RNA
 intermediate 1:386
 double-stranded RNA 1:385
 entry 1:384
 maturation 1:386
 release 1:386–387
 single-stranded (–)-sense RNA 1:385
 single-stranded (+)-sense RNA 1:385
 single-stranded DNA 1:385
 single-stranded RNA with DNA
 intermediate 1:386
 transcription and genome replication
 1:384–385
 uncoating 1:384
 replication organelle (RO) 1:495, 1:498
 defined 1:495
 replication origin (*ori*), defined 4:61
 replicon, defined 2:386, 2:747
 replisome, defined 4:61
 Rep protein 3:360
 representational difference analysis, defined
 2:48
 representativeness 5:247, 5:252
 reproduction number, defined 2:825
 reptilian adenoviruses 2:13–14
 RER *see* rough endoplasmic reticulum
 (RER)
 reservoir, defined 2:117
 resistance, defined 3:192
 resistance breaking strain, defined 3:355
 resistance gene, defined 3:60, 3:554, 3:555
 resistance gene analog (RGA) marker 3:563
 resistant, defined 4:276
 resistosome 3:64–66, 3:60
 respiratory syncytial virus (RSV) 1:205,
 5:272–273, 5:123–124
 animal models of 2:753–754
 antiviral agents 2:755
 classification 2:748–749
 disease 2:747–748
 F glycoprotein 2:749–750
 genome transcription and replication
 2:752–753
 G glycoprotein 2:750–752
 history 2:747
 live attenuated vaccines 2:754–755
 management of RSV infections
 clinical features 5:155–156
 epidemiology 5:155
 pathogenesis and immunity 5:155
 prophylaxis 5:156–157
 treatment strategies 5:156
 vaccination 5:157
 maternal vaccination 2:754
 non-structural viral proteins 2:753
 passive immunity and prophylactic
 therapy 2:754
 protection from RSV disease 2:754
 vaccination 2:754
 RSV Fusion glycoprotein 5:124
 RSV RNA polymerase 5:123–124
 third viral glycoprotein 2:753
 treatment of 2:755
 vectored RSV vaccines 2:755
 virion organization 2:749f
 virus entry 2:749
 virion 2:749
 respiratory tract infections (RTI) 5:99–100
 assays 5:100–101

 clinical impact 5:101
 lower 5:200
 upper 5:199–200
 restriction factor (RF) 1:627, 2:442, 1:628–
 629, 1:629–630
 restriction fragment length polymorphisms
 (RFLPs) 1:75, 3:192, 3:200
 restriction-modification system, defined 4:229
 reticulons, defined 3:32
 retinoblastoma protein, defined 2:79
 retinoic-acid-inducible gene 1 (RIG-I)
 2:391–392, 2:214, 2:555
 retroelements, classification of 3:98t
 retrograde, defined 2:738
 retrotranscription 2:62
 retrotranscytosis 1:529
 retrotransposons
 associated with invertebrates 4:722
 defined 3:274
 retrotransposons of plants
 Env-like functions in plants 3:102
 general classification 3:96–99
 long terminal repeat (LTR)
 retrotransposons
 different genera of 3:100–101
 life cycle of 3:99–100
 Metaviridae (Ty3/gypsy retrotransposons)
 3:101
 nomenclature issue 3:102–103
 Pseudoviridae (Ty1/copia retrotransposons)
 3:100–101
 quasispecies-like populations, evolution as
 3:100
 retroviral cycle, high similarities with
 intracellular steps of 3:99–100
 unclassified LTR retrotransposons 3:101–
 102
 retroviral cycle, high similarities with
 intracellular steps of 3:99–100
Retroviridae 2:56
 animal lentiviral infections 2:65–66
 bovine immunodeficiency (BI) and
 Jembrana disease (JD) 2:66

- equine infectious anemia (EIA) 2:67
 feline immunodeficiency and puma
 lentiviral infections 2:66
 visna-maedi (VM) and caprine arthritis
 and encephalitis (CAE) 2:66–67
 biological properties 2:63–64
 natural hosts 2:64
 transmission 2:64
 tropism 2:64
 variability 2:63–64
 classification 2:56–57
 encoded proteins 2:59–60
 genome 2:57–59
 pathogenic processes 2:64–65
 cell defenses and viral mechanisms 2:65
 immune deficiency 2:65
 inflammation 2:65
 replication cycle 2:60–63
 reverse transcription 2:62–63
 virion structure 2:57
Retroviridae 2:827–828
 clinical features 2:829–830
 defined 2:827
 epidemiology 2:829
 genome 2:828–829
 lifecycle 2:828–829
 immunity to 2:830
 taxonomy and classification 2:828
 virion structure 2:828
 retroviruses 1:525, 1:491–492
 see also fish retroviruses
 of birds
 classification 2:122–123
 clinical features 2:125
 diagnosis 2:126
 endogenous retroviruses 2:126
 epidemiology 2:124–125

 treatment 2:126
 virion structure 2:123
 in cellular evolution 1:627
 germline insertions 1:630–631
 molecular consequences of retrovirus
 integration 1:627–629
 as selective agents 1:629f
 and their life cycle 2:316–317
 retrovirus integration, molecular
 consequences of 1:627–629
 host dependency factors (HDFs) 1:629
 host genes with indirect effects on
 retrovirus infection, spread or disease
 1:630
 host immunity 1:630
 restriction factors (RFs) 1:629–630
 retrovirus virions, structure of
 env gene 1:358–360
 gag proteins and retroviral virion structure
 1:352–354
 immature retroviral virion, assembly of
 1:356–358
 individual gag domains, structures of
 1:354–355
 capsid protein (CA) 1:355–356
 linker peptides 1:356
 matrix protein (MA) 1:354–355
 nucleocapsid protein (NC) 1:356
 reverse genetics, defined 4:26, 3:123
 reverse-transcribing RNA and DNA viruses,
 origin of 1:18–19
 reverse-transcribing viruses (RTV) 1:42–43,
 1:15–16
 genome organization and functions of
 gene products 3:654–656
 host range and evolutionary dynamics
 3:662–664
 impact and relationships of LTR
 retrotransposons and retroviruses
 with their hosts 3:664–665
 life cycle and replication 3:659–662
 LTR retrotransposons and reverse-
 transcribing viruses 3:654
 taxonomy, phylogeny and members of the
 families 3:656–659
 reverse transcriptase (RT) 2:464, 5:132,
 2:62f, 2:63f, 3:313
 reverse transcriptase inhibitors (RTIs)
 2:472–473
 reverse transcriptase protein, defined 3:96
 reverse transcriptase structure and functions
 5:131
 reverse transcription (RT)-PCR 3:629
 reverse transcription, defined 2:460, 5:27,
 3:158
 reverse transcription, process of 5:131–132
 reverse transcriptase (RT) 5:132
 RNase H 5:132
 tRNA primer 5:131–132
 reverse transcription loop-mediated rapid
 isothermal amplification (RT-LAMP)
 detection kit 4:825
 reverse transcription polymerase chain
 reaction (RT-PCR) 2:241, 5:98,
 5:300, 2:704, 2:705, 2:743, 2:38,
 2:812–813, 3:322, 5:29, 2:214,
 2:341, 2:542, 3:539, 2:514
 rev gene 2:61t
 Rev Response Element (RRE) 2:463
 RF see restriction factor (RF)

 temperate, defined 1:621, 4:36, 4:276
 temperate bacteriophage, defined 4:77
 temperate phage
 decision making by 4:88
 counting by infecting phages 4:90–93
 decision to remain dormant 4:94–97
 post-infection decision of phage lambda 4:88–90
 single cell, view from 4:93–94
 defined 4:88, 4:98
 temperate versus virulent bacteriophages 4:48
 temperate virus, defined 1:162, 4:368
 template strand, defined 4:69
 temporal lobe 2:778
 temporal lobe epilepsy (TLE) 2:785, 2:778
 tenofovir alafenamide (TAF) 5:133, 5:134
 tenofovir disoproxil fumarate (TDF) 5:218, 5:133, 5:134
 tenuiviruses (*Phenuiviridae*) 3:719–720
 biological properties 3:724–725
 host range and geographic distribution 3:725
 classification 3:720
 components 3:720–723
 cytopathology 3:725
 disease symptoms and control 3:725–726
 genome organization 3:723
 insect vector and type of transmission 3:726
 physical and physicochemical properties 3:720
 relation to other taxa 3:726
 replication and transcription 3:723–724
 taxonomy 3:720
 virion structure 3:720
 morphology 3:720
 tepovirus, defined 3:805
 TER *see* transepithelial electrical resistance (TER)
 TerL DNA packaging domain 4:127
 TerL subunits 4:125–126
 terminally redundant DNA, defined 4:77
 terminal protein (TP) 4:761–762, 2:8, 4:62–63, 1:433–434
 Terminal Protein Region 1 (TPR1) and 2 (TPR2) 1:433–434
 terminal redundancy, defined 4:229
 terminase, defined 4:277, 4:160, 4:105
 terminase holoenzymes 4:126, 4:124
 terminase motors 4:152–153
 terminase protomer, defined 4:124
 termination upstream ribosome-binding site (TURBS) 2:875
 terrestrial dust 4:355
 terrestrial hot springs 4:345–347
 TerS subunits 4:125
 tetherin 2:65
 tetra virus capsid
 capsid maturation, auto-proteolysis and dynamics 4:901–902
 capsid structure 4:900–901
 tetra viruses 4:717
 tetra viruses of insects 4:897
 genome organization 4:897
 Alphatetraviridae 4:897
 Carmotetraviridae 4:898
 Permutotetraviridae 4:897–898
 pathology 4:902
 host range 4:902
 persistent infections 4:902–903
 symptoms and transmission 4:902
 taxonomic classification 4:898
 tetra virus capsid
 capsid maturation, auto-proteolysis and dynamics 4:901–902
 capsid structure 4:900–901
 viral replication 4:898–900

Renegade:

Adjective

‘Having rejected tradition: Unconventional.’

Merriam-Webster Dictionary

Acquiescence to tyranny is the death of the spirit

You may be 38 years old, as I happen to be. And one day, some great opportunity stands before you and calls you to stand up for some great principle, some great issue, some great cause. And you refuse to do it because you are afraid ... You refuse to do it because you want to live longer ... You're afraid that you will lose your job, or you are afraid that you will be criticised or that you will lose your popularity, or you're afraid that somebody will stab you, or shoot at you or bomb your house; so you refuse to take the stand.

Well, you may go on and live until you are 90, but you're just as dead at 38 as you would be at 90. And the cessation of breathing in your life is but the belated announcement of an earlier death of the spirit.

Martin Luther King

**How the few control the many and always have – the many do
whatever they're told**

'Forward, the Light Brigade!'
Was there a man dismayed?
Not though the soldier knew
Someone had blundered.
Theirs not to make reply,
Theirs not to reason why,
Theirs but to do and die.
Into the valley of Death
Rode the six hundred.

Cannon to right of them,
Cannon to left of them,
Cannon in front of them
Volleyed and thundered;
Stormed at with shot and shell,
Boldly they rode and well,
Into the jaws of Death,
Into the mouth of hell
Rode the six hundred

Alfred Lord Tennyson (1809-1892)

The mist is lifting slowly
I can see the way ahead
And I've left behind the empty streets
That once inspired my life
And the strength of the emotion
Is like thunder in the air
'Cos the promise that we made each other
Haunts me to the end

The secret of your beauty
And the mystery of your soul
I've been searching for in everyone I meet
And the times I've been mistaken
It's impossible to say
And the grass is growing
Underneath our feet

The words that I remember
From my childhood still are true
That there's none so blind
As those who will not see
And to those who lack the courage
And say it's dangerous to try
Well they just don't know
That love eternal will not be denied

I know you're out there somewhere
Somewhere, somewhere
I know you're out there somewhere

Somewhere you can hear my voice
I know I'll find you somehow
Somehow, somehow
I know I'll find you somehow
And somehow I'll return again to you

The Moody Blues

Are you a gutless wonder - or a Renegade Mind?

Monuments put from pen to paper,
Turns me into a gutless wonder,
And if you tolerate this,
Then your children will be next.
Gravity keeps my head down,
Or is it maybe shame ...

Manic Street Preachers

Rise like lions after slumber
In unvanquishable number.
Shake your chains to earth like dew
Which in sleep have fallen on you.
Ye are many – they are few.

Percy Shelley

CHAPTER ONE

I'm thinking' – Oh, but *are* you?

Think for yourself and let others enjoy the privilege of doing so too
Voltaire

French-born philosopher, mathematician and scientist René Descartes became famous for his statement in Latin in the 17th century which translates into English as: 'I think, therefore I am.'

On the face of it that is true. Thought reflects perception and perception leads to both behaviour and self-identity. In that sense 'we' are what we think. But who or what is doing the thinking and is thinking the only route to perception? Clearly, as we shall see, 'we' are not always the source of 'our' perception, indeed with regard to humanity as a whole this is rarely the case; and thinking is far from the only means of perception. Thought is the village idiot compared with other expressions of consciousness that we all have the potential to access and tap into. This has to be true when we *are* those other expressions of consciousness which are infinite in nature. We have forgotten this, or, more to the point, been manipulated to forget.

These are not just the esoteric musings of the navel. The whole foundation of human control and oppression is control of perception. Once perception is hijacked then so is behaviour which is dictated by perception. Collective perception becomes collective behaviour and collective behaviour is what we call human society. Perception is all and those behind human control know that which is

why perception is the target 24/7 of the psychopathic manipulators that I call the Global Cult. They know that if they dictate perception they will dictate behaviour and collectively dictate the nature of human society. They are further aware that perception is formed from information received and if they control the circulation of information they will to a vast extent direct human behaviour. Censorship of information and opinion has become globally Nazi-like in recent years and never more blatantly than since the illusory 'virus pandemic' was triggered out of China in 2019 and across the world in 2020. Why have billions submitted to house arrest and accepted fascistic societies in a way they would have never believed possible? Those controlling the information spewing from government, mainstream media and Silicon Valley (all controlled by the same Global Cult networks) told them they were in danger from a 'deadly virus' and only by submitting to house arrest and conceding their most basic of freedoms could they and their families be protected. This monumental and provable lie became the *perception* of the billions and therefore the *behaviour* of the billions. In those few words you have the whole structure and modus operandi of human control. Fear is a perception – False Emotion Appearing Real – and fear is the currency of control. In short ... get them by the balls (or give them the impression that you have) and their hearts and minds will follow. Nothing grips the dangly bits and freezes the rear-end more comprehensively than fear.

World number 1

There are two 'worlds' in what appears to be one 'world' and the prime difference between them is knowledge. First we have the mass of human society in which the population is maintained in coldly-calculated ignorance through control of information and the 'education' (indoctrination) system. That's all you really need to control to enslave billions in a perceptual delusion in which what are perceived to be *their* thoughts and opinions are ever-repeated mantras that the system has been downloading all their lives through 'education', media, science, medicine, politics and academia

in which the personnel and advocates are themselves overwhelmingly the perceptual products of the same repetition. Teachers and academics in general are processed by the same programming machine as everyone else, but unlike the great majority they never leave the 'education' program. It gripped them as students and continues to grip them as programmers of subsequent generations of students. The programmed become the programmers – the programmed programmers. The same can largely be said for scientists, doctors and politicians and not least because as the American writer Upton Sinclair said: 'It is difficult to get a man to understand something when his salary depends upon his not understanding it.' If your career and income depend on thinking the way the system demands then you will – bar a few free-minded exceptions – concede your mind to the Perceptual Mainframe that I call the Postage Stamp Consensus. This is a tiny band of perceived knowledge and possibility 'taught' (downloaded) in the schools and universities, pounded out by the mainstream media and on which all government policy is founded. Try thinking, and especially speaking and acting, outside of the 'box' of consensus and see what that does for your career in the Mainstream Everything which bullies, harasses, intimidates and ridicules the population into compliance. Here we have the simple structure which enslaves most of humanity in a perceptual prison cell for an entire lifetime and I'll go deeper into this process shortly. Most of what humanity is taught as fact is nothing more than programmed belief. American science fiction author Frank Herbert was right when he said: 'Belief can be manipulated. Only knowledge is dangerous.' In the 'Covid' age belief is promoted and knowledge is censored. It was always so, but never to the extreme of today.

World number 2

A 'number 2' is slang for 'doing a poo' and how appropriate that is when this other 'world' is doing just that on humanity every minute of every day. World number 2 is a global network of secret societies and semi-secret groups dictating the direction of society via

governments, corporations and authorities of every kind. I have spent more than 30 years uncovering and exposing this network that I call the Global Cult and knowing its agenda is what has made my books so accurate in predicting current and past events. Secret societies are secret for a reason. They want to keep their hoarded knowledge to themselves and their chosen initiates and to hide it from the population which they seek through ignorance to control and subdue. The whole foundation of the division between World 1 and World 2 is *knowledge*. What number 1 knows number 2 must not. Knowledge they have worked so hard to keep secret includes (a) the agenda to enslave humanity in a centrally-controlled global dictatorship, and (b) the nature of reality and life itself. The latter (b) must be suppressed to allow the former (a) to prevail as I shall be explaining. The way the Cult manipulates and interacts with the population can be likened to a spider's web. The 'spider' sits at the centre in the shadows and imposes its will through the web with each strand represented in World number 2 by a secret society, satanic or semi-secret group, and in World number 1 – the world of the seen – by governments, agencies of government, law enforcement, corporations, the banking system, media conglomerates and Silicon Valley (Fig 1 overleaf). The spider and the web connect and coordinate all these organisations to pursue the same global outcome while the population sees them as individual entities working randomly and independently. At the level of the web governments *are* the banking system *are* the corporations *are* the media *are* Silicon Valley *are* the World Health Organization working from their inner cores as one unit. Apparently unconnected countries, corporations, institutions, organisations and people are on the *same team* pursuing the same global outcome. Strands in the web immediately around the spider are the most secretive and exclusive secret societies and their membership is emphatically restricted to the Cult inner-circle emerging through the generations from particular bloodlines for reasons I will come to. At the core of the core you would get them in a single room. That's how many people are dictating the direction of human society and its transformation

through the 'Covid' hoax and other means. As the web expands out from the spider we meet the secret societies that many people will be aware of – the Freemasons, Knights Templar, Knights of Malta, Opus Dei, the inner sanctum of the Jesuit Order, and such like. Note how many are connected to the Church of Rome and there is a reason for that. The Roman Church was established as a revamp, a rebranding, of the relocated 'Church' of Babylon and the Cult imposing global tyranny today can be tracked back to Babylon and Sumer in what is now Iraq.

Figure 1: The global web through which the few control the many. (Image Neil Hague.)

Inner levels of the web operate in the unseen away from the public eye and then we have what I call the cusp organisations located at the point where the hidden meets the seen. They include a series of satellite organisations answering to a secret society founded in London in the late 19th century called the Round Table and among them are the Royal Institute of International Affairs (UK, founded in 1920); Council on Foreign Relations (US, 1921); Bilderberg Group (worldwide, 1954); Trilateral Commission (US/worldwide, 1972); and the Club of Rome (worldwide, 1968) which was created to exploit environmental concerns to justify the centralisation of global power to 'save the planet'. The Club of Rome instigated with others the human-caused climate change hoax which has led to all the 'green

new deals' demanding that very centralisation of control. Cusp organisations, which include endless 'think tanks' all over the world, are designed to coordinate a single global policy between political and business leaders, intelligence personnel, media organisations and anyone who can influence the direction of policy in their own sphere of operation. Major players and regular attenders will know what is happening – or some of it – while others come and go and are kept overwhelmingly in the dark about the big picture. I refer to these cusp groupings as semi-secret in that they can be publicly identified, but what goes on at the inner-core is kept very much 'in house' even from most of their members and participants through a fiercely-imposed system of compartmentalisation. Only let them know what they need to know to serve your interests and no more. The structure of secret societies serves as a perfect example of this principle. Most Freemasons never get higher than the bottom three levels of 'degree' (degree of knowledge) when there are 33 official degrees of the Scottish Rite. Initiates only qualify for the next higher 'compartment' or degree if those at that level choose to allow them. Knowledge can be carefully assigned only to those considered 'safe'. I went to my local Freemason's lodge a few years ago when they were having an 'open day' to show how cuddly they were and when I chatted to some of them I was astonished at how little the rank and file knew even about the most ubiquitous symbols they use. The mushroom technique – keep them in the dark and feed them bullshit – applies to most people in the web as well as the population as a whole. Sub-divisions of the web mirror in theme and structure transnational corporations which have a headquarters somewhere in the world dictating to all their subsidiaries in different countries. Subsidiaries operate in their methodology and branding to the same centrally-dictated plan and policy in pursuit of particular ends. The Cult web functions in the same way. Each country has its own web as a subsidiary of the global one. They consist of networks of secret societies, semi-secret groups and bloodline families and their job is to impose the will of the spider and the global web in their particular country. Subsidiary networks control and manipulate the national political system, finance, corporations, media, medicine, etc. to

ensure that they follow the globally-dictated Cult agenda. These networks were the means through which the 'Covid' hoax could be played out with almost every country responding in the same way.

The 'Yessir' pyramid

Compartmentalisation is the key to understanding how a tiny few can dictate the lives of billions when combined with a top-down sequence of imposition and acquiescence. The inner core of the Cult sits at the peak of the pyramidal hierarchy of human society (Fig 2 overleaf). It imposes its will – its agenda for the world – on the level immediately below which acquiesces to that imposition. This level then imposes the Cult will on the level below them which acquiesces and imposes on the next level. Very quickly we meet levels in the hierarchy that have no idea there even is a Cult, but the sequence of imposition and acquiescence continues down the pyramid in just the same way. 'I don't know why we are doing this but the order came from "on-high" and so we better just do it.' Alfred Lord Tennyson said of the cannon fodder levels in his poem *The Charge of the Light Brigade*: 'Theirs not to reason why; theirs but to do and die.' The next line says that 'into the valley of death rode the six hundred' and they died because they obeyed without question what their perceived 'superiors' told them to do. In the same way the population capitulated to 'Covid'. The whole hierarchical pyramid functions like this to allow the very few to direct the enormous many. Eventually imposition-acquiescence-imposition-acquiescence comes down to the mass of the population at the foot of the pyramid. If they acquiesce to those levels of the hierarchy imposing on them (governments/law enforcement/doctors/media) a circuit is completed between the population and the handful of super-psychopaths in the Cult inner core at the top of the pyramid. Without a circuit-breaking refusal to obey, the sequence of imposition and acquiescence allows a staggeringly few people to impose their will upon the entirety of humankind. We are looking at the very sequence that has subjugated billions since the start of 2020. Our freedom has not been taken from us. Humanity has given it

away. Fascists do not impose fascism because there are not enough of them. Fascism is imposed by the population acquiescing to fascism. Put another way allowing their perceptions to be programmed to the extent that leads to the population giving their freedom away by giving their perceptions – their mind – away. If this circuit is not broken by humanity ceasing to cooperate with their own enslavement then nothing can change. For that to happen people have to critically think and see through the lies and window dressing and then summon the backbone to act upon what they see. The Cult spends its days working to stop either happening and its methodology is systematic and highly detailed, but it can be overcome and that is what this book is all about.

Figure 2: The simple sequence of imposition and compliance that allows a handful of people at the peak of the pyramid to dictate the lives of billions.

The Life Program

Okay, back to world number 1 or the world of the 'masses'. Observe the process of what we call 'life' and it is a perceptual download from cradle to grave. The Cult has created a global structure in which perception can be programmed and the program continually topped-up with what appears to be constant confirmation that the program is indeed true reality. The important word here is 'appears'.

This is the structure, the fly-trap, the Postage Stamp Consensus or Perceptual Mainframe, which represents that incredibly narrow band of perceived possibility delivered by the 'education' system, mainstream media, science and medicine. From the earliest age the download begins with parents who have themselves succumbed to the very programming their children are about to go through. Most parents don't do this out of malevolence and mostly it is quite the opposite. They do what they believe is best for their children and that is what the program has told them is best. Within three or four years comes the major transition from parental programming to full-blown state (Cult) programming in school, college and university where perceptually-programmed teachers and academics pass on their programming to the next generations. Teachers who resist are soon marginalised and their careers ended while children who resist are called a problem child for whom Ritalin may need to be prescribed. A few years after entering the 'world' children are under the control of authority figures representing the state telling them when they have to be there, when they can leave and when they can speak, eat, even go to the toilet. This is calculated preparation for a lifetime of obeying authority in all its forms. Reflex-action fear of authority is instilled by authority from the start. Children soon learn the carrot and stick consequences of obeying or defying authority which is underpinned daily for the rest of their life. Fortunately I daydreamed through this crap and never obeyed authority simply because it told me to. This approach to my alleged 'betters' continues to this day. There can be consequences of pursuing open-minded freedom in a world of closed-minded conformity. I spent a lot of time in school corridors after being ejected from the classroom for not taking some of it seriously and now I spend a lot of time being ejected from Facebook, YouTube and Twitter. But I can tell you that being true to yourself and not compromising your self-respect is far more exhilarating than bowing to authority for authority's sake. You don't have to be a sheep to the shepherd (authority) and the sheep dog (fear of not obeying authority).

The perceptual download continues throughout the formative years in school, college and university while script-reading 'teachers', 'academics' 'scientists', 'doctors' and 'journalists' insist that ongoing generations must be as programmed as they are. Accept the program or you will not pass your 'exams' which confirm your 'degree' of programming. It is tragic to think that many parents pressure their offspring to work hard at school to download the program and qualify for the next stage at college and university. The late, great, American comedian George Carlin said: 'Here's a bumper sticker I'd like to see: We are proud parents of a child who has resisted his teachers' attempts to break his spirit and bend him to the will of his corporate masters.' Well, the best of luck finding many of those, George. Then comes the moment to leave the formal programming years in academia and enter the 'adult' world of work. There you meet others in your chosen or prescribed arena who went through the same Postage Stamp Consensus program before you did. There is therefore overwhelming agreement between almost everyone on the basic foundations of Postage Stamp reality and the rejection, even contempt, of the few who have a mind of their own and are prepared to use it. This has two major effects. Firstly, the consensus confirms to the programmed that their download is really how things are. I mean, everyone knows that, right? Secondly, the arrogance and ignorance of Postage Stamp adherents ensure that anyone questioning the program will have unpleasant consequences for seeking their own truth and not picking their perceptions from the shelf marked: 'Things you must believe without question and if you don't you're a dangerous lunatic conspiracy theorist and a harebrained nutter'.

Every government, agency and corporation is founded on the same Postage Stamp prison cell and you can see why so many people believe the same thing while calling it their own 'opinion'. Fusion of governments and corporations in pursuit of the same agenda was the definition of fascism described by Italian dictator Benito Mussolini. The pressure to conform to perceptual norms downloaded for a lifetime is incessant and infiltrates society right

down to family groups that become censors and condemners of their own 'black sheep' for not, ironically, being sheep. We have seen an explosion of that in the 'Covid' era. Cult-owned global media unleashes its propaganda all day every day in support of the Postage Stamp and targets with abuse and ridicule anyone in the public eye who won't bend their mind to the will of the tyranny. Any response to this is denied (certainly in my case). They don't want to give a platform to expose official lies. Cult-owned-and-created Internet giants like Facebook, Google, YouTube and Twitter delete you for having an unapproved opinion. Facebook boasts that its AI censors delete 97-percent of 'hate speech' before anyone even reports it. Much of that 'hate speech' will simply be an opinion that Facebook and its masters don't want people to see. Such perceptual oppression is widely known as fascism. Even Facebook executive Benny Thomas, a 'CEO Global Planning Lead', said in comments secretly recorded by investigative journalism operation Project Veritas that Facebook is 'too powerful' and should be broken up:

I mean, no king in history has been the ruler of two billion people, but Mark Zuckerberg is ... And he's 36. That's too much for a 36-year-old ... You should not have power over two billion people. I just think that's wrong.

Thomas said Facebook-owned platforms like Instagram, Oculus, and WhatsApp needed to be separate companies. 'It's too much power when they're all one together'. That's the way the Cult likes it, however. We have an executive of a Cult organisation in Benny Thomas that doesn't know there is a Cult such is the compartmentalisation. Thomas said that Facebook and Google 'are no longer companies, they're countries'. Actually they are more powerful than countries on the basis that if you control information you control perception and control human society.

I love my oppressor

Another expression of this psychological trickery is for those who realise they are being pressured into compliance to eventually

convince themselves to believe the official narratives to protect their self-respect from accepting the truth that they have succumbed to meek and subservient compliance. Such people become some of the most vehement defenders of the system. You can see them everywhere screaming abuse at those who prefer to think for themselves and by doing so reminding the compliers of their own capitulation to conformity. 'You are talking dangerous nonsense you Covidiot!!' Are you trying to convince me or yourself? It is a potent form of Stockholm syndrome which is defined as: 'A psychological condition that occurs when a victim of abuse identifies and attaches, or bonds, positively with their abuser.' An example is hostages bonding and even 'falling in love' with their kidnappers. The syndrome has been observed in domestic violence, abused children, concentration camp inmates, prisoners of war and many and various Satanic cults. These are some traits of Stockholm syndrome listed at goodtherapy.org:

- Positive regard towards perpetrators of abuse or captor [see 'Covid'].
- Failure to cooperate with police and other government authorities when it comes to holding perpetrators of abuse or kidnapping accountable [or in the case of 'Covid' cooperating with the police to enforce and defend their captors' demands].
- Little or no effort to escape [see 'Covid'].
- Belief in the goodness of the perpetrators or kidnappers [see 'Covid'].
- Appeasement of captors. This is a manipulative strategy for maintaining one's safety. As victims get rewarded – perhaps with less abuse or even with life itself – their appeasing behaviours are reinforced [see 'Covid'].
- Learned helplessness. This can be akin to 'if you can't beat 'em, join 'em'. As the victims fail to escape the abuse or captivity, they may start giving up and soon realize it's just easier for everyone if they acquiesce all their power to their captors [see 'Covid'].

- Feelings of pity toward the abusers, believing they are actually victims themselves. Because of this, victims may go on a crusade or mission to 'save' [protect] their abuser [see the venom unleashed on those challenging the official 'Covid' narrative].
- Unwillingness to learn to detach from their perpetrators and heal. In essence, victims may tend to be less loyal to themselves than to their abuser [*definitely* see 'Covid'].

Ponder on those traits and compare them with the behaviour of great swathes of the global population who have defended governments and authorities which have spent every minute destroying their lives and livelihoods and those of their children and grandchildren since early 2020 with fascistic lockdowns, house arrest and employment deletion to 'protect' them from a 'deadly virus' that their abusers' perceptually created to bring about this very outcome. We are looking at mass Stockholm syndrome. All those that agree to concede their freedom will believe those perceptions are originating in their own independent 'mind' when in fact by conceding their reality to Stockholm syndrome they have by definition conceded any independence of mind. Listen to the 'opinions' of the acquiescing masses in this 'Covid' era and what gushes forth is the repetition of the official version of everything delivered unprocessed, unfiltered and unquestioned. The whole programming dynamic works this way. I must be free because I'm told that I am and so I think that I am.

You can see what I mean with the chapter theme of 'I'm thinking – Oh, but *are* you?' The great majority are not thinking, let alone for themselves. They are repeating what authority has told them to believe which allows them to be controlled. Weaving through this mentality is the fear that the 'conspiracy theorists' are right and this again explains the often hysterical abuse that ensues when you dare to contest the official narrative of anything. Denial is the mechanism of hiding from yourself what you don't want to be true. Telling people what they want to hear is easy, but it's an infinitely greater challenge to tell them what they would rather not be happening.

One is akin to pushing against an open door while the other is met with vehement resistance no matter what the scale of evidence. I don't want it to be true so I'll convince myself that it's not. Examples are everywhere from the denial that a partner is cheating despite all the signs to the reflex-action rejection of any idea that world events in which country after country act in exactly the same way are centrally coordinated. To accept the latter is to accept that a force of unspeakable evil is working to destroy your life and the lives of your children with nothing too horrific to achieve that end. Who the heck wants that to be true? But if we don't face reality the end is duly achieved and the consequences are far worse and ongoing than breaking through the walls of denial today with the courage to make a stand against tyranny.

Connect the dots – but how?

A crucial aspect of perceptual programming is to portray a world in which everything is random and almost nothing is connected to anything else. Randomness cannot be coordinated by its very nature and once you perceive events as random the idea they could be connected is waved away as the rantings of the tinfoil-hat brigade. You can't plan and coordinate random you idiot! No, you can't, but you can hide the coldly-calculated and long-planned behind the *illusion* of randomness. A foundation manifestation of the Renegade Mind is to scan reality for patterns that connect the apparently random and turn pixels and dots into pictures. This is the way I work and have done so for more than 30 years. You look for similarities in people, modus operandi and desired outcomes and slowly, then ever quicker, the picture forms. For instance: There would seem to be no connection between the 'Covid pandemic' hoax and the human-caused global-warming hoax and yet they are masks (appropriately) on the same face seeking the same outcome. Those pushing the global warming myth through the Club of Rome and other Cult agencies are driving the lies about 'Covid' – Bill Gates is an obvious one, but they are endless. Why would the same people be involved in both when they are clearly not connected? Oh, but they

are. Common themes with personnel are matched by common goals. The 'solutions' to both 'problems' are centralisation of global power to impose the will of the few on the many to 'save' humanity from 'Covid' and save the planet from an 'existential threat' (we need 'zero Covid' and 'zero carbon emissions'). These, in turn, connect with the 'dot' of globalisation which was coined to describe the centralisation of global power in every area of life through incessant political and corporate expansion, trading blocks and superstates like the European Union. If you are the few and you want to control the many you have to centralise power and decision-making. The more you centralise power the more power the few at the centre will have over the many; and the more that power is centralised the more power those at the centre have to centralise even quicker. The momentum of centralisation gets faster and faster which is exactly the process we have witnessed. In this way the hoaxed 'pandemic' and the fakery of human-caused global warming serve the interests of globalisation and the seizure of global power in the hands of the Cult inner-circle which is behind 'Covid', 'climate change' and globalisation. At this point random 'dots' become a clear and obvious picture or pattern.

Klaus Schwab, the classic Bond villain who founded the Cult's Gates-funded World Economic Forum, published a book in 2020, *The Great Reset*, in which he used the 'problem' of 'Covid' to justify a total transformation of human society to 'save' humanity from 'climate change'. Schwab said: 'The pandemic represents a rare but narrow window of opportunity to reflect, reimagine, and reset our world.' What he didn't mention is that the Cult he serves is behind both hoaxes as I show in my book *The Answer*. He and the Cult don't have to reimagine the world. They know precisely what they want and that's why they destroyed human society with 'Covid' to 'build back better' in their grand design. Their job is not to imagine, but to get humanity to imagine and agree with their plans while believing it's all random. It must be pure coincidence that 'The Great Reset' has long been the Cult's code name for the global imposition of fascism and replaced previous code-names of the 'New World

Order' used by Cult frontmen like Father George Bush and the 'New Order of the Ages' which emerged from Freemasonry and much older secret societies. New Order of the Ages appears on the reverse of the Great Seal of the United States as 'Novus ordo seclorum' underneath the Cult symbol used since way back of the pyramid and all seeing-eye (Fig 3). The pyramid is the hierarchy of human control headed by the illuminated eye that symbolises the force behind the Cult which I will expose in later chapters. The term 'Annuit Coeptis' translates as 'He favours our undertaking'. We are told the 'He' is the Christian god, but 'He' is not as I will be explaining.

Figure 3: The all-seeing eye of the Cult 'god' on the Freemason-designed Great Seal of the United States and also on the dollar bill.

Having you on

Two major Cult techniques of perceptual manipulation that relate to all this are what I have called since the 1990s Problem-Reaction-Solution (PRS) and the Totalitarian Tiptoe (TT). They can be uncovered by the inquiring mind with a simple question: Who benefits? The answer usually identifies the perpetrators of a given action or happening through the concept of 'he who most benefits from a crime is the one most likely to have committed it'. The Latin 'Cue bono?' – Who benefits? – is widely attributed to the Roman orator and statesman Marcus Tullius Cicero. No wonder it goes back so far when the concept has been relevant to human behaviour since

history was recorded. Problem-Reaction-Solution is the technique used to manipulate us every day by covertly creating a problem (or the illusion of one) and offering the solution to the problem (or the illusion of one). In the first phase you create the problem and blame someone or something else for why it has happened. This may relate to a financial collapse, terrorist attack, war, global warming or pandemic, anything in fact that will allow you to impose the 'solution' to change society in the way you desire at that time. The 'problem' doesn't have to be real. PRS is manipulation of perception and all you need is the population to believe the problem is real. Human-caused global warming and the 'Covid pandemic' only have to be *perceived* to be real for the population to accept the 'solutions' of authority. I refer to this technique as NO-Problem-Reaction-Solution. Billions did not meekly accept house arrest from early 2020 because there was a real deadly 'Covid pandemic' but because they perceived – believed – that to be the case. The antidote to Problem-Reaction-Solution is to ask who benefits from the proposed solution. Invariably it will be anyone who wants to justify more control through deletion of freedom and centralisation of power and decision-making.

The two world wars were Problem-Reaction-Solutions that transformed and realigned global society. Both were manipulated into being by the Cult as I have detailed in books since the mid-1990s. They dramatically centralised global power, especially World War Two, which led to the United Nations and other global bodies thanks to the overt and covert manipulations of the Rockefeller family and other Cult bloodlines like the Rothschilds. The UN is a stalking horse for full-blown world government that I will come to shortly. The land on which the UN building stands in New York was donated by the Rockefellers and the same Cult family was behind Big Pharma scalpel and drug 'medicine' and the creation of the World Health Organization as part of the UN. They have been stalwarts of the eugenics movement and funded Hitler's race-purity expert' Ernst Rudin. The human-caused global warming hoax has been orchestrated by the Club of Rome through the UN which is

manufacturing both the 'problem' through its Intergovernmental Panel on Climate Change and imposing the 'solution' through its Agenda 21 and Agenda 2030 which demand the total centralisation of global power to 'save the world' from a climate hoax the United Nations is itself perpetrating. What a small world the Cult can be seen to be particularly among the inner circles. The bedfellow of Problem-Reaction-Solution is the Totalitarian Tiptoe which became the Totalitarian Sprint in 2020. The technique is fashioned to hide the carefully-coordinated behind the cover of apparently random events. You start the sequence at 'A' and you know you are heading for 'Z'. You don't want people to know that and each step on the journey is presented as a random happening while all the steps strung together lead in the same direction. The speed may have quickened dramatically in recent times, but you can still see the incremental approach of the Tiptoe in the case of 'Covid' as each new imposition takes us deeper into fascism. Tell people they have to do this or that to get back to 'normal', then this and this and this. With each new demand adding to the ones that went before the population's freedom is deleted until it disappears. The spider wraps its web around the flies more comprehensively with each new diktat. I'll highlight this in more detail when I get to the 'Covid' hoax and how it has been pulled off. Another prime example of the Totalitarian Tiptoe is how the Cult-created European Union went from a 'free-trade zone' to a centralised bureaucratic dictatorship through the Tiptoe of incremental centralisation of power until nations became mere administrative units for Cult-owned dark suits in Brussels.

The antidote to ignorance is knowledge which the Cult seeks vehemently to deny us, but despite the systematic censorship to that end the Renegade Mind can overcome this by vociferously seeking out the facts no matter the impediments put in the way. There is also a method of thinking and perceiving – *knowing* – that doesn't even need names, dates, place-type facts to identify the patterns that reveal the story. I'll get to that in the final chapter. All you need to know about the manipulation of human society and to what end is still out there – *at the time of writing* – in the form of books, videos

and websites for those that really want to breach the walls of programmed perception. To access this knowledge requires the abandonment of the mainstream media as a source of information in the awareness that this is owned and controlled by the Cult and therefore promotes mass perceptions that suit the Cult. Mainstream media lies all day, every day. That is its function and very reason for being. Where it does tell the truth, here and there, is only because the truth and the Cult agenda very occasionally coincide. If you look for fact and insight to the BBC, CNN and virtually all the rest of them you are asking to be conned and perceptually programmed.

Know the outcome and you'll see the journey

Events seem random when you have no idea where the world is being taken. Once you do the random becomes the carefully planned. Know the outcome and you'll see the journey is a phrase I have been using for a long time to give context to daily happenings that appear unconnected. Does a problem, or illusion of a problem, trigger a proposed 'solution' that further drives society in the direction of the outcome? Invariably the answer will be yes and the random – *abracadabra* – becomes the clearly coordinated. So what is this outcome that unlocks the door to a massively expanded understanding of daily events? I will summarise its major aspects – the fine detail is in my other books – and those new to this information will see that the world they thought they were living in is a very different place. The foundation of the Cult agenda is the incessant centralisation of power and all such centralisation is ultimately in pursuit of Cult control on a global level. I have described for a long time the planned world structure of top-down dictatorship as the Hunger Games Society. The term obviously comes from the movie series which portrayed a world in which a few living in military-protected hi-tech luxury were the overlords of a population condemned to abject poverty in isolated 'sectors' that were not allowed to interact. 'Covid' lockdowns and travel bans anyone? The 'Hunger Games' pyramid of structural control has the inner circle of the Cult at the top with pretty much the entire

population at the bottom under their control through dependency for survival on the Cult. The whole structure is planned to be protected and enforced by a military-police state ([Fig 4](#)).

Here you have the reason for the global lockdowns of the fake pandemic to coldly destroy independent incomes and livelihoods and make everyone dependent on the 'state' (the Cult that controls the 'states'). I have warned in my books for many years about the plan to introduce a 'guaranteed income' – a barely survivable pittance – designed to impose dependency when employment was destroyed by AI technology and now even more comprehensively at great speed by the 'Covid' scam. Once the pandemic was played and lockdown consequences began to delete independent income the authorities began to talk right on cue about the need for a guaranteed income and a 'Great Reset'. Guaranteed income will be presented as benevolent governments seeking to help a desperate people – desperate as a direct result of actions of the same governments. The truth is that such payments are a trap. You will only get them if you do exactly what the authorities demand including mass vaccination (genetic manipulation). We have seen this theme already in Australia where those dependent on government benefits have them reduced if parents don't agree to have their children vaccinated according to an insane health-destroying government-dictated schedule. Calculated economic collapse applies to governments as well as people. The Cult wants rid of countries through the creation of a world state with countries broken up into regions ruled by a world government and super states like the European Union. Countries must be bankrupted, too, to this end and it's being achieved by the trillions in 'rescue packages' and furlough payments, trillions in lost taxation, and money-no-object spending on 'Covid' including constant all-medium advertising (programming) which has made the media dependent on government for much of its income. The day of reckoning is coming – as planned – for government spending and given that it has been made possible by printing money and not by production/taxation there is inflation on the way that has the

potential to wipe out monetary value. In that case there will be no need for the Cult to steal your money. It just won't be worth anything (see the German Weimar Republic before the Nazis took over). Many have been okay with lockdowns while getting a percentage of their income from so-called furlough payments without having to work. Those payments are dependent, however, on people having at least a theoretical job with a business considered non-essential and ordered to close. As these business go under because they are closed by lockdown after lockdown the furlough stops and it will for everyone eventually. Then what? The 'then what?' is precisely the idea.

Figure 4: The Hunger Games Society structure I have long warned was planned and now the 'Covid' hoax has made it possible. This is the real reason for lockdowns.

Hired hands

Between the Hunger Games Cult elite and the dependent population is planned to be a vicious military-police state (a fusion of the two into one force). This has been in the making for a long time with police looking ever more like the military and carrying weapons to match. The pandemic scam has seen this process accelerate so fast as

lockdown house arrest is brutally enforced by carefully recruited fascist minds and gormless system-servers. The police and military are planned to merge into a centrally-directed world army in a global structure headed by a world government which wouldn't be elected even by the election fixes now in place. The world army is not planned even to be human and instead wars would be fought, primarily against the population, using robot technology controlled by artificial intelligence. I have been warning about this for decades and now militaries around the world are being transformed by this very AI technology. The global regime that I describe is a particular form of fascism known as a technocracy in which decisions are not made by clueless and co-opted politicians but by unelected technocrats – scientists, engineers, technologists and bureaucrats. Cult-owned-and-controlled Silicon Valley giants are examples of technocracy and they already have far more power to direct world events than governments. They are with their censorship *selecting* governments. I know that some are calling the 'Great Reset' a Marxist communist takeover, but fascism and Marxism are different labels for the same tyranny. Tell those who lived in fascist Germany and Stalinist Russia that there was a difference in the way their freedom was deleted and their lives controlled. I could call it a fascist technocracy or a Marxist technocracy and they would be equally accurate. The Hunger Games society with its world government structure would oversee a world army, world central bank and single world cashless currency imposing its will on a microchipped population ([Fig 5](#)). Scan its different elements and see how the illusory pandemic is forcing society in this very direction at great speed. Leaders of 23 countries and the World Health Organization (WHO) backed the idea in March, 2021, of a global treaty for 'international cooperation' in 'health emergencies' and nations should 'come together as a global community for peaceful cooperation that extends beyond this crisis'. Cut the Orwellian bullshit and this means another step towards global government. The plan includes a cashless digital money system that I first warned about in 1993. Right at the start of 'Covid' the deeply corrupt Tedros

Adhanom Ghebreyesus, the crooked and merely gofer 'head' of the World Health Organization, said it was possible to catch the 'virus' by touching cash and it was better to use cashless means. The claim was ridiculous nonsense and like the whole 'Covid' mind-trick it was nothing to do with 'health' and everything to do with pushing every aspect of the Cult agenda. As a result of the Tedros lie the use of cash has plummeted. The Cult script involves a single world digital currency that would eventually be technologically embedded in the body. China is a massive global centre for the Cult and if you watch what is happening there you will know what is planned for everywhere. The Chinese government is developing a digital currency which would allow fines to be deducted immediately via AI for anyone caught on camera breaking its fantastic list of laws and the money is going to be programmable with an expiry date to ensure that no one can accrue wealth except the Cult and its operatives.

Figure 5: The structure of global control the Cult has been working towards for so long and this has been enormously advanced by the 'Covid' illusion.

Serfdom is so smart

The Cult plan is far wider, extreme, and more comprehensive than even most conspiracy researchers appreciate and I will come to the true depths of deceit and control in the chapters 'Who controls the

Cult?’ and ‘Escaping Wetiko’. Even the world that we know is crazy enough. We are being deluged with ever more sophisticated and controlling technology under the heading of ‘smart’. We have smart televisions, smart meters, smart cards, smart cars, smart driving, smart roads, smart pills, smart patches, smart watches, smart skin, smart borders, smart pavements, smart streets, smart cities, smart communities, smart environments, smart growth, smart planet ... smart *everything* around us. Smart technologies and methods of operation are designed to interlock to create a global Smart Grid connecting the entirety of human society including human minds to create a centrally-dictated ‘hive’ mind. ‘Smart cities’ is code for densely-occupied megacities of total surveillance and control through AI. Ever more destructive frequency communication systems like 5G have been rolled out without any official testing for health and psychological effects (colossal). 5G/6G/7G systems are needed to run the Smart Grid and each one becomes more destructive of body and mind. Deleting independent income is crucial to forcing people into these AI-policed prisons by ending private property ownership (except for the Cult elite). The Cult’s Great Reset now openly foresees a global society in which no one will own any possessions and everything will be rented while the Cult would own literally everything under the guise of government and corporations. The aim has been to use the lockdowns to destroy sources of income on a mass scale and when the people are destitute and in unrepayable amounts of debt (problem) Cult assets come forward with the pledge to write-off debt in return for handing over all property and possessions (solution). Everything – literally everything including people – would be connected to the Internet via AI. I was warning years ago about the coming Internet of Things (IoT) in which all devices and technology from your car to your fridge would be plugged into the Internet and controlled by AI. Now we are already there with much more to come. The next stage is the Internet of Everything (IoE) which is planned to include the connection of AI to the human brain and body to replace the human mind with a centrally-controlled AI mind. Instead of perceptions

being manipulated through control of information and censorship those perceptions would come direct from the Cult through AI. What do you think? You think whatever AI decides that you think. In human terms there would be no individual 'think' any longer. Too incredible? The ravings of a lunatic? Not at all. Cult-owned crazies in Silicon Valley have been telling us the plan for years without explaining the real motivation and calculated implications. These include Google executive and 'futurist' Ray Kurzweil who highlights the year 2030 for when this would be underway. He said:

Our thinking ... will be a hybrid of biological and non-biological thinking ... humans will be able to extend their limitations and 'think in the cloud' ... We're going to put gateways to the cloud in our brains ... We're going to gradually merge and enhance ourselves ... In my view, that's the nature of being human – we transcend our limitations.

As the technology becomes vastly superior to what we are then the small proportion that is still human gets smaller and smaller and smaller until it's just utterly negligible.

The sales-pitch of Kurzweil and Cult-owned Silicon Valley is that this would make us 'super-human' when the real aim is to make us post-human and no longer 'human' in the sense that we have come to know. The entire global population would be connected to AI and become the centrally-controlled 'hive-mind' of externally-delivered perceptions. The Smart Grid being installed to impose the Cult's will on the world is being constructed to allow particular locations – even one location – to control the whole global system. From these prime control centres, which absolutely include China and Israel, anything connected to the Internet would be switched on or off and manipulated at will. Energy systems could be cut, communication via the Internet taken down, computer-controlled driverless autonomous vehicles driven off the road, medical devices switched off, the potential is limitless given how much AI and Internet connections now run human society. We have seen nothing yet if we allow this to continue. Autonomous vehicle makers are working with law enforcement to produce cars designed to automatically pull over if they detect a police or emergency vehicle flashing from up to 100 feet away. At a police stop the car would be unlocked and the

window rolled down automatically. Vehicles would only take you where the computer (the state) allowed. The end of petrol vehicles and speed limiters on all new cars in the UK and EU from 2022 are steps leading to electric computerised transport over which ultimately you have no control. The picture is far bigger even than the Cult global network or web and that will become clear when I get to the nature of the 'spider'. There is a connection between all these happenings and the instigation of DNA-manipulating 'vaccines' (which aren't 'vaccines') justified by the 'Covid' hoax. That connection is the unfolding plan to transform the human body from a biological to a synthetic biological state and this is why synthetic biology is such a fast-emerging discipline of mainstream science. 'Covid vaccines' are infusing self-replicating synthetic genetic material into the cells to cumulatively take us on the Totalitarian Tiptoe from Human 1.0 to the synthetic biological Human 2.0 which will be physically and perceptually attached to the Smart Grid to one hundred percent control every thought, perception and deed. Humanity needs to wake up and *fast*.

This is the barest explanation of where the 'outcome' is planned to go but it's enough to see the journey happening all around us. Those new to this information will already see 'Covid' in a whole new context. I will add much more detail as we go along, but for the minutiae evidence see my mega-works, *The Answer*, *The Trigger* and *Everything You Need to Know But Have Never Been Told*.

Now – how does a Renegade Mind see the 'world'?

CHAPTER TWO

Renegade Perception

It is one thing to be clever and another to be wise

George R.R. Martin

A simple definition of the difference between a programmed mind and a Renegade Mind would be that one sees only dots while the other connects them to see the picture. Reading reality with accuracy requires the observer to (a) know the planned outcome and (b) realise that everything, but *everything*, is connected.

The entirety of infinite reality is connected – that's its very nature – and with human society an expression of infinite reality the same must apply. Simple cause and effect is a connection. The effect is triggered by the cause and the effect then becomes the cause of another effect. Nothing happens in isolation because it *can't*. Life in whatever reality is simple choice and consequence. We make choices and these lead to consequences. If we don't like the consequences we can make different choices and get different consequences which lead to other choices and consequences. The choice and the consequence are not only connected they are indivisible. You can't have one without the other as an old song goes. A few cannot control the world unless those being controlled allow that to happen – cause and effect, choice and consequence. Control – who has it and who doesn't – is a two-way process, a symbiotic relationship, involving the controller and controlled. 'They took my freedom away!!' Well, yes, but you also gave it to them. Humanity is

subjected to mass control because humanity has acquiesced to that control. This is all cause and effect and literally a case of give and take. In the same way world events of every kind are connected and the Cult works incessantly to sell the illusion of the random and coincidental to maintain the essential (to them) perception of dots that hide the picture. Renegade Minds know this and constantly scan the world for patterns of connection. This is absolutely pivotal in understanding the happenings in the world and without that perspective clarity is impossible. First you know the planned outcome and then you identify the steps on the journey – the day-by-day apparently random which, when connected in relation to the outcome, no longer appear as individual events, but as the proverbial *chain* of events leading in the same direction. I'll give you some examples:

Political puppet show

We are told to believe that politics is 'adversarial' in that different parties with different beliefs engage in an endless tussle for power. There may have been some truth in that up to a point – and only a point – but today divisions between 'different' parties are rhetorical not ideological. Even the rhetorical is fusing into one-speak as the parties eject any remaining free thinkers while others succumb to the ever-gathering intimidation of anyone with the 'wrong' opinion. The Cult is not a new phenomenon and can be traced back thousands of years as my books have documented. Its intergenerational initiatives have been manipulating events with increasing effect the more that global power has been centralised. In ancient times the Cult secured control through the system of monarchy in which 'special' bloodlines (of which more later) demanded the right to rule as kings and queens simply by birthright and by vanquishing others who claimed the same birthright. There came a time, however, when people had matured enough to see the unfairness of such tyranny and demanded a say in who governed them. Note the word – *governed* them. Not served them – *governed* them, hence government defined as 'the political direction and control exercised over the

actions of the members, citizens, or inhabitants of communities, societies, and states; direction of the affairs of a state, community, etc.' Governments exercise control over rather than serve just like the monarchies before them. Bizarrely there are still countries like the United Kingdom which are ruled by a monarch *and* a government that officially answers to the monarch. The UK head of state and that of Commonwealth countries such as Canada, Australia and New Zealand is 'selected' by who in a *single family* had unprotected sex with whom and in what order. Pinch me it can't be true. Ouch! Shit, it is. The demise of monarchies in most countries offered a potential vacuum in which some form of free and fair society could arise and the Cult had that base covered. Monarchies had served its interests but they couldn't continue in the face of such widespread opposition and, anyway, replacing a 'royal' dictatorship that people could see with a dictatorship 'of the people' hiding behind the concept of 'democracy' presented far greater manipulative possibilities and ways of hiding coordinated tyranny behind the illusion of 'freedom'.

Democracy is quite wrongly defined as government selected by the population. This is not the case at all. It is government selected by *some* of the population (and then only in theory). This 'some' doesn't even have to be the majority as we have seen so often in first-past-the-post elections in which the so-called majority party wins fewer votes than the 'losing' parties combined. Democracy can give total power to a party in government from a minority of the votes cast. It's a sleight of hand to sell tyranny as freedom. Seventy-four million Trump-supporting Americans didn't vote for the 'Democratic' Party of Joe Biden in the distinctly dodgy election in 2020 and yet far from acknowledging the wishes and feelings of that great percentage of American society the Cult-owned Biden government set out from day one to destroy them and their right to a voice and opinion. Empty shell Biden and his Cult handlers said they were doing this to 'protect democracy'. Such is the level of lunacy and sickness to which politics has descended. Connect the dots and relate them to the desired outcome – a world government run by self-appointed technocrats and no longer even elected

politicians. While operating through its political agents in government the Cult is at the same time encouraging public disdain for politicians by putting idiots and incompetents in theoretical power on the road to deleting them. The idea is to instil a public reaction that says of the technocrats: 'Well, they couldn't do any worse than the pathetic politicians.' It's all about controlling perception and Renegade Minds can see through that while programmed minds cannot when they are ignorant of both the planned outcome and the manipulation techniques employed to secure that end. This knowledge can be learned, however, and fast if people choose to get informed.

Politics may at first sight appear very difficult to control from a central point. I mean look at the 'different' parties and how would you be able to oversee them all and their constituent parts? In truth, it's very straightforward because of their structure. We are back to the pyramid of imposition and acquiescence. Organisations are structured in the same way as the system as a whole. Political parties are not open forums of free expression. They are hierarchies. I was a national spokesman for the British Green Party which claimed to be a different kind of politics in which influence and power was devolved; but I can tell you from direct experience – and it's far worse now – that Green parties are run as hierarchies like all the others however much they may try to hide that fact or kid themselves that it's not true. A very few at the top of all political parties are directing policy and personnel. They decide if you are elevated in the party or serve as a government minister and to do that you have to be a yes man or woman. Look at all the maverick political thinkers who never ascended the greasy pole. If you want to progress within the party or reach 'high-office' you need to fall into line and conform. Exceptions to this are rare indeed. Should you want to run for parliament or Congress you have to persuade the local or state level of the party to select you and for that you need to play the game as dictated by the hierarchy. If you secure election and wish to progress within the greater structure you need to go on conforming to what is acceptable to those running the hierarchy

from the peak of the pyramid. Political parties are perceptual gulags and the very fact that there are party 'Whips' appointed to 'whip' politicians into voting the way the hierarchy demands exposes the ridiculous idea that politicians are elected to serve the people they are supposed to represent. Cult operatives and manipulation has long seized control of major parties that have any chance of forming a government and at least most of those that haven't. A new party forms and the Cult goes to work to infiltrate and direct. This has reached such a level today that you see video compilations of 'leaders' of all parties whether Democrats, Republicans, Conservative, Labour and Green parroting the same Cult mantra of 'Build Back Better' and the 'Great Reset' which are straight off the Cult song-sheet to describe the transformation of global society in response to the Cult-instigated hoaxes of the 'Covid pandemic' and human-caused 'climate change'. To see Caroline Lucas, the Green Party MP that I knew when I was in the party in the 1980s, speaking in support of plans proposed by Cult operative Klaus Schwab representing the billionaire global elite is a real head-shaker.

Many parties – one master

The party system is another mind-trick and was instigated to change the nature of the dictatorship by swapping 'royalty' for dark suits that people believed – though now ever less so – represented their interests. Understanding this trick is to realise that a single force (the Cult) controls all parties either directly in terms of the major ones or through manipulation of perception and ideology with others. You don't need to manipulate Green parties to demand your transformation of society in the name of 'climate change' when they are obsessed with the lie that this is essential to 'save the planet'. You just give them a platform and away they go serving your interests while believing they are being environmentally virtuous. America's political structure is a perfect blueprint for how the two or multi-party system is really a one-party state. The Republican Party is controlled from one step back in the shadows by a group made up of billionaires and their gofers known as neoconservatives or Neocons.

I have exposed them in fine detail in my books and they were the driving force behind the policies of the imbecilic presidency of Boy George Bush which included 9/11 (see *The Trigger* for a comprehensive demolition of the official story), the subsequent 'war on terror' (war of terror) and the invasions of Afghanistan and Iraq. The latter was a No-Problem-Reaction-Solution based on claims by Cult operatives, including Bush and British Prime Minister Tony Blair, about Saddam Hussein's 'weapons of mass destruction' which did not exist as war criminals Bush and Blair well knew.

Figure 6: Different front people, different parties – same control system.

The Democratic Party has its own 'Neocon' group controlling from the background which I call the 'Democons' and here's the penny-drop – the Neocons and Democons answer to the same masters one step further back into the shadows (Fig 6). At that level of the Cult the Republican and Democrat parties are controlled by the same people and no matter which is in power the Cult is in power. This is how it works in almost every country and certainly in Britain with Conservative, Labour, Liberal Democrat and Green parties now all on the same page whatever the rhetoric may be in their feeble attempts to appear different. Neocons operated at the time of Bush through a think tank called The Project for the New American Century which in September, 2000, published a document entitled *Rebuilding America's Defenses: Strategies, Forces, and Resources*

For a New Century demanding that America fight ‘multiple, simultaneous major theatre wars’ as a ‘core mission’ to force regime-change in countries including Iraq, Libya and Syria. Neocons arranged for Bush (‘Republican’) and Blair (‘Labour Party’) to front-up the invasion of Iraq and when they departed the Democons orchestrated the targeting of Libya and Syria through Barack Obama (‘Democrat’) and British Prime Minister David Cameron (‘Conservative Party’). We have ‘different’ parties and ‘different’ people, but the same unfolding script. The more the Cult has seized the reigns of parties and personnel the more their policies have transparently pursued the same agenda to the point where the fascist ‘Covid’ impositions of the Conservative junta of Jackboot Johnson in Britain were opposed by the Labour Party because they were not fascist enough. The Labour Party is likened to the US Democrats while the Conservative Party is akin to a British version of the Republicans and on both sides of the Atlantic they all speak the same language and support the direction demanded by the Cult although some more enthusiastically than others. It’s a similar story in country after country because it’s all centrally controlled. Oh, but what about Trump? I’ll come to him shortly. Political ‘choice’ in the ‘party’ system goes like this: You vote for Party A and they get into government. You don’t like what they do so next time you vote for Party B and they get into government. You don’t like what they do when it’s pretty much the same as Party A and why wouldn’t that be with both controlled by the same force? Given that only two, sometimes three, parties have any chance of forming a government to get rid of Party B that you don’t like you have to vote again for Party A which ... you don’t like. This, ladies and gentlemen, is what they call ‘democracy’ which we are told – wrongly – is a term interchangeable with ‘freedom’.

The cult of cults

At this point I need to introduce a major expression of the Global Cult known as Sabbatian-Frankism. Sabbatian is also spelt as Sabbatean. I will summarise here. I have published major exposés

and detailed background in other works. Sabbatian-Frankism combines the names of two frauds posing as 'Jewish' men, Sabbatai Zevi (1626-1676), a rabbi, black magician and occultist who proclaimed he was the Jewish messiah; and Jacob Frank (1726-1791), the Polish 'Jew', black magician and occultist who said he was the reincarnation of 'messiah' Zevi and biblical patriarch Jacob. They worked across two centuries to establish the Sabbatian-Frankist cult that plays a major, indeed central, role in the manipulation of human society by the Global Cult which has its origins much further back in history than Sabbatai Zevi. I should emphasise two points here in response to the shrill voices that will scream 'anti-Semitism': (1) Sabbatian-Frankists are NOT Jewish and only pose as such to hide their cult behind a Jewish façade; and (2) my information about this cult has come from Jewish sources who have long realised that their society and community has been infiltrated and taken over by interloper Sabbatian-Frankists. Infiltration has been the foundation technique of Sabbatian-Frankism from its official origin in the 17th century. Zevi's Sabbatian sect attracted a massive following described as the biggest messianic movement in Jewish history, spreading as far as Africa and Asia, and he promised a return for the Jews to the 'Promised Land' of Israel. Sabbatianism was not Judaism but an inversion of everything that mainstream Judaism stood for. So much so that this sinister cult would have a feast day when Judaism had a fast day and whatever was forbidden in Judaism the Sabbatians were encouraged and even commanded to do. This included incest and what would be today called Satanism. Members were forbidden to marry outside the sect and there was a system of keeping their children ignorant of what they were part of until they were old enough to be trusted not to unknowingly reveal anything to outsiders. The same system is employed to this day by the Global Cult in general which Sabbatian-Frankism has enormously influenced and now largely controls.

Zevi and his Sabbatians suffered a setback with the intervention by the Sultan of the Islamic Ottoman Empire in the Middle East and what is now the Republic of Turkey where Zevi was located. The

Sultan gave him the choice of proving his 'divinity', converting to Islam or facing torture and death. Funnily enough Zevi chose to convert or at least appear to. Some of his supporters were disillusioned and drifted away, but many did not with 300 families also converting – only in theory – to Islam. They continued behind this Islamic smokescreen to follow the goals, rules and rituals of Sabbatianism and became known as 'crypto-Jews' or the 'Dönme' which means 'to turn'. This is rather ironic because they didn't 'turn' and instead hid behind a fake Islamic persona. The process of appearing to be one thing while being very much another would become the calling card of Sabbatianism especially after Zevi's death and the arrival of the Satanist Jacob Frank in the 18th century when the cult became Sabbatian-Frankism and plumbed still new depths of depravity and infiltration which included – still includes – human sacrifice and sex with children. Wherever Sabbatians go paedophilia and Satanism follow and is it really a surprise that Hollywood is so infested with child abuse and Satanism when it was established by Sabbatian-Frankists and is still controlled by them? Hollywood has been one of the prime vehicles for global perceptual programming and manipulation. How many believe the version of 'history' portrayed in movies when it is a travesty and inversion (again) of the truth? Rabbi Marvin Antelman describes Frankism in his book, *To Eliminate the Opiate*, as 'a movement of complete evil' while Jewish professor Gershom Scholem said of Frank in *The Messianic Idea in Judaism*: 'In all his actions [he was] a truly corrupt and degenerate individual ... one of the most frightening phenomena in the whole of Jewish history.' Frank was excommunicated by traditional rabbis, as was Zevi, but Frank was undeterred and enjoyed vital support from the House of Rothschild, the infamous banking dynasty whose inner-core are Sabbatian-Frankists and not Jews. Infiltration of the Roman Church and Vatican was instigated by Frank with many Dönme 'turning' again to convert to Roman Catholicism with a view to hijacking the reins of power. This was the ever-repeating modus operandi and continues to be so. Pose as an advocate of the religion, culture or country that you want to control and then

manipulate your people into the positions of authority and influence largely as advisers, administrators and Svengalis for those that appear to be in power. They did this with Judaism, Christianity (Christian Zionism is part of this), Islam and other religions and nations until Sabbatian-Frankism spanned the world as it does today.

Sabbatian Saudis and the terror network

One expression of the Sabbatian-Frankist Dönme within Islam is the ruling family of Saudi Arabia, the House of Saud, through which came the vile distortion of Islam known as Wahhabism. This is the violent creed followed by terrorist groups like Al-Qaeda and ISIS or Islamic State. Wahhabism is the hand-chopping, head-chopping 'religion' of Saudi Arabia which is used to keep the people in a constant state of fear so the interloper House of Saud can continue to rule. Al-Qaeda and Islamic State were lavishly funded by the House of Saud while being created and directed by the Sabbatian-Frankist network in the United States that operates through the Pentagon, CIA and the government in general of whichever 'party'. The front man for the establishment of Wahhabism in the middle of the 18th century was a Sabbatian-Frankist 'crypto-Jew' posing as Islamic called Muhammad ibn Abd al-Wahhab. His daughter would marry the son of Muhammad bin Saud who established the first Saudi state before his death in 1765 with support from the British Empire. Bin Saud's successors would establish modern Saudi Arabia in league with the British and Americans in 1932 which allowed them to seize control of Islam's major shrines in Mecca and Medina. They have dictated the direction of Sunni Islam ever since while Iran is the major centre of the Shiite version and here we have the source of at least the public conflict between them. The Sabbatian network has used its Wahhabi extremists to carry out Problem-Reaction-Solution terrorist attacks in the name of 'Al-Qaeda' and 'Islamic State' to justify a devastating 'war on terror', ever-increasing surveillance of the population and to terrify people into compliance. Another insight of the Renegade Mind is the streetwise understanding that

just because a country, location or people are attacked doesn't mean that those apparently representing that country, location or people are not behind the attackers. Often they are *orchestrating* the attacks because of the societal changes that can be then justified in the name of 'saving the population from terrorists'.

I show in great detail in *The Trigger* how Sabbatian-Frankists were the real perpetrators of 9/11 and not '19 Arab hijackers' who were blamed for what happened. Observe what was justified in the name of 9/11 alone in terms of Middle East invasions, mass surveillance and control that fulfilled the demands of the Project for the New American Century document published by the Sabbatian Neocons. What appear to be enemies are on the deep inside players on the same Sabbatian team. Israel and Arab 'royal' dictatorships are all ruled by Sabbatians and the recent peace agreements between Israel and Saudi Arabia, the United Arab Emirates (UAE) and others are only making formal what has always been the case behind the scenes. Palestinians who have been subjected to grotesque tyranny since Israel was bombed and terrorised into existence in 1948 have never stood a chance. Sabbatian-Frankists have controlled Israel (so the constant theme of violence and war which Sabbatians love) and they have controlled the Arab countries that Palestinians have looked to for real support that never comes. 'Royal families' of the Arab world in Saudi Arabia, Bahrain, UAE, etc., are all Sabbatians with allegiance to the aims of the cult and not what is best for their Arabic populations. They have stolen the oil and financial resources from their people by false claims to be 'royal dynasties' with a genetic right to rule and by employing vicious militaries to impose their will.

Satanic 'illumination'

The Satanist Jacob Frank formed an alliance in 1773 with two other Sabbatians, Mayer Amschel Rothschild (1744-1812), founder of the Rothschild banking dynasty, and Jesuit-educated fraudulent Jew, Adam Weishaupt, and this led to the formation of the Bavarian Illuminati, firstly under another name, in 1776. The Illuminati would

be the manipulating force behind the French Revolution (1789-1799) and was also involved in the American Revolution (1775-1783) before and after the Illuminati's official creation. Weishaupt would later become (in public) a Protestant Christian in archetypal Sabbatian style. I read that his name can be decoded as Adam-Weishaupt or 'the first man to lead those who know'. He wasn't a leader in the sense that he was a subordinate, but he did lead those below him in a crusade of transforming human society that still continues today. The theme was confirmed as early as 1785 when a horseman courier called Lanz was reported to be struck by lightning and extensive Illuminati documents were found in his saddlebags. They made the link to Weishaupt and detailed the plan for world takeover. Current events with 'Covid' fascism have been in the making for a very long time. Jacob Frank was jailed for 13 years by the Catholic Inquisition after his arrest in 1760 and on his release he headed for Frankfurt, Germany, home city and headquarters of the House of Rothschild where the alliance was struck with Mayer Amschel Rothschild and Weishaupt. Rothschild arranged for Frank to be given the title of Baron and he became a wealthy nobleman with a big following of Jews in Germany, the Austro-Hungarian Empire and other European countries. Most of them would have believed he was on their side.

The name 'Illuminati' came from the Zohar which is a body of works in the Jewish mystical 'bible' called the Kabbalah. 'Zohar' is the foundation of Sabbatian-Frankist belief and in Hebrew 'Zohar' means 'splendour', 'radiance', 'illuminated', and so we have 'Illuminati'. They claim to be the 'Illuminated Ones' from their knowledge systematically hidden from the human population and passed on through generations of carefully-chosen initiates in the global secret society network or Cult. Hidden knowledge includes an awareness of the Cult agenda for the world and the nature of our collective reality that I will explore later. Cult 'illumination' is symbolised by the torch held by the Statue of Liberty which was gifted to New York by French Freemasons in Paris who knew exactly what it represents. 'Liberty' symbolises the goddess worshipped in

Babylon as Queen Semiramis or Ishtar. The significance of this will become clear. Notice again the ubiquitous theme of inversion with the Statue of 'Liberty' really symbolising mass control (Fig 7). A mirror-image statute stands on an island in the River Seine in Paris from where New York Liberty originated (Fig 8). A large replica of the Liberty flame stands on top of the Pont de l'Alma tunnel in Paris where Princess Diana died in a Cult ritual described in *The Biggest Secret*. Lucifer 'the light bringer' is related to all this (and much more as we'll see) and 'Lucifer' is a central figure in Sabbatian-Frankism and its associated Satanism. Sabbatians reject the Jewish Torah, or Pentateuch, the 'five books of Moses' in the Old Testament known as Genesis, Exodus, Leviticus, Numbers, and Deuteronomy which are claimed by Judaism and Christianity to have been dictated by 'God' to Moses on Mount Sinai. Sabbatians say these do not apply to them and they seek to replace them with the Zohar to absorb Judaism and its followers into their inversion which is an expression of a much greater global inversion. They want to delete all religions and force humanity to worship a one-world religion – Sabbatian Satanism that also includes worship of the Earth goddess. Satanic themes are being more and more introduced into mainstream society and while Christianity is currently the foremost target for destruction the others are planned to follow.

Figure 7: The Cult goddess of Babylon disguised as the Statue of Liberty holding the flame of Lucifer the 'light bringer'.

Figure 8: Liberty's mirror image in Paris where the New York version originated.

Marx brothers

Rabbi Marvin Antelman connects the Illuminati to the Jacobins in *To Eliminate the Opiate* and Jacobins were the force behind the French Revolution. He links both to the Bund der Gerechten, or League of the Just, which was the network that inflicted communism/Marxism on the world. Antelman wrote:

The original inner circle of the Bund der Gerechten consisted of born Catholics, Protestants and Jews [Sabbatian-Frankist infiltrators], and those representatives of respective subdivisions formulated schemes for the ultimate destruction of their faiths. The heretical Catholics laid plans which they felt would take a century or more for the ultimate destruction of the church; the apostate Jews for the ultimate destruction of the Jewish religion.

Sabbatian-created communism connects into this anti-religion agenda in that communism does not allow for the free practice of religion. The Sabbatian 'Bund' became the International Communist Party and Communist League and in 1848 'Marxism' was born with the Communist Manifesto of Sabbatian assets Karl Marx and Friedrich Engels. It is absolutely no coincidence that Marxism, just a different name for fascist and other centrally-controlled tyrannies, is being imposed worldwide as a result of the 'Covid' hoax and nor that Marxist/fascist China was the place where the hoax originated. The reason for this will become very clear in the chapter 'Covid: The calculated catastrophe'. The so-called 'Woke' mentality has hijacked

traditional beliefs of the political left and replaced them with far-right make-believe 'social justice' better known as Marxism. Woke will, however, be swallowed by its own perceived 'revolution' which is really the work of billionaires and billionaire corporations feigning being 'Woke'. Marxism is being touted by Wokers as a replacement for 'capitalism' when we don't have 'capitalism'. We have cartelism in which the market is stitched up by the very Cult billionaires and corporations bankrolling Woke. Billionaires love Marxism which keeps the people in servitude while they control from the top. Terminally naïve Wokers think they are 'changing the world' when it's the Cult that is doing the changing and when they have played their vital part and become surplus to requirements they, too, will be targeted. The Illuminati-Jacobins were behind the period known as 'The Terror' in the French Revolution in 1793 and 1794 when Jacobin Maximillian de Robespierre and his Orwellian 'Committee of Public Safety' killed 17,000 'enemies of the Revolution' who had once been 'friends of the Revolution'. Karl Marx (1818-1883), whose Sabbatian creed of Marxism has cost the lives of at least 100 million people, is a hero once again to Wokers who have been systematically kept ignorant of real history by their 'education' programming. As a result they now promote a Sabbatian 'Marxist' abomination destined at some point to consume them. Rabbi Antelman, who spent decades researching the Sabbatian plot, said of the League of the Just and Karl Marx:

Contrary to popular opinion Karl Marx did not originate the Communist Manifesto. He was paid for his services by the League of the Just, which was known in its country of origin, Germany, as the Bund der Geächteten.

Antelman said the text attributed to Marx was the work of other people and Marx 'was only repeating what others already said'. Marx was 'a hired hack – lackey of the wealthy Illuminists'. Marx famously said that religion was the 'opium of the people' (part of the Sabbatian plan to demonise religion) and Antelman called his books, *To Eliminate the Opiate*. Marx was born Jewish, but his family converted to Christianity (Sabbatian modus operandi) and he

attacked Jews, not least in his book, *A World Without Jews*. In doing so he supported the Sabbatian plan to destroy traditional Jewishness and Judaism which we are clearly seeing today with the vindictive targeting of orthodox Jews by the Sabbatian government of Israel over 'Covid' laws. I don't follow any religion and it has done much damage to the world over centuries and acted as a perceptual straightjacket. Renegade Minds, however, are always asking *why* something is being done. It doesn't matter if they agree or disagree with what is happening – *why* is it happening is the question. The 'why?' can be answered with regard to religion in that religions create interacting communities of believers when the Cult wants to dismantle all discourse, unity and interaction (see 'Covid' lockdowns) and the ultimate goal is to delete all religions for a one-world religion of Cult Satanism worshipping their 'god' of which more later. We see the same 'why?' with gun control in America. I don't have guns and don't want them, but why is the Cult seeking to disarm the population at the same time that law enforcement agencies are armed to their molars and why has every tyrant in history sought to disarm people before launching the final takeover? They include Hitler, Stalin, Pol Pot and Mao who followed confiscation with violent seizing of power. You know it's a Cult agenda by the people who immediately race to the microphones to exploit dead people in multiple shootings. Ultra-Zionist Cult lackey Senator Chuck Schumer was straight on the case after ten people were killed in Boulder, Colorado in March, 2121. Simple rule ... if Schumer wants it the Cult wants it and the same with his ultra-Zionist mate the wild-eyed Senator Adam Schiff. At the same time they were calling for the disarmament of Americans, many of whom live a long way from a police response, Schumer, Schiff and the rest of these pampered clowns were sitting on Capitol Hill behind a razor-wired security fence protected by thousands of armed troops in addition to their own armed bodyguards. Mom and pop in an isolated home? They're just potential mass shooters.

Zion Mainframe

Sabbatian-Frankists and most importantly the Rothschilds were behind the creation of 'Zionism', a political movement that demanded a Jewish homeland in Israel as promised by Sabbatai Zevi. The very symbol of Israel comes from the German meaning of the name Rothschild. Dynasty founder Mayer Amschel Rothschild changed the family name from Bauer to Rothschild, or 'Red-Shield' in German, in deference to the six-pointed 'Star of David' hexagram displayed on the family's home in Frankfurt. The symbol later appeared on the flag of Israel after the Rothschilds were centrally involved in its creation. Hexagrams are not a uniquely Jewish symbol and are widely used in occult ('hidden') networks often as a symbol for Saturn (see my other books for why). Neither are Zionism and Jewishness interchangeable. Zionism is a political movement and philosophy and not a 'race' or a people. Many Jews oppose Zionism and many non-Jews, including US President Joe Biden, call themselves Zionists as does Israel-centric Donald Trump. America's support for the Israel government is pretty much a gimme with ultra-Zionist billionaires and corporations providing fantastic and dominant funding for both political parties. Former Congresswoman Cynthia McKinney has told how she was approached immediately she ran for office to 'sign the pledge' to Israel and confirm that she would always vote in that country's best interests. All American politicians are approached in this way. Anyone who refuses will get no support or funding from the enormous and all-powerful Zionist lobby that includes organisations like mega-lobby group AIPAC, the American Israel Public Affairs Committee. Trump's biggest funder was ultra-Zionist casino and media billionaire Sheldon Adelson while major funders of the Democratic Party include ultra-Zionist George Soros and ultra-Zionist financial and media mogul, Haim Saban. Some may reel back at the suggestion that Soros is an Israel-firster (Sabbatian-controlled Israel-firster), but Renegade Minds watch the actions not the words and everywhere Soros donates his billions the Sabbatian agenda benefits. In the spirit of Sabbatian inversion Soros pledged \$1 billion for a new university network to promote 'liberal values and tackle intolerance'. He made the announcement during his annual speech

at the Cult-owned World Economic Forum in Davos, Switzerland, in January, 2020, after his 'harsh criticism' of 'authoritarian rulers' around the world. You can only laugh at such brazen mendacity. How *he* doesn't laugh is the mystery. Translated from the Orwellian 'liberal values and tackle intolerance' means teaching non-white people to hate white people and for white people to loathe themselves for being born white. The reason for that will become clear.

The 'Anti-Semitism' fraud

Zionists support the Jewish homeland in the land of Palestine which has been the Sabbatian-Rothschild goal for so long, but not for the benefit of Jews. Sabbatians and their global Anti-Semitism Industry have skewed public and political opinion to equate opposing the violent extremes of Zionism to be a blanket attack and condemnation of all Jewish people. Sabbatians and their global Anti-Semitism Industry have skewed public and political opinion to equate opposing the violent extremes of Zionism to be a blanket attack and condemnation of all Jewish people. This is nothing more than a Sabbatian protection racket to stop legitimate investigation and exposure of their agendas and activities. The official definition of 'anti-Semitism' has more recently been expanded to include criticism of Zionism – a *political movement* – and this was done to further stop exposure of Sabbatian infiltrators who created Zionism as we know it today in the 19th century. Renegade Minds will talk about these subjects when they know the shit that will come their way. People must decide if they want to know the truth or just cower in the corner in fear of what others will say. Sabbatians have been trying to label me as 'anti-Semitic' since the 1990s as I have uncovered more and more about their background and agendas. Useless, gutless, fraudulent 'journalists' then just repeat the smears without question and on the day I was writing this section a pair of unquestioning repeaters called Ben Quinn and Archie Bland (how appropriate) outright called me an 'anti-Semite' in the establishment propaganda sheet, the London *Guardian*, with no supporting evidence. The

Sabbatian Anti-Semitism Industry said so and who are they to question that? They wouldn't dare. Ironically 'Semitic' refers to a group of languages in the Middle East that are almost entirely Arabic. 'Anti-Semitism' becomes 'anti-Arab' which if the consequences of this misunderstanding were not so grave would be hilarious. Don't bother telling Quinn and Bland. I don't want to confuse them, bless 'em. One reason I am dubbed 'anti-Semitic' is that I wrote in the 1990s that Jewish operatives (Sabbatians) were heavily involved in the Russian Revolution when Sabbatians overthrew the Romanov dynasty. This apparently made me 'anti-Semitic'. Oh, really? Here is a section from *The Trigger*:

British journalist Robert Wilton confirmed these themes in his 1920 book *The Last Days of the Romanovs* when he studied official documents from the Russian government to identify the members of the Bolshevik ruling elite between 1917 and 1919. The Central Committee included 41 Jews among 62 members; the Council of the People's Commissars had 17 Jews out of 22 members; and 458 of the 556 most important Bolshevik positions between 1918 and 1919 were occupied by Jewish people. Only 17 were Russian. Then there were the 23 Jews among the 36 members of the vicious Cheka Soviet secret police established in 1917 who would soon appear all across the country.

Professor Robert Service of Oxford University, an expert on 20th century Russian history, found evidence that ['Jewish'] Leon Trotsky had sought to make sure that Jews were enrolled in the Red Army and were disproportionately represented in the Soviet civil bureaucracy that included the Cheka which performed mass arrests, imprisonment and executions of 'enemies of the people'. A US State Department Decimal File (861.00/5339) dated November 13th, 1918, names [Rothschild banking agent in America] Jacob Schiff and a list of ultra-Zionists as funders of the Russian Revolution leading to claims of a 'Jewish plot', but the key point missed by all is they were not 'Jews' – they were Sabbatian-Frankists.

Britain's Winston Churchill made the same error by mistake or otherwise. He wrote in a 1920 edition of the *Illustrated Sunday Herald* that those behind the Russian revolution were part of a 'worldwide conspiracy for the overthrow of civilisation and for the reconstitution of society on the basis of arrested development, of envious malevolence, and impossible equality' (see 'Woke' today because that has been created by the same network). Churchill said there was no need to exaggerate the part played in the creation of Bolshevism and in the actual bringing about of the Russian

Revolution 'by these international and for the most part atheistical Jews' ['atheistical Jews' = Sabbatians]. Churchill said it is certainly a very great one and probably outweighs all others: 'With the notable exception of Lenin, the majority of the leading figures are Jews.' He went on to describe, knowingly or not, the Sabbatian modus operandi of placing puppet leaders nominally in power while they control from the background:

Moreover, the principal inspiration and driving power comes from the Jewish leaders. Thus Tchitcherin, a pure Russian, is eclipsed by his nominal subordinate, Litvinoff, and the influence of Russians like Bukharin or Lunacharski cannot be compared with the power of Trotsky, or of Zinovieff, the Dictator of the Red Citadel (Petrograd), or of Krassin or Radek – all Jews. In the Soviet institutions the predominance of Jews is even more astonishing. And the prominent, if not indeed the principal, part in the system of terrorism applied by the Extraordinary Commissions for Combatting Counter-Revolution has been taken by Jews, and in some notable cases by Jewesses.

What I said about seriously disproportionate involvement in the Russian Revolution by Jewish 'revolutionaries' (Sabbatians) is provable fact, but truth is no defence against the Sabbatian Anti-Semitism Industry, its repeater parrots like Quinn and Bland, and the now breathtaking network of so-called 'Woke' 'anti-hate' groups with interlocking leaderships and funding which have the role of discrediting and silencing anyone who gets too close to exposing the Sabbatians. We have seen 'truth is no defence' confirmed in legal judgements with the Saskatchewan Human Rights Commission in Canada decreeing this: 'Truthful statements can be presented in a manner that would meet the definition of hate speech, and not all truthful statements must be free from restriction.' Most 'anti-hate' activists, who are themselves consumed by hatred, are too stupid and ignorant of the world to know how they are being used. They are far too far up their own virtue-signalling arses and it's far too dark for them to see anything.

The 'revolution' game

The background and methods of the 'Russian' Revolution are straight from the Sabbatian playbook seen in the French Revolution

and endless others around the world that appear to start as a revolution of the people against tyrannical rule and end up with a regime change to more tyrannical rule overtly or covertly. Wars, terror attacks and regime overthrows follow the Sabbatian cult through history with its agents creating them as Problem-Reaction-Solutions to remove opposition on the road to world domination. Sabbatian dots connect the Rothschilds with the Illuminati, Jacobins of the French Revolution, the 'Bund' or League of the Just, the International Communist Party, Communist League and the Communist Manifesto of Karl Marx and Friedrich Engels that would lead to the Rothschild-funded Russian Revolution. The sequence comes under the heading of 'creative destruction' when you advance to your global goal by continually destroying the status quo to install a new status quo which you then also destroy. The two world wars come to mind. With each new status quo you move closer to your planned outcome. Wars and mass murder are to Sabbatians a collective blood sacrifice ritual. They are obsessed with death for many reasons and one is that death is an inversion of life. Satanists and Sabbatians are obsessed with death and often target churches and churchyards for their rituals. Inversion-obsessed Sabbatians explain the use of inverted symbolism including the *inverted* pentagram and *inverted* cross. The inversion of the cross has been related to targeting Christianity, but the cross was a religious symbol long before Christianity and its inversion is a statement about the Sabbatian mentality and goals more than any single religion.

Sabbatians operating in Germany were behind the rise of the occult-obsessed Nazis and the subsequent Jewish exodus from Germany and Europe to Palestine and the United States after World War Two. The Rothschild dynasty was at the forefront of this both as political manipulators and by funding the operation. Why would Sabbatians help to orchestrate the horrors inflicted on Jews by the Nazis and by Stalin after they organised the Russian Revolution? Sabbatians hate Jews and their religion, that's why. They pose as Jews and secure positions of control within Jewish society and play the 'anti-Semitism' card to protect themselves from exposure

through a global network of organisations answering to the Sabbatian-created-and-controlled globe-spanning intelligence network that involves a stunning web of military-intelligence operatives and operations for a tiny country of just nine million. Among them are Jewish assets who are not Sabbatians but have been convinced by them that what they are doing is for the good of Israel and the Jewish community to protect them from what they have been programmed since childhood to believe is a Jew-hating hostile world. The Jewish community is just a highly convenient cover to hide the true nature of Sabbatians. Anyone getting close to exposing their game is accused by Sabbatian place-people and gofers of 'anti-Semitism' and claiming that all Jews are part of a plot to take over the world. I am not saying that. I am saying that Sabbatians – the *real* Jew-haters – have infiltrated the Jewish community to use them both as a cover and an 'anti-Semitic' defence against exposure. Thus we have the Anti-Semitism Industry targeted researchers in this way and most Jewish people think this is justified and genuine. They don't know that their 'Jewish' leaders and institutions of state, intelligence and military are not controlled by Jews at all, but cultists and stooges of Sabbatian-Frankism. I once added my name to a pro-Jewish freedom petition online and the next time I looked my name was gone and text had been added to the petition blurb to attack me as an 'anti-Semite' such is the scale of perceptual programming.

Moving on America

I tell the story in *The Trigger* and a chapter called 'Atlantic Crossing' how particularly after Israel was established the Sabbatians moved in on the United States and eventually grasped control of government administration, the political system via both Democrats and Republicans, the intelligence community like the CIA and National Security Agency (NSA), the Pentagon and mass media. Through this seriously compartmentalised network Sabbatians and their operatives in Mossad, Israeli Defense Forces (IDF) and US agencies pulled off 9/11 and blamed it on 19 'Al-Qaeda hijackers' dominated by men from, or connected to, Sabbatian-ruled Saudi

Arabia. The '19' were not even on the planes let alone flew those big passenger jets into buildings while being largely incompetent at piloting one-engine light aircraft. 'Hijacker' Hani Hanjour who is said to have flown American Airlines Flight 77 into the Pentagon with a turn and manoeuvre most professional pilots said they would have struggled to do was banned from renting a small plane by instructors at the Freeway Airport in Bowie, Maryland, just *six weeks* earlier on the grounds that he was an incompetent pilot. The Jewish population of the world is just 0.2 percent with even that almost entirely concentrated in Israel (75 percent Jewish) and the United States (around two percent). This two percent and globally 0.2 percent refers to *Jewish* people and not Sabbatian interlopers who are a fraction of that fraction. What a sobering thought when you think of the fantastic influence on world affairs of tiny Israel and that the Project for the New America Century (PNAC) which laid out the blueprint in September, 2000, for America's war on terror and regime change wars in Iraq, Libya and Syria was founded and dominated by Sabbatians known as 'Neocons'. The document conceded that this plan would not be supported politically or publicly without a major attack on American soil and a Problem-Reaction-Solution excuse to send troops to war across the Middle East. Sabbatian Neocons said:

... [The] process of transformation ... [war and regime change] ... is likely to be a long one, absent some catastrophic and catalysing event – like a new Pearl Harbor.

Four months later many of those who produced that document came to power with their inane puppet George Bush from the long-time Sabbatian Bush family. They included Sabbatian Dick Cheney who was officially vice-president, but really de-facto president for the entirety of the 'Bush' government. Nine months after the 'Bush' inauguration came what Bush called at the time 'the Pearl Harbor of the 21st century' and with typical Sabbatian timing and symbolism 2001 was the 60th anniversary of the attack in 1941 by the Japanese Air Force on Pearl Harbor, Hawaii, which allowed President Franklin Delano Roosevelt to take the United States into a Sabbatian-

instigated Second World War that he said in his election campaign that he never would. The evidence is overwhelming that Roosevelt and his military and intelligence networks knew the attack was coming and did nothing to stop it, but they did make sure that America's most essential naval ships were not in Hawaii at the time. Three thousand Americans died in the Pearl Harbor attacks as they did on September 11th. By the 9/11 year of 2001 Sabbatians had widely infiltrated the US government, military and intelligence operations and used their compartmentalised assets to pull off the 'Al-Qaeda' attacks. If you read *The Trigger* it will blow your mind to see the utterly staggering concentration of 'Jewish' operatives (Sabbatian infiltrators) in essential positions of political, security, legal, law enforcement, financial and business power before, during, and after the attacks to make them happen, carry them out, and then cover their tracks – and I do mean *staggering* when you think of that 0.2 percent of the world population and two percent of Americans which are Jewish while Sabbatian infiltrators are a fraction of that. A central foundation of the 9/11 conspiracy was the hijacking of government, military, Air Force and intelligence computer systems in real time through 'back-door' access made possible by Israeli (Sabbatian) 'cyber security' software. Sabbatian-controlled Israel is on the way to rivalling Silicon Valley for domination of cyberspace and is becoming the dominant force in cyber-security which gives them access to entire computer systems and their passcodes across the world. Then add to this that Zionists head (officially) Silicon Valley giants like Google (Larry Page and Sergey Brin), Google-owned YouTube (Susan Wojcicki), Facebook (Mark Zuckerberg and Sheryl Sandberg), and Apple (Chairman Arthur D. Levinson), and that ultra-Zionist hedge fund billionaire Paul Singer has a \$1 billion stake in Twitter which is only nominally headed by 'CEO' pothead Jack Dorsey. As cable news host Tucker Carlson said of Dorsey: 'There used to be debate in the medical community whether dropping a ton of acid had permanent effects and I think that debate has now ended.' Carlson made the comment after Dorsey told a hearing on Capitol Hill (if you cut through his bullshit) that he

believed in free speech so long as he got to decide what you can hear and see. These 'big names' of Silicon Valley are only front men and women for the Global Cult, not least the Sabbatians, who are the true controllers of these corporations. Does anyone still wonder why these same people and companies have been ferociously censoring and banning people (like me) for exposing any aspect of the Cult agenda and especially the truth about the 'Covid' hoax which Sabbatians have orchestrated?

The Jeffrey Epstein paedophile ring was a Sabbatian operation. He was officially 'Jewish' but he was a Sabbatian and women abused by the ring have told me about the high number of 'Jewish' people involved. The Epstein horror has Sabbatian written all over it and matches perfectly their modus operandi and obsession with sex and ritual. Epstein was running a Sabbatian blackmail ring in which famous people with political and other influence were provided with young girls for sex while everything was being filmed and recorded on hidden cameras and microphones at his New York house, Caribbean island and other properties. Epstein survivors have described this surveillance system to me and some have gone public. Once the famous politician or other figure knew he or she was on video they tended to do whatever they were told. Here we go again ...when you've got them by the balls their hearts and minds will follow. Sabbatians use this blackmail technique on a wide scale across the world to entrap politicians and others they need to act as demanded. Epstein's private plane, the infamous 'Lolita Express', had many well-known passengers including Bill Clinton while Bill Gates has flown on an Epstein plane and met with him four years after Epstein had been jailed for paedophilia. They subsequently met many times at Epstein's home in New York according to a witness who was there. Epstein's infamous side-kick was Ghislaine Maxwell, daughter of Mossad agent and ultra-Zionist mega-crooked British businessman, Bob Maxwell, who at one time owned the *Daily Mirror* newspaper. Maxwell was murdered at sea on his boat in 1991 by Sabbatian-controlled Mossad when he became a liability with his

business empire collapsing as a former Mossad operative has confirmed (see *The Trigger*).

Money, money, money, funny money ...

Before I come to the Sabbatian connection with the last three US presidents I will lay out the crucial importance to Sabbatians of controlling banking and finance. Sabbatian Mayer Amschel Rothschild set out to dominate this arena in his family's quest for total global control. What is freedom? It is, in effect, choice. The more choices you have the freer you are and the fewer your choices the more you are enslaved. In the global structure created over centuries by Sabbatians the biggest decider and restrictor of choice is ... money. Across the world if you ask people what they would like to do with their lives and why they are not doing that they will reply 'I don't have the money'. This is the idea. A global elite of multi-billionaires are described as 'greedy' and that is true on one level; but control of money – who has it and who doesn't – is not primarily about greed. It's about control. Sabbatians have seized ever more control of finance and sucked the wealth of the world out of the hands of the population. We talk now, after all, about the 'One-percent' and even then the wealthiest are a lot fewer even than that. This has been made possible by a money scam so outrageous and so vast it could rightly be called the scam of scams founded on creating 'money' out of nothing and 'loaning' that with interest to the population. Money out of nothing is called 'credit'. Sabbatians have asserted control over governments and banking ever more completely through the centuries and secured financial laws that allow banks to lend hugely more than they have on deposit in a confidence trick known as fractional reserve lending. Imagine if you could lend money that doesn't exist and charge the recipient interest for doing so. You would end up in jail. Bankers by contrast end up in mansions, private jets, Malibu and Monaco.

Banks are only required to keep a fraction of their deposits and wealth in their vaults and they are allowed to lend 'money' they don't have called 'credit'. Go into a bank for a loan and if you succeed

the banker will not move any real wealth into your account. They will type into your account the amount of the agreed 'loan' – say £100,000. This is not wealth that really exists; it is non-existent, fresh-air, created-out-of-nothing 'credit' which has never, does not, and will never exist except in theory. Credit is backed by nothing except wind and only has buying power because people think that it has buying power and accept it in return for property, goods and services. I have described this situation as like those cartoon characters you see chasing each other and when they run over the edge of a cliff they keep running forward on fresh air until one of them looks down, realises what's happened, and they all crash into the ravine. The whole foundation of the Sabbatian financial system is to stop people looking down except for periodic moments when they want to crash the system (as in 2008 and 2020 ongoing) and reap the rewards from all the property, businesses and wealth their borrowers had signed over as 'collateral' in return for a 'loan' of fresh air. Most people think that money is somehow created by governments when it comes into existence from the start as a debt through banks 'lending' illusory money called credit. Yes, the very currency of exchange is a *debt* from day one issued as an interest-bearing loan. Why don't governments create money interest-free and lend it to their people interest-free? Governments are controlled by Sabbatians and the financial system is controlled by Sabbatians for whom interest-free money would be a nightmare come true. Sabbatians underpin their financial domination through their global network of central banks, including the privately-owned US Federal Reserve and Britain's Bank of England, and this is orchestrated by a privately-owned central bank coordination body called the Bank for International Settlements in Basle, Switzerland, created by the usual suspects including the Rockefellers and Rothschilds. Central bank chiefs don't answer to governments or the people. They answer to the Bank for International Settlements or, in other words, the Global Cult which is dominated today by Sabbatians.

Built-in disaster

There are so many constituent scams within the overall banking scam. When you take out a loan of thin-air credit only the amount of that loan is theoretically brought into circulation to add to the amount in circulation; but you are paying back the principle plus interest. The additional interest is not created and this means that with every 'loan' there is a shortfall in the money in circulation between what is borrowed and what has to be paid back. There is never even close to enough money in circulation to repay all outstanding public and private debt including interest. Coldly weaved in the very fabric of the system is the certainty that some will lose their homes, businesses and possessions to the banking 'lender'. This is less obvious in times of 'boom' when the amount of money in circulation (and the debt) is expanding through more people wanting and getting loans. When a downturn comes and the money supply contracts it becomes painfully obvious that there is not enough money to service all debt and interest. This is less obvious in times of 'boom' when the amount of money in circulation (and the debt) is expanding through more people wanting and getting loans. When a downturn comes and the money supply contracts and it becomes painfully obvious – as in 2008 and currently – that there is not enough money to service all debt and interest. Sabbatian banksters have been leading the human population through a calculated series of booms (more debt incurred) and busts (when the debt can't be repaid and the banks get the debtor's tangible wealth in exchange for non-existent 'credit'). With each 'bust' Sabbatian bankers have absorbed more of the world's tangible wealth and we end up with the One-percent. Governments are in bankruptcy levels of debt to the same system and are therefore owned by a system they do not control. The Federal Reserve, 'America's central bank', is privately-owned and American presidents only nominally appoint its chairman or woman to maintain the illusion that it's an arm of government. It's not. The 'Fed' is a cartel of private banks which handed billions to its associates and friends after the crash of 2008 and has been Sabbatian-controlled since it was manipulated into being in 1913 through the covert trickery of Rothschild banking agents Jacob Schiff and Paul

Warburg, and the Sabbatian Rockefeller family. Somehow from a Jewish population of two-percent and globally 0.2 percent (Sabbatian interlopers remember are far smaller) ultra-Zionists headed the Federal Reserve for 31 years between 1987 and 2018 in the form of Alan Greenspan, Bernard Bernanke and Janet Yellen (now Biden's Treasury Secretary) with Yellen's deputy chairman a Israeli-American dual citizen and ultra-Zionist Stanley Fischer, a former governor of the Bank of Israel. Ultra-Zionist Fed chiefs spanned the presidencies of Ronald Reagan ('Republican'), Father George Bush ('Republican'), Bill Clinton ('Democrat'), Boy George Bush ('Republican') and Barack Obama ('Democrat'). We should really add the pre-Greenspan chairman, Paul Adolph Volcker, 'appointed' by Jimmy Carter ('Democrat') who ran the Fed between 1979 and 1987 during the Carter and Reagan administrations before Greenspan took over. Volcker was a long-time associate and business partner of the Rothschilds. No matter what the 'party' officially in power the United States economy was directed by the same force. Here are members of the Obama, Trump and Biden administrations and see if you can make out a common theme.

Barack Obama ('Democrat')

Ultra-Zionists Robert Rubin, Larry Summers, and Timothy Geithner ran the US Treasury in the Clinton administration and two of them reappeared with Obama. Ultra-Zionist Fed chairman Alan Greenspan had manipulated the crash of 2008 through deregulation and jumped ship just before the disaster to make way for ultra-Zionist Bernard Bernanke to hand out trillions to Sabbatian 'too big to fail' banks and businesses, including the ubiquitous ultra-Zionist Goldman Sachs which has an ongoing staff revolving door operation between itself and major financial positions in government worldwide. Obama inherited the fallout of the crash when he took office in January, 2009, and fortunately he had the support of his ultra-Zionist White House Chief of Staff Rahm Emmanuel, son of a terrorist who helped to bomb Israel into being in 1948, and his ultra-Zionist senior adviser David Axelrod, chief strategist in Obama's two

successful presidential campaigns. Emmanuel, later mayor of Chicago and former senior fundraiser and strategist for Bill Clinton, is an example of the Sabbatian policy after Israel was established of migrating insider families to America so their children would be born American citizens. 'Obama' chose this financial team throughout his administration to respond to the Sabbatian-instigated crisis:

Timothy Geithner (ultra-Zionist) Treasury Secretary; Jacob J. Lew, Treasury Secretary; Larry Summers (ultra-Zionist), director of the White House National Economic Council; Paul Adolph Volcker (Rothschild business partner), chairman of the Economic Recovery Advisory Board; Peter Orszag (ultra-Zionist), director of the Office of Management and Budget overseeing all government spending; Penny Pritzker (ultra-Zionist), Commerce Secretary; Jared Bernstein (ultra-Zionist), chief economist and economic policy adviser to Vice President Joe Biden; Mary Schapiro (ultra-Zionist), chair of the Securities and Exchange Commission (SEC); Gary Gensler (ultra-Zionist), chairman of the Commodity Futures Trading Commission (CFTC); Sheila Bair (ultra-Zionist), chair of the Federal Deposit Insurance Corporation (FDIC); Karen Mills (ultra-Zionist), head of the Small Business Administration (SBA); Kenneth Feinberg (ultra-Zionist), Special Master for Executive [bail-out] Compensation. Feinberg would be appointed to oversee compensation (with strings) to 9/11 victims and families in a campaign to stop them having their day in court to question the official story. At the same time ultra-Zionist Bernard Bernanke was chairman of the Federal Reserve and these are only some of the ultra-Zionists with allegiance to Sabbatian-controlled Israel in the Obama government. Obama's biggest corporate donor was ultra-Zionist Goldman Sachs which had employed many in his administration.

Donald Trump ('Republican')

Trump claimed to be an outsider (he wasn't) who had come to 'drain the swamp'. He embarked on this goal by immediately appointing ultra-Zionist Steve Mnuchin, a Goldman Sachs employee for 17

years, as his Treasury Secretary. Others included Gary Cohn (ultra-Zionist), chief operating officer of Goldman Sachs, his first Director of the National Economic Council and chief economic adviser, who was later replaced by Larry Kudlow (ultra-Zionist). Trump's senior adviser throughout his four years in the White House was his sinister son-in-law Jared Kushner, a life-long friend of Israel Prime Minister Benjamin Netanyahu. Kushner is the son of a convicted crook who was pardoned by Trump in his last days in office. Other ultra-Zionists in the Trump administration included: Stephen Miller, Senior Policy Adviser; Avrahm Berkowitz, Deputy Adviser to Trump and his Senior Adviser Jared Kushner; Ivanka Trump, Adviser to the President, who converted to Judaism when she married Jared Kushner; David Friedman, Trump lawyer and Ambassador to Israel; Jason Greenblatt, Trump Organization executive vice president and chief legal officer, who was made Special Representative for International Negotiations and the Israeli-Palestinian Conflict; Rod Rosenstein, Deputy Attorney General; Elliot Abrams, Special Representative for Venezuela, then Iran; John Eisenberg, National Security Council Legal Adviser and Deputy Council to the President for National Security Affairs; Anne Neuberger, Deputy National Manager, National Security Agency; Ezra Cohen-Watnick, Acting Under Secretary of Defense for Intelligence; Elan Carr, Special Envoy to monitor and combat anti-Semitism; Len Khodorkovsky, Deputy Special Envoy to monitor and combat anti-Semitism; Reed Cordish, Assistant to the President, Intragovernmental and Technology Initiatives. Trump Vice President Mike Pence and Secretary of State Mike Pompeo, both Christian Zionists, were also vehement supporters of Israel and its goals and ambitions.

Donald 'free-speech believer' Trump pardoned a number of financial and violent criminals while ignoring calls to pardon Julian Assange and Edward Snowden whose crimes are revealing highly relevant information about government manipulation and corruption and the widespread illegal surveillance of the American people by US 'security' agencies. It's so good to know that Trump is on the side of freedom and justice and not mega-criminals with

allegiance to Sabbatian-controlled Israel. These included a pardon for Israeli spy Jonathan Pollard who was jailed for life in 1987 under the Espionage Act. Aviem Sella, the Mossad agent who recruited Pollard, was also pardoned by Trump while Assange sat in jail and Snowden remained in exile in Russia. Sella had 'fled' (was helped to escape) to Israel in 1987 and was never extradited despite being charged under the Espionage Act. A Trump White House statement said that Sella's clemency had been 'supported by Benjamin Netanyahu, Ron Dermer, Israel's US Ambassador, David Friedman, US Ambassador to Israel and Miriam Adelson, wife of leading Trump donor Sheldon Adelson who died shortly before. Other friends of Jared Kushner were pardoned along with Sholom Weiss who was believed to be serving the longest-ever white-collar prison sentence of more than 800 years in 2000. The sentence was commuted of Ponzi-schemer Eliyahu Weinstein who defrauded Jews and others out of \$200 million. I did mention that Assange and Snowden were ignored, right? Trump gave Sabbatians almost everything they asked for in military and political support, moving the US Embassy from Tel Aviv to Jerusalem with its critical symbolic and literal implications for Palestinian statehood, and the 'deal of the Century' designed by Jared Kushner and David Friedman which gave the Sabbatian Israeli government the green light to substantially expand its already widespread program of building illegal Jewish-only settlements in the occupied land of the West Bank. This made a two-state 'solution' impossible by seizing all the land of a potential Palestinian homeland and that had been the plan since 1948 and then 1967 when the Arab-controlled Gaza Strip, West Bank, Sinai Peninsula and Syrian Golan Heights were occupied by Israel. All the talks about talks and road maps and delays have been buying time until the West Bank was physically occupied by Israeli real estate. Trump would have to be a monumentally ill-informed idiot not to see that this was the plan he was helping to complete. The Trump administration was in so many ways the Kushner administration which means the Netanyahu administration which means the Sabbatian administration. I understand why many opposing Cult fascism in all its forms gravitated to Trump, but he

was a crucial part of the Sabbatian plan and I will deal with this in the next chapter.

Joe Biden ('Democrat')

A barely cognitive Joe Biden took over the presidency in January, 2021, along with his fellow empty shell, Vice-President Kamala Harris, as the latest Sabbatian gofers to enter the White House. Names on the door may have changed and the 'party' – the force behind them remained the same as Zionists were appointed to a stream of pivotal areas relating to Sabbatian plans and policy. They included: Janet Yellen, Treasury Secretary, former head of the Federal Reserve, and still another ultra-Zionist running the US Treasury after Mnuchin (Trump), Lew and Geithner (Obama), and Summers and Rubin (Clinton); Anthony Blinken, Secretary of State; Wendy Sherman, Deputy Secretary of State (so that's 'Biden's' Sabbatian foreign policy sorted); Jeff Zients, White House coronavirus coordinator; Rochelle Walensky, head of the Centers for Disease Control; Rachel Levine, transgender deputy health secretary (that's 'Covid' hoax policy under control); Merrick Garland, Attorney General; Alejandro Mayorkas, Secretary of Homeland Security; Cass Sunstein, Homeland Security with responsibility for new immigration laws; Avril Haines, Director of National Intelligence; Anne Neuberger, National Security Agency cybersecurity director (note, cybersecurity); David Cohen, CIA Deputy Director; Ronald Klain, Biden's Chief of Staff (see Rahm Emanuel); Eric Lander, a 'leading geneticist', Office of Science and Technology Policy director (see Smart Grid, synthetic biology agenda); Jessica Rosenworcel, acting head of the Federal Communications Commission (FCC) which controls Smart Grid technology policy and electromagnetic communication systems including 5G. How can it be that so many pivotal positions are held by two-percent of the American population and 0.2 percent of the world population administration after administration no matter who is the president and what is the party? It's a coincidence? Of course it's not and this is why Sabbatians have built their colossal global web of interlocking 'anti-

hate' hate groups to condemn anyone who asks these glaring questions as an 'anti-Semite'. The way that Jewish people horrifically abused in Sabbatian-backed Nazi Germany are exploited to this end is stomach-turning and disgusting beyond words.

Political fusion

Sabbatian manipulation has reversed the roles of Republicans and Democrats and the same has happened in Britain with the Conservative and Labour Parties. Republicans and Conservatives were always labelled the 'right' and Democrats and Labour the 'left', but look at the policy positions now and the Democrat-Labour 'left' has moved further to the 'right' than Republicans and Conservatives under the banner of 'Woke', the Cult-created far-right tyranny. Where once the Democrat-Labour 'left' defended free speech and human rights they now seek to delete them and as I said earlier despite the 'Covid' fascism of the Jackboot Johnson Conservative government in the UK the Labour Party of leader Keir Starmer demanded even more extreme measures. The Labour Party has been very publicly absorbed by Sabbatians after a political and media onslaught against the previous leader, the weak and inept Jeremy Corbyn, over made-up allegations of 'anti-Semitism' both by him and his party. The plan was clear with this 'anti-Semite' propaganda and what was required in response was a swift and decisive 'fuck off' from Corbyn and a statement to expose the Anti-Semitism Industry (Sabbatian) attempt to silence Labour criticism of the Israeli government (Sabbatians) and purge the party of all dissent against the extremes of ultra-Zionism (Sabbatians). Instead Corbyn and his party fell to their knees and appeased the abusers which, by definition, is impossible. Appeasing one demand leads only to a new demand to be appeased until takeover is complete. Like I say – 'fuck off' would have been a much more effective policy and I have used it myself with great effect over the years when Sabbatians are on my case which is most of the time. I consider that fact a great compliment, by the way. The outcome of the Labour Party capitulation is that we now have a Sabbatian-controlled

Conservative Party 'opposed' by a Sabbatian-controlled Labour Party in a one-party Sabbatian state that hurtles towards the extremes of tyranny (the Sabbatian cult agenda). In America the situation is the same. Labour's Keir Starmer spends his days on his knees with his tongue out pointing to Tel Aviv, or I guess now Jerusalem, while Boris Johnson has an 'anti-Semitism czar' in the form of former Labour MP John Mann who keeps Starmer company on his prayer mat.

Sabbatian influence can be seen in Jewish members of the Labour Party who have been ejected for criticism of Israel including those from families that suffered in Nazi Germany. Sabbatians despise real Jewish people and target them even more harshly because it is so much more difficult to dub them 'anti-Semitic' although in their desperation they do try.

CHAPTER THREE

The Pushbacker sting

*Until you realize how easy it is for your mind to be manipulated, you
remain the puppet of someone else's game*

Evita Ochel

I will use the presidencies of Trump and Biden to show how the manipulation of the one-party state plays out behind the illusion of political choice across the world. No two presidencies could – on the face of it – be more different and apparently at odds in terms of direction and policy.

A Renegade Mind sees beyond the obvious and focuses on outcomes and consequences and not image, words and waffle. The Cult embarked on a campaign to divide America between those who blindly support its agenda (the mentality known as 'Woke') and those who are pushing back on where the Cult and its Sabbatians want to go. This presents infinite possibilities for dividing and ruling the population by setting them at war with each other and allows a perceptual ring fence of demonisation to encircle the Pushbackers in a modern version of the Little Big Horn in 1876 when American cavalry led by Lieutenant Colonel George Custer were drawn into a trap, surrounded and killed by Native American tribes defending their land of thousands of years from being seized by the government. In this modern version the roles are reversed and it's those defending themselves from the Sabbatian government who are surrounded and the government that's seeking to destroy them. This trap was set years ago and to explain how we must return to 2016

and the emergence of Donald Trump as a candidate to be President of the United States. He set out to overcome the best part of 20 other candidates in the Republican Party before and during the primaries and was not considered by many in those early stages to have a prayer of living in the White House. The Republican Party was said to have great reservations about Trump and yet somehow he won the nomination. When you know how American politics works – politics in general – there is no way that Trump could have become the party's candidate unless the Sabbatian-controlled 'Neocons' that run the Republican Party wanted that to happen. We saw the proof in emails and documents made public by WikiLeaks that the Democratic Party hierarchy, or Democons, systematically undermined the campaign of Bernie Sanders to make sure that Sabbatian gofer Hillary Clinton won the nomination to be their presidential candidate. If the Democons could do that then the Neocons in the Republican Party could have derailed Trump in the same way. But they didn't and at that stage I began to conclude that Trump could well be the one chosen to be president. If that was the case the 'why' was pretty clear to see – the goal of dividing America between Cult agenda-supporting Wokers and Pushbackers who gravitated to Trump because he was telling them what they wanted to hear. His constituency of support had been increasingly ignored and voiceless for decades and profoundly through the eight years of Sabbatian puppet Barack Obama. Now here was someone speaking their language of pulling back from the incessant globalisation of political and economic power, the exporting of American jobs to China and elsewhere by 'American' (Sabbatian) corporations, the deletion of free speech, and the mass immigration policies that had further devastated job opportunities for the urban working class of all races and the once American heartlands of the Midwest.

Beware the forked tongue

Those people collectively sighed with relief that at last a political leader was apparently on their side, but another trait of the Renegade Mind is that you look even harder at people telling you

what you want to hear than those who are telling you otherwise. Obviously as I said earlier people wish what they want to hear to be true and genuine and they are much more likely to believe that than someone saying what they don't want to hear and don't want to be true. Sales people are taught to be skilled in eliciting by calculated questioning what their customers want to hear and repeating that back to them as their own opinion to get their targets to like and trust them. Assets of the Cult are also sales people in the sense of selling perception. To read Cult manipulation you have to play the long and expanded game and not fall for the Vaudeville show of party politics. Both American parties are vehicles for the Cult and they exploit them in different ways depending on what the agenda requires at that moment. Trump and the Republicans were used to be the focus of dividing America and isolating Pushbackers to open the way for a Biden presidency to become the most extreme in American history by advancing the full-blown Woke (Cult) agenda with the aim of destroying and silencing Pushbackers now labelled Nazi Trump supporters and white supremacists.

Sabbatians wanted Trump in office for the reasons described by ultra-Zionist Saul Alinsky (1909-1972) who was promoting the Woke philosophy through 'community organising' long before anyone had heard of it. In those days it still went by its traditional name of Marxism. The reason for the manipulated Trump phenomenon was laid out in Alinsky's 1971 book, *Rules for Radicals*, which was his blueprint for overthrowing democratic and other regimes and replacing them with Sabbatian Marxism. Not surprisingly his to-do list was evident in the Sabbatian French and Russian 'Revolutions' and that in China which will become very relevant in the next chapter about the 'Covid' hoax. Among Alinsky's followers have been the deeply corrupt Barack Obama, House Speaker Nancy Pelosi and Hillary Clinton who described him as a 'hero'. All three are Sabbatian stooges with Pelosi personifying the arrogant corrupt idiocy that so widely fronts up for the Cult inner core. Predictably as a Sabbatian advocate of the 'light-bringer' Alinsky features Lucifer on the dedication page of his book as the original radical who gained

his own kingdom ('Earth' as we shall see). One of Alinsky's golden radical rules was to pick an individual and focus all attention, hatred and blame on them and not to target faceless bureaucracies and corporations. *Rules for Radicals* is really a Sabbatian handbook with its contents repeatedly employed all over the world for centuries and why wouldn't Sabbatians bring to power their designer-villain to be used as the individual on which all attention, hatred and blame was bestowed? This is what they did and the only question for me is how much Trump knew that and how much he was manipulated. A bit of both, I suspect. This was Alinsky's Trump technique from a man who died in 1972. The technique has spanned history:

Pick the target, freeze it, personalize it, polarize it. Don't try to attack abstract corporations or bureaucracies. Identify a responsible individual. Ignore attempts to shift or spread the blame.

From the moment Trump came to illusory power everything was about him. It wasn't about Republican policy or opinion, but all about Trump. Everything he did was presented in negative, derogatory and abusive terms by the Sabbatian-dominated media led by Cult operations such as CNN, MSNBC, *The New York Times* and the Jeff Bezos-owned *Washington Post* – 'Pick the target, freeze it, personalize it, polarize it.' Trump was turned into a demon to be vilified by those who hated him and a demi-god loved by those who worshipped him. This, in turn, had his supporters, too, presented as equally demonic in preparation for the punchline later down the line when Biden was about to take office. It was here's a Trump, there's a Trump, everywhere a Trump, Trump. Virtually every news story or happening was filtered through the lens of 'The Donald'. You loved him or hated him and which one you chose was said to define you as Satan's spawn or a paragon of virtue. Even supporting some Trump policies or statements and not others was enough for an assault on your character. No shades of grey were or are allowed. Everything is black and white (literally and figuratively). A Californian I knew had her head utterly scrambled by her hatred for Trump while telling people they should love each other. She was so totally consumed by

Trump Derangement Syndrome as it became to be known that this glaring contradiction would never have occurred to her. By definition anyone who criticised Trump or praised his opponents was a hero and this lady described Joe Biden as 'a kind, honest gentleman' when he's a provable liar, mega-crook and vicious piece of work to boot. Sabbatians had indeed divided America using Trump as the fall-guy and all along the clock was ticking on the consequences for his supporters.

In hock to his masters

Trump gave Sabbatians via Israel almost everything they wanted in his four years. Ask and you shall receive was the dynamic between himself and Benjamin Netanyahu orchestrated by Trump's ultra-Zionist son-in-law Jared Kushner, his ultra-Zionist Ambassador to Israel, David Friedman, and ultra-Zionist 'Israel adviser', Jason Greenblatt. The last two were central to the running and protecting from collapse of his business empire, the Trump Organisation, and colossal business failures made him forever beholding to Sabbatian networks that bailed him out. By the start of the 1990s Trump owed \$4 billion to banks that he couldn't pay and almost \$1 billion of that was down to him personally and not his companies. This mega-disaster was the result of building two new casinos in Atlantic City and buying the enormous Taj Mahal operation which led to crippling debt payments. He had borrowed fantastic sums from 72 banks with major Sabbatian connections and although the scale of debt should have had him living in a tent alongside the highway they never foreclosed. A plan was devised to lift Trump from the mire by BT Securities Corporation and Rothschild Inc. and the case was handled by Wilber Ross who had worked for the Rothschilds for 27 years. Ross would be named US Commerce Secretary after Trump's election. Another crucial figure in saving Trump was ultra-Zionist 'investor' Carl Icahn who bought the Taj Mahal casino. Icahn was made special economic adviser on financial regulation in the Trump administration. He didn't stay long but still managed to find time to make a tidy sum of a reported \$31.3 million when he sold his

holdings affected by the price of steel three days before Trump imposed a 235 percent tariff on steel imports. What amazing bits of luck these people have. Trump and Sabbatian operatives have long had a close association and his mentor and legal adviser from the early 1970s until 1986 was the dark and genetically corrupt ultra-Zionist Roy Cohn who was chief counsel to Senator Joseph McCarthy's 'communist' witch-hunt in the 1950s. *Esquire* magazine published an article about Cohn with the headline 'Don't mess with Roy Cohn'. He was described as the most feared lawyer in New York and 'a ruthless master of dirty tricks ... [with] ... more than one Mafia Don on speed dial'. Cohn's influence, contacts, support and protection made Trump a front man for Sabbatians in New York with their connections to one of Cohn's many criminal employers, the 'Russian' Sabbatian Mafia. Israel-centric media mogul Rupert Murdoch was introduced to Trump by Cohn and they started a long friendship. Cohn died in 1986 weeks after being disbarred for unethical conduct by the Appellate Division of the New York State Supreme Court. The wheels of justice do indeed run slow given the length of Cohn's crooked career.

QAnon-sense

We are asked to believe that Donald Trump with his fundamental connections to Sabbatian networks and operatives has been leading the fight to stop the Sabbatian agenda for the fascistic control of America and the world. Sure he has. A man entrapped during his years in the White House by Sabbatian operatives and whose biggest financial donor was casino billionaire Sheldon Adelson who was Sabbatian to his DNA?? Oh, do come on. Trump has been used to divide America and isolate Pushbackers on the Cult agenda under the heading of 'Trump supporters', 'insurrectionists' and 'white supremacists'. The US Intelligence/Mossad Psyop or psychological operation known as QAnon emerged during the Trump years as a central pillar in the Sabbatian campaign to lead Pushbackers into the trap set by those that wished to destroy them. I knew from the start that QAnon was a scam because I had seen the same scenario many

times before over 30 years under different names and I had written about one in particular in the books. 'Not again' was my reaction when QAnon came to the fore. The same script is pulled out every few years and a new name added to the letterhead. The story always takes the same form: 'Insiders' or 'the good guys' in the government-intelligence-military 'Deep State' apparatus were going to instigate mass arrests of the 'bad guys' which would include the Rockefellers, Rothschilds, Barack Obama, Hillary Clinton, George Soros, etc., etc. Dates are given for when the 'good guys' are going to move in, but the dates pass without incident and new dates are given which pass without incident. The central message to Pushbackers in each case is that they don't have to do anything because there is 'a plan' and it is all going to be sorted by the 'good guys' on the inside. 'Trust the plan' was a QAnon mantra when the only plan was to misdirect Pushbackers into putting their trust in a Psyop they believed to be real. Beware, beware, those who tell you what you want to hear and always check it out. Right up to Biden's inauguration QAnon was still claiming that 'the Storm' was coming and Trump would stay on as president when Biden and his cronies were arrested and jailed. It was never going to happen and of course it didn't, but what did happen as a result provided that punchline to the Sabbatian Trump/QAnon Psyop.

On January 6th, 2021, a very big crowd of Trump supporters gathered in the National Mall in Washington DC down from the Capitol Building to protest at what they believed to be widespread corruption and vote fraud that stopped Trump being re-elected for a second term as president in November, 2020. I say as someone that does not support Trump or Biden that the evidence is clear that major vote-fixing went on to favour Biden, a man with cognitive problems so advanced he can often hardly string a sentence together without reading the words written for him on the Teleprompter. Glaring ballot discrepancies included serious questions about electronic voting machines that make vote rigging a comparative cinch and hundreds of thousands of paper votes that suddenly appeared during already advanced vote counts and virtually all of

them for Biden. Early Trump leads in crucial swing states suddenly began to close and disappear. The pandemic hoax was used as the excuse to issue almost limitless numbers of mail-in ballots with no checks to establish that the recipients were still alive or lived at that address. They were sent to streams of people who had not even asked for them. Private organisations were employed to gather these ballots and who knows what they did with them before they turned up at the counts. The American election system has been manipulated over decades to become a sick joke with more holes than a Swiss cheese for the express purpose of dictating the results. Then there was the criminal manipulation of information by Sabbatian tech giants like Facebook, Twitter and Google-owned YouTube which deleted pro-Trump, anti-Biden accounts and posts while everything in support of Biden was left alone. Sabbatians wanted Biden to win because after the dividing of America it was time for full-on Woke and every aspect of the Cult agenda to be unleashed.

Hunter gatherer

Extreme Silicon Valley bias included blocking information by the *New York Post* exposing a Biden scandal that should have ended his bid for president in the final weeks of the campaign. Hunter Biden, his monumentally corrupt son, is reported to have sent a laptop to be repaired at a local store and failed to return for it. Time passed until the laptop became the property of the store for non-payment of the bill. When the owner saw what was on the hard drive he gave a copy to the FBI who did nothing even though it confirmed widespread corruption in which the Joe Biden family were using his political position, especially when he was vice president to Obama, to make multiple millions in countries around the world and most notably Ukraine and China. Hunter Biden's one-time business partner Tony Bobulinski went public when the story broke in the *New York Post* to confirm the corruption he saw and that Joe Biden not only knew what was going on he also profited from the spoils. Millions were handed over by a Chinese company with close

connections – like all major businesses in China – to the Chinese communist party of President Xi Jinping. Joe Biden even boasted at a meeting of the Cult's World Economic Forum that as vice president he had ordered the government of Ukraine to fire a prosecutor. What he didn't mention was that the same man just happened to be investigating an energy company which was part of Hunter Biden's corrupt portfolio. The company was paying him big bucks for no other reason than the influence his father had. Overnight Biden's presidential campaign should have been over given that he had lied publicly about not knowing what his son was doing. Instead almost the entire Sabbatian-owned mainstream media and Sabbatian-owned Silicon Valley suppressed circulation of the story. This alone went a mighty way to rigging the election of 2020. Cult assets like Mark Zuckerberg at Facebook also spent hundreds of millions to be used in support of Biden and vote 'administration'.

The Cult had used Trump as the focus to divide America and was now desperate to bring in moronic, pliable, corrupt Biden to complete the double-whammy. No way were they going to let little things like the will of the people thwart their plan. Silicon Valley widely censored claims that the election was rigged because it *was* rigged. For the same reason anyone claiming it was rigged was denounced as a 'white supremacist' including the pathetically few Republican politicians willing to say so. Right across the media where the claim was mentioned it was described as a 'false claim' even though these excuses for 'journalists' would have done no research into the subject whatsoever. Trump won seven million more votes than any sitting president had ever achieved while somehow a cognitively-challenged soon to be 78-year-old who was hidden away from the public for most of the campaign managed to win more votes than any presidential candidate in history. It makes no sense. You only had to see election rallies for both candidates to witness the enthusiasm for Trump and the apathy for Biden. Tens of thousands would attend Trump events while Biden was speaking in empty car parks with often only television crews attending and framing their shots to hide the fact that no one was there. It was pathetic to see

footage come to light of Biden standing at a podium making speeches only to TV crews and party fixers while reading the words written for him on massive Teleprompter screens. So, yes, those protestors on January 6th had a point about election rigging, but some were about to walk into a trap laid for them in Washington by the Cult Deep State and its QAnon Psyop. This was the Capitol Hill riot ludicrously dubbed an 'insurrection'.

The spider and the fly

Renegade Minds know there are not two 'sides' in politics, only one side, the Cult, working through all 'sides'. It's a stage show, a puppet show, to direct the perceptions of the population into focusing on diversions like parties and candidates while missing the puppeteers with their hands holding all the strings. The Capitol Hill 'insurrection' brings us back to the Little Big Horn. Having created two distinct opposing groupings – Woke and Pushbackers – the trap was about to be sprung. Pushbackers were to be encircled and isolated by associating them all in the public mind with Trump and then labelling Trump as some sort of Confederate leader. I knew immediately that the Capitol riot was a set-up because of two things. One was how easy the rioters got into the building with virtually no credible resistance and secondly I could see – as with the 'Covid' hoax in the West at the start of 2020 – how the Cult could exploit the situation to move its agenda forward with great speed. My experience of Cult techniques and activities over more than 30 years has showed me that while they do exploit situations they haven't themselves created this never happens with events of fundamental agenda significance. Every time major events giving cultists the excuse to rapidly advance their plan you find they are manipulated into being for the specific reason of providing that excuse – Problem-Reaction-Solution. Only a tiny minority of the huge crowd of Washington protestors sought to gain entry to the Capitol by smashing windows and breaching doors. That didn't matter. The whole crowd and all Pushbackers, even if they did not support Trump, were going to be lumped together as dangerous

insurrectionists and conspiracy theorists. The latter term came into widespread use through a CIA memo in the 1960s aimed at discrediting those questioning the nonsensical official story of the Kennedy assassination and it subsequently became widely employed by the media. It's still being used by inept 'journalists' with no idea of its origin to discredit anyone questioning anything that authority claims to be true. When you are perpetrating a conspiracy you need to discredit the very word itself even though the dictionary definition of conspiracy is merely 'the activity of secretly planning with other people to do something bad or illegal' and 'a general agreement to keep silent about a subject for the purpose of keeping it secret'. On that basis there are conspiracies almost wherever you look. For obvious reasons the Cult and its lapdog media have to claim there are no conspiracies even though the word appears in state laws as with conspiracy to defraud, to murder, and to corrupt public morals.

Agent provocateurs are widely used by the Cult Deep State to manipulate genuine people into acting in ways that suit the desired outcome. By genuine in this case I mean protestors genuinely supporting Trump and claims that the election was stolen. In among them, however, were agents of the state wearing the garb of Trump supporters and QAnon to pump-prime the Capital riot which some genuine Trump supporters naively fell for. I described the situation as 'Come into my parlour said the spider to the fly'. Leaflets appeared through the Woke paramilitary arm Antifa, the anti-fascist fascists, calling on supporters to turn up in Washington looking like Trump supporters even though they hated him. Some of those arrested for breaching the Capitol Building were sourced to Antifa and its stable mate Black Lives Matter. Both organisations are funded by Cult billionaires and corporations. One man charged for the riot was according to his lawyer a former FBI agent who had held top secret security clearance for 40 years. Attorney Thomas Plofchan said of his client, 66-year-old Thomas Edward Caldwell:

He has held a Top Secret Security Clearance since 1979 and has undergone multiple Special Background Investigations in support of his clearances. After retiring from the Navy, he

worked as a section chief for the Federal Bureau of Investigation from 2009-2010 as a GS-12 [mid-level employee].

He also formed and operated a consulting firm performing work, often classified, for U.S government customers including the US. Drug Enforcement Agency, Department of Housing and Urban Development, the US Coast Guard, and the US Army Personnel Command.

A judge later released Caldwell pending trial in the absence of evidence about a conspiracy or that he tried to force his way into the building. *The New York Post* reported a 'law enforcement source' as saying that 'at least two known Antifa members were spotted' on camera among Trump supporters during the riot while one of the rioters arrested was John Earle Sullivan, a seriously extreme Black Lives Matter Trump-hater from Utah who was previously arrested and charged in July, 2020, over a BLM-Antifa riot in which drivers were threatened and one was shot. Sullivan is the founder of Utah-based Insurgence USA which is an affiliate of the Cult-created-and-funded Black Lives Matter movement. Footage appeared and was then deleted by Twitter of Trump supporters calling out Antifa infiltrators and a group was filmed changing into pro-Trump clothing before the riot. Security at the building was *pathetic* – as planned. Colonel Leroy Fletcher Prouty, a man with long experience in covert operations working with the US security apparatus, once described the tell-tale sign to identify who is involved in an assassination. He said:

No one has to direct an assassination – it happens. The active role is played secretly by permitting it to happen. This is the greatest single clue. Who has the power to call off or reduce the usual security precautions?

This principle applies to many other situations and certainly to the Capitol riot of January 6th, 2021.

The sting

With such a big and potentially angry crowd known to be gathering near the Capitol the security apparatus would have had a major police detail to defend the building with National Guard troops on

standby given the strength of feeling among people arriving from all over America encouraged by the QAnon Psyop and statements by Donald Trump. Instead Capitol Police 'security' was flimsy, weak, and easily breached. The same number of officers was deployed as on a regular day and that is a blatant red flag. They were not staffed or equipped for a possible riot that had been an obvious possibility in the circumstances. No protective and effective fencing worth the name was put in place and there were no contingency plans. The whole thing was basically a case of standing aside and waving people in. Once inside police mostly backed off apart from one Capitol police officer who ridiculously shot dead unarmed Air Force veteran protestor Ashli Babbitt without a warning as she climbed through a broken window. The 'investigation' refused to name or charge the officer after what must surely be considered a murder in the circumstances. They just lifted a carpet and swept. The story was endlessly repeated about five people dying in the 'armed insurrection' when there was no report of rioters using weapons. Apart from Babbitt the other four died from a heart attack, strokes and apparently a drug overdose. Capitol police officer Brian Sicknick was reported to have died after being bludgeoned with a fire extinguisher when he was alive after the riot was over and died later of what the Washington Medical Examiner's Office said was a stroke. Sicknick had no external injuries. The lies were delivered like rapid fire. There was a narrative to build with incessant repetition of the lie until the lie became the accepted 'everybody knows that' truth. The 'Big Lie' technique of Nazi Propaganda Minister Joseph Goebbels is constantly used by the Cult which was behind the Nazis and is today behind the 'Covid' and 'climate change' hoaxes. Goebbels said:

If you tell a lie big enough and keep repeating it, people will eventually come to believe it. The lie can be maintained only for such time as the State can shield the people from the political, economic and/or military consequences of the lie. It thus becomes vitally important for the State to use all of its powers to repress dissent, for the truth is the mortal enemy of the lie, and thus by extension, the truth is the greatest enemy of the State.

Most protestors had a free run of the Capitol Building. This allowed pictures to be taken of rioters in iconic parts of the building including the Senate chamber which could be used as propaganda images against all Pushbackers. One Congresswoman described the scene as 'the worst kind of non-security anybody could ever imagine'. Well, the first part was true, but someone obviously did imagine it and made sure it happened. Some photographs most widely circulated featured people wearing QAnon symbols and now the Psyop would be used to dub all QAnon followers with the ubiquitous fit-all label of 'white supremacist' and 'insurrectionists'. When a Muslim extremist called Noah Green drove his car at two police officers at the Capitol Building killing one in April, 2021, there was no such political and media hysteria. They were just disappointed he wasn't white.

The witch-hunt

Government prosecutor Michael Sherwin, an aggressive, dark-eyed, professional Rottweiler led the 'investigation' and to call it over the top would be to understate reality a thousand fold. Hundreds were tracked down and arrested for the crime of having the wrong political views and people were jailed who had done nothing more than walk in the building, committed no violence or damage to property, took a few pictures and left. They were labelled a 'threat to the Republic' while Biden sat in the White House signing executive orders written for him that were dismantling 'the Republic'. Even when judges ruled that a mother and son should not be in jail the government kept them there. Some of those arrested have been badly beaten by prison guards in Washington and lawyers for one man said he suffered a fractured skull and was made blind in one eye. Meanwhile a woman is shot dead for no reason by a Capitol Police officer and we are not allowed to know who he is never mind what has happened to him although that will be *nothing*. The Cult's QAnon/Trump sting to identify and isolate Pushbackers and then target them on the road to crushing and deleting them was a resounding success. You would have thought the Russians had

invaded the building at gunpoint and lined up senators for a firing squad to see the political and media reaction. Congresswoman Alexandria Ocasio-Cortez is a child in a woman's body, a terrible-tuos, me, me, me, Woker narcissist of such proportions that words have no meaning. She said she thought she was going to die when 'insurrectionists' banged on her office door. It turned out she wasn't even in the Capitol Building when the riot was happening and the 'banging' was a Capitol Police officer. She referred to herself as a 'survivor' which is an insult to all those true survivors of violent and sexual abuse while she lives her pampered and privileged life talking drivel for a living. Her Woke colleague and fellow mega-narcissist Rashida Tlaib broke down describing the devastating effect on her, too, of *not being* in the building when the rioters were there. Ocasio-Cortez and Tlaib are members of a fully-Woke group of Congresswomen known as 'The Squad' along with Ilhan Omar and Ayanna Pressley. The Squad from what I can see can be identified by its vehement anti-white racism, anti-white men agenda, and, as always in these cases, the absence of brain cells on active duty.

The usual suspects were on the riot case immediately in the form of Democrat ultra-Zionist senators and operatives Chuck Schumer and Adam Schiff demanding that Trump be impeached for 'his part in the insurrection'. The same pair of prats had led the failed impeachment of Trump over the invented 'Russia collusion' nonsense which claimed Russia had helped Trump win the 2016 election. I didn't realise that Tel Aviv had been relocated just outside Moscow. I must find an up-to-date map. The Russia hoax was a Sabbatian operation to keep Trump occupied and impotent and to stop any rapport with Russia which the Cult wants to retain as a perceptual enemy to be pulled out at will. Puppet Biden began attacking Russia when he came to office as the Cult seeks more upheaval, division and war across the world. A two-year stage show 'Russia collusion inquiry' headed by the not-very-bright former 9/11 FBI chief Robert Mueller, with support from 19 lawyers, 40 FBI agents plus intelligence analysts, forensic accountants and other

staff, devoured tens of millions of dollars and found no evidence of Russia collusion which a ten-year-old could have told them on day one. Now the same moronic Schumer and Schiff wanted a second impeachment of Trump over the Capitol 'insurrection' (riot) which the arrested development of Schumer called another 'Pearl Harbor' while others compared it with 9/11 in which 3,000 died and, in the case of CNN, with the Rwandan genocide in the 1990s in which an estimated 500,000 to 600,000 were murdered, between 250, 000 and 500,000 women were raped, and populations of whole towns were hacked to death with machetes. To make those comparisons purely for Cult political reasons is beyond insulting to those that suffered and lost their lives and confirms yet again the callous inhumanity that we are dealing with. Schumer is a monumental idiot and so is Schiff, but they serve the Cult agenda and do whatever they're told so they get looked after. Talking of idiots – another inane man who spanned the Russia and Capitol impeachment attempts was Senator Eric Swalwell who had the nerve to accuse Trump of collusion with the Russians while sleeping with a Chinese spy called Christine Fang or 'Fang Fang' which is straight out of a Bond film no doubt starring Klaus Schwab as the bloke living on a secret island and controlling laser weapons positioned in space and pointing at world capitals. Fang Fang plays the part of Bond's infiltrator girlfriend which I'm sure she would enjoy rather more than sharing a bed with the brainless Swalwell, lying back and thinking of China. The FBI eventually warned Swalwell about Fang Fang which gave her time to escape back to the Chinese dictatorship. How very thoughtful of them. The second Trump impeachment also failed and hardly surprising when an impeachment is supposed to remove a sitting president and by the time it happened Trump was no longer president. These people are running your country America, well, officially anyway. Terrifying isn't it?

Outcomes tell the story - always

The outcome of all this – and it's the *outcome* on which Renegade Minds focus, not the words – was that a vicious, hysterical and

obviously pre-planned assault was launched on Pushbackers to censor, silence and discredit them and even targeted their right to earn a living. They have since been condemned as 'domestic terrorists' that need to be treated like Al-Qaeda and Islamic State. 'Domestic terrorists' is a label the Cult has been trying to make stick since the period of the Oklahoma bombing in 1995 which was blamed on 'far-right domestic terrorists'. If you read *The Trigger* you will see that the bombing was clearly a Problem-Reaction-Solution carried out by the Deep State during a Bill Clinton administration so corrupt that no dictionary definition of the term would even nearly suffice. Nearly 30, 000 troops were deployed from all over America to the empty streets of Washington for Biden's inauguration. Ten thousand of them stayed on with the pretext of protecting the capital from insurrectionists when it was more psychological programming to normalise the use of the military in domestic law enforcement in support of the Cult plan for a police-military state. Biden's fascist administration began a purge of 'wrong-thinkers' in the military which means anyone that is not on board with Woke. The Capitol Building was surrounded by a fence with razor wire and the Land of the Free was further symbolically and literally dismantled. The circle was completed with the installation of Biden and the exploitation of the QAnon Psyop.

America had never been so divided since the civil war of the 19th century, Pushbackers were isolated and dubbed terrorists and now, as was always going to happen, the Cult immediately set about deleting what little was left of freedom and transforming American society through a swish of the hand of the most controlled 'president' in American history leading (officially at least) the most extreme regime since the country was declared an independent state on July 4th, 1776. Biden issued undebated, dictatorial executive orders almost by the hour in his opening days in office across the whole spectrum of the Cult wish-list including diluting controls on the border with Mexico allowing thousands of migrants to illegally enter the United States to transform the demographics of America and import an election-changing number of perceived Democrat

voters. Then there were Biden deportation amnesties for the already illegally resident (estimated to be as high as 20 or even 30 million). A bill before Congress awarded American citizenship to anyone who could prove they had worked in agriculture for just 180 days in the previous two years as 'Big Ag' secured its slave labour long-term. There were the plans to add new states to the union such as Puerto Rico and making Washington DC a state. They are all parts of a plan to ensure that the Cult-owned Woke Democrats would be permanently in power.

Border – what border?

I have exposed in detail in other books how mass immigration into the United States and Europe is the work of Cult networks fuelled by the tens of billions spent to this and other ends by George Soros and his global Open Society (open borders) Foundations. The impact can be seen in America alone where the population has increased by *100 million* in little more than 30 years mostly through immigration. I wrote in *The Answer* that the plan was to have so many people crossing the southern border that the numbers become unstoppable and we are now there under Cult-owned Biden. El Salvador in Central America puts the scale of what is happening into context. A third of the population now lives in the United States, much of it illegally, and many more are on the way. The methodology is to crush Central and South American countries economically and spread violence through machete-wielding psychopathic gangs like MS-13 based in El Salvador and now operating in many American cities. Biden-imposed lax security at the southern border means that it is all but open. He said before his 'election' that he wanted to see a surge towards the border if he became president and that was the green light for people to do just that after election day to create the human disaster that followed for both America and the migrants. When that surge came the imbecilic Alexandria Ocasio-Cortez said it wasn't a 'surge' because they are 'children, not insurgents' and the term 'surge' (used by Biden) was a claim of 'white supremacists'.

This disingenuous lady may one day enter the realm of the most basic intelligence, but it won't be any time soon.

Sabbatians and the Cult are in the process of destroying America by importing violent people and gangs in among the genuine to terrorise American cities and by overwhelming services that cannot cope with the sheer volume of new arrivals. Something similar is happening in Europe as Western society in general is targeted for demographic and cultural transformation and upheaval. The plan demands violence and crime to create an environment of intimidation, fear and division and Soros has been funding the election of district attorneys across America who then stop prosecuting many crimes, reduce sentences for violent crimes and free as many violent criminals as they can. Sabbatians are creating the chaos from which order – their order – can respond in a classic Problem-Reaction-Solution. A Freemasonic moto says 'Ordo Ab Chao' (Order out of Chaos) and this is why the Cult is constantly creating chaos to impose a new 'order'. Here you have the reason the Cult is constantly creating chaos. The 'Covid' hoax can be seen with those entering the United States by plane being forced to take a 'Covid' test while migrants flooding through southern border processing facilities do not. Nothing is put in the way of mass migration and if that means ignoring the government's own 'Covid' rules then so be it. They know it's all bullshit anyway. Any pushback on this is denounced as 'racist' by Wokers and Sabbatian fronts like the ultra-Zionist Anti-Defamation League headed by the appalling Jonathan Greenblatt which at the same time argues that Israel should not give citizenship and voting rights to more Palestinian Arabs or the 'Jewish population' (in truth the Sabbatian network) will lose control of the country.

Society-changing numbers

Biden's masters have declared that countries like El Salvador are so dangerous that their people must be allowed into the United States for humanitarian reasons when there are fewer murders in large parts of many Central American countries than in US cities like

Baltimore. That is not to say Central America cannot be a dangerous place and Cult-controlled American governments have been making it so since way back, along with the dismantling of economies, in a long-term plan to drive people north into the United States. Parts of Central America are very dangerous, but in other areas the story is being greatly exaggerated to justify relaxing immigration criteria. Migrants are being offered free healthcare and education in the United States as another incentive to head for the border and there is no requirement to be financially independent before you can enter to prevent the resources of America being drained. You can't blame migrants for seeking what they believe will be a better life, but they are being played by the Cult for dark and nefarious ends. The numbers since Biden took office are huge. In February, 2021, more than 100,000 people were known to have tried to enter the US illegally through the southern border (it was 34,000 in the same month in 2020) and in March it was 170,000 – a 418 percent increase on March, 2020. These numbers are only known people, not the ones who get in unseen. The true figure for migrants illegally crossing the border in a single month was estimated by one congressman at 250,000 and that number will only rise under Biden's current policy. Gangs of murdering drug-running thugs that control the Mexican side of the border demand money – thousands of dollars – to let migrants cross the Rio Grande into America. At the same time gun battles are breaking out on the border several times a week between rival Mexican drug gangs (which now operate globally) who are equipped with sophisticated military-grade weapons, grenades and armoured vehicles. While the Capitol Building was being 'protected' from a non-existent 'threat' by thousands of troops, and others were still deployed at the time in the Cult Neocon war in Afghanistan, the southern border of America was left to its fate. This is not incompetence, it is cold calculation.

By March, 2021, there were 17,000 unaccompanied children held at border facilities and many of them are ensnared by people traffickers for paedophile rings and raped on their journey north to America. This is not conjecture – this is fact. Many of those designated

children are in reality teenage boys or older. Meanwhile Wokers posture their self-purity for encouraging poor and tragic people to come to America and face this nightmare both on the journey and at the border with the disgusting figure of House Speaker Nancy Pelosi giving disingenuous speeches about caring for migrants. The woman's evil. Wokers condemned Trump for having children in cages at the border (so did Obama, *Shhhh*), but now they are sleeping on the floor without access to a shower with one border facility 729 percent over capacity. The Biden insanity even proposed flying migrants from the southern border to the northern border with Canada for 'processing'. The whole shambles is being overseen by ultra-Zionist Secretary of Homeland Security, the moronic liar Alejandro Mayorkas, who banned news cameras at border facilities to stop Americans seeing what was happening. Mayorkas said there was not a ban on news crews; it was just that they were not allowed to film. Alongside him at Homeland Security is another ultra-Zionist Cass Sunstein appointed by Biden to oversee new immigration laws. Sunstein despises conspiracy researchers to the point where he suggests they should be banned or *taxed* for having such views. The man is not bonkers or anything. He's perfectly well-adjusted, but adjusted to what is the question. Criticise what is happening and you are a 'white supremacist' when earlier non-white immigrants also oppose the numbers which effect their lives and opportunities. Black people in poor areas are particularly damaged by uncontrolled immigration and the increased competition for work opportunities with those who will work for less. They are also losing voting power as Hispanics become more dominant in former black areas. It's a downward spiral for them while the billionaires behind the policy drone on about how much they care about black people and 'racism'. None of this is about compassion for migrants or black people – that's just wind and air. Migrants are instead being mercilessly exploited to transform America while the countries they leave are losing their future and the same is true in Europe. Mass immigration may now be the work of Woke Democrats, but it can be traced back to the 1986 Immigration Reform and Control Act (it

wasn't) signed into law by Republican hero President Ronald Reagan which gave amnesty to millions living in the United States illegally and other incentives for people to head for the southern border. Here we have the one-party state at work again.

Save me syndrome

Almost every aspect of what I have been exposing as the Cult agenda was on display in even the first days of 'Biden' with silencing of Pushbackers at the forefront of everything. A Renegade Mind will view the Trump years and QAnon in a very different light to their supporters and advocates as the dots are connected. The QAnon/Trump Psyop has given the Cult all it was looking for. We may not know how much, or little, that Trump realised he was being used, but that's a side issue. This pincer movement produced the desired outcome of dividing America and having Pushbackers isolated. To turn this around we have to look at new routes to empowerment which do not include handing our power to other people and groups through what I will call the 'Save Me Syndrome' – 'I want someone else to do it so that I don't have to'. We have seen this at work throughout human history and the QAnon/Trump Psyop is only the latest incarnation alongside all the others. Religion is an obvious expression of this when people look to a 'god' or priest to save them or tell them how to be saved and then there are 'save me' politicians like Trump. Politics is a diversion and not a 'saviour'. It is a means to block positive change, not make it possible.

Save Me Syndrome always comes with the same repeating theme of handing your power to whom or what you believe will save you while your real 'saviour' stares back from the mirror every morning. Renegade Minds are constantly vigilant in this regard and always asking the question 'What can I do?' rather than 'What can someone else do for me?' Gandhi was right when he said: 'You must be the change you want to see in the world.' We are indeed the people we have been waiting for. We are presented with a constant raft of reasons to concede that power to others and forget where the real power is. Humanity has the numbers and the Cult does not. It has to

use diversion and division to target the unstoppable power that comes from unity. Religions, governments, politicians, corporations, media, QAnon, are all different manifestations of this power-diversion and dilution. Refusing to give your power to governments and instead handing it to Trump and QAnon is not to take a new direction, but merely to recycle the old one with new names on the posters. I will explore this phenomenon as we proceed and how to break the cycles and recycles that got us here through the mists of repeating perception and so repeating history.

For now we shall turn to the most potent example in the entire human story of the consequences that follow when you give your power away. I am talking, of course, of the 'Covid' hoax.

CHAPTER FOUR

'Covid': Calculated catastrophe

Facts are threatening to those invested in fraud
DaShanne Stokes

We can easily unravel the real reason for the 'Covid pandemic' hoax by employing the Renegade Mind methodology that I have outlined this far. We'll start by comparing the long-planned Cult outcome with the 'Covid pandemic' outcome. Know the outcome and you'll see the journey.

I have highlighted the plan for the Hunger Games Society which has been in my books for so many years with the very few controlling the very many through ongoing dependency. To create this dependency it is essential to destroy independent livelihoods, businesses and employment to make the population reliant on the state (the Cult) for even the basics of life through a guaranteed pittance income. While independence of income remained these Cult ambitions would be thwarted. With this knowledge it was easy to see where the 'pandemic' hoax was going once talk of 'lockdowns' began and the closing of all but perceived 'essential' businesses to 'save' us from an alleged 'deadly virus'. Cult corporations like Amazon and Walmart were naturally considered 'essential' while mom and pop shops and stores had their doors closed by fascist decree. As a result with every new lockdown and new regulation more small and medium, even large businesses not owned by the Cult, went to the wall while Cult giants and their frontmen and women grew financially fatter by the second. Mom and pop were

denied an income and the right to earn a living and the wealth of people like Jeff Bezos (Amazon), Mark Zuckerberg (Facebook) and Sergei Brin and Larry Page (Google/Alphabet) have reached record levels. The Cult was increasing its own power through further dramatic concentrations of wealth while the competition was being destroyed and brought into a state of dependency. Lockdowns have been instigated to secure that very end and were never anything to do with health. My brother Paul spent 45 years building up a bus repair business, but lockdowns meant buses were running at a fraction of normal levels for months on end. Similar stories can be told in their hundreds of millions worldwide. Efforts of a lifetime coldly destroyed by Cult multi-billionaires and their lackeys in government and law enforcement who continued to earn their living from the taxation of the people while denying the right of the same people to earn theirs. How different it would have been if those making and enforcing these decisions had to face the same financial hardships of those they affected, but they never do.

Gates of Hell

Behind it all in the full knowledge of what he is doing and why is the psychopathic figure of Cult operative Bill Gates. His puppet Tedros at the World Health Organization declared 'Covid' a pandemic in March, 2020. The WHO had changed the definition of a 'pandemic' in 2009 just a month before declaring the 'swine flu pandemic' which would not have been so under the previous definition. The same applies to 'Covid'. The definition had included... 'an infection by an infectious agent, occurring simultaneously in different countries, with a significant mortality rate relative to the proportion of the population infected'. The new definition removed the need for 'significant mortality'. The 'pandemic' has been fraudulent even down to the definition, but Gates demanded economy-destroying lockdowns, school closures, social distancing, mandatory masks, a 'vaccination' for every man, woman and child on the planet and severe consequences and restrictions for those that refused. Who gave him this power? The

Cult did which he serves like a little boy in short trousers doing what his daddy tells him. He and his psychopathic missus even smiled when they said that much worse was to come (what they knew was planned to come). Gates responded in the matter-of-fact way of all psychopaths to a question about the effect on the world economy of what he was doing:

Well, it won't go to zero but it will shrink. Global GDP is probably going to take the biggest hit ever [Gates was smiling as he said this] ... in my lifetime this will be the greatest economic hit. But you don't have a choice. People act as if you have a choice. People don't feel like going to the stadium when they might get infected ... People are deeply affected by seeing these stats, by knowing they could be part of the transmission chain, old people, their parents and grandparents, could be affected by this, and so you don't get to say ignore what is going on here.

There will be the ability to open up, particularly in rich countries, if things are done well over the next few months, but for the world at large normalcy only returns when we have largely vaccinated the entire population.

The man has no compassion or empathy. How could he when he's a psychopath like all Cult players? My own view is that even beyond that he is very seriously mentally ill. Look in his eyes and you can see this along with his crazy flailing arms. You don't do what he has done to the world population since the start of 2020 unless you are mentally ill and at the most extreme end of psychopathic. You especially don't do it when to you know, as we shall see, that cases and deaths from 'Covid' are fakery and a product of monumental figure massaging. 'These stats' that Gates referred to are based on a 'test' that's not testing for the 'virus' as he has known all along. He made his fortune with big Cult support as an infamously ruthless software salesman and now buys global control of 'health' (death) policy without the population he affects having any say. It's a breathtaking outrage. Gates talked about people being deeply affected by fear of 'Covid' when that was because of *him* and his global network lying to them minute-by-minute supported by a lying media that he seriously influences and funds to the tune of hundreds of millions. He's handed big sums to media operations including the BBC, NBC, Al Jazeera, Univision, *PBS NewsHour*,

ProPublica, National Journal, The Guardian, The Financial Times, The Atlantic, Texas Tribune, USA Today publisher Gannett, Washington Monthly, Le Monde, Center for Investigative Reporting, Pulitzer Center on Crisis Reporting, National Press Foundation, International Center for Journalists, Solutions Journalism Network, the Poynter Institute for Media Studies, and many more. Gates is everywhere in the 'Covid' hoax and the man must go to prison – or a mental facility – for the rest of his life and his money distributed to those he has taken such enormous psychopathic pleasure in crushing.

The Muscle

The Hunger Games global structure demands a police-military state – a fusion of the two into one force – which viciously imposes the will of the Cult on the population and protects the Cult from public rebellion. In that regard, too, the 'Covid' hoax just keeps on giving. Often unlawful, ridiculous and contradictory 'Covid' rules and regulations have been policed across the world by moronic automatons and psychopaths made faceless by face-nappy masks and acting like the Nazi SS and fascist blackshirts and brownshirts of Hitler and Mussolini. The smallest departure from the rules decreed by the psychos in government and their clueless gofers were jumped upon by the face-nappy fascists. Brutality against public protestors soon became commonplace even on girls, women and old people as the brave men with the batons – the Face-Nappies as I call them – broke up peaceful protests and handed out fines like confetti to people who couldn't earn a living let alone pay hundreds of pounds for what was once an accepted human right. Robot Face-Nappies of Nottingham police in the English East Midlands fined one group £11,000 for attending a child's birthday party. For decades I charted the transformation of law enforcement as genuine, decent officers were replaced with psychopaths and the brain dead who would happily and brutally do whatever their masters told them. Now they were let loose on the public and I would emphasise the point that none of this just happened. The step-by-step change in the dynamic between police and public was orchestrated from the shadows by

those who knew where this was all going and the same with the perceptual reframing of those in all levels of authority and official administration through 'training courses' by organisations such as Common Purpose which was created in the late 1980s and given a massive boost in Blair era Britain until it became a global phenomenon. Supposed public 'servants' began to view the population as the enemy and the same was true of the police. This was the start of the explosion of behaviour manipulation organisations and networks preparing for the all-war on the human psyche unleashed with the dawn of 2020. I will go into more detail about this later in the book because it is a core part of what is happening.

Police desecrated beauty spots to deter people gathering and arrested women for walking in the countryside alone 'too far' from their homes. We had arrogant, clueless sergeants in the Isle of Wight police where I live posting on Facebook what they insisted the population must do or else. A schoolmaster sergeant called Radford looked young enough for me to ask if his mother knew he was out, but he was posting what he *expected* people to do while a Sergeant Wilkinson boasted about fining lads for meeting in a McDonald's car park where they went to get a lockdown takeaway. Wilkinson added that he had even cancelled their order. What a pair of prats these people are and yet they have increasingly become the norm among Jackboot Johnson's Yellowshirts once known as the British police. This was the theme all over the world with police savagery common during lockdown protests in the United States, the Netherlands, and the fascist state of Victoria in Australia under its tyrannical and again moronic premier Daniel Andrews. Amazing how tyrannical and moronic tend to work as a team and the same combination could be seen across America as arrogant, narcissistic Woke governors and mayors such as Gavin Newsom (California), Andrew Cuomo (New York), Gretchen Whitmer (Michigan), Lori Lightfoot (Chicago) and Eric Garcetti (Los Angeles) did their Nazi and Stalin impressions with the full support of the compliant brutality of their enforcers in uniform as they arrested small business owners defying

fascist shutdown orders and took them to jail in ankle shackles and handcuffs. This happened to bistro owner Marlena Pavlos-Hackney in Gretchen Whitmer's fascist state of Michigan when police arrived to enforce an order by a state-owned judge for 'putting the community at risk' at a time when other states like Texas were dropping restrictions and migrants were pouring across the southern border without any 'Covid' questions at all. I'm sure there are many officers appalled by what they are ordered to do, but not nearly enough of them. If they were truly appalled they would not do it. As the months passed every opportunity was taken to have the military involved to make their presence on the streets ever more familiar and 'normal' for the longer-term goal of police-military fusion.

Another crucial element to the Hunger Games enforcement network has been encouraging the public to report neighbours and others for 'breaking the lockdown rules'. The group faced with £11,000 in fines at the child's birthday party would have been dobbed-in by a neighbour with a brain the size of a pea. The technique was most famously employed by the Stasi secret police in communist East Germany who had public informants placed throughout the population. A police chief in the UK says his force doesn't need to carry out 'Covid' patrols when they are flooded with so many calls from the public reporting other people for visiting the beach. Dorset police chief James Vaughan said people were so enthusiastic about snitching on their fellow humans they were now operating as an auxiliary arm of the police: 'We are still getting around 400 reports a week from the public, so we will respond to reports ... We won't need to be doing hotspot patrols because people are very quick to pick the phone up and tell us.' Vaughan didn't say that this is a pillar of all tyrannies of whatever complexion and the means to hugely extend the reach of enforcement while spreading distrust among the people and making them wary of doing anything that might get them reported. Those narcissistic Isle of Wight sergeants Radford and Wilkinson never fail to add a link to their Facebook posts where the public can inform on their fellow slaves.

Neither would be self-aware enough to realise they were imitating the Stasi which they might well never have heard of. Government psychologists that I will expose later laid out a policy to turn communities against each other in the same way.

A coincidence? Yep, and I can knit fog

I knew from the start of the alleged pandemic that this was a Cult operation. It presented limitless potential to rapidly advance the Cult agenda and exploit manipulated fear to demand that every man, woman and child on the planet was 'vaccinated' in a process never used on humans before which infuses self-replicating *synthetic* material into human cells. Remember the plan to transform the human body from a biological to a synthetic biological state. I'll deal with the 'vaccine' (that's not actually a vaccine) when I focus on the genetic agenda. Enough to say here that mass global 'vaccination' justified by this 'new virus' set alarms ringing after 30 years of tracking these people and their methods. The 'Covid' hoax officially beginning in China was also a big red flag for reasons I will be explaining. The agenda potential was so enormous that I could dismiss any idea that the 'virus' appeared naturally. Major happenings with major agenda implications never occur without Cult involvement in making them happen. My questions were twofold in early 2020 as the media began its campaign to induce global fear and hysteria: Was this alleged infectious agent released on purpose by the Cult or did it even exist at all? I then did what I always do in these situations. I sat, observed and waited to see where the evidence and information would take me. By March and early April synchronicity was strongly – and ever more so since then – pointing me in the direction of *there is no 'virus'*. I went public on that with derision even from swathes of the alternative media that voiced a scenario that the Chinese government released the 'virus' in league with Deep State elements in the United States from a top-level bio-lab in Wuhan where the 'virus' is said to have first appeared. I looked at that possibility, but I didn't buy it for several reasons. Deaths from the 'virus' did not in any way match what they

would have been with a 'deadly bioweapon' and it is much more effective if you sell the *illusion* of an infectious agent rather than having a real one unless you can control through injection who has it and who doesn't. Otherwise you lose control of events. A made-up 'virus' gives you a blank sheet of paper on which you can make it do whatever you like and have any symptoms or mutant 'variants' you choose to add while a real infectious agent would limit you to what it actually does. A phantom disease allows you to have endless ludicrous 'studies' on the 'Covid' dollar to widen the perceived impact by inventing ever more 'at risk' groups including one study which said those who walk slowly may be almost four times more likely to die from the 'virus'. People are in psychiatric wards for less.

A real 'deadly bioweapon' can take out people in the hierarchy that are not part of the Cult, but essential to its operation. Obviously they don't want that. Releasing a real disease means you immediately lose control of it. Releasing an illusory one means you don't. Again it's vital that people are extra careful when dealing with what they want to hear. A bioweapon unleashed from a Chinese laboratory in collusion with the American Deep State may fit a conspiracy narrative, but is it true? Would it not be far more effective to use the excuse of a 'virus' to justify the real bioweapon – the 'vaccine'? That way your disease agent does not have to be transmitted and arrives directly through a syringe. I saw a French virologist Luc Montagnier quoted in the alternative media as saying he had discovered that the alleged 'new' severe acute respiratory syndrome coronavirus , or SARS-CoV-2, was made artificially and included elements of the human immunodeficiency 'virus' (HIV) and a parasite that causes malaria. SARS-CoV-2 is alleged to trigger an alleged illness called Covid-19. I remembered Montagnier's name from my research years before into claims that an HIV 'retrovirus' causes AIDs – claims that were demolished by Berkeley virologist Peter Duesberg who showed that no one had ever proved that HIV causes acquired immunodeficiency syndrome or AIDS. Claims that become accepted as fact, publicly and medically, with no proof whatsoever are an ever-recurring story that profoundly applies to

‘Covid’. Nevertheless, despite the lack of proof, Montagnier’s team at the Pasteur Institute in Paris had a long dispute with American researcher Robert Gallo over which of them discovered and isolated the HIV ‘virus’ and with *no evidence* found it to cause AIDS. You will see later that there is also no evidence that any ‘virus’ causes any disease or that there is even such a thing as a ‘virus’ in the way it is said to exist. The claim to have ‘isolated’ the HIV ‘virus’ will be presented in its real context as we come to the shocking story – and it is a story – of SARS-CoV-2 and so will Montagnier’s assertion that he identified the full SARS-CoV-2 genome.

Hoax in the making

We can pick up the ‘Covid’ story in 2010 and the publication by the Rockefeller Foundation of a document called ‘Scenarios for the Future of Technology and International Development’. The inner circle of the Rockefeller family has been serving the Cult since John D. Rockefeller (1839-1937) made his fortune with Standard Oil. It is less well known that the same Rockefeller – the Bill Gates of his day – was responsible for establishing what is now referred to as ‘Big Pharma’, the global network of pharmaceutical companies that make outrageous profits dispensing scalpel and drug ‘medicine’ and are obsessed with pumping vaccines in ever-increasing number into as many human arms and backsides as possible. John D. Rockefeller was the driving force behind the creation of the ‘education’ system in the United States and elsewhere specifically designed to program the perceptions of generations thereafter. The Rockefeller family donated exceptionally valuable land in New York for the United Nations building and were central in establishing the World Health Organization in 1948 as an agency of the UN which was created from the start as a Trojan horse and stalking horse for world government. Now enter Bill Gates. His family and the Rockefellers have long been extremely close and I have seen genealogy which claims that if you go back far enough the two families fuse into the same bloodline. Gates has said that the Bill and Melinda Gates Foundation was inspired by the Rockefeller Foundation and why not

when both are serving the same Cult? Major tax-exempt foundations are overwhelmingly criminal enterprises in which Cult assets fund the Cult agenda in the guise of 'philanthropy' while avoiding tax in the process. Cult operatives can become mega-rich in their role of front men and women for the psychopaths at the inner core and they, too, have to be psychopaths to knowingly serve such evil. Part of the deal is that a big percentage of the wealth gleaned from representing the Cult has to be spent advancing the ambitions of the Cult and hence you have the Rockefeller Foundation, Bill and Melinda Gates Foundation (and *so* many more) and people like George Soros with his global Open Society Foundations spending their billions in pursuit of global Cult control. Gates is a global public face of the Cult with his interventions in world affairs including Big Tech influence; a central role in the 'Covid' and 'vaccine' scam; promotion of the climate change shakedown; manipulation of education; geoengineering of the skies; and his food-control agenda as the biggest owner of farmland in America, his GMO promotion and through other means. As one writer said: 'Gates monopolizes or wields disproportionate influence over the tech industry, global health and vaccines, agriculture and food policy (including biopiracy and fake food), weather modification and other climate technologies, surveillance, education and media.' The almost limitless wealth secured through Microsoft and other not-allowed-to-fail ventures (including vaccines) has been ploughed into a long, long list of Cult projects designed to enslave the entire human race. Gates and the Rockefellers have been working as one unit with the Rockefeller-established World Health Organization leading global 'Covid' policy controlled by Gates through his mouth-piece Tedros. Gates became the WHO's biggest funder when Trump announced that the American government would cease its donations, but Biden immediately said he would restore the money when he took office in January, 2021. The Gates Foundation (the Cult) owns through limitless funding the world health system and the major players across the globe in the 'Covid' hoax.

Okay, with that background we return to that Rockefeller Foundation document of 2010 headed 'Scenarios for the Future of Technology and International Development' and its 'imaginary' epidemic of a virulent and deadly influenza strain which infected 20 percent of the global population and killed eight million in seven months. The Rockefeller scenario was that the epidemic destroyed economies, closed shops, offices and other businesses and led to governments imposing fierce rules and restrictions that included mandatory wearing of face masks and body-temperature checks to enter communal spaces like railway stations and supermarkets. The document predicted that even after the height of the Rockefeller-envisaged epidemic the authoritarian rule would continue to deal with further pandemics, transnational terrorism, environmental crises and rising poverty. Now you may think that the Rockefellers are our modern-day seers or alternatively, and rather more likely, that they well knew what was planned a few years further on. Fascism had to be imposed, you see, to 'protect citizens from risk and exposure'. The Rockefeller scenario document said:

During the pandemic, national leaders around the world flexed their authority and imposed airtight rules and restrictions, from the mandatory wearing of face masks to body-temperature checks at the entries to communal spaces like train stations and supermarkets. Even after the pandemic faded, this more authoritarian control and oversight of citizens and their activities stuck and even intensified. In order to protect themselves from the spread of increasingly global problems – from pandemics and transnational terrorism to environmental crises and rising poverty – leaders around the world took a firmer grip on power.

At first, the notion of a more controlled world gained wide acceptance and approval. Citizens willingly gave up some of their sovereignty – and their privacy – to more paternalistic states in exchange for greater safety and stability. Citizens were more tolerant, and even eager, for top-down direction and oversight, and national leaders had more latitude to impose order in the ways they saw fit.

In developed countries, this heightened oversight took many forms: biometric IDs for all citizens, for example, and tighter regulation of key industries whose stability was deemed vital to national interests. In many developed countries, enforced cooperation with a suite of new regulations and agreements slowly but steadily restored both order and, importantly, economic growth.

There we have the prophetic Rockefellers in 2010 and three years later came their paper for the Global Health Summit in Beijing, China, when government representatives, the private sector, international organisations and groups met to discuss the next 100 years of 'global health'. The Rockefeller Foundation-funded paper was called 'Dreaming the Future of Health for the Next 100 Years and more prophecy ensued as it described a dystopian future: 'The abundance of data, digitally tracking and linking people may mean the 'death of privacy' and may replace physical interaction with transient, virtual connection, generating isolation and raising questions of how values are shaped in virtual networks.' Next in the 'Covid' hoax preparation sequence came a 'table top' simulation in 2018 for another 'imaginary' pandemic of a disease called Clade X which was said to kill 900 million people. The exercise was organised by the Gates-funded Johns Hopkins University's Center for Health Security in the United States and this is the very same university that has been compiling the disgustingly and systematically erroneous global figures for 'Covid' cases and deaths. Similar Johns Hopkins health crisis scenarios have included the Dark Winter exercise in 2001 and Atlantic Storm in 2005.

Nostradamus 201

For sheer predictive genius look no further prophecy-watchers than the Bill Gates-funded Event 201 held only six weeks before the 'coronavirus pandemic' is supposed to have broken out in China and Event 201 was based on a scenario of a global 'coronavirus pandemic'. Melinda Gates, the great man's missus, told the BBC that he had 'prepared for years' for a coronavirus pandemic which told us what we already knew. Nostradamugates had predicted in a TED talk in 2015 that a pandemic was coming that would kill a lot of people and demolish the world economy. My god, the man is a machine – possibly even literally. Now here he was only weeks before the real thing funding just such a simulated scenario and involving his friends and associates at Johns Hopkins, the World Economic Forum Cult-front of Klaus Schwab, the United Nations,

Johnson & Johnson, major banks, and officials from China and the Centers for Disease Control in the United States. What synchronicity – Johns Hopkins would go on to compile the fraudulent ‘Covid’ figures, the World Economic Forum and Schwab would push the ‘Great Reset’ in response to ‘Covid’, the Centers for Disease Control would be at the forefront of ‘Covid’ policy in the United States, Johnson & Johnson would produce a ‘Covid vaccine’, and everything would officially start just weeks later in China. Spooky, eh? They were even accurate in creating a simulation of a ‘virus’ pandemic because the ‘real thing’ would also be a simulation. Event 201 was not an exercise preparing for something that might happen; it was a rehearsal for what those in control knew was *going* to happen and very shortly. Hours of this simulation were posted on the Internet and the various themes and responses mirrored what would soon be imposed to transform human society. News stories were inserted and what they said would be commonplace a few weeks later with still more prophecy perfection. Much discussion focused on the need to deal with misinformation and the ‘anti-vax movement’ which is exactly what happened when the ‘virus’ arrived – was said to have arrived – in the West.

Cult-owned social media banned criticism and exposure of the official ‘virus’ narrative and when I said there *was* no ‘virus’ in early April, 2020, I was banned by one platform after another including YouTube, Facebook and later Twitter. The mainstream broadcast media in Britain was in effect banned from interviewing me by the Tony-Blair-created government broadcasting censor Ofcom headed by career government bureaucrat Melanie Dawes who was appointed just as the ‘virus’ hoax was about to play out in January, 2020. At the same time the Ickonic media platform was using Vimeo, another ultra-Zionist-owned operation, while our own player was being created and they deleted in an instant hundreds of videos, documentaries, series and shows to confirm their unbelievable vindictiveness. We had copies, of course, and they had to be restored one by one when our player was ready. These people have no class. Sabbatian Facebook promised free advertisements for the Gates-

controlled World Health Organization narrative while deleting ‘false claims and conspiracy theories’ to stop ‘misinformation’ about the alleged coronavirus. All these responses could be seen just a short while earlier in the scenarios of Event 201. Extreme censorship was absolutely crucial for the Cult because the official story was so ridiculous and unsupportable by the evidence that it could never survive open debate and the free-flow of information and opinion. If you can’t win a debate then don’t have one is the Cult’s approach throughout history. Facebook’s little boy front man – front boy – Mark Zuckerberg equated ‘credible and accurate information’ with official sources and exposing their lies with ‘misinformation’.

Silencing those that can see

The censorship dynamic of Event 201 is now the norm with an army of narrative-supporting ‘fact-checker’ organisations whose entire reason for being is to tell the public that official narratives are true and those exposing them are lying. One of the most appalling of these ‘fact-checkers’ is called NewsGuard founded by ultra-Zionist Americans Gordon Crovitz and Steven Brill. Crovitz is a former publisher of *The Wall Street Journal*, former Executive Vice President of Dow Jones, a member of the Council on Foreign Relations (CFR), and on the board of the American Association of Rhodes Scholars. The CFR and Rhodes Scholarships, named after Rothschild agent Cecil Rhodes who plundered the gold and diamonds of South Africa for his masters and the Cult, have featured widely in my books. NewsGuard don’t seem to like me for some reason – I really can’t think why – and they have done all they can to have me censored and discredited which is, to quote an old British politician, like being savaged by a dead sheep. They are, however, like all in the censorship network, very well connected and funded by organisations themselves funded by, or connected to, Bill Gates. As you would expect with anything associated with Gates NewsGuard has an offshoot called HealthGuard which ‘fights online health care hoaxes’. How very kind. Somehow the NewsGuard European Managing Director Anna-Sophie Harling, a remarkably young-

looking woman with no broadcasting experience and little hands-on work in journalism, has somehow secured a position on the 'Content Board' of UK government broadcast censor Ofcom. An executive of an organisation seeking to discredit dissidents of the official narratives is making decisions for the government broadcast 'regulator' about content?? Another appalling 'fact-checker' is Full Fact funded by George Soros and global censors Google and Facebook.

It's amazing how many activists in the 'fact-checking', 'anti-hate', arena turn up in government-related positions – people like UK Labour Party activist Imran Ahmed who heads the Center for Countering Digital Hate founded by people like Morgan McSweeney, now chief of staff to the Labour Party's hapless and useless 'leader' Keir Starmer. Digital Hate – which is what it really is – uses the American spelling of Center to betray its connection to a transatlantic network of similar organisations which in 2020 shapeshifted from attacking people for 'hate' to attacking them for questioning the 'Covid' hoax and the dangers of the 'Covid vaccine'. It's just a coincidence, you understand. This is one of Imran Ahmed's hysterical statements: 'I would go beyond calling anti-vaxxers conspiracy theorists to say they are an extremist group that pose a national security risk.' No one could ever accuse this prat of understatement and he's including in that those parents who are now against vaccines after their children were damaged for life or killed by them. He's such a nice man. Ahmed does the rounds of the Woke media getting soft-ball questions from spineless 'journalists' who never ask what right he has to campaign to destroy the freedom of speech of others while he demands it for himself. There also seems to be an overrepresentation in Ofcom of people connected to the narrative-worshipping BBC. This incredible global network of narrative-support was super-vital when the 'Covid' hoax was played in the light of the mega-whopper lies that have to be defended from the spotlight cast by the most basic intelligence.

Setting the scene

The Cult plays the long game and proceeds step-by-step ensuring that everything is in place before major cards are played and they don't come any bigger than the 'Covid' hoax. The psychopaths can't handle events where the outcome isn't certain and as little as possible – preferably nothing – is left to chance. Politicians, government and medical officials who would follow direction were brought to illusory power in advance by the Cult web whether on the national stage or others like state governors and mayors of America. For decades the dynamic between officialdom, law enforcement and the public was changed from one of service to one of control and dictatorship. Behaviour manipulation networks established within government were waiting to impose the coming 'Covid' rules and regulations specifically designed to subdue and rewire the psyche of the people in the guise of protecting health. These included in the UK the Behavioural Insights Team part-owned by the British government Cabinet Office; the Scientific Pandemic Insights Group on Behaviours (SPI-B); and a whole web of intelligence and military groups seeking to direct the conversation on social media and control the narrative. Among them are the cyberwarfare (on the people) 77th Brigade of the British military which is also coordinated through the Cabinet Office as civilian and military leadership continues to combine in what they call the Fusion Doctrine. The 77th Brigade is a British equivalent of the infamous Israeli (Sabbatian) military cyberwarfare and Internet manipulation operation Unit 8200 which I expose at length in *The Trigger*. Also carefully in place were the medical and science advisers to government – many on the payroll past or present of Bill Gates – and a whole alternative structure of unelected government stood by to take control when elected parliaments were effectively closed down once the 'Covid' card was slammed on the table. The structure I have described here and so much more was installed in every major country through the Cult networks. The top-down control hierarchy looks like this: The Cult – Cult-owned Gates – the World Health Organization and Tedros – Gates-funded or controlled chief medical officers and science 'advisers' (dictators) in each country –

political 'leaders' – law enforcement – The People. Through this simple global communication and enforcement structure the policy of the Cult could be imposed on virtually the entire human population so long as they acquiesced to the fascism. With everything in place it was time for the button to be pressed in late 2019/early 2020.

These were the prime goals the Cult had to secure for its will to prevail:

- 1) Locking down economies, closing all but designated 'essential' businesses (Cult-owned corporations were 'essential'), and putting the population under house arrest was an imperative to destroy independent income and employment and ensure dependency on the Cult-controlled state in the Hunger Games Society. Lockdowns had to be established as the global blueprint from the start to respond to the 'virus' and followed by pretty much the entire world.
- 2) The global population had to be terrified into believing in a deadly 'virus' that didn't actually exist so they would unquestioningly obey authority in the belief that authority must know how best to protect them and their families. Software salesman Gates would suddenly morph into the world's health expert and be promoted as such by the Cult-owned media.
- 3) A method of testing that wasn't testing for the 'virus', but was only claimed to be, had to be in place to provide the illusion of 'cases' and subsequent 'deaths' that had a very different cause to the 'Covid-19' that would be scribbled on the death certificate.
- 4) Because there was no 'virus' and the great majority testing positive with a test not testing for the 'virus' would have no symptoms of anything the lie had to be sold that people without symptoms (without the 'virus') could still pass it on to others. This was crucial to justify for the first time quarantining – house arresting – healthy people. Without this the economy-destroying lockdown of *everybody* could not have been credibly sold.
- 5) The 'saviour' had to be seen as a vaccine which beyond evil drug companies were working like angels of mercy to develop as quickly as possible, with all corners cut, to save the day. The public must absolutely not know that the 'vaccine' had nothing to do with a 'virus' or that the contents were ready and waiting with a very different motive long before the 'Covid' card was even lifted from the pack.

I said in March, 2020, that the 'vaccine' would have been created way ahead of the 'Covid' hoax which justified its use and the following December an article in the New York *Intelligencer* magazine said the Moderna 'vaccine' had been 'designed' by

January, 2020. This was 'before China had even acknowledged that the disease could be transmitted from human to human, more than a week before the first confirmed coronavirus case in the United States'. The article said that by the time the first American death was announced a month later 'the vaccine had already been manufactured and shipped to the National Institutes of Health for the beginning of its Phase I clinical trial'. The 'vaccine' was actually 'designed' long before that although even with this timescale you would expect the article to ask how on earth it could have been done that quickly. Instead it asked why the 'vaccine' had not been rolled out then and not months later. Journalism in the mainstream is truly dead. I am going to detail in the next chapter why the 'virus' has never existed and how a hoax on that scale was possible, but first the foundation on which the Big Lie of 'Covid' was built.

The test that doesn't test

Fraudulent 'testing' is the bottom line of the whole 'Covid' hoax and was the means by which a 'virus' that did not exist *appeared* to exist. They could only achieve this magic trick by using a test not testing for the 'virus'. To use a test that *was* testing for the 'virus' would mean that every test would come back negative given there was no 'virus'. They chose to exploit something called the RT-PCR test invented by American biochemist Kary Mullis in the 1980s who said publicly that his PCR test ... *cannot detect infectious disease*. Yes, the 'test' used worldwide to detect infectious 'Covid' to produce all the illusory 'cases' and 'deaths' compiled by Johns Hopkins and others *cannot detect infectious disease*. This fact came from the mouth of the man who invented PCR and was awarded the Nobel Prize in Chemistry in 1993 for doing so. Sadly, and incredibly conveniently for the Cult, Mullis died in August, 2019, at the age of 74 just before his test would be fraudulently used to unleash fascism on the world. He was said to have died from pneumonia which was an irony in itself. A few months later he would have had 'Covid-19' on his death certificate. I say the timing of his death was convenient because had he lived Mullis, a brilliant, honest and decent man, would have been

vociferously speaking out against the use of his test to detect 'Covid' when it was never designed, or able, to do that. I know that to be true given that Mullis made the same point when his test was used to 'detect' – not detect – HIV. He had been seriously critical of the Gallo/Montagnier claim to have isolated the HIV 'virus' and shown it to cause AIDS for which Mullis said there was no evidence. AIDS is actually not a disease but a series of diseases from which people die all the time. When they die from those *same diseases* after a positive 'test' for HIV then AIDS goes on their death certificate. I think I've heard that before somewhere. Countries instigated a policy with 'Covid' that anyone who tested positive with a test not testing for the 'virus' and died of any other cause within 28 days and even longer 'Covid-19' had to go on the death certificate. Cases have come from the test that can't test for infectious disease and the deaths are those who have died of *anything* after testing positive with a test not testing for the 'virus'. I'll have much more later about the death certificate scandal.

Mullis was deeply dismissive of the now US 'Covid' star Anthony Fauci who he said was a liar who didn't know anything about anything – 'and I would say that to his face – nothing.' He said of Fauci: 'The man thinks he can take a blood sample, put it in an electron microscope and if it's got a virus in there you'll know it – he doesn't understand electron microscopy and he doesn't understand medicine and shouldn't be in a position like he's in.' That position, terrifyingly, has made him the decider of 'Covid' fascism policy on behalf of the Cult in his role as director since 1984 of the National Institute of Allergy and Infectious Diseases (NIAID) while his record of being wrong is laughable; but being wrong, so long as it's the *right kind* of wrong, is why the Cult loves him. He'll say anything the Cult tells him to say. Fauci was made Chief Medical Adviser to the President immediately Biden took office. Biden was installed in the White House by Cult manipulation and one of his first decisions was to elevate Fauci to a position of even more control. This is a coincidence? Yes, and I identify as a flamenco dancer called Lola. How does such an incompetent criminal like Fauci remain in that

pivotal position in American health since *the 1980s*? When you serve the Cult it looks after you until you are surplus to requirements. Kary Mullis said prophetically of Fauci and his like: 'Those guys have an agenda and it's not an agenda we would like them to have ... they make their own rules, they change them when they want to, and Tony Fauci does not mind going on television in front of the people who pay his salary and lie directly into the camera.' Fauci has done that almost daily since the 'Covid' hoax began. Lying is in Fauci's DNA. To make the situation crystal clear about the PCR test this is a direct quote from its inventor Kary Mullis:

It [the PCR test] doesn't tell you that you're sick and doesn't tell you that the thing you ended up with was really going to hurt you ...'

Ask yourself why governments and medical systems the world over have been using this very test to decide who is 'infected' with the SARS-CoV-2 'virus' and the alleged disease it allegedly causes, 'Covid-19'. The answer to that question will tell you what has been going on. By the way, here's a little show-stopper – the 'new' SARS-CoV-2 'virus' was 'identified' as such right from the start using ... *the PCR test not testing for the 'virus'*. If you are new to this and find that shocking then stick around. I have hardly started yet. Even worse, other 'tests', like the 'Lateral Flow Device' (LFD), are considered so useless that they have to be *confirmed* by the PCR test! Leaked emails written by Ben Dyson, adviser to UK 'Health' Secretary Matt Hancock, said they were 'dangerously unreliable'. Dyson, executive director of strategy at the Department of Health, wrote: 'As of today, someone who gets a positive LFD result in (say) London has at best a 25 per cent chance of it being a true positive, but if it is a self-reported test potentially as low as 10 per cent (on an optimistic assumption about specificity) or as low as 2 per cent (on a more pessimistic assumption).' These are the 'tests' that schoolchildren and the public are being urged to have twice a week or more and have to isolate if they get a positive. Each fake positive goes in the statistics as a 'case' no matter how ludicrously inaccurate and the

'cases' drive lockdown, masks and the pressure to 'vaccinate'. The government said in response to the email leak that the 'tests' were accurate which confirmed yet again what shocking bloody liars they are. The real false positive rate is *100 percent* as we'll see. In another 'you couldn't make it up' the UK government agreed to pay £2.8 billion to California's Innova Medical Group to supply the irrelevant lateral flow tests. The company's primary test-making centre is in China. Innova Medical Group, established in March, 2020, is owned by Pasaca Capital Inc, chaired by Chinese-American millionaire Charles Huang who was born in Wuhan.

How it works – and how it doesn't

The RT-PCR test, known by its full title of Polymerase chain reaction, is used across the world to make millions, even billions, of copies of a DNA/RNA genetic information sample. The process is called 'amplification' and means that a tiny sample of genetic material is amplified to bring out the detailed content. I stress that it is not testing for an infectious disease. It is simply amplifying a sample of genetic material. In the words of Kary Mullis: 'PCR is ... just a process that's used to make a whole lot of something out of something.' To emphasise the point companies that make the PCR tests circulated around the world to 'test' for 'Covid' warn on the box that it can't be used to detect 'Covid' or infectious disease and is for research purposes only. It's okay, rest for a minute and you'll be fine. This is the test that produces the 'cases' and 'deaths' that have been used to destroy human society. All those global and national medical and scientific 'experts' demanding this destruction to 'save us' *KNOW* that the test is not testing for the 'virus' and the cases and deaths they claim to be real are an almost unimaginable fraud. Every one of them and so many others including politicians and psychopaths like Gates and Tedros must be brought before Nuremburg-type trials and jailed for the rest of their lives. The more the genetic sample is amplified by PCR the more elements of that material become sensitive to the test and by that I don't mean sensitive for a 'virus' but for elements of the genetic material which

is *naturally* in the body or relates to remnants of old conditions of various kinds lying dormant and causing no disease. Once the amplification of the PCR reaches a certain level *everyone* will test positive. So much of the material has been made sensitive to the test that everyone will have some part of it in their body. Even lying criminals like Fauci have said that once PCR amplifications pass 35 cycles everything will be a false positive that cannot be trusted for the reasons I have described. I say, like many proper doctors and scientists, that 100 percent of the 'positives' are false, but let's just go with Fauci for a moment.

He says that any amplification over 35 cycles will produce false positives and yet the US Centers for Disease Control (CDC) and Food and Drug Administration (FDA) have recommended up to 40 *cycles* and the National Health Service (NHS) in Britain admitted in an internal document for staff that it was using 45 *cycles* of amplification. A long list of other countries has been doing the same and at least one 'testing' laboratory has been using 50 *cycles*. Have you ever heard a doctor, medical 'expert' or the media ask what level of amplification has been used to claim a 'positive'. The 'test' comes back 'positive' and so you have the 'virus', end of story. Now we can see how the government in Tanzania could send off samples from a goat and a pawpaw fruit under human names and both came back positive for 'Covid-19'. Tanzania president John Magufuli mocked the 'Covid' hysteria, the PCR test and masks and refused to import the DNA-manipulating 'vaccine'. The Cult hated him and an article sponsored by the Bill Gates Foundation appeared in the London *Guardian* in February, 2021, headed 'It's time for Africa to rein in Tanzania's anti-vaxxer president'. Well, 'reined in' he shortly was. Magufuli appeared in good health, but then, in March, 2021, he was dead at 61 from 'heart failure'. He was replaced by Samia Hassan Suhulu who is connected to Klaus Schwab's World Economic Forum and she immediately reversed Magufuli's 'Covid' policy. A sample of cola tested positive for 'Covid' with the PCR test in Germany while American actress and singer-songwriter Erykah Badu tested positive in one nostril and negative in the other. Footballer Ronaldo called

the PCR test 'bullshit' after testing positive three times and being forced to quarantine and miss matches when there was nothing wrong with him. The mantra from Tedros at the World Health Organization and national governments (same thing) has been test, test, test. They know that the more tests they can generate the more fake 'cases' they have which go on to become 'deaths' in ways I am coming to. The UK government has its Operation Moonshot planned to test multiple millions every day in workplaces and schools with free tests for everyone to use twice a week at home in line with the Cult plan from the start to make testing part of life. A government advertisement for an 'Interim Head of Asymptomatic Testing Communication' said the job included responsibility for delivering a 'communications strategy' (propaganda) 'to support the expansion of asymptomatic testing that *'normalises testing as part of everyday life'*'. More tests means more fake 'cases', 'deaths' and fascism. I have heard of, and from, many people who booked a test, couldn't turn up, and yet got a positive result through the post for a test they'd never even had. The whole thing is crazy, but for the Cult there's method in the madness. Controlling and manipulating the level of amplification of the test means the authorities can control whenever they want the number of apparent 'cases' and 'deaths'. If they want to justify more fascist lockdown and destruction of livelihoods they keep the amplification high. If they want to give the illusion that lockdowns and the 'vaccine' are working then they lower the amplification and 'cases' and 'deaths' will appear to fall. In January, 2021, the Cult-owned World Health Organization suddenly warned laboratories about over-amplification of the test and to lower the threshold. Suddenly headlines began appearing such as: 'Why ARE "Covid" cases plummeting?' This was just when the vaccine rollout was underway and I had predicted months before they would make cases appear to fall through amplification tampering when the 'vaccine' came. These people are so predictable.

Cow vaccines?

The question must be asked of what is on the test swabs being poked far up the nose of the population to the base of the brain? A nasal swab punctured one woman's brain and caused it to leak fluid. Most of these procedures are being done by people with little training or medical knowledge. Dr Lorraine Day, former orthopaedic trauma surgeon and Chief of Orthopaedic Surgery at San Francisco General Hospital, says the tests are really a '*vaccine*'. Cows have long been vaccinated this way. She points out that masks have to cover the nose and the mouth where it is claimed the '*virus*' exists in saliva. Why then don't they take saliva from the mouth as they do with a DNA test instead of pushing a long swab up the nose towards the brain? The ethmoid bone separates the nasal cavity from the brain and within that bone is the cribriform plate. Dr Day says that when the swab is pushed up against this plate and twisted the procedure is '*depositing things back there*'. She claims that among these '*things*' are nanoparticles that can enter the brain. Researchers have noted that a team at the Gates-funded Johns Hopkins have designed tiny, star-shaped micro-devices that can latch onto intestinal mucosa and release drugs into the body. Mucosa is the thin skin that covers the inside surface of parts of the body such as *the nose* and mouth and produces mucus to protect them. The Johns Hopkins micro-devices are called '*theragrippers*' and were '*inspired*' by a parasitic worm that digs its sharp teeth into a host's intestines. Nasal swabs are also coated in the sterilisation agent ethylene oxide. The US National Cancer Institute posts this explanation on its website:

At room temperature, ethylene oxide is a flammable colorless gas with a sweet odor. It is used primarily to produce other chemicals, including antifreeze. In smaller amounts, ethylene oxide is used as a pesticide and a sterilizing agent. The ability of ethylene oxide to damage DNA makes it an effective sterilizing agent but also accounts for its cancer-causing activity.

The Institute mentions lymphoma and leukaemia as cancers most frequently reported to be associated with occupational exposure to ethylene oxide along with stomach and breast cancers. How does anyone think this is going to work out with the constant testing

regime being inflicted on adults and children at home and at school that will accumulate in the body anything that's on the swab?

Doctors know best

It is vital for people to realise that 'hero' doctors 'know' only what the Big Pharma-dominated medical authorities tell them to 'know' and if they refuse to 'know' what they are told to 'know' they are out the door. They are mostly not physicians or healers, but repeaters of the official narrative – or else. I have seen alleged professional doctors on British television make shocking statements that we are supposed to take seriously. One called 'Dr' Amir Khan, who is actually telling patients how to respond to illness, said that men could take the birth pill to 'help slow down the effects of Covid-19'. In March, 2021, another ridiculous 'Covid study' by an American doctor proposed injecting men with the female sex hormone progesterone as a 'Covid' treatment. British doctor Nighat Arif told the BBC that face coverings were now going to be part of ongoing normal. Yes, the vaccine protects you, she said (evidence?) ... but the way to deal with viruses in the community was always going to come down to hand washing, face covering and keeping a physical distance. That's not what we were told before the 'vaccine' was circulating. Arif said she couldn't imagine ever again going on the underground or in a lift without a mask. I was just thanking my good luck that she was not my doctor when she said – in March, 2021 – that if 'we are *behaving* and we are doing all the right things' she thought we could 'have our nearest and dearest around us at home ... around *Christmas* and *New Year*! Her patronising delivery was the usual school teacher talking to six-year-olds as she repeated every government talking point and probably believed them all. If we have learned anything from the 'Covid' experience surely it must be that humanity's perception of doctors needs a fundamental rethink. NHS 'doctor' Sara Kayat told her television audience that the 'Covid vaccine' would '100 percent prevent hospitalisation and death'. Not even Big Pharma claimed that. We have to stop taking 'experts' at their word without question when so many of them are

clueless and only repeating the party line on which their careers depend. That is not to say there are not brilliant doctors – there are and I have spoken to many of them since all this began – but you won't see them in the mainstream media or quoted by the psychopaths and yes-people in government.

Remember the name – Christian Drosten

German virologist Christian Drosten, Director of Charité Institute of Virology in Berlin, became a national star after the pandemic hoax began. He was feted on television and advised the German government on 'Covid' policy. Most importantly to the wider world Drosten led a group that produced the 'Covid' testing protocol for the PCR test. What a remarkable feat given the PCR cannot test for infectious disease and even more so when you think that Drosten said that his method of testing for SARS-CoV-2 was developed 'without having virus material available'. *He developed a test for a 'virus' that he didn't have and had never seen.* Let that sink in as you survey the global devastation that came from what he did. The whole catastrophe of Drosten's 'test' was based on the alleged genetic sequence published by Chinese scientists on the Internet. We will see in the next chapter that this alleged 'genetic sequence' has never been produced by China or anyone and cannot be when there *is no* SARS-CoV-2. Drosten, however, doesn't seem to let little details like that get in the way. He was the lead author with Victor Corman from the same Charité Hospital of the paper 'Detection of 2019 novel coronavirus (2019-nCoV) by real-time PCR' published in a magazine called *Eurosurveillance*. This became known as the Corman-Drosten paper. In November, 2020, with human society devastated by the effects of the Corman-Drosten test baloney, the protocol was publicly challenged by 22 international scientists and independent researchers from Europe, the United States, and Japan. Among them were senior molecular geneticists, biochemists, immunologists, and microbiologists. They produced a document headed 'External peer review of the RTPCR test to detect SARS-Cov-2 Reveals 10 Major Flaws At The Molecular and Methodological Level: Consequences

For False-Positive Results'. The flaws in the Corman-Drosten test included the following:

- The test is non-specific because of erroneous design
- Results are enormously variable
- The test is unable to discriminate between the whole 'virus' and viral fragments
- It doesn't have positive or negative controls
- The test lacks a standard operating procedure
- It is unsupported by proper peer view

The scientists said the PCR 'Covid' testing protocol was not founded on science and they demanded the Corman-Drosten paper be retracted by *Eurosurveillance*. They said all present and previous Covid deaths, cases, and 'infection rates' should be subject to a massive retroactive inquiry. Lockdowns and travel restrictions should be reviewed and relaxed and those diagnosed through PCR to have 'Covid-19' should not be forced to isolate. Dr Kevin Corbett, a health researcher and nurse educator with a long academic career producing a stream of peer-reviewed publications at many UK universities, made the same point about the PCR test debacle. He said of the scientists' conclusions: 'Every scientific rationale for the development of that test has been totally destroyed by this paper. It's like Hiroshima/Nagasaki to the Covid test.' He said that China hadn't given them an isolated 'virus' when Drosten developed the test. Instead they had developed the test from *a sequence in a gene bank*.' Put another way ... *they made it up!* The scientists were supported in this contention by a Portuguese appeals court which ruled in November, 2020, that PCR tests are unreliable and it is unlawful to quarantine people based solely on a PCR test. The point about China not providing an isolated virus must be true when the 'virus' has never been isolated to this day and the consequences of that will become clear. Drosten and company produced this useless 'protocol' right on cue in January, 2020, just as the 'virus' was said to

be moving westward and it somehow managed to successfully pass a peer-review in 24 hours. In other words there was no peer-review for a test that would be used to decide who had 'Covid' and who didn't across the world. The Cult-created, Gates-controlled World Health Organization immediately recommended all its nearly 200 member countries to use the Drosten PCR protocol to detect 'cases' and 'deaths'. The sting was underway and it continues to this day.

So who is this Christian Drosten that produced the means through which death, destruction and economic catastrophe would be justified? His education background, including his doctoral thesis, would appear to be somewhat shrouded in mystery and his track record is dire as with another essential player in the 'Covid' hoax, the Gates-funded Professor Neil Ferguson at the Gates-funded Imperial College in London of whom more shortly. Drosten predicted in 2003 that the alleged original SARS 'virus' (SARS-1) was an epidemic that could have serious effects on economies and an effective vaccine would take at least two years to produce. Drosten's answer to every alleged 'outbreak' is a vaccine which you won't be shocked to know. What followed were just 774 official deaths worldwide and none in Germany where there were only nine cases. That is even if you believe there ever was a SARS 'virus' when the evidence is zilch and I will expand on this in the next chapter. Drosten claims to be co-discoverer of 'SARS-1' and developed a test for it in 2003. He was screaming warnings about 'swine flu' in 2009 and how it was a widespread infection far more severe than any dangers from a vaccine could be and people should get vaccinated. It would be helpful for Drosten's vocal chords if he simply recorded the words 'the virus is deadly and you need to get vaccinated' and copies could be handed out whenever the latest made-up threat comes along. Drosten's swine flu epidemic never happened, but Big Pharma didn't mind with governments spending hundreds of millions on vaccines that hardly anyone bothered to use and many who did wished they hadn't. A study in 2010 revealed that the risk of dying from swine flu, or H1N1, was no higher than that of the annual seasonal flu which is what at least most of 'it' really was as in

the case of 'Covid-19'. A media investigation into Drosten asked how with such a record of inaccuracy he could be *the* government adviser on these issues. The answer to that question is the same with Drosten, Ferguson and Fauci – they keep on giving the authorities the 'conclusions' and 'advice' they want to hear. Drosten certainly produced the goods for them in January, 2020, with his PCR protocol garbage and provided the foundation of what German internal medicine specialist Dr Claus Köhnlein, co-author of *Virus Mania*, called the 'test pandemic'. The 22 scientists in the *Eurosurveillance* challenge called out conflicts of interest within the Drosten 'protocol' group and with good reason. Olfert Landt, a regular co-author of Drosten 'studies', owns the biotech company TIB Molbiol Syntheselabor GmbH in Berlin which manufactures and sells the tests that Drosten and his mates come up with. They have done this with SARS, Enterotoxigenic E. coli (ETEC), MERS, Zika 'virus', yellow fever, and now 'Covid'. Landt told the *Berliner Zeitung* newspaper:

The testing, design and development came from the Charité [Drosten and Corman]. We simply implemented it immediately in the form of a kit. And if we don't have the virus, which originally only existed in Wuhan, we can make a synthetic gene to simulate the genome of the virus. That's what we did very quickly.

This is more confirmation that the Drosten test was designed without access to the 'virus' and only a synthetic simulation which is what SARS-CoV-2 really is – a computer-generated synthetic fiction. It's quite an enterprise they have going here. A Drosten team decides what the test for something should be and Landt's biotech company flogs it to governments and medical systems across the world. His company must have made an absolute fortune since the 'Covid' hoax began. Dr Reiner Fuellmich, a prominent German consumer protection trial lawyer in Germany and California, is on Drosten's case and that of Tedros at the World Health Organization for crimes against humanity with a class-action lawsuit being prepared in the United States and other legal action in Germany.

Why China?

Scamming the world with a 'virus' that doesn't exist would seem impossible on the face of it, but not if you have control of the relatively few people that make policy decisions and the great majority of the global media. Remember it's not about changing 'real' reality it's about controlling *perception* of reality. You don't have to make something happen you only have to make people *believe* that it's happening. Renegade Minds understand this and are therefore much harder to swindle. 'Covid-19' is not a 'real' 'virus'. It's a mind virus, like a computer virus, which has infected the minds, not the bodies, of billions. It all started, publically at least, in China and that alone is of central significance. The Cult was behind the revolution led by its asset Mao Zedong, or Chairman Mao, which established the People's Republic of China on October 1st, 1949. It should have been called The Cult's Republic of China, but the name had to reflect the recurring illusion that vicious dictatorships are run by and for the people (see all the 'Democratic Republics' controlled by tyrants). In the same way we have the 'Biden' Democratic Republic of America officially ruled by a puppet tyrant (at least temporarily) on behalf of Cult tyrants. The creation of Mao's merciless communist/fascist dictatorship was part of a frenzy of activity by the Cult at the conclusion of World War Two which, like the First World War, it had instigated through its assets in Germany, Britain, France, the United States and elsewhere. Israel was formed in 1948; the Soviet Union expanded its 'Iron Curtain' control, influence and military power with the Warsaw Pact communist alliance in 1955; the United Nations was formed in 1945 as a Cult precursor to world government; and a long list of world bodies would be established including the World Health Organization (1948), World Trade Organization (1948 under another name until 1995), International Monetary Fund (1945) and World Bank (1944). Human society was redrawn and hugely centralised in the global Problem-Reaction-Solution that was World War Two. All these changes were significant. Israel would become the headquarters of the Sabbatians

and the revolution in China would prepare the ground and control system for the events of 2019/2020.

Renegade Minds know there are no borders except for public consumption. The Cult is a seamless, borderless global entity and to understand the game we need to put aside labels like borders, nations, countries, communism, fascism and democracy. These delude the population into believing that countries are ruled within their borders by a government of whatever shade when these are mere agencies of a global power. America's illusion of democracy and China's communism/fascism are subsidiaries – vehicles – for the same agenda. We may hear about conflict and competition between America and China and on the lower levels that will be true; but at the Cult level they are branches of the same company in the way of the McDonald's example I gave earlier. I have tracked in the books over the years support by US governments of both parties for Chinese Communist Party infiltration of American society through allowing the sale of land, even military facilities, and the acquisition of American business and university influence. All this is underpinned by the infamous stealing of intellectual property and technological know-how. Cult-owned Silicon Valley corporations waive their fraudulent 'morality' to do business with human-rights-free China; Cult-controlled Disney has become China's PR department; and China in effect owns 'American' sports such as basketball which depends for much of its income on Chinese audiences. As a result any sports player, coach or official speaking out against China's horrific human rights record is immediately condemned or fired by the China-worshipping National Basketball Association. One of the first acts of China-controlled Biden was to issue an executive order telling federal agencies to stop making references to the 'virus' by the 'geographic location of its origin'. Long-time Congressman Jerry Nadler warned that criticising China, America's biggest rival, leads to hate crimes against Asian people in the United States. So shut up you bigot. China is fast closing in on Israel as a country that must not be criticised which is apt, really, given that Sabbatians control them both. The two countries have

developed close economic, military, technological and strategic ties which include involvement in China's 'Silk Road' transport and economic initiative to connect China with Europe. Israel was the first country in the Middle East to recognise the establishment of Mao's tyranny in 1950 months after it was established.

Project Wuhan – the 'Covid' Psyop

I emphasise again that the Cult plays the long game and what is happening to the world today is the result of centuries of calculated manipulation following a script to take control step-by-step of every aspect of human society. I will discuss later the common force behind all this that has spanned those centuries and thousands of years if the truth be told. Instigating the Mao revolution in China in 1949 with a 2020 'pandemic' in mind is not only how they work – the 71 years between them is really quite short by the Cult's standards of manipulation preparation. The reason for the Cult's Chinese revolution was to create a fiercely-controlled environment within which an extreme structure for human control could be incubated to eventually be unleashed across the world. We have seen this happen since the 'pandemic' emerged from China with the Chinese control-structure founded on AI technology and tyrannical enforcement sweep across the West. Until the moment when the Cult went for broke in the West and put its fascism on public display Western governments had to pay some lip-service to freedom and democracy to not alert too many people to the tyranny-in-the-making. Freedoms were more subtly eroded and power centralised with covert government structures put in place waiting for the arrival of 2020 when that smokescreen of 'freedom' could be dispensed with. The West was not able to move towards tyranny before 2020 anything like as fast as China which was created as a tyranny and had no limits on how fast it could construct the Cult's blueprint for global control. When the time came to impose that structure on the world it was the same Cult-owned Chinese communist/fascist government that provided the excuse – the 'Covid pandemic'. It was absolutely crucial to the Cult plan for the Chinese response to the 'pandemic' –

draconian lockdowns of the entire population – to become the blueprint that Western countries would follow to destroy the livelihoods and freedom of their people. This is why the Cult-owned, Gates-owned, WHO Director-General Tedros said early on:

The Chinese government is to be congratulated for the extraordinary measures it has taken to contain the outbreak. China is actually setting a new standard for outbreak response and it is not an exaggeration.

Forbes magazine said of China: ‘... those measures protected untold millions from getting the disease’. The Rockefeller Foundation ‘epidemic scenario’ document in 2010 said ‘prophetically’:

However, a few countries did fare better – China in particular. The Chinese government’s quick imposition and enforcement of mandatory quarantine for all citizens, as well as its instant and near-hermetic sealing off of all borders, saved millions of lives, stopping the spread of the virus far earlier than in other countries and enabling a swifter post-pandemic recovery.

Once again – *spooky*.

The first official story was the ‘bat theory’ or rather the bat diversion. The source of the ‘virus outbreak’ we were told was a ‘wet market’ in Wuhan where bats and other animals are bought and eaten in horrifically unhygienic conditions. Then another story emerged through the alternative media that the ‘virus’ had been released on purpose or by accident from a BSL-4 (biosafety level 4) laboratory in Wuhan not far from the wet market. The lab was reported to create and work with lethal concoctions and bioweapons. Biosafety level 4 is the highest in the World Health Organization system of safety and containment. Renegade Minds are aware of what I call designer manipulation. The ideal for the Cult is for people to buy its prime narrative which in the opening salvos of the ‘pandemic’ was the wet market story. It knows, however, that there is now a considerable worldwide alternative media of researchers sceptical of anything governments say and they are often given a version of events in a form they can perceive as credible while misdirecting them from the real truth. In this case let them

think that the conspiracy involved is a 'bioweapon virus' released from the Wuhan lab to keep them from the real conspiracy – *there is no 'virus'*. The WHO's current position on the source of the outbreak at the time of writing appears to be: 'We haven't got a clue, mate.' This is a good position to maintain mystery and bewilderment. The inner circle will know where the 'virus' came from – *nowhere*. The bottom line was to ensure the public believed there *was* a 'virus' and it didn't much matter if they thought it was natural or had been released from a lab. The belief that there was a 'deadly virus' was all that was needed to trigger global panic and fear. The population was terrified into handing their power to authority and doing what they were told. They had to or they were 'all gonna die'.

In March, 2020, information began to come my way from real doctors and scientists and my own additional research which had my intuition screaming: 'Yes, that's it! *There is no virus.*' The 'bioweapon' was not the 'virus'; it was the '*vaccine*' already being talked about that would be the bioweapon. My conclusion was further enhanced by happenings in Wuhan. The 'virus' was said to be sweeping the city and news footage circulated of people collapsing in the street (which they've never done in the West with the same 'virus'). The Chinese government was building 'new hospitals' in a matter of ten days to 'cope with demand' such was the virulent nature of the 'virus'. Yet in what seemed like no time the 'new hospitals' closed – even if they even opened – and China declared itself 'virus-free'. It was back to business as usual. This was more propaganda to promote the Chinese draconian lockdowns in the West as the way to 'beat the virus'. Trouble was that we subsequently had lockdown after lockdown, but never business as usual. As the people of the West and most of the rest of the world were caught in an ever-worsening spiral of lockdown, social distancing, masks, isolated old people, families forced apart, and livelihood destruction, it was party-time in Wuhan. Pictures emerged of thousands of people enjoying pool parties and concerts. It made no sense until you realised there never was a 'virus' and the

whole thing was a Cult set-up to transform human society out of one of its major global strongholds – China.

How is it possible to deceive virtually the entire world population into believing there is a deadly virus when there is not even a 'virus' let alone a deadly one? It's nothing like as difficult as you would think and that's clearly true because it happened.

Postscript: See end of book Postscript for more on the 'Wuhan lab virus release' story which the authorities and media were pushing heavily in the summer of 2021 to divert attention from the truth that the 'Covid virus' is pure invention.

CHAPTER FIVE

There is no 'virus'

You can fool some of the people all of the time, and all of the people some of the time, but you cannot fool all of the people all of the time
Abraham Lincoln

The greatest form of mind control is repetition. The more you repeat the same mantra of alleged 'facts' the more will accept them to be true. It becomes an 'everyone knows that, mate'. If you can also censor any other version or alternative to your alleged 'facts' you are pretty much home and cooking.

By the start of 2020 the Cult owned the global mainstream media almost in its entirety to spew out its 'Covid' propaganda and ignore or discredit any other information and view. Cult-owned social media platforms in Cult-owned Silicon Valley were poised and ready to unleash a campaign of ferocious censorship to obliterate all but the official narrative. To complete the circle many demands for censorship by Silicon Valley were led by the mainstream media as 'journalists' became full-out enforcers for the Cult both as propagandists and censors. Part of this has been the influx of young people straight out of university who have become 'journalists' in significant positions. They have no experience and a headful of programmed perceptions from their years at school and university at a time when today's young are the most perceptually-targeted generations in known human history given the insidious impact of technology. They enter the media perceptually prepared and ready to repeat the narratives of the system that programmed them to

repeat its narratives. The BBC has a truly pathetic 'specialist disinformation reporter' called Marianna Spring who fits this bill perfectly. She is clueless about the world, how it works and what is really going on. Her role is to discredit anyone doing the job that a proper journalist would do and system-serving hacks like Spring wouldn't dare to do or even see the need to do. They are too busy licking the arse of authority which can never be wrong and, in the case of the BBC propaganda programme, *Panorama*, contacting payments systems such as PayPal to have a donations page taken down for a film company making documentaries questioning vaccines. Even the BBC soap opera *EastEnders* included a disgracefully biased scene in which an inarticulate white working class woman was made to look foolish for questioning the 'vaccine' while a well-spoken black man and Asian woman promoted the government narrative. It ticked every BBC box and the fact that the black and minority community was resisting the 'vaccine' had nothing to do with the way the scene was written. The BBC has become a disgusting tyrannical propaganda and censorship operation that should be defunded and disbanded and a free media take its place with a brief to stop censorship instead of demanding it. A BBC 'interview' with Gates goes something like: 'Mr Gates, sir, if I can call you sir, would you like to tell our audience why you are such a great man, a wonderful humanitarian philanthropist, and why you should absolutely be allowed as a software salesman to decide health policy for approaching eight billion people? Thank you, sir, please sir.' Propaganda programming has been incessant and merciless and when all you hear is the same story from the media, repeated by those around you who have only heard the same story, is it any wonder that people on a grand scale believe absolute mendacious garbage to be true? You are about to see, too, why this level of information control is necessary when the official 'Covid' narrative is so nonsensical and unsupportable by the evidence.

Structure of Deceit

The pyramid structure through which the 'Covid' hoax has been manifested is very simple and has to be to work. As few people as possible have to be involved with full knowledge of what they are doing – and why – or the real story would get out. At the top of the pyramid are the inner core of the Cult which controls Bill Gates who, in turn, controls the World Health Organization through his pivotal funding and his puppet Director-General mouthpiece, Tedros. Before he was appointed Tedros was chair of the Gates-founded Global Fund to 'fight against AIDS, tuberculosis and malaria', a board member of the Gates-funded 'vaccine alliance' GAVI, and on the board of another Gates-funded organisation. Gates owns him and picked him for a specific reason – Tedros is a crook and worse. 'Dr' Tedros (he's not a medical doctor, the first WHO chief not to be) was a member of the tyrannical Marxist government of Ethiopia for decades with all its human rights abuses. He has faced allegations of corruption and misappropriation of funds and was exposed three times for covering up cholera epidemics while Ethiopia's health minister. Tedros appointed the mass-murdering genocidal Zimbabwe dictator Robert Mugabe as a WHO goodwill ambassador for public health which, as with Tedros, is like appointing a psychopath to run a peace and love campaign. The move was so ridiculous that he had to drop Mugabe in the face of widespread condemnation. American economist David Steinman, a Nobel peace prize nominee, lodged a complaint with the International Criminal Court in The Hague over alleged genocide by Tedros when he was Ethiopia's foreign minister. Steinman says Tedros was a 'crucial decision maker' who directed the actions of Ethiopia's security forces from 2013 to 2015 and one of three officials in charge when those security services embarked on the 'killing' and 'torturing' of Ethiopians. You can see where Tedros is coming from and it's sobering to think that he has been the vehicle for Gates and the Cult to direct the global response to 'Covid'. Think about that. A psychopathic Cult dictates to psychopath Gates who dictates to psychopath Tedros who dictates how countries of the world must respond to a 'Covid virus' never scientifically shown to exist. At the same time psychopathic Cult-owned Silicon Valley information

giants like Google, YouTube, Facebook and Twitter announced very early on that they would give the Cult/Gates/Tedros/WHO version of the narrative free advertising and censor those who challenged their intelligence-insulting, mendacious story.

The next layer in the global 'medical' structure below the Cult, Gates and Tedros are the chief medical officers and science 'advisers' in each of the WHO member countries which means virtually all of them. Medical officers and arbiters of science (they're not) then take the WHO policy and recommended responses and impose them on their country's population while the political 'leaders' say they are deciding policy (they're clearly not) by 'following the science' on the advice of the 'experts' – the same medical officers and science 'advisers' (dictators). In this way with the rarest of exceptions the entire world followed the same policy of lockdown, people distancing, masks and 'vaccines' dictated by the psychopathic Cult, psychopathic Gates and psychopathic Tedros who we are supposed to believe give a damn about the health of the world population they are seeking to enslave. That, amazingly, is all there is to it in terms of crucial decision-making. Medical staff in each country then follow like sheep the dictates of the shepherds at the top of the national medical hierarchies – chief medical officers and science 'advisers' who themselves follow like sheep the shepherds of the World Health Organization and the Cult. Shepherds at the national level often have major funding and other connections to Gates and his Bill and Melinda Gates Foundation which carefully hands out money like confetti at a wedding to control the entire global medical system from the WHO down.

Follow the money

Christopher Whitty, Chief Medical Adviser to the UK Government at the centre of 'virus' policy, a senior adviser to the government's Scientific Advisory Group for Emergencies (SAGE), and Executive Board member of the World Health Organization, was gifted a grant of \$40 million by the Bill and Melinda Gates Foundation for malaria research in Africa. The BBC described the unelected Whitty as 'the

official who will probably have the greatest impact on our everyday lives of any individual policymaker in modern times' and so it turned out. What Gates and Tedros have said Whitty has done like his equivalents around the world. Patrick Vallance, co-chair of SAGE and the government's Chief Scientific Adviser, is a former executive of Big Pharma giant GlaxoSmithKline with its fundamental financial and business connections to Bill Gates. In September, 2020, it was revealed that Vallance owned a deferred bonus of shares in GlaxoSmithKline worth £600,000 while the company was 'developing' a 'Covid vaccine'. Move along now – nothing to see here – what could possibly be wrong with that? Imperial College in London, a major player in 'Covid' policy in Britain and elsewhere with its 'Covid-19' Response Team, is funded by Gates and has big connections to China while the now infamous Professor Neil Ferguson, the useless 'computer modeller' at Imperial College is also funded by Gates. Ferguson delivered the dramatically inaccurate excuse for the first lockdowns (much more in the next chapter). The Institute for Health Metrics and Evaluation (IHME) in the United States, another source of outrageously false 'Covid' computer models to justify lockdowns, is bankrolled by Gates who is a vehement promotor of lockdowns. America's version of Whitty and Vallance, the again now infamous Anthony Fauci, has connections to 'Covid vaccine' maker Moderna as does Bill Gates through funding from the Bill and Melinda Gates Foundation. Fauci is director of the National Institute of Allergy and Infectious Diseases (NIAID), a major recipient of Gates money, and they are very close. Deborah Birx who was appointed White House Coronavirus Response Coordinator in February, 2020, is yet another with ties to Gates. Everywhere you look at the different elements around the world behind the coordination and decision making of the 'Covid' hoax there is Bill Gates and his money. They include the World Health Organization; Centers for Disease Control (CDC) in the United States; National Institutes of Health (NIH) of Anthony Fauci; Imperial College and Neil Ferguson; the London School of Hygiene where Chris Whitty worked; Regulatory agencies like the UK Medicines & Healthcare products Regulatory Agency (MHRA)

which gave emergency approval for 'Covid vaccines'; Wellcome Trust; GAVI, the Vaccine Alliance; the Coalition for Epidemic Preparedness Innovations (CEPI); Johns Hopkins University which has compiled the false 'Covid' figures; and the World Economic Forum. A [Nationalfile.com](https://www.nationalfile.com) article said:

Gates has a lot of pull in the medical world, he has a multi-million dollar relationship with Dr. Fauci, and Fauci originally took the Gates line supporting vaccines and casting doubt on [the drug hydroxychloroquine]. Coronavirus response team member Dr. Deborah Birx, appointed by former president Obama to serve as United States Global AIDS Coordinator, also sits on the board of a group that has received billions from Gates' foundation, and Birx reportedly used a disputed Bill Gates-funded model for the White House's Coronavirus effort. Gates is a big proponent for a population lockdown scenario for the Coronavirus outbreak.

Another funder of Moderna is the Defense Advanced Research Projects Agency (DARPA), the technology-development arm of the Pentagon and one of the most sinister organisations on earth. DARPA had a major role with the CIA covert technology-funding operation In-Q-Tel in the development of Google and social media which is now at the centre of global censorship. Fauci and Gates are extremely close and openly admit to talking regularly about 'Covid' policy, but then why wouldn't Gates have a seat at every national 'Covid' table after his Foundation committed \$1.75 billion to the 'fight against Covid-19'. When passed through our Orwellian Translation Unit this means that he has bought and paid for the Cult-driven 'Covid' response worldwide. Research the major 'Covid' response personnel in your own country and you will find the same Gates funding and other connections again and again. Medical and science chiefs following World Health Organization 'policy' sit atop a medical hierarchy in their country of administrators, doctors and nursing staff. These 'subordinates' are told they must work and behave in accordance with the policy delivered from the 'top' of the national 'health' pyramid which is largely the policy delivered by the WHO which is the policy delivered by Gates and the Cult. The whole 'Covid' narrative has been imposed on medical staff by a climate of fear although great numbers don't even need that to comply. They do so through breathtaking levels of ignorance and

include doctors who go through life simply repeating what Big Pharma and their hierarchical masters tell them to say and believe. No wonder Big Pharma 'medicine' is one of the biggest killers on Planet Earth.

The same top-down system of intimidation operates with regard to the Cult Big Pharma cartel which also dictates policy through national and global medical systems in this way. The Cult and Big Pharma agendas are the same because the former controls and owns the latter. 'Health' administrators, doctors, and nursing staff are told to support and parrot the dictated policy or they will face consequences which can include being fired. How sad it's been to see medical staff meekly repeating and imposing Cult policy without question and most of those who can see through the deceit are only willing to speak anonymously off the record. They know what will happen if their identity is known. This has left the courageous few to expose the lies about the 'virus', face masks, overwhelmed hospitals that aren't, and the dangers of the 'vaccine' that isn't a vaccine. When these medical professionals and scientists, some renowned in their field, have taken to the Internet to expose the truth their articles, comments and videos have been deleted by Cult-owned Facebook, Twitter and YouTube. What a real head-shaker to see YouTube videos with leading world scientists and highly qualified medical specialists with an added link underneath to the notorious Cult propaganda website *Wikipedia* to find the 'facts' about the same subject.

HIV – the 'Covid' trial-run

I'll give you an example of the consequences for health and truth that come from censorship and unquestioning belief in official narratives. The story was told by PCR inventor Kary Mullis in his book *Dancing Naked in the Mind Field*. He said that in 1984 he accepted as just another scientific fact that Luc Montagnier of France's Pasteur Institute and Robert Gallo of America's National Institutes of Health had independently discovered that a 'retrovirus' dubbed HIV (human immunodeficiency virus) caused AIDS. They

were, after all, Mullis writes, specialists in retroviruses. This is how the medical and science pyramids work. Something is announced or *assumed* and then becomes an everybody-knows-that purely through repetition of the assumption as if it is fact. Complete crap becomes accepted truth with no supporting evidence and only repetition of the crap. This is how a 'virus' that doesn't exist became the 'virus' that changed the world. The HIV-AIDS fairy story became a multi-billion pound industry and the media poured out propaganda terrifying the world about the deadly HIV 'virus' that caused the lethal AIDS. By then Mullis was working at a lab in Santa Monica, California, to detect retroviruses with his PCR test in blood donations received by the Red Cross. In doing so he asked a virologist where he could find a reference for HIV being the cause of AIDS. 'You don't need a reference,' the virologist said ... '*Everybody knows it.*' Mullis said he wanted to quote a reference in the report he was doing and he said he felt a little funny about not knowing the source of such an important discovery when everyone else seemed to. The virologist suggested he cite a report by the Centers for Disease Control and Prevention (CDC) on morbidity and mortality. Mullis read the report, but it only said that an organism had been identified and did not say how. The report did not identify the original scientific work. Physicians, however, *assumed* (key recurring theme) that if the CDC was convinced that HIV caused AIDS then proof must exist. Mullis continues:

I did computer searches. Neither Montagnier, Gallo, nor anyone else had published papers describing experiments which led to the conclusion that HIV probably caused AIDS. I read the papers in *Science* for which they had become well known as AIDS doctors, but all they had said there was that they had found evidence of a past infection by something which was probably HIV in some AIDS patients.

They found antibodies. Antibodies to viruses had always been considered evidence of past disease, not present disease. Antibodies signaled that the virus had been defeated. The patient had saved himself. There was no indication in these papers that this virus caused a disease. They didn't show that everybody with the antibodies had the disease. In fact they found some healthy people with antibodies.

Mullis asked why their work had been published if Montagnier and Gallo hadn't really found this evidence, and why had they been fighting so hard to get credit for the discovery? He says he was hesitant to write 'HIV is the probable cause of AIDS' until he found published evidence to support that. 'Tens of thousands of scientists and researchers were spending billions of dollars a year doing research based on this idea,' Mullis writes. 'The reason had to be there somewhere; otherwise these people would not have allowed their research to settle into one narrow channel of investigation.' He said he lectured about PCR at numerous meetings where people were always talking about HIV and he asked them how they knew that HIV was the cause of AIDS:

Everyone said something. Everyone had the answer at home, in the office, in some drawer. They all knew, and they would send me the papers as soon as they got back. But I never got any papers. Nobody ever sent me the news about how AIDS was caused by HIV.

Eventually Mullis was able to ask Montagnier himself about the reference proof when he lectured in San Diego at the grand opening of the University of California AIDS Research Center. Mullis says this was the last time he would ask his question without showing anger. Montagnier said he should reference the CDC report. 'I read it', Mullis said, and it didn't answer the question. 'If Montagnier didn't know the answer who the hell did?' Then one night Mullis was driving when an interview came on National Public Radio with Peter Duesberg, a prominent virologist at Berkeley and a California Scientist of the Year. Mullis says he finally understood why he could not find references that connected HIV to AIDS – *there weren't any!* No one had ever proved that HIV causes AIDS even though it had spawned a multi-billion pound global industry and the media was repeating this as fact every day in their articles and broadcasts terrifying the shit out of people about AIDS and giving the impression that a positive test for HIV (see 'Covid') was a death sentence. Duesberg was a threat to the AIDS gravy train and the agenda that underpinned it. He was therefore abused and castigated after he told the Proceedings of the National Academy of Sciences

there was no good evidence implicating the new 'virus'. Editors rejected his manuscripts and his research funds were deleted. Mullis points out that the CDC has defined AIDS as one of more than 30 diseases *if accompanied* by a positive result on a test that detects antibodies to HIV; but those same diseases are not defined as AIDS cases when antibodies are not detected:

If an HIV-positive woman develops uterine cancer, for example, she is considered to have AIDS. If she is not HIV positive, she simply has uterine cancer. An HIV-positive man with tuberculosis has AIDS; if he tests negative he simply has tuberculosis. If he lives in Kenya or Colombia, where the test for HIV antibodies is too expensive, he is simply presumed to have the antibodies and therefore AIDS, and therefore he can be treated in the World Health Organization's clinic. It's the only medical help available in some places. And it's free, because the countries that support WHO are worried about AIDS.

Mullis accuses the CDC of continually adding new diseases (see ever more 'Covid symptoms') to the grand AIDS definition and of virtually doctoring the books to make it appear as if the disease continued to spread. He cites how in 1993 the CDC enormously broadened its AIDS definition and county health authorities were delighted because they received \$2,500 per year from the Federal government for every reported AIDS case. Ladies and gentlemen, I have just described, via Kary Mullis, the 'Covid pandemic' of 2020 and beyond. Every element is the same and it's been pulled off in the same way by the same networks.

The 'Covid virus' exists? Okay – prove it. Er ... still waiting

What Kary Mullis described with regard to 'HIV' has been repeated with 'Covid'. A claim is made that a new, or 'novel', infection has been found and the entire medical system of the world repeats that as fact exactly as they did with HIV and AIDS. No one in the mainstream asks rather relevant questions such as 'How do you know?' and 'Where is your proof?' The SARS-Cov-2 'virus' and the 'Covid-19 disease' became an overnight 'everybody-knows-that'. The origin could be debated and mulled over, but what you could not suggest was that 'SARS-Cov-2' didn't exist. That would be

ridiculous. 'Everybody knows' the 'virus' exists. Well, I didn't for one along with American proper doctors like Andrew Kaufman and Tom Cowan and long-time American proper journalist Jon Rappaport. We dared to pursue the obvious and simple question: 'Where's the evidence?' The overwhelming majority in medicine, journalism and the general public did not think to ask that. After all, *everyone knew* there was a new 'virus'. Everyone was saying so and I heard it on the BBC. Some would eventually argue that the 'deadly virus' was nothing like as deadly as claimed, but few would venture into the realms of its very existence. Had they done so they would have found that the evidence for that claim had gone AWOL as with HIV causes AIDS. In fact, not even that. For something to go AWOL it has to exist in the first place and scientific proof for a 'SARS-Cov-2' can be filed under nothing, nowhere and zilch.

Dr Andrew Kaufman is a board-certified forensic psychiatrist in New York State, a Doctor of Medicine and former Assistant Professor and Medical Director of Psychiatry at SUNY Upstate Medical University, and Medical Instructor of Hematology and Oncology at the Medical School of South Carolina. He also studied biology at the Massachusetts Institute of Technology (MIT) and trained in Psychiatry at Duke University. Kaufman is retired from allopathic medicine, but remains a consultant and educator on natural healing. I saw a video of his very early on in the 'Covid' hoax in which he questioned claims about the 'virus' in the absence of any supporting evidence and with plenty pointing the other way. I did everything I could to circulate his work which I felt was asking the pivotal questions that needed an answer. I can recommend an excellent pull-together interview he did with the website The Last Vagabond entitled *Dr Andrew Kaufman: Virus Isolation, Terrain Theory and Covid-19* and his website is andrewkaufmanmd.com. Kaufman is not only a forensic psychiatrist; he is forensic in all that he does. He always reads original scientific papers, experiments and studies instead of second-third-fourth-hand reports about the 'virus' in the media which are repeating the repeated repetition of the narrative. When he did so with the original Chinese 'virus' papers Kaufman

realised that there was no evidence of a 'SARS-Cov-2'. They had never – from the start – shown it to exist and every repeat of this claim worldwide was based on the accepted existence of proof that was nowhere to be found – see Kary Mullis and HIV. Here we go again.

Let's postulate

Kaufman discovered that the Chinese authorities immediately concluded that the cause of an illness that broke out among about 200 initial patients in Wuhan was a 'new virus' when there were no grounds to make that conclusion. The alleged 'virus' was not isolated from other genetic material in their samples and then shown through a system known as Koch's postulates to be the causative agent of the illness. The world was told that the SARS-Cov-2 'virus' caused a disease they called 'Covid-19' which had 'flu-like' symptoms and could lead to respiratory problems and pneumonia. If it wasn't so tragic it would almost be funny. *'Flu-like' symptoms? Pneumonia? Respiratory disease?* What in *CHINA* and particularly in *Wuhan*, one of the most polluted cities in the world with a resulting epidemic of respiratory disease?? Three hundred thousand people get pneumonia in China every year and there are nearly a billion cases worldwide of 'flu-like symptoms'. These have a whole range of causes – including pollution in Wuhan – but no other possibility was credibly considered in late 2019 when the world was told there was a new and deadly 'virus'. The global prevalence of pneumonia and 'flu-like systems' gave the Cult networks unlimited potential to re-diagnose these other causes as the mythical 'Covid-19' and that is what they did from the very start. Kaufman revealed how Chinese medical and science authorities (all subordinates to the Cult-owned communist government) took genetic material from the lungs of only a few of the first patients. The material contained their own cells, bacteria, fungi and other microorganisms living in their bodies. The only way you could prove the existence of the 'virus' and its responsibility for the alleged 'Covid-19' was to isolate the virus from all the other material – a process also known as 'purification' – and

then follow the postulates sequence developed in the late 19th century by German physician and bacteriologist Robert Koch which became the 'gold standard' for connecting an alleged causation agent to a disease:

1. The microorganism (bacteria, fungus, virus, etc.) must be present in every case of the disease and all patients must have the same symptoms. It must also *not be present in healthy individuals*.
2. The microorganism must be isolated from the host with the disease. If the microorganism is a bacteria or fungus it must be grown in a pure culture. If it is a virus, it must be purified (i.e. containing no other material except the virus particles) from a clinical sample.
3. The specific disease, with all of its characteristics, must be reproduced when the infectious agent (the purified virus or a pure culture of bacteria or fungi) is inoculated into a healthy, susceptible host.
4. The microorganism must be recoverable from the experimentally infected host as in step 2.

Not one of these criteria has been met in the case of 'SARS-Cov-2' and 'Covid-19'. Not ONE. EVER. Robert Koch refers to bacteria and not viruses. What are called 'viral particles' are so minute (hence masks are useless by any definition) that they could only be seen after the invention of the electron microscope in the 1930s and can still only be observed through that means. American bacteriologist and virologist Thomas Milton Rivers, the so-called 'Father of Modern Virology' who was very significantly director of the Rockefeller Institute for Medical Research in the 1930s, developed a less stringent version of Koch's postulates to identify 'virus' causation known as 'Rivers criteria'. 'Covid' did not pass that process either. Some even doubt whether any 'virus' can be isolated from other particles containing genetic material in the Koch method. Freedom of Information requests in many countries asking for scientific proof that the 'Covid virus' has been purified and isolated and shown to exist have all come back with a 'we don't have that' and when this happened with a request to the UK Department of Health they added this comment:

However, outside of the scope of the [Freedom of Information Act] and on a discretionary basis, the following information has been advised to us, which may be of interest. Most infectious diseases are caused by viruses, bacteria or fungi. Some bacteria or fungi have the capacity to grow on their own in isolation, for example in colonies on a petri dish. Viruses are different in that they are what we call 'obligate pathogens' – that is, they cannot survive or reproduce without infecting a host ...

... For some diseases, it is possible to establish causation between a microorganism and a disease by isolating the pathogen from a patient, growing it in pure culture and reintroducing it to a healthy organism. These are known as 'Koch's postulates' and were developed in 1882. However, as our understanding of disease and different disease-causing agents has advanced, these are no longer the method for determining causation [Andrew Kaufman asks why in that case are there two published articles falsely claiming to satisfy Koch's postulates].

It has long been known that viral diseases cannot be identified in this way as viruses cannot be grown in 'pure culture'. When a patient is tested for a viral illness, this is normally done by looking for the presence of antigens, or viral genetic code in a host with molecular biology techniques [Kaufman asks how you could know the origin of these chemicals without having a pure culture for comparison].

For the record 'antigens' are defined so:

Invading microorganisms have antigens on their surface that the human body can recognise as being foreign – meaning not belonging to it. When the body recognises a foreign antigen, lymphocytes (white blood cells) produce antibodies, which are complementary in shape to the antigen.

Notwithstanding that this is open to question in relation to 'SARS-Cov-2' the presence of 'antibodies' can have many causes and they are found in people that are perfectly well. Kary Mullis said: 'Antibodies ... had always been considered evidence of past disease, not present disease.'

'Covid' really is a *computer* 'virus'

Where the UK Department of Health statement says 'viruses' are now 'diagnosed' through a 'viral genetic code in a host with molecular biology techniques', they mean ... *the PCR test* which its inventor said cannot test for infectious disease. They have no credible method of connecting a 'virus' to a disease and we will see that there is no scientific proof that any 'virus' causes any disease or there is any such thing as a 'virus' in the way that it is described. Tenacious Canadian researcher Christine Massey and her team made

some 40 Freedom of Information requests to national public health agencies in different countries asking for proof that SARS-CoV-2 has been isolated and not one of them could supply that information. Massey said of her request in Canada: 'Freedom of Information reveals Public Health Agency of Canada has no record of 'SARS-COV-2' isolation performed by anyone, anywhere, ever.' If you accept the comment from the UK Department of Health it's because they can't isolate a 'virus'. Even so many 'science' papers claimed to have isolated the 'Covid virus' until they were questioned and had to admit they hadn't. A reply from the Robert Koch Institute in Germany was typical: 'I am not aware of a paper which purified isolated SARS-CoV-2.' So what the hell was Christian Drosten and his gang using to design the 'Covid' testing protocol that has produced all the illusory Covid' cases and 'Covid' deaths when the head of the Chinese version of the CDC admitted there was a problem right from the start in that the 'virus' had never been isolated/purified? Breathe deeply: What they are calling 'Covid' is actually created by a *computer program* i.e. *they made it up* – er, that's it. They took lung fluid, with many sources of genetic material, from one single person alleged to be infected with Covid-19 by a PCR test which they *claimed*, without clear evidence, contained a 'virus'. They used several computer programs to create a model of a theoretical virus genome sequence from more than fifty-six million small sequences of RNA, each of an unknown source, assembling them like a puzzle with no known solution. The computer filled in the gaps with sequences from bits in the gene bank to make it look like a bat SARS-like coronavirus! A wave of the magic wand and poof, an *in silico* (computer-generated) genome, a scientific fantasy, was created. UK health researcher Dr Kevin Corbett made the same point with this analogy:

... It's like giving you a few bones and saying that's your fish. It could be any fish. Not even a skeleton. Here's a few fragments of bones. That's your fish ... It's all from gene bank and the bits of the virus sequence that weren't there they made up.

They synthetically created them to fill in the blanks. That's what genetics is; it's a code. So it's ABBCCDDDD and you're missing some what you think is EEE so you put it in. It's all

synthetic. You just manufacture the bits that are missing. This is the end result of the geneticization of virology. This is basically a computer virus.

Further confirmation came in an email exchange between British citizen journalist Frances Leader and the government's Medicines & Healthcare Products Regulatory Agency (the Gates-funded MHRA) which gave emergency permission for untested 'Covid vaccines' to be used. The agency admitted that the 'vaccine' is not based on an isolated 'virus', but comes from a *computer-generated model*. Frances Leader was naturally banned from Cult-owned fascist Twitter for making this exchange public. The process of creating computer-generated alleged 'viruses' is called 'in silico' or 'in silicon' – computer chips – and the term 'in silico' is believed to originate with biological experiments using only a computer in 1989. 'Vaccines' involved with 'Covid' are also produced 'in silico' or by computer not a natural process. If the original 'virus' is nothing more than a made-up computer model how can there be 'new variants' of something that never existed in the first place? They are not new 'variants'; they are new *computer models* only minutely different to the original program and designed to further terrify the population into having the 'vaccine' and submitting to fascism. You want a 'new variant'? Click, click, enter – there you go. Tell the medical profession that you have discovered a 'South African variant', 'UK variants' or a 'Brazilian variant' and in the usual HIV-causes-AIDS manner they will unquestioningly repeat it with no evidence whatsoever to support these claims. They will go on television and warn about the dangers of 'new variants' while doing nothing more than repeating what they have been told to be true and knowing that any deviation from that would be career suicide. Big-time insiders will know it's a hoax, but much of the medical community is clueless about the way they are being played and themselves play the public without even being aware they are doing so. What an interesting 'coincidence' that AstraZeneca and Oxford University were conducting 'Covid vaccine trials' in the three countries – the UK, South Africa and Brazil – where the first three 'variants' were claimed to have 'broken out'.

Here's your 'virus' – it's a unicorn

Dr Andrew Kaufman presented a brilliant analysis describing how the 'virus' was imagined into fake existence when he dissected an article published by *Nature* and written by 19 authors detailing *alleged* 'sequencing of a complete viral genome' of the 'new SARS-CoV-2 virus'. This computer-modelled *in silico* genome was used as a template for all subsequent genome sequencing experiments that resulted in the so-called variants which he said now number more than 6,000. The fake genome was constructed from more than 56 million individual short strands of RNA. Those little pieces were assembled into longer pieces by finding areas of overlapping sequences. The computer programs created over two million possible combinations from which the authors simply chose the longest one. They then compared this to a 'bat virus' and the computer 'alignment' rearranged the sequence and filled in the gaps! They called this computer-generated abomination the 'complete genome'. Dr Tom Cowan, a fellow medical author and collaborator with Kaufman, said such computer-generation constitutes scientific fraud and he makes this superb analogy:

Here is an equivalency: A group of researchers claim to have found a unicorn because they found a piece of a hoof, a hair from a tail, and a snippet of a horn. They then add that information into a computer and program it to re-create the unicorn, and they then claim this computer re-creation is the real unicorn. Of course, they had never actually seen a unicorn so could not possibly have examined its genetic makeup to compare their samples with the actual unicorn's hair, hooves and horn.

The researchers claim they decided which is the real genome of SARS-CoV-2 by 'consensus', sort of like a vote. Again, different computer programs will come up with different versions of the imaginary 'unicorn', so they come together as a group and decide which is the real imaginary unicorn.

This is how the 'virus' that has transformed the world was brought into fraudulent 'existence'. Extraordinary, yes, but as the Nazis said the bigger the lie the more will believe it. Cowan, however, wasn't finished and he went on to identify what he called the real blockbuster in the paper. He quotes this section from a paper written

by virologists and published by the CDC and then explains what it means:

Therefore, we examined the capacity of SARS-CoV-2 to infect and replicate in several common primate and human cell lines, including human adenocarcinoma cells (A549), human liver cells (HUH 7.0), and human embryonic kidney cells (HEK-293T). In addition to Vero E6 and Vero CCL81 cells. ... Each cell line was inoculated at high multiplicity of infection and examined 24h post-infection.

No CPE was observed in any of the cell lines except in Vero cells, which grew to greater than 10 to the 7th power at 24 h post-infection. In contrast, HUH 7.0 and 293T showed only modest viral replication, and A549 cells were incompatible with SARS CoV-2 infection.

Cowan explains that when virologists attempt to prove infection they have three possible 'hosts' or models on which they can test. The first was humans. Exposure to humans was generally not done for ethical reasons and has never been done with SARS-CoV-2 or any coronavirus. The second possible host was animals. Cowan said that forgetting for a moment that they never actually use purified virus when exposing animals they do use solutions that they *claim* contain the virus. Exposure to animals has been done with SARS-CoV-2 in an experiment involving mice and this is what they found: *None of the wild (normal) mice got sick*. In a group of genetically-modified mice, a statistically insignificant number lost weight and had slightly bristled fur, but they experienced nothing like the illness called 'Covid-19'. Cowan said the third method – the one they mostly rely on – is to inoculate solutions they *say* contain the virus onto a variety of tissue cultures. This process had never been shown to kill tissue *unless* the sample material was starved of nutrients and poisoned as *part of the process*. Yes, incredibly, in tissue experiments designed to show the 'virus' is responsible for killing the tissue they starve the tissue of nutrients and add toxic drugs including antibiotics and they do not have control studies to see if it's the starvation and poisoning that is degrading the tissue rather than the 'virus' they allege to be in there somewhere. You want me to pinch you? Yep, I understand. Tom Cowan said this about the whole nonsensical farce as he explains what that quote from the CDC paper really means:

The shocking thing about the above quote is that using their own methods, the virologists found that solutions containing SARS-CoV-2 – even in high amounts – were NOT, I repeat NOT, infective to any of the three human tissue cultures they tested. In plain English, this means they proved, on their terms, that this ‘new coronavirus’ is not infectious to human beings. It is ONLY infective to monkey kidney cells, and only then when you add two potent drugs (gentamicin and amphotericin), known to be toxic to kidneys, to the mix.

My friends, read this again and again. These virologists, published by the CDC, performed a clear proof, on their terms, showing that the SARS-CoV-2 virus is harmless to human beings. That is the only possible conclusion, but, unfortunately, this result is not even mentioned in their conclusion. They simply say they can provide virus stocks cultured only on monkey Vero cells, thanks for coming.

Cowan concluded: ‘If people really understood how this “science” was done, I would hope they would storm the gates and demand honesty, transparency and truth.’ Dr Michael Yeadon, former Vice President and Chief Scientific Adviser at drug giant Pfizer has been a vocal critic of the ‘Covid vaccine’ and its potential for multiple harm. He said in an interview in April, 2021, that ‘not one [vaccine] has the virus. He was asked why vaccines normally using a ‘dead’ version of a disease to activate the immune system were not used for ‘Covid’ and instead we had the synthetic methods of the ‘mRNA Covid vaccine’. Yeadon said that to do the former ‘you’d have to have some of [the virus] wouldn’t you?’ He added: ‘No-one’s got any – seriously.’ Yeadon said that surely they couldn’t have fooled the whole world for a year without having a virus, ‘but oddly enough ask around – no one’s got it’. He didn’t know why with all the ‘great labs’ around the world that the virus had not been isolated – ‘Maybe they’ve been too busy running bad PCR tests and vaccines that people don’t need.’ What is today called ‘science’ is not ‘science’ at all. Science is no longer what is, but whatever people can be manipulated to *believe* that it is. Real science has been hijacked by the Cult to dispense and produce the ‘expert scientists’ and contentions that suit the agenda of the Cult. How big-time this has happened with the ‘Covid’ hoax which is entirely based on fake science delivered by fake ‘scientists’ and fake ‘doctors’. The human-caused climate change hoax is also entirely based on fake science delivered by fake ‘scientists’ and fake ‘climate experts’. In both cases real

scientists, climate experts and doctors have their views suppressed and deleted by the Cult-owned science establishment, media and Silicon Valley. This is the 'science' that politicians claim to be 'following' and a common denominator of 'Covid' and climate are Cult psychopaths Bill Gates and his mate Klaus Schwab at the Gates-funded World Economic Forum. But, don't worry, it's all just a coincidence and absolutely nothing to worry about. Zzzzzzzzz.

What is a 'virus' REALLY?

Dr Tom Cowan is one of many contesting the very existence of viruses let alone that they cause disease. This is understandable when there is no scientific evidence for a disease-causing 'virus'. German virologist Dr Stefan Lanka won a landmark case in 2017 in the German Supreme Court over his contention that there is no such thing as a measles virus. He had offered a big prize for anyone who could prove there is and Lanka won his case when someone sought to claim the money. There is currently a prize of more than 225,000 euros on offer from an Isolate Truth Fund for anyone who can prove the isolation of SARS-CoV-2 and its genetic substance. Lanka wrote in an article headed 'The Misconception Called Virus' that scientists think a 'virus' is causing tissue to become diseased and degraded when in fact it is the *processes they are using* which do that – not a 'virus'. Lanka has done an important job in making this point clear as Cowan did in his analysis of the CDC paper. Lanka says that all claims about viruses as disease-causing pathogens are wrong and based on 'easily recognisable, understandable and verifiable misinterpretations.' Scientists believed they were working with 'viruses' in their laboratories when they were really working with 'typical particles of specific dying tissues or cells ...' Lanka said that the tissue decaying process claimed to be caused by a 'virus' still happens when no alleged 'virus' is involved. It's the *process* that does the damage and not a 'virus'. The genetic sample is deprived of nutrients, removed from its energy supply through removal from the body and then doused in toxic antibiotics to remove any bacteria. He confirms again that establishment scientists do not (pinch me)

conduct control experiments to see if this is the case and if they did they would see the claims that 'viruses' are doing the damage is nonsense. He adds that during the measles 'virus' court case he commissioned an independent laboratory to perform just such a control experiment and the result was that the tissues and cells died in the exact same way as with alleged 'infected' material. This is supported by a gathering number of scientists, doctors and researchers who reject what is called 'germ theory' or the belief in the body being infected by contagious sources emitted by other people. Researchers Dawn Lester and David Parker take the same stance in their highly-detailed and sourced book *What Really Makes You Ill – Why everything you thought you knew about disease is wrong* which was recommended to me by a number of medical professionals genuinely seeking the truth. Lester and Parker say there is no provable scientific evidence to show that a 'virus' can be transmitted between people or people and animals or animals and people:

The definition also claims that viruses are the cause of many diseases, as if this has been definitively proven. But this is not the case; there is no original scientific evidence that definitively demonstrates that any virus is the cause of any disease. The burden of proof for any theory lies with those who proposed it; but none of the existing documents provides 'proof' that supports the claim that 'viruses' are pathogens.

Dr Tom Cowan employs one of his clever analogies to describe the process by which a 'virus' is named as the culprit for a disease when what is called a 'virus' is only material released by cells detoxing themselves from infiltration by chemical or radiation poisoning. The tidal wave of technologically-generated radiation in the 'smart' modern world plus all the toxic food and drink are causing this to happen more than ever. Deluded 'scientists' misread this as a gathering impact of what they wrongly label 'viruses'.

Paper can infect houses

Cowan said in an article for davidicke.com – with his tongue only mildly in his cheek – that he believed he had made a tremendous

discovery that may revolutionise science. He had discovered that small bits of paper are alive, 'well alive-ish', can 'infect' houses, and then reproduce themselves inside the house. The result was that this explosion of growth in the paper inside the house causes the house to explode, blowing it to smithereens. His evidence for this new theory is that in the past months he had carefully examined many of the houses in his neighbourhood and found almost no scraps of paper on the lawns and surrounds of the house. There was an occasional stray label, but nothing more. Then he would return to these same houses a week or so later and with a few, not all of them, particularly the old and decrepit ones, he found to his shock and surprise they were littered with stray bits of paper. He knew then that the paper had infected these houses, made copies of itself, and blew up the house. A young boy on a bicycle at one of the sites told him he had seen a demolition crew using dynamite to explode the house the previous week, but Cowan dismissed this as the idle thoughts of silly boys because 'I was on to something big'. He was on to how 'scientists' mistake genetic material in the detoxifying process for something they call a 'virus'. Cowan said of his house and paper story:

If this sounds crazy to you, it's because it should. This scenario is obviously nuts. But consider this admittedly embellished, for effect, current viral theory that all scientists, medical doctors and virologists currently believe.

He takes the example of the 'novel SARS-Cov2' virus to prove the point. First they take someone with an undefined illness called 'Covid-19' and don't even attempt to find any virus in their sputum. Never mind the scientists still describe how this 'virus', which they have not located attaches to a cell receptor, injects its genetic material, in 'Covid's' case, RNA, into the cell. The RNA once inserted exploits the cell to reproduce itself and makes 'thousands, nay millions, of copies of itself ... Then it emerges victorious to claim its next victim':

If you were to look in the scientific literature for proof, actual scientific proof, that uniform SARS-CoV2 viruses have been properly isolated from the sputum of a sick person, that actual spike proteins could be seen protruding from the virus (which has not been found), you would find that such evidence doesn't exist.

If you go looking in the published scientific literature for actual pictures, proof, that these spike proteins or any viral proteins are ever attached to any receptor embedded in any cell membrane, you would also find that no such evidence exists. If you were to look for a video or documented evidence of the intact virus injecting its genetic material into the body of the cell, reproducing itself and then emerging victorious by budding off the cell membrane, you would find that no such evidence exists.

The closest thing you would find is electron micrograph pictures of cellular particles, possibly attached to cell debris, both of which to be seen were stained by heavy metals, a process that completely distorts their architecture within the living organism. This is like finding bits of paper stuck to the blown-up bricks, thereby proving the paper emerged by taking pieces of the bricks on its way out.

The Enders baloney

Cowan describes the 'Covid' story as being just as make-believe as his paper story and he charts back this fantasy to a Nobel Prize winner called John Enders (1897-1985), an American biomedical scientist who has been dubbed 'The Father of Modern Vaccines'. Enders is claimed to have 'discovered' the process of the viral culture which 'proved' that a 'virus' caused measles. Cowan explains how Enders did this 'by using the EXACT same procedure that has been followed by every virologist to find and characterize every new virus since 1954'. Enders took throat swabs from children with measles and immersed them in 2ml of milk. Penicillin (100u/ml) and the antibiotic streptomycin (50,g/ml) were added and the whole mix was centrifuged – rotated at high speed to separate large cellular debris from small particles and molecules as with milk and cream, for example. Cowan says that if the aim is to find little particles of genetic material ('viruses') in the snot from children with measles it would seem that the last thing you would do is mix the snot with other material – milk –that also has genetic material. 'How are you ever going to know whether whatever you found came from the snot or the milk?' He points out that streptomycin is a 'nephrotoxic' or poisonous-to-the-kidney drug. You will see the relevance of that

shortly. Cowan says that it gets worse, much worse, when Enders describes the culture medium upon which the virus 'grows': 'The culture medium consisted of bovine amniotic fluid (90%), beef embryo extract (5%), horse serum (5%), antibiotics and phenol red as an indicator of cell metabolism.' Cowan asks incredulously: 'Did he just say that the culture medium also contained fluids and tissues that are themselves rich sources of genetic material?' The genetic cocktail, or 'medium', is inoculated onto tissue and cells from rhesus monkey *kidney* tissue. This is where the importance of streptomycin comes in and currently-used antimicrobials and other drugs that are *poisonous to kidneys* and used in ALL modern viral cultures (e.g. gentamicin, streptomycin, and amphotericin). Cowan asks: 'How are you ever going to know from this witch's brew where any genetic material comes from as we now have five different sources of rich genetic material in our mix?' Remember, he says, that all genetic material, whether from monkey kidney tissues, bovine serum, milk, etc., is made from the exact same components. The same central question returns: 'How are you possibly going to know that it was the virus that killed the kidney tissue and not the toxic antibiotic and starvation rations on which you are growing the tissue?' John Enders answered the question himself – *you can't*:

A second agent was obtained from an uninoculated culture of monkey kidney cells. The cytopathic changes [death of the cells] it induced in the unstained preparations could not be distinguished with confidence from the viruses isolated from measles.

The death of the cells ('cytopathic changes') happened in exactly the same manner, whether they inoculated the kidney tissue with the measles snot or not, Cowan says. 'This is evidence that the destruction of the tissue, the very proof of viral causation of illness, was not caused by anything in the snot because they saw the same destructive effect when the snot was not even used ... the cytopathic, i.e., cell-killing, changes come from the process of the culture itself, not from any virus in any snot, period.' Enders quotes in his 1957 paper a virologist called Ruckle as reporting similar findings 'and in addition has isolated an agent from monkey kidney tissue that is so

far indistinguishable from human measles virus'. In other words, Cowan says, these particles called 'measles viruses' are simply and clearly breakdown products of the starved and poisoned tissue. For measles 'virus' see all 'viruses' including the so-called 'Covid virus'. Enders, the 'Father of Modern Vaccines', also said:

There is a potential risk in employing cultures of primate cells for the production of vaccines composed of attenuated virus, since the presence of other agents possibly latent in primate tissues cannot be definitely excluded by any known method.

Cowan further quotes from a paper published in the journal *Viruses* in May, 2020, while the 'Covid pandemic' was well underway in the media if not in reality. 'EVs' here refers to particles of genetic debris from our own tissues, such as exosomes of which more in a moment: 'The remarkable resemblance between EVs and viruses has caused quite a few problems in the studies focused on the analysis of EVs released during viral infections.' Later the paper adds that to date a reliable method that can actually guarantee a complete separation (of EVs from viruses) DOES NOT EXIST. This was published at a time when a fairy tale 'virus' was claimed in total certainty to be causing a fairy tale 'viral disease' called 'Covid-19' – a fairy tale that was already well on the way to transforming human society in the image that the Cult has worked to achieve for so long. Cowan concludes his article:

To summarize, there is no scientific evidence that pathogenic viruses exist. What we think of as 'viruses' are simply the normal breakdown products of dead and dying tissues and cells. When we are well, we make fewer of these particles; when we are starved, poisoned, suffocated by wearing masks, or afraid, we make more.

There is no engineered virus circulating and making people sick. People in laboratories all over the world are making genetically modified products to make people sick. These are called vaccines. There is no virome, no 'ecosystem' of viruses, viruses are not 8%, 50% or 100 % of our genetic material. These are all simply erroneous ideas based on the misconception called a virus.

What is 'Covid'? Load of bollocks

The background described here by Cowan and Lanka was emphasised in the first video presentation that I saw by Dr Andrew Kaufman when he asked whether the 'Covid virus' was in truth a natural defence mechanism of the body called 'exosomes'. These are released by cells when in states of toxicity – see the same themes returning over and over. They are released ever more profusely as chemical and radiation toxicity increases and think of the potential effect therefore of 5G alone as its destructive frequencies infest the human energetic information field with a gathering pace (5G went online in Wuhan in 2019 as the 'virus' emerged). I'll have more about this later. Exosomes transmit a warning to the rest of the body that 'Houston, we have a problem'. Kaufman presented images of exosomes and compared them with 'Covid' under an electron microscope and the similarity was remarkable. They both attach to the same cell receptors (*claimed* in the case of 'Covid'), contain the same genetic material in the form of RNA or ribonucleic acid, and both are found in 'viral cell cultures' with damaged or dying cells. James Hildreth MD, President and Chief Executive Officer of the Meharry Medical College at Johns Hopkins, said: 'The virus is fully an exosome in every sense of the word.' Kaufman's conclusion was that there is no 'virus': 'This entire pandemic is a completely manufactured crisis ... there is no evidence of anyone dying from [this] illness.' Dr Tom Cowan and Sally Fallon Morell, authors of *The Contagion Myth*, published a statement with Dr Kaufman in February, 2021, explaining why the 'virus' does not exist and you can read it that in full in the Appendix.

'Virus' theory can be traced to the 'cell theory' in 1858 of German physician Rudolf Virchow (1821-1920) who contended that disease originates from a single cell infiltrated by a 'virus'. Dr Stefan Lanka said that findings and insights with respect to the structure, function and central importance of tissues in the creation of life, which were already known in 1858, comprehensively refute the cell theory. Virchow ignored them. We have seen the part later played by John Enders in the 1950s and Lanka notes that infection theories were only established as a global dogma through the policies and

eugenics of the Third Reich in Nazi Germany (creation of the same Sabbatian cult behind the 'Covid' hoax). Lanka said: 'Before 1933, scientists dared to contradict this theory; after 1933, these critical scientists were silenced'. Dr Tom Cowan's view is that ill-health is caused by too much of something, too little of something, or toxification from chemicals and radiation – not contagion. We must also highlight as a major source of the 'virus' theology a man still called the 'Father of Modern Virology' – Thomas Milton Rivers (1888-1962). There is no way given the Cult's long game policy that it was a coincidence for the 'Father of Modern Virology' to be director of the Rockefeller Institute for Medical Research from 1937 to 1956 when he is credited with making the Rockefeller Institute a leader in 'viral research'. Cult Rockefellerers were the force behind the creation of Big Pharma 'medicine', established the World Health Organisation in 1948, and have long and close associations with the Gates family that now runs the WHO during the pandemic hoax through mega-rich Cult gofer and psychopath Bill Gates.

Only a Renegade Mind can see through all this bullshit by asking the questions that need to be answered, not taking 'no' or prevarication for an answer, and certainly not hiding from the truth in fear of speaking it. Renegade Minds have always changed the world for the better and they will change this one no matter how bleak it may currently appear to be.

CHAPTER SIX

Sequence of deceit

If you tell the truth, you don't have to remember anything
Mark Twain

Against the background that I have laid out this far the sequence that took us from an invented 'virus' in Cult-owned China in late 2019 to the fascist transformation of human society can be seen and understood in a whole new context.

We were told that a deadly disease had broken out in Wuhan and the world media began its campaign (coordinated by behavioural psychologists as we shall see) to terrify the population into unquestioning compliance. We were shown images of Chinese people collapsing in the street which never happened in the West with what was supposed to be the same condition. In the earliest days when alleged cases and deaths were few the fear register was hysterical in many areas of the media and this would expand into the common media narrative across the world. The real story was rather different, but we were never told that. The Chinese government, one of the Cult's biggest centres of global operation, said they had discovered a new illness with flu-like and pneumonia-type symptoms in a city with such toxic air that it is overwhelmed with flu-like symptoms, pneumonia and respiratory disease. Chinese scientists said it was a new – 'novel' – coronavirus which they called Sars-Cov-2 and that it caused a disease they labelled 'Covid-19'. There was no evidence for this and the 'virus' has never to this day been isolated, purified and its genetic code established from that. It

was from the beginning a computer-generated fiction. Stories of Chinese whistleblowers saying the number of deaths was being suppressed or that the 'new disease' was related to the Wuhan bio-lab misdirected mainstream and alternative media into cul-de-sacs to obscure the real truth – there was no 'virus'.

Chinese scientists took genetic material from the lung fluid of just a few people and said they had found a 'new' disease when this material had a wide range of content. There was no evidence for a 'virus' for the very reasons explained in the last two chapters. The 'virus' has never been shown to (a) exist and (b) cause any disease. People were diagnosed on symptoms that are so widespread in Wuhan and polluted China and with a PCR test that can't detect infectious disease. On this farce the whole global scam was sold to the rest of the world which would also diagnose respiratory disease as 'Covid-19' from symptoms alone or with a PCR test not testing for a 'virus'. Flu miraculously disappeared *worldwide* in 2020 and into 2021 as it was redesignated 'Covid-19'. It was really the same old flu with its 'flu-like' symptoms attributed to 'flu-like' 'Covid-19'. At the same time with very few exceptions the Chinese response of draconian lockdown and fascism was the chosen weapon to respond across the West as recommended by the Cult-owned Tedros at the Cult-owned World Health Organization run by the Cult-owned Gates. All was going according to plan. Chinese scientists – everything in China is controlled by the Cult-owned government – compared their contaminated RNA lung-fluid material with other RNA sequences and said it appeared to be just under 80 percent identical to the SARS-CoV-1 'virus' claimed to be the cause of the SARS (severe acute respiratory syndrome) 'outbreak' in 2003. They decreed that because of this the 'new virus' had to be related and they called it SARS-CoV-2. There are some serious problems with this assumption and *assumption* was all it was. Most 'factual' science turns out to be assumptions repeated into everyone-knows-that. A match of under 80-percent is meaningless. Dr Kaufman makes the point that there's a 96 percent genetic correlation between humans and chimpanzees, but 'no one would say our genetic material is part

of the chimpanzee family'. Yet the Chinese authorities were claiming that a much lower percentage, less than 80 percent, proved the existence of a new 'coronavirus'. For goodness sake human DNA is 60 percent similar to a *banana*.

You are feeling sleepy

The entire 'Covid' hoax is a global Psyop, a psychological operation to program the human mind into believing and fearing a complete fantasy. A crucial aspect of this was what *appeared* to happen in Italy. It was all very well streaming out daily images of an alleged catastrophe in Wuhan, but to the Western mind it was still on the other side of the world in a very different culture and setting. A reaction of 'this could happen to me and my family' was still nothing like as intense enough for the mind-doctors. The Cult needed a Western example to push people over that edge and it chose Italy, one of its major global locations going back to the Roman Empire. An Italian 'Covid' crisis was manufactured in a particular area called Lombardy which just happens to be notorious for its toxic air and therefore respiratory disease. Wuhan, China, *déjà vu*. An hysterical media told horror stories of Italians dying from 'Covid' in their droves and how Lombardy hospitals were being overrun by a tidal wave of desperately ill people needing treatment after being struck down by the 'deadly virus'. Here was the psychological turning point the Cult had planned. Wow, if this is happening in Italy, the Western mind concluded, this indeed could happen to me and my family. Another point is that Italian authorities responded by following the Chinese blueprint so vehemently recommended by the Cult-owned World Health Organization. They imposed fascistic lockdowns on the whole country viciously policed with the help of surveillance drones sweeping through the streets seeking out anyone who escaped from mass house arrest. Livelihoods were destroyed and psychology unravelled in the way we have witnessed since in all lockdown countries. Crucial to the plan was that Italy responded in this way to set the precedent of suspending freedom and imposing fascism in a 'Western liberal democracy'. I emphasised in an

animated video explanation on davidicke.com posted in the summer of 2020 how important it was to the Cult to expand the Chinese lockdown model across the West. Without this, and the bare-faced lie that non-symptomatic people could still transmit a 'disease' they didn't have, there was no way locking down the whole population, sick and not sick, could be pulled off. At just the right time and with no evidence Cult operatives and gofers claimed that people without symptoms could pass on the 'disease'. In the name of protecting the 'vulnerable' like elderly people, who lockdowns would kill by the tens of thousands, we had for the first time healthy people told to isolate as well as the sick. The great majority of people who tested positive had no symptoms because there was nothing wrong with them. It was just a trick made possible by a test not testing for the 'virus'.

Months after my animated video the Gates-funded Professor Neil Ferguson at the Gates-funded Imperial College confirmed that I was right. He didn't say it in those terms, naturally, but he did say it. Ferguson will enter the story shortly for his outrageously crazy 'computer models' that led to Britain, the United States and many other countries following the Chinese and now Italian methods of response. Put another way, following the Cult script. Ferguson said that SAGE, the UK government's scientific advisory group which has controlled 'Covid' policy from the start, wanted to follow the Chinese lockdown model (while they all continued to work and be paid), but they wondered if they could possibly, in Ferguson's words, 'get away with it in Europe'. 'Get away with it'? Who the hell do these moronic, arrogant people think they are? This appalling man Ferguson said that once Italy went into national lockdown they realised they, too, could mimic China:

It's a communist one-party state, we said. We couldn't get away with it in Europe, we thought ... and then Italy did it. And we realised we could. Behind this garbage from Ferguson is a simple fact: Doing the same as China in every country was the plan from the start and Ferguson's 'models' would play a central role in achieving that. It's just a coincidence, of course, and absolutely nothing to worry your little head about.

Oops, sorry, our mistake

Once the Italian segment of the Psyop had done the job it was designed to do a very different story emerged. Italian authorities revealed that 99 percent of those who had 'died from Covid-19' in Italy had one, two, three, or more 'co-morbidities' or illnesses and health problems that could have ended their life. The US Centers for Disease Control and Prevention (CDC) published a figure of 94 percent for Americans dying of 'Covid' while having other serious medical conditions – on average two to three (some five or six) other potential causes of death. In terms of death from an unproven 'virus' I say it is 100 percent. The other one percent in Italy and six percent in the US would presumably have died from 'Covid's' flu-like symptoms with a range of other possible causes in conjunction with a test not testing for the 'virus'. Fox News reported that even more startling figures had emerged in one US county in which 410 of 422 deaths attributed to 'Covid-19' had other potentially deadly health conditions. The Italian National Health Institute said later that the average age of people dying with a 'Covid-19' diagnosis in Italy was about 81. Ninety percent were over 70 with ten percent over 90. In terms of other reasons to die some 80 percent had two or more chronic diseases with half having three or more including cardiovascular problems, diabetes, respiratory problems and cancer. Why is the phantom 'Covid-19' said to kill overwhelmingly old people and hardly affect the young? Old people continually die of many causes and especially respiratory disease which you can re-diagnose 'Covid-19' while young people die in tiny numbers by comparison and rarely of respiratory disease. Old people 'die of Covid' because they die of other things that can be redesignated 'Covid' and it really is that simple.

Flu has flown

The blueprint was in place. Get your illusory 'cases' from a test not testing for the 'virus' and redesignate other causes of death as 'Covid-19'. You have an instant 'pandemic' from something that is nothing more than a computer-generated fiction. With near-on a

billion people having 'flu-like' symptoms every year the potential was limitless and we can see why flu quickly and apparently miraculously disappeared *worldwide* by being diagnosed 'Covid-19'. The painfully bloody obvious was explained away by the childlike media in headlines like this in the UK '*Independent*': 'Not a single case of flu detected by Public Health England this year as Covid restrictions suppress virus'. I kid you not. The masking, social distancing and house arrest that did not make the 'Covid virus' disappear somehow did so with the 'flu virus'. Even worse the article, by a bloke called Samuel Lovett, suggested that maybe the masking, sanitising and other 'Covid' measures should continue to keep the flu away. With a ridiculousness that disturbs your breathing (it's 'Covid-19') the said Lovett wrote: 'With widespread social distancing and mask-wearing measures in place throughout the UK, the usual routes of transmission for influenza have been blocked.' He had absolutely no evidence to support that statement, but look at the consequences of him acknowledging the obvious. With flu not disappearing at all and only being relabelled 'Covid-19' he would have to contemplate that 'Covid' was a hoax on a scale that is hard to imagine. You need guts and commitment to truth to even go there and that's clearly something Samuel Lovett does not have in abundance. He would never have got it through the editors anyway.

Tens of thousands die in the United States alone every winter from flu including many with pneumonia complications. CDC figures record *45 million* Americans diagnosed with flu in 2017-2018 of which 61,000 died and some reports claim 80,000. Where was the same hysteria then that we have seen with 'Covid-19'? Some 250,000 Americans are admitted to hospital with pneumonia every year with about 50,000 cases proving fatal. About 65 million suffer respiratory disease every year and three million deaths makes this the third biggest cause of death worldwide. You only have to redesignate a portion of all these people 'Covid-19' and you have an instant global pandemic or the *appearance* of one. Why would doctors do this? They are told to do this and all but a few dare not refuse those who must be obeyed. Doctors in general are not researching their own

knowledge and instead take it direct and unquestioned from the authorities that own them and their careers. The authorities say they must now diagnose these symptoms 'Covid-19' and not flu, or whatever, and they do it. Dark suits say put 'Covid-19' on death certificates no matter what the cause of death and the doctors do it. Renegade Minds don't fall for the illusion that doctors and medical staff are all highly-intelligent, highly-principled, seekers of medical truth. *Some are*, but not the majority. They are repeaters, gofers, and yes sir, no sir, purveyors of what the system demands they purvey. The 'Covid' con is not merely confined to diseases of the lungs. Instructions to doctors to put 'Covid-19' on death certificates for anyone dying of *anything* within 28 days (or much more) of a positive test not testing for the 'virus' opened the floodgates. The term dying *with* 'Covid' and not *of* 'Covid' was coined to cover the truth. Whether it was a *with* or an *of* they were all added to the death numbers attributed to the 'deadly virus' compiled by national governments and globally by the Gates-funded Johns Hopkins operation in the United States that was so involved in those 'pandemic' simulations. Fraudulent deaths were added to the ever-growing list of fraudulent 'cases' from false positives from a false test. No wonder Professor Walter Ricciardi, scientific advisor to the Italian minister of health, said after the Lombardy hysteria had done its job that 'Covid' death rates were due to Italy having the second oldest population in the world and to *how hospitals record deaths*:

The way in which we code deaths in our country is very generous in the sense that all the people who die in hospitals with the coronavirus are deemed to be dying of the coronavirus. On re-evaluation by the National Institute of Health, only 12 per cent of death certificates have shown a direct causality from coronavirus, while 88 per cent of patients who have died have at least one pre-morbidity – many had two or three.

This is extraordinary enough when you consider the propaganda campaign to use Italy to terrify the world, but how can they even say twelve percent were genuine when the 'virus' has not been shown to exist, its 'code' is a computer program, and diagnosis comes from a test not testing for it? As in China, and soon the world, 'Covid-19' in

Italy was a redesignation of diagnosis. Lies and corruption were to become the real 'pandemic' fuelled by a pathetically-compliant medical system taking its orders from the tiny few at the top of their national hierarchy who answered to the World Health Organization which answers to Gates and the Cult. Doctors were told – ordered – to diagnose a particular set of symptoms 'Covid-19' and put that on the death certificate for any cause of death if the patient had tested positive with a test not testing for the virus or had 'Covid' symptoms like the flu. The United States even introduced big financial incentives to manipulate the figures with hospitals receiving £4,600 from the Medicare system for diagnosing someone with regular pneumonia, \$13,000 if they made the diagnosis from the same symptoms 'Covid-19' pneumonia, and \$39,000 if they put a 'Covid' diagnosed patient on a ventilator that would almost certainly kill them. A few – painfully and pathetically few – medical whistleblowers revealed (before Cult-owned YouTube deleted their videos) that they had been instructed to 'let the patient crash' and put them straight on a ventilator instead of going through a series of far less intrusive and dangerous methods as they would have done before the pandemic hoax began and the financial incentives kicked in. We are talking cold-blooded murder given that ventilators are so damaging to respiratory systems they are usually the last step before heaven awaits. Renegade Minds never fall for the belief that people in white coats are all angels of mercy and cannot be full-on psychopaths. I have explained in detail in *The Answer* how what I am describing here played out across the world coordinated by the World Health Organization through the medical hierarchies in almost every country.

Medical scientist calls it

Information about the non-existence of the 'virus' began to emerge for me in late March, 2020, and mushroomed after that. I was sent an email by Sir Julian Rose, a writer, researcher, and organic farming promotor, from a medical scientist friend of his in the United States. Even at that early stage in March the scientist was able to explain

how the 'Covid' hoax was being manipulated. He said there were no reliable tests for a specific 'Covid-19 virus' and nor were there any reliable agencies or media outlets for reporting numbers of actual 'Covid-19' cases. We have seen in the long period since then that he was absolutely right. 'Every action and reaction to Covid-19 is based on totally flawed data and we simply cannot make accurate assessments,' he said. Most people diagnosed with 'Covid-19' were showing nothing more than cold and flu-like symptoms 'because most coronavirus strains *are* nothing more than cold/flu-like symptoms'. We had farcical situations like an 84-year-old German man testing positive for 'Covid-19' and his nursing home ordered to quarantine only for him to be found to have a common cold. The scientist described back then why PCR tests and what he called the 'Mickey Mouse test kits' were useless for what they were claimed to be identifying. 'The idea these kits can isolate a specific virus like Covid-19 is nonsense,' he said. Significantly, he pointed out that 'if you want to create a totally false panic about a totally false pandemic – pick a coronavirus'. This is exactly what the Cult-owned Gates, World Economic Forum and Johns Hopkins University did with their Event 201 'simulation' followed by their real-life simulation called the 'pandemic'. The scientist said that all you had to do was select the sickest of people with respiratory-type diseases in a single location – 'say Wuhan' – and administer PCR tests to them. You can then claim that anyone showing 'viral sequences' similar to a coronavirus 'which will inevitably be quite a few' is suffering from a 'new' disease:

Since you already selected the sickest flu cases a fairly high proportion of your sample will go on to die. You can then say this 'new' virus has a CFR [case fatality rate] higher than the flu and use this to infuse more concern and do more tests which will of course produce more 'cases', which expands the testing, which produces yet more 'cases' and so on and so on. Before long you have your 'pandemic', and all you have done is use a simple test kit trick to convert the worst flu and pneumonia cases into something new that doesn't ACTUALLY EXIST [my emphasis].

He said that you then 'just run the same scam in other countries' and make sure to keep the fear message running high 'so that people

will feel panicky and less able to think critically'. The only problem to overcome was the fact *there is no* actual new deadly pathogen and only regular sick people. This meant that deaths from the 'new deadly pathogen' were going to be way too low for a real new deadly virus pandemic, but he said this could be overcome in the following ways – all of which would go on to happen:

1. You can claim this is just the beginning and more deaths are imminent [you underpin this with fantasy 'computer projections']. Use this as an excuse to quarantine everyone and then claim the quarantine prevented the expected millions of dead.
2. You can [say that people] 'minimizing' the dangers are irresponsible and bully them into not talking about numbers.
3. You can talk crap about made up numbers hoping to blind people with pseudoscience.
4. You can start testing well people (who, of course, will also likely have shreds of coronavirus [RNA] in them) and thus inflate your 'case figures' with 'asymptomatic carriers' (you will of course have to spin that to sound deadly even though any virologist knows the more symptom-less cases you have the less deadly is your pathogen).

The scientist said that if you take these simple steps 'you can have your own entirely manufactured pandemic up and running in weeks'. His analysis made so early in the hoax was brilliantly prophetic of what would actually unfold. Pulling all the information together in these recent chapters we have this is simple 1, 2, 3, of how you can delude virtually the entire human population into believing in a 'virus' that doesn't exist:

- A 'Covid case' is someone who tests positive with a test not testing for the 'virus'.
- A 'Covid death' is someone who dies of *any cause* within 28 days (or much longer) of testing positive with a test not testing for the 'virus'.
- Asymptomatic means there is nothing wrong with you, but they claim you can pass on what you don't have to justify locking

down (quarantining) healthy people in totality.

The foundations of the hoax are that simple. A study involving ten million people in Wuhan, published in November, 2020, demolished the whole lie about those without symptoms passing on the 'virus'. They found '300 asymptomatic cases' and traced their contacts to find that not one of them was detected with the 'virus'.

'Asymptomatic' patients and their contacts were isolated for no less than two weeks and nothing changed. I know it's all crap, but if you are going to claim that those without symptoms can transmit 'the virus' then you must produce evidence for that and they never have. Even World Health Organization official Dr Maria Van Kerkhove, head of the emerging diseases and zoonosis unit, said as early as June, 2020, that she doubted the validity of asymptomatic transmission. She said that 'from the data we have, it still seems to be rare that an asymptomatic person actually transmits onward to a secondary individual' and by 'rare' she meant that she couldn't cite any case of asymptomatic transmission.

The Ferguson factor

The problem for the Cult as it headed into March, 2020, when the script had lockdown due to start, was that despite all the manipulation of the case and death figures they still did not have enough people alleged to have died from 'Covid' to justify mass house arrest. This was overcome in the way the scientist described: 'You can claim this is just the beginning and more deaths are imminent ... Use this as an excuse to quarantine everyone and then claim the quarantine prevented the expected millions of dead.' Enter one Professor Neil Ferguson, the Gates-funded 'epidemiologist' at the Gates-funded Imperial College in London. Ferguson is Britain's Christian Drosten in that he has a dire record of predicting health outcomes, but is still called upon to advise government on the next health outcome when another 'crisis' comes along. This may seem to be a strange and ridiculous thing to do. Why would you keep turning for policy guidance to people who have a history of being

monumentally wrong? Ah, but it makes sense from the Cult point of view. These 'experts' keep on producing predictions that suit the Cult agenda for societal transformation and so it was with Neil Ferguson as he revealed his horrific (and clearly insane) computer model predictions that allowed lockdowns to be imposed in Britain, the United States and many other countries. Ferguson does not have even an A-level in biology and would appear to have no formal training in computer modelling, medicine or epidemiology, according to Derek Winton, an MSc in Computational Intelligence. He wrote an article somewhat aghast at what Ferguson did which included taking no account of respiratory disease 'seasonality' which means it is far worse in the winter months. Who would have thought that respiratory disease could be worse in the winter? Well, certainly not Ferguson.

The massively China-connected Imperial College and its bizarre professor provided the excuse for the long-incubated Chinese model of human control to travel westward at lightning speed. Imperial College confirms on its website that it collaborates with the Chinese Research Institute; publishes more than 600 research papers every year with Chinese research institutions; has 225 Chinese staff; 2,600 Chinese students – the biggest international group; 7,000 former students living in China which is the largest group outside the UK; and was selected for a tour by China's President Xi Jinping during his state visit to the UK in 2015. The college takes major donations from China and describes itself as the UK's number one university collaborator with Chinese research institutions. The China communist/fascist government did not appear phased by the woeful predictions of Ferguson and Imperial when during the lockdown that Ferguson induced the college signed a five-year collaboration deal with China tech giant Huawei that will have Huawei's indoor 5G network equipment installed at the college's West London tech campus along with an 'AI cloud platform'. The deal includes Chinese sponsorship of Imperial's Venture Catalyst entrepreneurship competition. Imperial is an example of the enormous influence the Chinese government has within British and North American

universities and research centres – and further afield. Up to 200 academics from more than a dozen UK universities are being investigated on suspicion of ‘unintentionally’ helping the Chinese government build weapons of mass destruction by ‘transferring world-leading research in advanced military technology such as aircraft, missile designs and cyberweapons’. Similar scandals have broken in the United States, but it’s all a coincidence. Imperial College serves the agenda in many other ways including the promotion of every aspect of the United Nations Agenda 21/2030 (the Great Reset) and produced computer models to show that human-caused ‘climate change’ is happening when in the real world it isn’t. Imperial College is driving the climate agenda as it drives the ‘Covid’ agenda (both Cult hoaxes) while Patrick Vallance, the UK government’s Chief Scientific Adviser on ‘Covid’, was named Chief Scientific Adviser to the UN ‘climate change’ conference known as COP26 hosted by the government in Glasgow, Scotland. ‘Covid’ and ‘climate’ are fundamentally connected.

Professor Woeful

From Imperial’s bosom came Neil Ferguson still advising government despite his previous disasters and it was announced early on that he and other key people like UK Chief Medical Adviser Chris Whitty had caught the ‘virus’ as the propaganda story was being sold. Somehow they managed to survive and we had Prime Minister Boris Johnson admitted to hospital with what was said to be a severe version of the ‘virus’ in this same period. His whole policy and demeanour changed when he returned to Downing Street. It’s a small world with these government advisors – especially in their communal connections to Gates – and Ferguson had partnered with Whitty to write a paper called ‘Infectious disease: Tough choices to reduce Ebola transmission’ which involved another scare-story that didn’t happen. Ferguson’s ‘models’ predicted that up to 150,000 could die from ‘mad cow disease’, or BSE, and its version in sheep if it was transmitted to humans. BSE was not transmitted and instead triggered by an organophosphate pesticide used to treat a pest on

cows. Fewer than 200 deaths followed from the human form. Models by Ferguson and his fellow incompetents led to the unnecessary culling of millions of pigs, cattle and sheep in the foot and mouth outbreak in 2001 which destroyed the lives and livelihoods of farmers and their families who had often spent decades building their herds and flocks. Vast numbers of these animals did not have foot and mouth and had no contact with the infection. Another 'expert' behind the cull was Professor Roy Anderson, a computer modeller at Imperial College specialising in the epidemiology of *human*, not animal, disease. Anderson has served on the Bill and Melinda Gates Grand Challenges in Global Health advisory board and chairs another Gates-funded organisation. Gates is everywhere.

In a precursor to the 'Covid' script Ferguson backed closing schools 'for prolonged periods' over the swine flu 'pandemic' in 2009 and said it would affect a third of the world population if it continued to spread at the speed he claimed to be happening. His mates at Imperial College said much the same and a news report said: 'One of the authors, the epidemiologist and disease modeller Neil Ferguson, who sits on the World Health Organisation's emergency committee for the outbreak, said the virus had "full pandemic potential".' Professor Liam Donaldson, the Chris Whitty of his day as Chief Medical Officer, said the worst case could see 30 percent of the British people infected by swine flu with 65,000 dying. Ferguson and Donaldson were indeed proved correct when at the end of the year the number of deaths attributed to swine flu was 392. The term 'expert' is rather liberally applied unfortunately, not least to complete idiots. Swine flu 'projections' were great for GlaxoSmithKline (GSK) as millions rolled in for its Pandemrix influenza vaccine which led to brain damage with children most affected. The British government (taxpayers) paid out more than £60 million in compensation after GSK was given immunity from prosecution. Yet another 'Covid' déjà vu. Swine flu was supposed to have broken out in Mexico, but Dr Wolfgang Wodarg, a German doctor, former member of parliament and critic of the 'Covid' hoax, observed 'the spread of swine flu' in Mexico City at the time. He

said: 'What we experienced in Mexico City was a very mild flu which did not kill more than usual – which killed even fewer people than usual.' Hyping the fear against all the facts is not unique to 'Covid' and has happened many times before. Ferguson is reported to have over-estimated the projected death toll of bird flu (H5N1) by some three million-fold, but bird flu vaccine makers again made a killing from the scare. This is some of the background to the Neil Ferguson who produced the perfectly-timed computer models in early 2020 predicting that half a million people would die in Britain without draconian lockdown and 2.2 million in the United States. Politicians panicked, people panicked, and lockdowns of alleged short duration were instigated to 'flatten the curve' of cases gleaned from a test not testing for the 'virus'. I said at the time that the public could forget the 'short duration' bit. This was an agenda to destroy the livelihoods of the population and force them into mass control through dependency and there was going to be nothing 'short' about it. American researcher Daniel Horowitz described the consequences of the 'models' spewed out by Gates-funded Ferguson and Imperial College:

What led our government and the governments of many other countries into panic was a single Imperial College of UK study, funded by global warming activists, that predicted 2.2 million deaths if we didn't lock down the country. In addition, the reported 8-9% death rate in Italy scared us into thinking there was some other mutation of this virus that they got, which might have come here.

Together with the fact that we were finally testing and had the ability to actually report new cases, we thought we were headed for a death spiral. But again ... we can't flatten a curve if we don't know when the curve started.

How about it *never* started?

Giving them what they want

An investigation by German news outlet *Welt Am Sonntag* (*World on Sunday*) revealed how in March, 2020, the German government gathered together 'leading scientists from several research institutes and universities' and 'together, they were to produce a [modelling]

paper that would serve as legitimization for further tough political measures'. The Cult agenda was justified by computer modelling not based on evidence or reality; it was specifically constructed to justify the Cult demand for lockdowns all over the world to destroy the independent livelihoods of the global population. All these modellers and everyone responsible for the 'Covid' hoax have a date with a trial like those in Nuremberg after World War Two when Nazis faced the consequences of their war crimes. These corrupt-beyond-belief 'modellers' wrote the paper according to government instructions and it said that if lockdown measures were lifted then up to one million Germans would die from 'Covid-19' adding that some would die 'agonizingly at home, gasping for breath' unable to be treated by hospitals that couldn't cope. All lies. No matter – it gave the Cult all that it wanted. What did long-time government 'modeller' Neil Ferguson say? If the UK and the United States didn't lockdown half a million would die in Britain and 2.2 million Americans. Anyone see a theme here? 'Modellers' are such a crucial part of the lockdown strategy that we should look into their background and follow the money. Researcher Rosemary Frei produced an excellent article headlined 'The Modelling-paper Mafiosi'. She highlights a guy called John Edmunds, a British epidemiologist, and professor in the Faculty of Epidemiology and Population Health at the London School of Hygiene & Tropical Medicine. He studied at Imperial College. Edmunds is a member of government 'Covid' advisory bodies which have been dictating policy, the New and Emerging Respiratory Virus Threats Advisory Group (NERVTAG) and the Scientific Advisory Group for Emergencies (SAGE).

Ferguson, another member of NERVTAG and SAGE, led the way with the original 'virus' and Edmunds has followed in the 'variant' stage and especially the so-called UK or Kent variant known as the 'Variant of Concern' (VOC) B.1.1.7. He said in a co-written report for the Centre for Mathematical modelling of Infectious Diseases at the London School of Hygiene and Tropical Medicine, with input from the Centre's 'Covid-19' Working Group, that there was 'a realistic

possibility that VOC B.1.1.7 is associated with an increased risk of death compared to non-VOC viruses'. Fear, fear, fear, get the vaccine, fear, fear, fear, get the vaccine. Rosemary Frei reveals that almost all the paper's authors and members of the modelling centre's 'Covid-19' Working Group receive funding from the Bill and Melinda Gates Foundation and/or the associated Gates-funded Wellcome Trust. The paper was published by e-journal *Medrx* ^{xiv} which only publishes papers not peer-reviewed and the journal was established by an organisation headed by Facebook's Mark Zuckerberg and his missus. What a small world it is. Frei discovered that Edmunds is on the Scientific Advisory Board of the Coalition for Epidemic Preparedness Innovations (CEPI) which was established by the Bill and Melinda Gates Foundation, Klaus Schwab's Davos World Economic Forum and Big Pharma giant Wellcome. CEPI was 'launched in Davos [in 2017] to develop vaccines to stop future epidemics', according to its website. 'Our mission is to accelerate the development of vaccines against emerging infectious diseases and enable equitable access to these vaccines for people during outbreaks.' What kind people they are. Rosemary Frei reveals that Public Health England (PHE) director Susan Hopkins is an author of her organisation's non-peer-reviewed reports on 'new variants'. Hopkins is a professor of infectious diseases at London's Imperial College which is gifted tens of millions of dollars a year by the Bill and Melinda Gates Foundation. Gates-funded modelling disaster Neil Ferguson also co-authors Public Health England reports and he spoke in December, 2020, about the potential danger of the B.1.1.7. 'UK variant' promoted by Gates-funded modeller John Edmunds. When I come to the 'Covid vaccines' the 'new variants' will be shown for what they are – bollocks.

Connections, connections

All these people and modellers are lockdown-obsessed or, put another way, they demand what the Cult demands. Edmunds said in January, 2021, that to ease lockdowns too soon would be a disaster and they had to 'vaccinate much, much, much more widely than the

elderly'. Rosemary Frei highlights that Edmunds is married to Jeanne Pimenta who is described in a LinkedIn profile as director of epidemiology at GlaxoSmithKline (GSK) and she held shares in the company. Patrick Vallance, co-chair of SAGE and the government's Chief Scientific Adviser, is a former executive of GSK and has a deferred bonus of shares in the company worth £600,000. GSK has serious business connections with Bill Gates and is collaborating with mRNA-'vaccine' company CureVac to make 'vaccines' for the new variants that Edmunds is talking about. GSK is planning a 'Covid vaccine' with drug giant Sanofi. Puppets Prime Minister Boris Johnson announced in the spring of 2021 that up to 60 million vaccine doses were to be made at the GSK facility at Barnard Castle in the English North East. Barnard Castle, with a population of just 6,000, was famously visited in breach of lockdown rules in April, 2020, by Johnson aide Dominic Cummings who said that he drove there 'to test his eyesight' before driving back to London. Cummings would be better advised to test his integrity – not that it would take long. The GSK facility had nothing to do with his visit then although I'm sure Patrick Vallance would have been happy to arrange an introduction and some tea and biscuits. Ruthless psychopath Gates has made yet another fortune from vaccines in collaboration with Big Pharma companies and gushes at the phenomenal profits to be made from vaccines – more than a 20-to-1 return as he told one interviewer. Gates also tweeted in December, 2019, with the foreknowledge of what was coming: 'What's next for our foundation? I'm particularly excited about what the next year could mean for one of the best buys in global health: vaccines.'

Modeller John Edmunds is a big promotor of vaccines as all these people appear to be. He's the dean of the London School of Hygiene & Tropical Medicine's Faculty of Epidemiology and Population Health which is primarily funded by the Bill and Melinda Gates Foundation and the Gates-established and funded GAVI vaccine alliance which is the Gates vehicle to vaccinate the world. The organisation Doctors Without Borders has described GAVI as being 'aimed more at supporting drug-industry desires to promote new

products than at finding the most efficient and sustainable means for fighting the diseases of poverty'. But then that's why the psychopath Gates created it. John Edmunds said in a video that the London School of Hygiene & Tropical Medicine is involved in every aspect of vaccine development including large-scale clinical trials. He contends that mathematical modelling can show that vaccines protect individuals and society. That's on the basis of shit in and shit out, I take it. Edmunds serves on the UK Vaccine Network as does Ferguson and the government's foremost 'Covid' adviser, the grim-faced, dark-eyed Chris Whitty. The Vaccine Network says it works 'to support the government to identify and shortlist targeted investment opportunities for the most promising vaccines and vaccine technologies that will help combat infectious diseases with epidemic potential, and to address structural issues related to the UK's broader vaccine infrastructure'. Ferguson is acting Director of the Imperial College Vaccine Impact Modelling Consortium which has funding from the Bill and Melina Gates Foundation and the Gates-created GAVI 'vaccine alliance'. Anyone wonder why these characters see vaccines as the answer to every problem? Ferguson is wildly enthusiastic in his support for GAVI's campaign to vaccinate children en masse in poor countries. You would expect someone like Gates who has constantly talked about the need to reduce the population to want to fund vaccines to keep more people alive. I'm sure that's why he does it. The John Edmunds London School of Hygiene & Tropical Medicine (LSHTM) has a Vaccines Manufacturing Innovation Centre which develops, tests and commercialises vaccines. Rosemary Frei writes:

The vaccines centre also performs affiliated activities like combating 'vaccine hesitancy'. The latter includes the Vaccine Confidence Project. The project's stated purpose is, among other things, 'to provide analysis and guidance for early response and engagement with the public to ensure sustained confidence in vaccines and immunisation'. The Vaccine Confidence Project's director is LSHTM professor Heidi Larson. For more than a decade she's been researching how to combat vaccine hesitancy.

How the bloody hell can blokes like John Edmunds and Neil Ferguson with those connections and financial ties model 'virus' case

and death projections for the government and especially in a way that gives their paymasters like Gates exactly what they want? It's insane, but this is what you find throughout the world.

'Covid' is not dangerous, oops, wait, yes it is

Only days before Ferguson's nightmare scenario made Jackboot Johnson take Britain into a China-style lockdown to save us from a deadly 'virus' the UK government website gov.uk was reporting something very different to Ferguson on a page of official government guidance for 'high consequence infectious diseases (HCID)'. It said this about 'Covid-19':

As of 19 March 2020, COVID-19 is no longer considered to be a high consequence infectious diseases (HCID) in the UK [my emphasis]. The 4 nations public health HCID group made an interim recommendation in January 2020 to classify COVID-19 as an HCID. This was based on consideration of the UK HCID criteria about the virus and the disease with information available during the early stages of the outbreak.

Now that more is known about COVID-19, the public health bodies in the UK have reviewed the most up to date information about COVID-19 against the UK HCID criteria. They have determined that several features have now changed; in particular, more information is available about mortality rates (low overall), and there is now greater clinical awareness and a specific and sensitive laboratory test, the availability of which continues to increase. The Advisory Committee on Dangerous Pathogens (ACDP) is also of the opinion that COVID-19 should no longer be classified as an HCID.

Soon after the government had been exposed for downgrading the risk they upgraded it again and everyone was back to singing from the same Cult hymn book. Ferguson and his fellow Gates clones indicated that lockdowns and restrictions would have to continue until a Gates-funded vaccine was developed. Gates said the same because Ferguson and his like were repeating the Gates script which is the Cult script. 'Flatten the curve' became an ongoing nightmare of continuing lockdowns with periods in between of severe restrictions in pursuit of destroying independent incomes and had nothing to do with protecting health about which the Cult gives not a shit. Why wouldn't Ferguson be pushing a vaccine 'solution' when he's owned by vaccine-obsessive Gates who makes a fortune from them and

when Ferguson heads the Vaccine Impact Modelling Consortium at Imperial College funded by the Gates Foundation and GAVI, the 'vaccine alliance', created by Gates as his personal vaccine promotion operation? To compound the human catastrophe that Ferguson's 'models' did so much to create he was later exposed for breaking his own lockdown rules by having sexual liaisons with his married girlfriend Antonia Staats at his home while she was living at another location with her husband and children. Staats was a 'climate' activist and senior campaigner at the Soros-funded Avaaz which I wouldn't trust to tell me that grass is green. Ferguson had to resign as a government advisor over this hypocrisy in May, 2020, but after a period of quiet he was back being quoted by the ridiculous media on the need for more lockdowns and a vaccine rollout. Other government-advising 'scientists' from Imperial College held the fort in his absence and said lockdown could be indefinite until a vaccine was found. The Cult script was being sung by the payrolled choir. I said there was no intention of going back to 'normal' when the 'vaccine' came because the 'vaccine' is part of a very different agenda that I will discuss in Human 2.0. Why would the Cult want to let the world go back to normal when destroying that normal forever was the whole point of what was happening? House arrest, closing businesses and schools through lockdown, (un)social distancing and masks all followed the Ferguson fantasy models. Again as I predicted (these people are so predictable) when the 'vaccine' arrived we were told that house arrest, lockdown, (un)social distancing and masks would still have to continue. I will deal with the masks in the next chapter because they are of fundamental importance.

Where's the 'pandemic'?

Any mildly in-depth assessment of the figures revealed what was really going on. Cult-funded and controlled organisations still have genuine people working within them such is the number involved. So it is with Genevieve Briand, assistant program director of the Applied Economics master's degree program at Johns Hopkins

University. She analysed the impact that 'Covid-19' had on deaths from *all* causes in the United States using official data from the CDC for the period from early February to early September, 2020. She found that allegedly 'Covid' *related*-deaths exceeded those from heart disease which she found strange with heart disease always the biggest cause of fatalities. Her research became even more significant when she noted the sudden decline in 2020 of *all* non-'Covid' deaths: 'This trend is completely contrary to the pattern observed in all previous years ... the total decrease in deaths by other causes almost exactly equals the increase in deaths by Covid-19.' This was such a game, set and match in terms of what was happening that Johns Hopkins University deleted the article on the grounds that it 'was being used to support false and dangerous inaccuracies about the impact of the pandemic'. No – because it exposed the scam from official CDC figures and this was confirmed when those figures were published in January, 2021. Here we can see the effect of people dying from heart attacks, cancer, road accidents and gunshot wounds – *anything* – having 'Covid-19' on the death certificate along with those diagnosed from 'symptoms' who had even not tested positive with a test not testing for the 'virus'. I am not kidding with the gunshot wounds, by the way. Brenda Bock, coroner in Grand County, Colorado, revealed that two gunshot victims tested positive for the 'virus' within the previous 30 days and were therefore classified as 'Covid deaths'. Bock said: 'These two people had tested positive for Covid, but that's not what killed them. A gunshot wound is what killed them.' She said she had not even finished her investigation when the state listed the gunshot victims as deaths due to the 'virus'. The death and case figures for 'Covid-19' are an absolute joke and yet they are repeated like parrots by the media, politicians and alleged medical 'experts'. The official Cult narrative is the only show in town.

Genevieve Briand found that deaths from all causes were not exceptional in 2020 compared with previous years and a Spanish magazine published figures that said the same about Spain which was a 'Covid' propaganda hotspot at one point. *Discovery Salud*, a

health and medicine magazine, quoted government figures which showed how 17,000 *fewer* people died in Spain in 2020 than in 2019 and more than 26,000 fewer than in 2018. The age-standardised mortality rate for England and Wales when age distribution is taken into account was significantly lower in 2020 than the 1970s, 80s and 90s, and was only the ninth highest since 2000. Where is the 'pandemic'?

Post mortems and autopsies virtually disappeared for 'Covid' deaths amid claims that 'virus-infected' bodily fluids posed a risk to those carrying out the autopsy. This was rejected by renowned German pathologist and forensic doctor Klaus Püschel who said that he and his staff had by then done 150 autopsies on 'Covid' patients with no problems at all. He said they were needed to know why some 'Covid' patients suffered blood clots and not severe respiratory infections. The 'virus' is, after all, called SARS or 'severe acute respiratory syndrome'. I highlighted in the spring of 2020 this phenomenon and quoted New York intensive care doctor Cameron Kyle-Sidell who posted a soon deleted YouTube video to say that they had been told to prepare to treat an infectious disease called 'Covid-19', but that was not what they were dealing with. Instead he likened the lung condition of the most severely ill patients to what you would expect with cabin depressurisation in a plane at 30,000 feet or someone dropped on the top of Everest without oxygen or acclimatisation. I have never said this is not happening to a small minority of alleged 'Covid' patients – I am saying this is not caused by a phantom 'contagious virus'. Indeed Kyle-Sidell said that 'Covid-19' was not the disease they were told was coming their way. 'We are operating under a medical paradigm that is untrue,' he said, and he believed they were treating the wrong disease: 'These people are being slowly starved of oxygen.' Patients would take off their oxygen masks in a state of fear and stress and while they were blue in the face on the brink of death. They did not look like patients dying of pneumonia. You can see why they don't want autopsies when their virus doesn't exist and there is another condition in some people that they don't wish to be uncovered. I should add here that

the 5G system of millimetre waves was being rapidly introduced around the world in 2020 and even more so now as they fire 5G at the Earth from satellites. At 60 gigahertz within the 5G range that frequency interacts with the oxygen molecule and stops people breathing in sufficient oxygen to be absorbed into the bloodstream. They are installing 5G in schools and hospitals. The world is not mad or anything. 5G can cause major changes to the lungs and blood as I detail in *The Answer* and these consequences are labelled 'Covid-19', the alleged symptoms of which can be caused by 5G and other electromagnetic frequencies as cells respond to radiation poisoning.

The 'Covid death' scam

Dr Scott Jensen, a Minnesota state senator and medical doctor, exposed 'Covid' Medicare payment incentives to hospitals and death certificate manipulation. He said he was sent a seven-page document by the US Department of Health 'coaching' him on how to fill out death certificates which had never happened before. The document said that he didn't need to have a laboratory test for 'Covid-19' to put that on the death certificate and that shocked him when death certificates are supposed to be about facts. Jensen described how doctors had been 'encouraged, if not pressured' to make a diagnosis of 'Covid-19' if they thought it was probable or '*presumed*'. No positive test was necessary – not that this would have mattered anyway. He said doctors were told to diagnose 'Covid' by symptoms when these were the same as colds, allergies, other respiratory problems, and certainly with influenza which 'disappeared' in the 'Covid' era. A common sniffle was enough to get the dreaded verdict. Ontario authorities decreed that a single care home resident with *one* symptom from a long list must lead to the isolation of the entire home. Other courageous doctors like Jensen made the same point about death figure manipulation and how deaths by other causes were falling while 'Covid-19 deaths' were rising at the same rate due to re-diagnosis. Their videos rarely survive long on YouTube with its Cult-supporting algorithms courtesy of CEO Susan Wojcicki and her bosses at Google. Figure-tampering was so glaring

and ubiquitous that even officials were letting it slip or outright saying it. UK chief scientific adviser Patrick Vallance said on one occasion that 'Covid' on the death certificate doesn't mean 'Covid' was the cause of death (so why the hell is it there?) and we had the rare sight of a BBC reporter telling the truth when she said: 'Someone could be successfully treated for Covid, in say April, discharged, and then in June, get run over by a bus and die ... That person would still be counted as a Covid death in England.' Yet the BBC and the rest of the world media went on repeating the case and death figures as if they were real. Illinois Public Health Director Dr Ngozi Ezike revealed the deceit while her bosses must have been clenching their buttocks:

If you were in a hospice and given a few weeks to live and you were then found to have Covid that would be counted as a Covid death. [There might be] a clear alternate cause, but it is still listed as a Covid death. So everyone listed as a Covid death doesn't mean that was the cause of the death, but that they had Covid at the time of death.

Yes, a 'Covid virus' never shown to exist and tested for with a test not testing for the 'virus'. In the first period of the pandemic hoax through the spring of 2020 the process began of designating almost everything a 'Covid' death and this has continued ever since. I sat in a restaurant one night listening to a loud conversation on the next table where a family was discussing in bewilderment how a relative who had no symptoms of 'Covid', and had died of a long-term problem, could have been diagnosed a death by the 'virus'. I could understand their bewilderment. If they read this book they will know why this medical fraud has been perpetrated the world over.

Some media truth shock

The media ignored the evidence of death certificate fraud until eventually one columnist did speak out when she saw it first-hand. Bel Mooney is a long-time national newspaper journalist in Britain currently working for the *Daily Mail*. Her article on February 19th, 2021, carried this headline: 'My dad Ted passed three Covid tests

and died of a chronic illness yet he's officially one of Britain's 120,000 victims of the virus and is far from alone ... so how many more are there?' She told how her 99-year-old father was in a care home with a long-standing chronic obstructive pulmonary disease and vascular dementia. Maybe, but he was still aware enough to tell her from the start that there was no 'virus' and he refused the 'vaccine' for that reason. His death was not unexpected given his chronic health problems and Mooney said she was shocked to find that 'Covid-19' was declared the cause of death on his death certificate. She said this was a 'bizarre and unacceptable untruth' for a man with long-time health problems who had tested negative twice at the home for the 'virus'. I was also shocked by this story although not by what she said. I had been highlighting the death certificate manipulation for ten months. It was the confirmation that a professional full-time journalist only realised this was going on when it affected her directly and neither did she know that whether her dad tested positive or negative was irrelevant with the test not testing for the 'virus'. Where had she been? She said she did not believe in 'conspiracy theories' without knowing I'm sure that this and 'conspiracy theorists' were terms put into widespread circulation by the CIA in the 1960s to discredit those who did not accept the ridiculous official story of the Kennedy assassination. A blanket statement of 'I don't believe in conspiracy theories' is always bizarre. The dictionary definition of the term alone means the world is drowning in conspiracies. What she said was even more daft when her dad had just been affected by the 'Covid' conspiracy. Why else does she think that 'Covid-19' was going on the death certificates of people who died of something else?

To be fair once she saw from personal experience what was happening she didn't mince words. Mooney was called by the care home on the morning of February 9th to be told her father had died in his sleep. When she asked for the official cause of death what came back was 'Covid-19'. Mooney challenged this and was told there had been deaths from Covid on the dementia floor (confirmed by a test not testing for the 'virus') so they considered it 'reasonable

to assume'. 'But doctor,' Mooney rightly protested, 'an assumption isn't a diagnosis.' She said she didn't blame the perfectly decent and sympathetic doctor – 'he was just doing his job'. Sorry, but that's *bullshit*. He wasn't doing his job at all. He was putting a false cause of death on the death certificate and that is a criminal offence for which he should be brought to account and the same with the millions of doctors worldwide who have done the same. They were not doing their job they were following orders and that must not wash at new Nuremberg trials any more than it did at the first ones. Mooney's doctor was 'assuming' (presuming) as he was told to, but 'just following orders' makes no difference to his actions. A doctor's job is to serve the patient and the truth, not follow orders, but that's what they have done all over the world and played a central part in making the 'Covid' hoax possible with all its catastrophic consequences for humanity. Shame on them and they must answer for their actions. Mooney said her disquiet worsened when she registered her father's death by telephone and was told by the registrar there had been very many other cases like hers where 'the deceased' had not tested positive for 'Covid' yet it was recorded as the cause of death. The test may not matter, but those involved at their level *think* it matters and it shows a callous disregard for accurate diagnosis. The pressure to do this is coming from the top of the national 'health' pyramids which in turn obey the World Health Organization which obeys Gates and the Cult. Mooney said the registrar agreed that this must distort the national figures adding that 'the strangest thing is that every winter we record countless deaths from flu, and this winter there have been none. Not one!' She asked if the registrar thought deaths from flu were being misdiagnosed and lumped together with 'Covid' deaths. The answer was a 'puzzled yes'. Mooney said that the funeral director said the same about 'Covid' deaths which had nothing to do with 'Covid'. They had lost count of the number of families upset by this and other funeral companies in different countries have had the same experience. Mooney wrote:

The nightly shroud-waving and shocking close-ups of pain imposed on us by the TV news bewildered and terrified the population into eager compliance with lockdowns. We were invited to 'save the NHS' and to grieve for strangers – the real-life loved ones behind those shocking death counts. Why would the public imagine what I now fear, namely that the way Covid-19 death statistics are compiled might make the numbers seem greater than they are?

Oh, just a little bit – like 100 percent.

Do the maths

Mooney asked why a country would wish to skew its mortality figures by wrongly certifying deaths? What had been going on? Well, if you don't believe in conspiracies you will never find the answer which is that *it's a conspiracy*. She did, however, describe what she had discovered as a 'national scandal'. In reality it's a global scandal and happening everywhere. Pillars of this conspiracy were all put into place before the button was pressed with the Drosten PCR protocol and high amplifications to produce the cases and death certificate changes to secure illusory 'Covid' deaths. Mooney notes that normally two doctors were needed to certify a death, with one having to know the patient, and how the rules were changed in the spring of 2020 to allow one doctor to do this. In the same period 'Covid deaths' were decreed to be all cases where Covid-19 was put on the death certificate even without a positive test or any symptoms. Mooney asked: 'How many of the 30,851 (as of January 15) care home resident deaths with Covid-19 on the certificate (32.4 per cent of all deaths so far) were based on an assumption, like that of my father? And what has that done to our national psyche?' All of them is the answer to the first question and it has devastated and dismantled the national psyche, actually the global psyche, on a colossal scale. In the UK case and death data is compiled by organisations like Public Health England (PHE) and the Office for National Statistics (ONS). Mooney highlights the insane policy of counting a death from any cause as 'Covid-19' if this happens within 28 days of a positive test (with a test not testing for the 'virus') and she points out that ONS statistics reflect deaths 'involving Covid' 'or due to Covid' which meant in practice any

death where 'Covid-19' was mentioned on the death certificate. She described the consequences of this fraud:

Most people will accept the narrative they are fed, so panicky governments here and in Europe witnessed the harsh measures enacted in totalitarian China and jumped into lockdown. Headlines about Covid deaths tolled like the knell that would bring doomsday to us all. Fear stalked our empty streets. Politicians parroted the frankly ridiculous aim of 'zero Covid' and shut down the economy, while most British people agreed that lockdown was essential and (astonishingly to me, as a patriotic Brit) even wanted more restrictions.

For what? Lies on death certificates? Never mind the grim toll of lives ruined, suicides, schools closed, rising inequality, depression, cancelled hospital treatments, cancer patients in a torture of waiting, poverty, economic devastation, loneliness, families kept apart, and so on. How many lives have been lost as a direct result of lockdown?

She said that we could join in a national chorus of shock and horror at reaching the 120,000 death toll which was surely certain to have been totally skewed all along, but what about the human cost of lockdown justified by these 'death figures'? *The British Medical Journal* had reported a 1,493 percent increase in cases of children taken to Great Ormond Street Hospital with abusive head injuries alone and then there was the effect on families:

Perhaps the most shocking thing about all this is that families have been kept apart – and obeyed the most irrational, changing rules at the whim of government – because they believed in the statistics. They succumbed to fear, which his generation rejected in that war fought for freedom. Dad (God rest his soul) would be angry. And so am I.

Another theme to watch is that in the winter months when there are more deaths from all causes they focus on 'Covid' deaths and in the summer when the British Lung Foundation says respiratory disease plummets by 80 percent they rage on about 'cases'. Either way fascism on population is always the answer.

Nazi eugenics in the 21st century

Elderly people in care homes have been isolated from their families month after lonely month with no contact with relatives and grandchildren who were banned from seeing them. We were told

that lockdown fascism was to 'protect the vulnerable' like elderly people. At the same time Do Not Resuscitate (DNR) orders were placed on their medical files so that if they needed resuscitation it wasn't done and 'Covid-19' went on their death certificates. Old people were not being 'protected' they were being culled – murdered in truth. DNR orders were being decreed for disabled and young people with learning difficulties or psychological problems. The UK Care Quality Commission, a non-departmental body of the Department of Health and Social Care, found that 34 percent of those working in health and social care were pressured into placing 'do not attempt cardiopulmonary resuscitation' orders on 'Covid' patients who suffered from disabilities and learning difficulties without involving the patient or their families in the decision. UK judges ruled that an elderly woman with dementia should have the DNA-manipulating 'Covid vaccine' against her son's wishes and that a man with severe learning difficulties should have the jab despite his family's objections. Never mind that many had already died. The judiciary always supports doctors and government in fascist dictatorships. They wouldn't dare do otherwise. A horrific video was posted showing fascist officers from Los Angeles police forcibly giving the 'Covid' shot to women with special needs who were screaming that they didn't want it. The same fascists are seen giving the jab to a sleeping elderly woman in a care home. This is straight out of the Nazi playbook. Hitler's Nazis committed mass murder of the mentally ill and physically disabled throughout Germany and occupied territories in the programme that became known as Aktion T4, or just T4. Sabbatian-controlled Hitler and his grotesque crazies set out to kill those they considered useless and unnecessary. The Reich Committee for the Scientific Registering of Hereditary and Congenital Illnesses registered the births of babies identified by physicians to have 'defects'. By 1941 alone more than 5,000 children were murdered by the state and it is estimated that in total the number of innocent people killed in Aktion T4 was between 275,000 and 300,000. Parents were told their children had been sent away for 'special treatment' never to return. It is rather pathetic to see claims about plans for new extermination camps being dismissed today

when the same force behind current events did precisely that 80 years ago. Margaret Sanger was a Cult operative who used 'birth control' to sanitise her programme of eugenics. Organisations she founded became what is now Planned Parenthood. Sanger proposed that 'the whole dysgenic population would have its choice of segregation or sterilization'. These included epileptics, 'feeble-minded', and prostitutes. Sanger opposed charity because it perpetuated 'human waste'. She reveals the Cult mentality and if anyone thinks that extermination camps are a 'conspiracy theory' their naivety is touching if breathtakingly stupid.

If you don't believe that doctors can act with callous disregard for their patients it is worth considering that doctors and medical staff agreed to put government-decreed DNR orders on medical files and do nothing when resuscitation is called for. I don't know what you call such people in your house. In mine they are Nazis from the Josef Mengele School of Medicine. Phenomenal numbers of old people have died worldwide from the effects of lockdown, depression, lack of treatment, the 'vaccine' (more later) and losing the will to live. A common response at the start of the manufactured pandemic was to remove old people from hospital beds and transfer them to nursing homes. The decision would result in a mass cull of elderly people in those homes through lack of treatment – *not* 'Covid'. Care home whistleblowers have told how once the 'Covid' era began doctors would not come to their homes to treat patients and they were begging for drugs like antibiotics that often never came. The most infamous example was ordered by New York governor Andrew Cuomo, brother of a moronic CNN host, who amazingly was given an Emmy Award for his handling of the 'Covid crisis' by the ridiculous Wokers that hand them out. Just how ridiculous could be seen in February, 2021, when a Department of Justice and FBI investigation began into how thousands of old people in New York died in nursing homes after being discharged from hospital to make way for 'Covid' patients on Cuomo's say-so – and how he and his staff covered up these facts. This couldn't have happened to a nicer psychopath. Even then there was a 'Covid' spin. Reports said that

thousands of old people who tested positive for 'Covid' in hospital were transferred to nursing homes to both die of 'Covid' and transmit it to others. No – they were in hospital because they were ill and the fact that they tested positive with a test not testing for the 'virus' is irrelevant. They were ill often with respiratory diseases ubiquitous in old people near the end of their lives. Their transfer out of hospital meant that their treatment stopped and many would go on to die.

They're old. Who gives a damn?

I have exposed in the books for decades the Cult plan to cull the world's old people and even to introduce at some point what they call a 'demise pill' which at a certain age everyone would take and be out of here by law. In March, 2021, Spain legalised euthanasia and assisted suicide following the Netherlands, Belgium, Luxembourg and Canada on the Tiptoe to the demise pill. Treatment of old people by many 'care' homes has been a disgrace in the 'Covid' era. There are many, many, caring staff – I know some. There have, however, been legions of stories about callous treatment of old people and their families. Police were called when families came to take their loved ones home in the light of isolation that was killing them. They became prisoners of the state. Care home residents in insane, fascist Ontario, Canada, were not allowed to leave their *room* once the 'Covid' hoax began. UK staff have even wheeled elderly people away from windows where family members were talking with them. Oriana Criscuolo from Stockport in the English North West dropped off some things for her 80-year-old father who has Parkinson's disease and dementia and she wanted to wave to him through a ground-floor window. She was told that was 'illegal'. When she went anyway they closed the curtains in the middle of the day. Oriana said:

It's just unbelievable. I cannot understand how care home staff – people who are being paid to care – have become so uncaring. Their behaviour is inhumane and cruel. It's beyond belief.

She was right and this was not a one-off. What a way to end your life in such loveless circumstances. UK registered nurse Nicky Millen, a proper old school nurse for 40 years, said that when she started her career care was based on dignity, choice, compassion and empathy. Now she said 'the things that are important to me have gone out of the window.' She was appalled that people were dying without their loved ones and saying goodbye on iPads. Nicky described how a distressed 89-year-old lady stroked her face and asked her 'how many paracetamol would it take to finish me off'. Life was no longer worth living while not seeing her family. Nicky said she was humiliated in front of the ward staff and patients for letting the lady stroke her face and giving her a cuddle. Such is the dehumanisation that the 'Covid' hoax has brought to the surface. Nicky worked in care homes where patients told her they were being held prisoner. 'I want to live until I die', one said to her. 'I had a lady in tears because she hadn't seen her great-grandson.' Nicky was compassionate old school meeting psychopathic New Normal. She also said she had worked on a 'Covid' ward with no 'Covid' patients. Jewish writer Shai Held wrote an article in March, 2020, which was headlined 'The Staggering, Heartless Cruelty Toward the Elderly'. What he described was happening from the earliest days of lockdown. He said 'the elderly' were considered a group and not unique individuals (the way of the Woke). Shai Held said:

Notice how the all-too-familiar rhetoric of dehumanization works: 'The elderly' are bunched together as a faceless mass, all of them considered culprits and thus effectively deserving of the suffering the pandemic will inflict upon them. Lost entirely is the fact that the elderly are individual human beings, each with a distinctive face and voice, each with hopes and dreams, memories and regrets, friendships and marriages, loves lost and loves sustained.

'The elderly' have become another dehumanised group for which anything goes and for many that has resulted in cold disregard for their rights and their life. The distinctive face that Held talks about is designed to be deleted by masks until everyone is part of a faceless mass.

'War-zone' hospitals myth

Again and again medical professionals have told me what was really going on and how hospitals 'overrun like war zones' according to the media were virtually empty. The mantra from medical whistleblowers was please don't use my name or my career is over. Citizen journalists around the world sneaked into hospitals to film evidence exposing the 'war-zone' lie. They really *were* largely empty with closed wards and operating theatres. I met a hospital worker in my town on the Isle of Wight during the first lockdown in 2020 who said the only island hospital had never been so quiet. Lockdown was justified by the psychopaths to stop hospitals being overrun. At the same time that the island hospital was near-empty the military arrived here to provide *extra beds*. It was all propaganda to ramp up the fear to ensure compliance with fascism as were never-used temporary hospitals with thousands of beds known as Nightingales and never-used make-shift mortuaries opened by the criminal UK government. A man who helped to install those extra island beds attributed to the army said they were never used and the hospital was empty. Doctors and nurses 'stood around talking or on their phones, wandering down to us to see what we were doing'. There were no masks or social distancing. He accused the useless local island paper, the *County Press*, of 'pumping the fear as if our hospital was overrun and we only have one so it should have been'. He described ambulances parked up with crews outside in deck chairs. When his brother called an ambulance he was told there was a two-hour backlog which he called 'bullshit'. An old lady on the island fell 'and was in a bad way', but a caller who rang for an ambulance was told the situation wasn't urgent enough. Ambulance stations were working under capacity while people would hear ambulances with sirens blaring driving through the streets. When those living near the stations realised what was going on they would follow them as they left, circulated around an urban area with the sirens going, and then came back without stopping. All this was to increase levels of fear and the same goes for the 'ventilator shortage crisis' that cost tens of millions for hastily produced ventilators never to be used.

Ambulance crews that agreed to be exploited in this way for fear propaganda might find themselves a mirror. I wish them well with that. Empty hospitals were the obvious consequence of treatment and diagnoses of non-'Covid' conditions cancelled and those involved handed a death sentence. People have been dying at home from undiagnosed and untreated cancer, heart disease and other life-threatening conditions to allow empty hospitals to deal with a 'pandemic' that wasn't happening.

Death of the innocent

'War-zones' have been laying off nursing staff, even doctors where they can. There was no work for them. Lockdown was justified by saving lives and protecting the vulnerable they were actually killing with DNR orders and preventing empty hospitals being 'overrun'. In Britain the mantra of stay at home to 'save the NHS' was everywhere and across the world the same story was being sold when it was all lies. Two California doctors, Dan Erickson and Artin Massihi at Accelerated Urgent Care in Bakersfield, held a news conference in April, 2020, to say that intensive care units in California were 'empty, essentially', with hospitals shutting floors, not treating patients and laying off doctors. The California health system was working at minimum capacity 'getting rid of doctors because we just don't have the volume'. They said that people with conditions such as heart disease and cancer were not coming to hospital out of fear of 'Covid-19'. Their video was deleted by Susan Wojcicki's Cult-owned YouTube after reaching five million views. Florida governor Ron Desantis, who rejected the severe lockdowns of other states and is being targeted for doing so, said that in March, 2020, every US governor was given models claiming they would run out of hospital beds in days. That was never going to happen and the 'modellers' knew it. Deceit can be found at every level of the system. Urgent children's operations were cancelled including fracture repairs and biopsies to spot cancer. Eric Nicholls, a consultant paediatrician, said 'this is obviously concerning and we need to return to normal operating and to increase capacity as soon as possible'. Psychopaths

in power were rather less concerned *because* they are psychopaths. Deletion of urgent care and diagnosis has been happening all over the world and how many kids and others have died as a result of the actions of these cold and heartless lunatics dictating 'health' policy? The number must be stratospheric. Richard Sullivan, professor of cancer and global health at King's College London, said people feared 'Covid' more than cancer such was the campaign of fear. 'Years of lost life will be quite dramatic', Sullivan said, with 'a huge amount of avoidable mortality'. Sarah Woolnough, executive director for policy at Cancer Research UK, said there had been a 75 percent drop in urgent referrals to hospitals by family doctors of people with suspected cancer. Sullivan said that 'a lot of services have had to scale back – we've seen a dramatic decrease in the amount of elective cancer surgery'. Lockdown deaths worldwide has been absolutely fantastic with the *New York Post* reporting how data confirmed that 'lockdowns end more lives than they save':

There was a sharp decline in visits to emergency rooms and an increase in fatal heart attacks because patients didn't receive prompt treatment. Many fewer people were screened for cancer. Social isolation contributed to excess deaths from dementia and Alzheimer's.

Researchers predicted that the social and economic upheaval would lead to tens of thousands of "deaths of despair" from drug overdoses, alcoholism and suicide. As unemployment surged and mental-health and substance-abuse treatment programs were interrupted, the reported levels of anxiety, depression and suicidal thoughts increased dramatically, as did alcohol sales and fatal drug overdoses.

This has been happening while nurses and other staff had so much time on their hands in the 'war-zones' that Tic-Tok dancing videos began appearing across the Internet with medical staff dancing around in empty wards and corridors as people died at home from causes that would normally have been treated in hospital.

Mentions in dispatches

One brave and truth-committed whistleblower was Louise Hampton, a call handler with the UK NHS who made a viral Internet video saying she had done 'fuck all' during the 'pandemic'

which was 'a load of bollocks'. She said that 'Covid-19' was rebranded flu and of course she lost her job. This is what happens in the medical and endless other professions now when you tell the truth. Louise filmed inside 'war-zone' accident and emergency departments to show they were empty and I mean *empty* as in no one there. The mainstream media could have done the same and blown the gaff on the whole conspiracy. They haven't to their eternal shame. Not that most 'journalists' seem capable of manifesting shame as with the psychopaths they slavishly repeat without question. The relative few who were admitted with serious health problems were left to die alone with no loved ones allowed to see them because of 'Covid' rules and they included kids dying without the comfort of mum and dad at their bedside while the evil behind this couldn't give a damn. It was all good fun to them. A Scottish NHS staff nurse publicly quit in the spring of 2021 saying: 'I can no longer be part of the lies and the corruption by the government.' She said hospitals 'aren't full, the beds aren't full, beds have been shut, wards have been shut'. Hospitals were never busy throughout 'Covid'. The staff nurse said that Nicola Sturgeon, tragically the leader of the Scottish government, was on television saying save the hospitals and the NHS – 'but the beds are empty' and 'we've not seen flu, we always see flu every year'. She wrote to government and spoke with her union Unison (the unions are Cult-compromised and *useless*, but nothing changed. Many of her colleagues were scared of losing their jobs if they spoke out as they wanted to. She said nursing staff were being affected by wearing masks all day and 'my head is splitting every shift from wearing a mask'. The NHS is part of the fascist tyranny and must be dismantled so we can start again with human beings in charge. (Ironically, hospitals were reported to be busier again when official 'Covid' cases *fell* in spring/summer of 2021 and many other conditions required treatment at the same time as *the fake vaccine rollout*.)

I will cover the 'Covid vaccine' scam in detail later, but it is another indicator of the sickening disregard for human life that I am highlighting here. The DNA-manipulating concoctions do not fulfil

the definition of a 'vaccine', have never been used on humans before and were given only emergency approval because trials were not completed and they continued using the unknowing public. The result was what a NHS senior nurse with responsibility for 'vaccine' procedure said was 'genocide'. She said the 'vaccines' were not 'vaccines'. They had not been shown to be safe and claims about their effectiveness by drug companies were 'poetic licence'. She described what was happening as a 'horrid act of human annihilation'. The nurse said that management had instigated a policy of not providing a Patient Information Leaflet (PIL) before people were 'vaccinated' even though health care professionals are supposed to do this according to protocol. Patients should also be told that they are taking part in an ongoing clinical trial. Her challenges to what is happening had seen her excluded from meetings and ridiculed in others. She said she was told to 'watch my step ... or I would find myself surplus to requirements'. The nurse, who spoke anonymously in fear of her career, said she asked her NHS manager why he/she was content with taking part in genocide against those having the 'vaccines'. The reply was that everyone had to play their part and to 'put up, shut up, and get it done'. Government was 'leaning heavily' on NHS management which was clearly leaning heavily on staff. This is how the global 'medical' hierarchy operates and it starts with the Cult and its World Health Organization.

She told the story of a doctor who had the Pfizer jab and when questioned had no idea what was in it. The doctor had never read the literature. We have to stop treating doctors as intellectual giants when so many are moral and medical pygmies. The doctor did not even know that the 'vaccines' were not fully approved or that their trials were ongoing. They were, however, asking their patients if they minded taking part in follow-ups for research purposes – yes, the *ongoing clinical trial*. The nurse said the doctor's ignorance was not rare and she had spoken to a hospital consultant who had the jab without any idea of the background or that the 'trials' had not been completed. Nurses and pharmacists had shown the same ignorance.

‘My NHS colleagues have forsaken their duty of care, broken their code of conduct – Hippocratic Oath – and have been brainwashed just the same as the majority of the UK public through propaganda ...’ She said she had not been able to recruit a single NHS colleague, doctor, nurse or pharmacist to stand with her and speak out. Her union had refused to help. She said that if the genocide came to light she would not hesitate to give evidence at a Nuremberg-type trial against those in power who could have affected the outcomes but didn’t.

And all for what?

To put the nonsense into perspective let’s say the ‘virus’ does exist and let’s go completely crazy and accept that the official manipulated figures for cases and deaths are accurate. *Even then* a study by Stanford University epidemiologist Dr John Ioannidis published on the World Health Organization website produced an average infection to fatality rate of ... *0.23 percent!* Ioannidis said: ‘If one could sample equally from all locations globally, the median infection fatality rate might even be substantially lower than the 0.23% observed in my analysis.’ For healthy people under 70 it was ... *0.05 percent!* This compares with the 3.4 percent claimed by the Cult-owned World Health Organization when the hoax was first played and maximum fear needed to be generated. An updated Stanford study in April, 2021, put the ‘infection’ to ‘fatality’ rate at just 0.15 percent. Another team of scientists led by Megan O’Driscoll and Henrik Salje studied data from 45 countries and published their findings on the Nature website. For children and young people the figure is so small it virtually does not register although authorities will be hyping dangers to the young when they introduce DNA-manipulating ‘vaccines’ for children. The O’Driscoll study produced an average infection-fatality figure of 0.003 for children from birth to four; 0.001 for 5 to 14; 0.003 for 15 to 19; and it was still only 0.456 up to 64. To claim that children must be ‘vaccinated’ to protect them from ‘Covid’ is an obvious lie and so there must be another reason and there is. What’s more the average age of a ‘Covid’ death is akin

to the average age that people die in general. The average age of death in England is about 80 for men and 83 for women. The average age of death from alleged 'Covid' is between 82 and 83. California doctors, Dan Erickson and Artin Massihi, said at their April media conference that projection models of millions of deaths had been 'woefully inaccurate'. They produced detailed figures showing that Californians had a 0.03 chance of dying from 'Covid' based on the number of people who tested positive (with a test not testing for the 'virus'). Erickson said there was a 0.1 percent chance of dying from 'Covid' in the *state* of New York, not just the city, and a 0.05 percent chance in Spain, a centre of 'Covid-19' hysteria at one stage. The Stanford studies supported the doctors' data with fatality rate estimates of 0.23 and 0.15 percent. How close are these figures to my estimate of *zero*? Death-rate figures claimed by the World Health Organization at the start of the hoax were some 15 times higher. The California doctors said there was no justification for lockdowns and the economic devastation they caused. Everything they had ever learned about quarantine was that you quarantine the *sick* and not the healthy. They had never seen this before and it made no medical sense.

Why in the in the light of all this would governments and medical systems the world over say that billions must go under house arrest; lose their livelihood; in many cases lose their mind, their health and their life; force people to wear masks dangerous to health and psychology; make human interaction and even family interaction a criminal offence; ban travel; close restaurants, bars, watching live sport, concerts, theatre, and any activity involving human togetherness and discourse; and closing schools to isolate children from their friends and cause many to commit suicide in acts of hopelessness and despair? The California doctors said lockdown consequences included increased child abuse, partner abuse, alcoholism, depression, and other impacts they were seeing every day. Who would do that to the entire human race if not mentally-ill psychopaths of almost unimaginable extremes like Bill Gates? We must face the reality of what we are dealing with and come out of

denial. Fascism and tyranny are made possible only by the target population submitting and acquiescing to fascism and tyranny. The whole of human history shows that to be true. Most people naively and unquestioning believed what they were told about a 'deadly virus' and meekly and weakly submitted to house arrest. Those who didn't believe it – at least in total – still submitted in fear of the consequences of not doing so. For the rest who wouldn't submit draconian fines have been imposed, brutal policing by psychopaths *for* psychopaths, and condemnation from the meek and weak who condemn the Pushbackers on behalf of the very force that has them, too, in its gun sights. 'Pathetic' does not even begin to suffice. Britain's brainless 'Health' Secretary Matt Hancock warned anyone lying to border officials about returning from a list of 'hotspot' countries could face a jail sentence of up to ten years which is more than for racially-aggravated assault, incest and attempting to have sex with a child under 13. Hancock is a lunatic, but he has the state apparatus behind him in a Cult-led chain reaction and the same with UK 'Vaccine Minister' Nadhim Zahawi, a prominent member of the mega-Cult secret society, Le Cercle, which featured in my earlier books. The Cult enforces its will on governments and medical systems; government and medical systems enforce their will on business and police; business enforces its will on staff who enforce it on customers; police enforce the will of the Cult on the population and play their essential part in creating a world of fascist control that their own children and grandchildren will have to live in their entire lives. It is a hierarchical pyramid of imposition and acquiescence and, yes indeed, of clinical insanity.

Does anyone bright enough to read this book have to ask what the answer is? I think not, but I will reveal it anyway in the fewest of syllables: Tell the psychos and their moronic lackeys to fuck off and let's get on with our lives. We are many – They are few.

CHAPTER SEVEN

War on your mind

One believes things because one has been conditioned to believe them

Aldous Huxley, Brave New World

I have described the 'Covid' hoax as a 'Psyop' and that is true in every sense and on every level in accordance with the definition of that term which is psychological warfare. Break down the 'Covid pandemic' to the foundation themes and it is psychological warfare on the human individual and collective mind.

The same can be said for the entire human belief system involving every subject you can imagine. Huxley was right in his contention that people believe what they are conditioned to believe and this comes from the repetition throughout their lives of the same falsehoods. They spew from government, corporations, media and endless streams of 'experts' telling you what the Cult wants you to believe and often believing it themselves (although *far* from always). 'Experts' are rewarded with 'prestigious' jobs and titles and as agents of perceptual programming with regular access to the media. The Cult has to control the narrative – control *information* – or they lose control of the vital, crucial, without-which-they-cannot-prevail public perception of reality. The foundation of that control today is the Internet made possible by the Defense Advanced Research Projects Agency (DARPA), the incredibly sinister technological arm of the Pentagon. The Internet is the result of military technology.

DARPA openly brags about establishing the Internet which has been a long-term project to lasso the minds of the global population. I have said for decades the plan is to control information to such an extreme that eventually no one would see or hear anything that the Cult does not approve. We are closing in on that end with ferocious censorship since the 'Covid' hoax began and in my case it started back in the 1990s in terms of books and speaking venues. I had to create my own publishing company in 1995 precisely because no one else would publish my books even then. I think they're all still running.

Cult Internet

To secure total control of information they needed the Internet in which pre-programmed algorithms can seek out 'unclean' content for deletion and even stop it being posted in the first place. The Cult had to dismantle print and non-Internet broadcast media to ensure the transfer of information to the appropriate-named 'Web' – a critical expression of the *Cult* web. We've seen the ever-quicken demise of traditional media and control of what is left by a tiny number of corporations operating worldwide. Independent journalism in the mainstream is already dead and never was that more obvious than since the turn of 2020. The Cult wants all information communicated via the Internet to globally censor and allow the plug to be pulled any time. Lockdowns and forced isolation has meant that communication between people has been through electronic means and no longer through face-to-face discourse and discussion. Cult psychopaths have targeted the bars, restaurants, sport, venues and meeting places in general for this reason. None of this is by chance and it's to stop people gathering in any kind of privacy or number while being able to track and monitor all Internet communications and block them as necessary. Even private messages between individuals have been censored by these fascists that control Cult fronts like Facebook, Twitter, Google and YouTube which are all officially run by Sabbatian place-people and from the background by higher-level Sabbatian place people.

Facebook, Google, Amazon and their like were seed-funded and supported into existence with money-no-object infusions of funds either directly or indirectly from DARPA and CIA technology arm In-Q-Tel. The Cult plays the long game and prepares very carefully for big plays like 'Covid'. Amazon is another front in the psychological war and pretty much controls the global market in book sales and increasingly publishing. Amazon's limitless funds have deleted fantastic numbers of independent publishers to seize global domination on the way to deciding which books can be sold and circulated and which cannot. Moves in that direction are already happening. Amazon's leading light Jeff Bezos is the grandson of Lawrence Preston Gise who worked with DARPA predecessor ARPA. Amazon has big connections to the CIA and the Pentagon. The plan I have long described went like this:

1. Employ military technology to establish the Internet.
2. Sell the Internet as a place where people can freely communicate without censorship and allow that to happen until the Net becomes the central and irreversible pillar of human society. If the Internet had been highly censored from the start many would have rejected it.
3. Fund and manipulate major corporations into being to control the circulation of information on your Internet using cover stories about geeks in garages to explain how they came about. Give them unlimited funds to expand rapidly with no need to make a profit for years while non-Cult companies who need to balance the books cannot compete. You know that in these circumstances your Googles, YouTubes, Facebooks and Amazons are going to secure near monopolies by either crushing or buying up the opposition.
4. Allow freedom of expression on both the Internet and communication platforms to draw people in until the Internet is the central and irreversible pillar of human society and your communication corporations have reached a stage of near monopoly domination.
5. Then unleash your always-planned frenzy of censorship on the basis of 'where else are you going to go?' and continue to expand that until nothing remains that the Cult does not want its human targets to see.

The process was timed to hit the 'Covid' hoax to ensure the best chance possible of controlling the narrative which they knew they had to do at all costs. They were, after all, about to unleash a 'deadly virus' that didn't really exist. If you do that in an environment of free-flowing information and opinion you would be dead in the

water before you could say Gates is a psychopath. The network was in place through which the Cult-created-and-owned World Health Organization could dictate the 'Covid' narrative and response policy slavishly supported by Cult-owned Internet communication giants and mainstream media while those telling a different story were censored. Google, YouTube, Facebook and Twitter openly announced that they would do this. What else would we expect from Cult-owned operations like Facebook which former executives have confirmed set out to make the platform more addictive than cigarettes and coldly manipulates emotions of its users to sow division between people and groups and scramble the minds of the young? If Zuckerberg lives out the rest of his life without going to jail for crimes against humanity, and most emphatically against the young, it will be a travesty of justice. Still, no matter, cause and effect will catch up with him eventually and the same with Sergey Brin and Larry Page at Google with its CEO Sundar Pichai who fix the Google search results to promote Cult narratives and hide the opposition. Put the same key words into Google and other search engines like DuckDuckGo and you will see how different results can be. Wikipedia is another intensely biased 'encyclopaedia' which skews its content to the Cult agenda. YouTube links to Wikipedia's version of 'Covid' and 'climate change' on video pages in which experts in their field offer a different opinion (even that is increasingly rare with Wojcicki censorship). Into this 'Covid' silence-them network must be added government media censors, sorry 'regulators', such as Ofcom in the UK which imposed tyrannical restrictions on British broadcasters that had the effect of banning me from ever appearing. Just to debate with me about my evidence and views on 'Covid' would mean breaking the fascistic impositions of Ofcom and its CEO career government bureaucrat Melanie Dawes. Gutless British broadcasters tremble at the very thought of fascist Ofcom.

Psychos behind 'Covid'

The reason for the 'Covid' catastrophe in all its facets and forms can be seen by whom and what is driving the policies worldwide in such a coordinated way. Decisions are not being made to protect health, but to target psychology. The dominant group guiding and 'advising' government policy are not medical professionals. They are psychologists and behavioural scientists. Every major country has its own version of this phenomenon and I'll use the British example to show how it works. In many ways the British version has been affecting the wider world in the form of the huge behaviour manipulation network in the UK which operates in other countries. The network involves private companies, government, intelligence and military. The Cabinet Office is at the centre of the government 'Covid' Psyop and part-owns, with 'innovation charity' Nesta, the Behavioural Insights Team (BIT) which claims to be independent of government but patently isn't. The BIT was established in 2010 and its job is to manipulate the psyche of the population to acquiesce to government demands and so much more. It is also known as the 'Nudge Unit', a name inspired by the 2009 book by two ultra-Zionists, Cass Sunstein and Richard Thaler, called *Nudge: Improving Decisions About Health, Wealth, and Happiness*. The book, as with the Behavioural Insights Team, seeks to 'nudge' behaviour (manipulate it) to make the public follow patterns of action and perception that suit those in authority (the Cult). Sunstein is so skilled at this that he advises the World Health Organization and the UK Behavioural Insights Team and was Administrator of the White House Office of Information and Regulatory Affairs in the Obama administration. Biden appointed him to the Department of Homeland Security – another ultra-Zionist in the fold to oversee new immigration laws which is another policy the Cult wants to control. Sunstein is desperate to silence anyone exposing conspiracies and co-authored a 2008 report on the subject in which suggestions were offered to ban 'conspiracy theorizing' or impose 'some kind of tax, financial or otherwise, on those who disseminate such theories'. I guess a psychiatrist's chair is out of the question?

Sunstein's mate Richard Thaler, an 'academic affiliate' of the UK Behavioural Insights Team, is a proponent of 'behavioural economics' which is defined as the study of 'the effects of psychological, cognitive, emotional, cultural and social factors on the decisions of individuals and institutions'. Study the effects so they can be manipulated to be what you want them to be. Other leading names in the development of behavioural economics are ultra-Zionists Daniel Kahneman and Robert J. Shiller and they, with Thaler, won the Nobel Memorial Prize in Economic Sciences for their work in this field. The Behavioural Insights Team is operating at the heart of the UK government and has expanded globally through partnerships with several universities including Harvard, Oxford, Cambridge, University College London (UCL) and Pennsylvania. They claim to have 'trained' (reframed) 20,000 civil servants and run more than 750 projects involving 400 randomised controlled trials in dozens of countries' as another version of mind reframers Common Purpose. BIT works from its office in New York with cities and their agencies, as well as other partners, across the United States and Canada – this is a company part-owned by the British government Cabinet Office. An executive order by President Cult-servant Obama established a US Social and Behavioral Sciences Team in 2015. They all have the same reason for being and that's to brainwash the population directly and by brainwashing those in positions of authority.

'Covid' mind game

Another prime aspect of the UK mind-control network is the 'independent' [joke] Scientific Pandemic Insights Group on Behaviours (SPI-B) which 'provides behavioural science advice aimed at anticipating and helping people adhere to interventions that are recommended by medical or epidemiological experts'. That means manipulating public perception and behaviour to do whatever government tells them to do. It's disgusting and if they really want the public to be 'safe' this lot should all be under lock and key. According to the government website SPI-B consists of

'behavioural scientists, health and social psychologists, anthropologists and historians' and advises the Whitty-Vallance-led Scientific Advisory Group for Emergencies (SAGE) which in turn advises the government on 'the science' (it doesn't) and 'Covid' policy. When politicians say they are being guided by 'the science' this is the rabble in each country they are talking about and that 'science' is dominated by behaviour manipulators to enforce government fascism through public compliance. The Behaviour Insight Team is headed by psychologist David Solomon Halpern, a visiting professor at King's College London, and connects with a national and global web of other civilian and military organisations as the Cult moves towards its goal of fusing them into one fascistic whole in every country through its 'Fusion Doctrine'. The behaviour manipulation network involves, but is not confined to, the Foreign Office; National Security Council; government communications headquarters (GCHQ); MI5; MI6; the Cabinet Office-based Media Monitoring Unit; and the Rapid Response Unit which 'monitors digital trends to spot emerging issues; including misinformation and disinformation; and identifies the best way to respond'.

There is also the 77th Brigade of the UK military which operates like the notorious Israeli military's Unit 8200 in manipulating information and discussion on the Internet by posing as members of the public to promote the narrative and discredit those who challenge it. Here we have the military seeking to manipulate *domestic* public opinion while the Nazis in government are fine with that. Conservative Member of Parliament Tobias Ellwood, an advocate of lockdown and control through 'vaccine passports', is a Lieutenant Colonel reservist in the 77th Brigade which connects with the military operation jHub, the 'innovation centre' for the Ministry of Defence and Strategic Command. jHub has also been involved with the civilian National Health Service (NHS) in 'symptom tracing' the population. The NHS is a key part of this mind control network and produced a document in December, 2020, explaining to staff how to use psychological manipulation with different groups and ages to get them to have the DNA-manipulating 'Covid vaccine'

that's designed to cumulatively rewrite human genetics. The document, called 'Optimising Vaccination Roll Out – Do's and Don'ts for all messaging, documents and "communications" in the widest sense', was published by NHS England and the NHS Improvement *Behaviour Change Unit* in partnership with Public Health England and Warwick Business School. I hear the mantra about 'save the NHS' and 'protect the NHS' when we need to scrap the NHS and start again. The current version is far too corrupt, far too anti-human and totally compromised by Cult operatives and their assets. UK government broadcast media censor Ofcom will connect into this web – as will the BBC with its tremendous Ofcom influence – to control what the public see and hear and dictate mass perception. Nuremberg trials must include personnel from all these organisations.

The fear factor

The 'Covid' hoax has led to the creation of the UK Cabinet Office-connected Joint Biosecurity Centre (JBC) which is officially described as providing 'expert advice on pandemics' using its independent [all Cult operations are 'independent'] analytical function to provide real-time analysis about infection outbreaks to identify and respond to outbreaks of Covid-19'. Another role is to advise the government on a response to spikes in infections – 'for example by closing schools or workplaces in local areas where infection levels have risen'. Put another way, promoting the Cult agenda. The Joint Biosecurity Centre is modelled on the Joint Terrorism Analysis Centre which analyses intelligence to set 'terrorism threat levels' and here again you see the fusion of civilian and military operations and intelligence that has led to military intelligence producing documents about 'vaccine hesitancy' and how it can be combated. Domestic civilian matters and opinions should not be the business of the military. The Joint Biosecurity Centre is headed by Tom Hurd, director general of the Office for Security and Counter-Terrorism from the establishment-to-its-fingertips Hurd family. His father is former Foreign Secretary Douglas Hurd. How coincidental that Tom

Hurd went to the elite Eton College and Oxford University with Boris Johnson. Imperial College with its ridiculous computer modeller Neil Ferguson will connect with this gigantic web that will itself interconnect with similar set-ups in other major and not so major countries. Compared with this Cult network the politicians, be they Boris Johnson, Donald Trump or Joe Biden, are bit-part players 'following the science'. The network of psychologists was on the 'Covid' case from the start with the aim of generating maximum fear of the 'virus' to ensure compliance by the population. A government behavioural science group known as SPI-B produced a paper in March, 2020, for discussion by the main government science advisory group known as SAGE. It was headed 'Options for increasing adherence to social distancing measures' and it said the following in a section headed 'Persuasion':

- A substantial number of people still do not feel sufficiently personally threatened; it could be that they are reassured by the low death rate in their demographic group, although levels of concern may be rising. Having a good understanding of the risk has been found to be positively associated with adoption of COVID-19 social distancing measures in Hong Kong.
- The perceived level of personal threat needs to be increased among those who are complacent, using hard-hitting evaluation of options for increasing social distancing emotional messaging. To be effective this must also empower people by making clear the actions they can take to reduce the threat.
- Responsibility to others: There seems to be insufficient understanding of, or feelings of responsibility about, people's role in transmitting the infection to others ... Messaging about actions need to be framed positively in terms of protecting oneself and the community, and increase confidence that they will be effective.
- Some people will be more persuaded by appeals to play by the rules, some by duty to the community, and some to personal risk.

All these different approaches are needed. The messaging also needs to take account of the realities of different people's lives. Messaging needs to take account of the different motivational levers and circumstances of different people.

All this could be achieved the SPI-B psychologists said by *using the media to increase the sense of personal threat* which translates as terrify the shit out of the population, including children, so they all do what we want. That's not happened has it? Those excuses for 'journalists' who wouldn't know journalism if it bit them on the arse (the great majority) have played their crucial part in serving this Cult-government Psyop to enslave their own kids and grandkids. How they live with themselves I have no idea. The psychological war has been underpinned by constant government 'Covid' propaganda in almost every television and radio ad break, plus the Internet and print media, which has pounded out the fear with taxpayers footing the bill for their own programming. The result has been people terrified of a 'virus' that doesn't exist or one with a tiny fatality rate even if you believe it does. People walk down the street and around the shops wearing face-nappies damaging their health and psychology while others report those who refuse to be that naïve to the police who turn up in their own face-nappies. I had a cameraman come to my flat and he was so frightened of 'Covid' he came in wearing a mask and refused to shake my hand in case he caught something. He had – naïveitis – and the thought that he worked in the mainstream media was both depressing and made his behaviour perfectly explainable. The fear which has gripped the minds of so many and frozen them into compliance has been carefully cultivated by these psychologists who are really psychopaths. If lives get destroyed and a lot of young people commit suicide it shows our plan is working. SPI-B then turned to compulsion on the public to comply. 'With adequate preparation, rapid change can be achieved', it said. Some countries had introduced mandatory self-isolation on a wide scale without evidence of major public unrest and a large majority of the UK's population appeared to be supportive of more coercive measures with 64 percent of adults saying they would

support putting London under a lockdown (watch the 'polls' which are designed to make people believe that public opinion is in favour or against whatever the subject in hand).

For 'aggressive protective measures' to be effective, the SPI-B paper said, special attention should be devoted to those population groups that are more at risk. Translated from the Orwellian this means making the rest of population feel guilty for not protecting the 'vulnerable' such as old people which the Cult and its agencies were about to kill on an industrial scale with lockdown, lack of treatment and the Gates 'vaccine'. Psychopath psychologists sold their guilt-trip so comprehensively that Los Angeles County Supervisor Hilda Solis reported that children were apologising (from a distance) to their parents and grandparents for bringing 'Covid' into their homes and getting them sick. '... These apologies are just some of the last words that loved ones will ever hear as they die alone,' she said. Gut-wrenchingly Solis then used this childhood tragedy to tell children to stay at home and 'keep your loved ones alive'. Imagine heaping such potentially life-long guilt on a kid when it has absolutely nothing to do with them. These people are deeply disturbed and the psychologists behind this even more so.

Uncivil war – divide and rule

Professional mind-controllers at SPI-B wanted the media to increase a sense of responsibility to others (do as you're told) and promote 'positive messaging' for those actions while in contrast to invoke 'social disapproval' by the unquestioning, obedient, community of anyone with a mind of their own. Again the compliant Goebbels-like media obliged. This is an old, old, trick employed by tyrannies the world over throughout human history. You get the target population to keep the target population in line – *your* line. SPI-B said this could 'play an important role in preventing anti-social behaviour or discouraging failure to enact pro-social behaviour'. For 'anti-social' in the Orwellian parlance of SPI-B see any behaviour that government doesn't approve. SPI-B recommendations said that 'social disapproval' should be accompanied by clear messaging and

promotion of strong collective identity – hence the government and celebrity mantra of ‘we’re all in this together’. Sure we are. The mind doctors have such contempt for their targets that they think some clueless comedian, actor or singer telling them to do what the government wants will be enough to win them over. We have had UK comedian Lenny Henry, actor Michael Caine and singer Elton John wheeled out to serve the propagandists by urging people to have the DNA-manipulating ‘Covid’ non-‘vaccine’. The role of Henry and fellow black celebrities in seeking to coax a ‘vaccine’ reluctant black community into doing the government’s will was especially stomach-turning. An emotion-manipulating script and carefully edited video featuring these black ‘celebs’ was such an insult to the intelligence of black people and where’s the self-respect of those involved selling their souls to a fascist government agenda? Henry said he heard black people’s ‘legitimate worries and concerns’, but people must ‘trust the facts’ when they were doing exactly that by not having the ‘vaccine’. They had to include the obligatory reference to Black Lives Matter with the line ... ‘Don’t let coronavirus cost even more black lives – because we matter’. My god, it was pathetic. ‘I know the vaccine is safe and what it does.’ How? ‘I’m a comedian and it says so in my script.’

SPI-B said social disapproval needed to be carefully managed to avoid victimisation, scapegoating and misdirected criticism, but they knew that their ‘recommendations’ would lead to exactly that and the media were specifically used to stir-up the divide-and-conquer hostility. Those who conform like good little baa, baas, are praised while those who have seen through the tidal wave of lies are ‘Covidiot’. The awake have been abused by the fast asleep for not conforming to fascism and impositions that the awake know are designed to endanger their health, dehumanise them, and tear asunder the very fabric of human society. We have had the curtain-twitchers and morons reporting neighbours and others to the face-napped police for breaking ‘Covid rules’ with fascist police delighting in posting links and phone numbers where this could be done. The Cult cannot impose its will without a compliant police

and military or a compliant population willing to play their part in enslaving themselves and their kids. The words of a pastor in Nazi Germany are so appropriate today:

First they came for the socialists and I did not speak out because I was not a socialist.

Then they came for the trade unionists and I did not speak out because I was not a trade unionist.

Then they came for the Jews and I did not speak out because I was not a Jew.

Then they came for me and there was no one left to speak for me.

Those who don't learn from history are destined to repeat it and so many are.

'Covid' rules: Rewiring the mind

With the background laid out to this gigantic national and global web of psychological manipulation we can put 'Covid' rules into a clear and sinister perspective. Forget the claims about protecting health. 'Covid' rules are about dismantling the human mind, breaking the human spirit, destroying self-respect, and then putting Humpty Dumpty together again as a servile, submissive slave. Social isolation through lockdown and distancing have devastating effects on the human psyche as the psychological psychopaths well know and that's the real reason for them. Humans need contact with each other, discourse, closeness and touch, or they eventually, and literally, go crazy. Masks, which I will address at some length, fundamentally add to the effects of isolation and the Cult agenda to dehumanise and de-individualise the population. To do this while knowing – in fact *seeking* – this outcome is the very epitome of evil and psychologists involved in this *are* the epitome of evil. They must like all the rest of the Cult demons and their assets stand trial for crimes against humanity on a scale that defies the imagination. Psychopaths in uniform use isolation to break enemy troops and agents and make them subservient and submissive to tell what they know. The technique is rightly considered a form of torture and

torture is most certainly what has been imposed on the human population.

Clinically-insane American psychologist Harry Harlow became famous for his isolation experiments in the 1950s in which he separated baby monkeys from their mothers and imprisoned them for months on end in a metal container or 'pit of despair'. They soon began to show mental distress and depression as any idiot could have predicted. Harlow put other monkeys in steel chambers for three, six or twelve months while denying them any contact with animals or humans. He said that the effects of total social isolation for six months were 'so devastating and debilitating that we had assumed initially that twelve months of isolation would not produce any additional decrement'; but twelve months of isolation 'almost obliterated the animals socially'. This is what the Cult and its psychopaths are doing to you and your children. Even monkeys in partial isolation in which they were not allowed to form relationships with other monkeys became 'aggressive and hostile, not only to others, but also towards their own bodies'. We have seen this in the young as a consequence of lockdown. UK government psychopaths launched a public relations campaign telling people not to hug each other even after they received the 'Covid-19 vaccine' which we were told with more lies would allow a return to 'normal life'. A government source told *The Telegraph*: 'It will be along the lines that it is great that you have been vaccinated, but if you are going to visit your family and hug your grandchildren there is a chance you are going to infect people you love.' The source was apparently speaking from a secure psychiatric facility. Janet Lord, director of Birmingham University's Institute of Inflammation and Ageing, said that parents and grandparents should avoid hugging their children. Well, how can I put it, Ms Lord? Fuck off. Yep, that'll do.

Destroying the kids – where are the parents?

Observe what has happened to people enslaved and isolated by lockdown as suicide and self-harm has soared worldwide,

particularly among the young denied the freedom to associate with their friends. A study of 49,000 people in English-speaking countries concluded that almost half of young adults are at clinical risk of mental health disorders. A national survey in America of 1,000 currently enrolled high school and college students found that 5 percent reported attempting suicide during the pandemic. Data from the US CDC's National Syndromic Surveillance Program from January 1st to October 17th, 2020, revealed a *31 percent* increase in mental health issues among adolescents aged 12 to 17 compared with 2019. The CDC reported that America in general suffered the biggest drop in life expectancy since World War Two as it fell by a year in the first half of 2020 as a result of 'deaths of despair' – overdoses and suicides. Deaths of despair have leapt by more than 20 percent during lockdown and include the highest number of fatal overdoses ever recorded in a single year – 81,000. Internet addiction is another consequence of being isolated at home which lowers interest in physical activities as kids fall into inertia and what's the point? Children and young people are losing hope and giving up on life, sometimes literally. A 14-year-old boy killed himself in Maryland because he had 'given up' when his school district didn't reopen; an 11-year-old boy shot himself during a zoom class; a teenager in Maine succumbed to the isolation of the 'pandemic' when he ended his life after experiencing a disrupted senior year at school. Children as young as nine have taken their life and all these stories can be repeated around the world. Careers are being destroyed before they start and that includes those in sport in which promising youngsters have not been able to take part. The plan of the psycho-psychologists is working all right. Researchers at Cambridge University found that lockdowns cause significant harm to children's mental health. Their study was published in the *Archives of Disease in Childhood*, and followed 168 children aged between 7 and 11. The researchers concluded:

During the UK lockdown, children's depression symptoms have increased substantially, relative to before lockdown. The scale of this effect has direct relevance for the continuation of different elements of lockdown policy, such as complete or partial school closures ...

... Specifically, we observed a statistically significant increase in ratings of depression, with a medium-to-large effect size. Our findings emphasise the need to incorporate the potential impact of lockdown on child mental health in planning the ongoing response to the global pandemic and the recovery from it.

Not a chance when the Cult's psycho-psychologists were getting exactly what they wanted. The UK's Royal College of Paediatrics and Child Health has urged parents to look for signs of eating disorders in children and young people after a three to four fold increase. Specialists say the 'pandemic' is a major reason behind the rise. You don't say. The College said isolation from friends during school closures, exam cancellations, loss of extra-curricular activities like sport, and an increased use of social media were all contributory factors along with fears about the virus (psycho-psychologists again), family finances, and students being forced to quarantine. Doctors said young people were becoming severely ill by the time they were seen with 'Covid' regulations reducing face-to-face consultations. Nor is it only the young that have been devastated by the psychopaths. Like all bullies and cowards the Cult is targeting the young, elderly, weak and infirm. A typical story was told by a British lady called Lynn Parker who was not allowed to visit her husband in 2020 for the last ten and half months of his life 'when he needed me most' between March 20th and when he died on December 19th. This vacates the criminal and enters the territory of evil. The emotional impact on the immune system alone is immense as are the number of people of all ages worldwide who have died as a result of Cult-demanded, Gates-demanded, lockdowns.

Isolation is torture

The experience of imposing solitary confinement on millions of prisoners around the world has shown how a large percentage become 'actively psychotic and/or acutely suicidal'. Social isolation has been found to trigger 'a specific psychiatric syndrome, characterized by hallucinations; panic attacks; overt paranoia; diminished impulse control; hypersensitivity to external stimuli; and difficulties with thinking, concentration and memory'. Juan Mendez,

a United Nations rapporteur (investigator), said that isolation is a form of torture. Research has shown that even after isolation prisoners find it far more difficult to make social connections and I remember chatting to a shop assistant after one lockdown who told me that when her young son met another child again he had no idea how to act or what to do. Hannah Flanagan, Director of Emergency Services at Journey Mental Health Center in Dane County, Wisconsin, said: 'The specificity about Covid social distancing and isolation that we've come across as contributing factors to the suicides are really new to us this year.' But they are not new to those that devised them. They are getting the effect they want as the population is psychologically dismantled to be rebuilt in a totally different way. Children and the young are particularly targeted. They will be the adults when the full-on fascist AI-controlled technocracy is planned to be imposed and they are being prepared to meekly submit. At the same time older people who still have a memory of what life was like before – and how fascist the new normal really is – are being deleted. You are going to see efforts to turn the young against the old to support this geriatric genocide. Hannah Flanagan said the big increase in suicide in her county proved that social isolation is not only harmful, but deadly. Studies have shown that isolation from others is one of the main risk factors in suicide and even more so with women. Warnings that lockdown could create a 'perfect storm' for suicide were ignored. After all this was one of the *reasons* for lockdown. Suicide, however, is only the most extreme of isolation consequences. There are many others. Dr Dhruv Khullar, assistant professor of healthcare policy at Weill Cornell Medical College, said in a *New York Times* article in 2016 long before the fake 'pandemic':

A wave of new research suggests social separation is bad for us. Individuals with less social connection have disrupted sleep patterns, altered immune systems, more inflammation and higher levels of stress hormones. One recent study found that isolation increases the risk of heart disease by 29 percent and stroke by 32 percent. Another analysis that pooled data from 70 studies and 3.4 million people found that socially isolated individuals had a 30 percent higher risk of dying in the next seven years, and that this effect was largest in middle age.

Loneliness can accelerate cognitive decline in older adults, and isolated individuals are twice as likely to die prematurely as those with more robust social interactions. These effects start early: Socially isolated children have significantly poorer health 20 years later, even after controlling for other factors. All told, loneliness is as important a risk factor for early death as obesity and smoking.

There you have proof from that one article alone four years before 2020 that those who have enforced lockdown, social distancing and isolation knew what the effect would be and that is even more so with professional psychologists that have been driving the policy across the globe. We can go back even further to the years 2000 and 2003 and the start of a major study on the effects of isolation on health by Dr Janine Gronewold and Professor Dirk M. Hermann at the University Hospital in Essen, Germany, who analysed data on 4,316 people with an average age of 59 who were recruited for the long-term research project. They found that socially isolated people are more than 40 percent more likely to have a heart attack, stroke, or other major cardiovascular event and nearly 50 percent more likely to die from any cause. Given the financial Armageddon unleashed by lockdown we should note that the study found a relationship between increased cardiovascular risk and lack of financial support. After excluding other factors social isolation was still connected to a 44 percent increased risk of cardiovascular problems and a 47 percent increased risk of death by any cause. Lack of financial support was associated with a 30 percent increase in the risk of cardiovascular health events. Dr Gronewold said it had been known for some time that feeling lonely or lacking contact with close friends and family can have an impact on physical health and the study had shown that having strong social relationships is of high importance for heart health. Gronewold said they didn't understand yet why people who are socially isolated have such poor health outcomes, but this was obviously a worrying finding, particularly during these times of prolonged social distancing. Well, it can be explained on many levels. You only have to identify the point in the body where people feel loneliness and missing people they are parted from – it's in the centre of the chest where they feel the ache of loneliness and the ache of missing people. 'My heart aches for

you' ... 'My heart aches for some company.' I will explain this more in the chapter Escaping Wetiko, but when you realise that the body is the mind – they are expressions of each other – the reason why state of the mind dictates state of the body becomes clear.

American psychologist Ranjit Powar was highlighting the effects of lockdown isolation as early as April, 2020. She said humans have evolved to be social creatures and are wired to live in interactive groups. Being isolated from family, friends and colleagues could be unbalancing and traumatic for most people and could result in short or even long-term psychological and physical health problems. An increase in levels of anxiety, aggression, depression, forgetfulness and hallucinations were possible psychological effects of isolation. 'Mental conditions may be precipitated for those with underlying pre-existing susceptibilities and show up in many others without any pre-condition.' Powar said personal relationships helped us cope with stress and if we lost this outlet for letting off steam the result can be a big emotional void which, for an average person, was difficult to deal with. 'Just a few days of isolation can cause increased levels of anxiety and depression' – so what the hell has been the effect on the global population of *18 months* of this at the time of writing? Powar said: 'Add to it the looming threat of a dreadful disease being repeatedly hammered in through the media and you have a recipe for many shades of mental and physical distress.' For those with a house and a garden it is easy to forget that billions have had to endure lockdown isolation in tiny overcrowded flats and apartments with nowhere to go outside. The psychological and physical consequences of this are unimaginable and with lunatic and abusive partners and parents the consequences have led to tremendous increases in domestic and child abuse and alcoholism as people seek to shut out the horror. Ranjit Powar said:

Staying in a confined space with family is not all a rosy picture for everyone. It can be extremely oppressive and claustrophobic for large low-income families huddled together in small single-room houses. Children here are not lucky enough to have many board/electronic games or books to keep them occupied.

Add to it the deep insecurity of running out of funds for food and basic necessities. On the other hand, there are people with dysfunctional family dynamics, such as domineering, abusive or alcoholic partners, siblings or parents which makes staying home a period of trial. Incidence of suicide and physical abuse against women has shown a worldwide increase. Heightened anxiety and depression also affect a person's immune system, making them more susceptible to illness.

To think that Powar's article was published on April 11th, 2020.

Six-feet fantasy

Social (unsocial) distancing demanded that people stay six feet or two metres apart. UK government advisor Robert Dingwall from the New and Emerging Respiratory Virus Threats Advisory Group said in a radio interview that the two-metre rule was 'conjured up out of nowhere' and was not based on science. No, it was not based on *medical* science, but it didn't come out of nowhere. The distance related to *psychological* science. Six feet/two metres was adopted in many countries and we were told by people like the criminal Anthony Fauci and his ilk that it was founded on science. Many schools could not reopen because they did not have the space for six-foot distancing. Then in March, 2021, after a year of six-foot 'science', a study published in the *Journal of Infectious Diseases* involving more than 500,000 students and almost 100,000 staff over 16 weeks revealed no significant difference in 'Covid' cases between six feet and three feet and Fauci changed his tune. Now three feet was okay. There is no difference between six feet and three *inches* when there is no 'virus' and they got away with six feet for psychological reasons for as long as they could. I hear journalists and others talk about 'unintended consequences' of lockdown. They are not *unintended* at all; they have been coldly-calculated for a specific outcome of human control and that's why super-psychopaths like Gates have called for them so vehemently. Super-psychopath psychologists have demanded them and psychopathic or clueless, spineless, politicians have gone along with them by 'following the science'. But it's not science at all. 'Science' is not what is; it's only what people can be manipulated to believe it is. The whole 'Covid' catastrophe is

founded on mind control. Three word or three statement mantras issued by the UK government are a well-known mind control technique and so we've had 'Stay home/protect the NHS/save lives', 'Stay alert/control the virus/save lives' and 'hands/face/space'. One of the most vocal proponents of extreme 'Covid' rules in the UK has been Professor Susan Michie, a member of the British Communist Party, who is not a medical professional. Michie is the director of the Centre for Behaviour Change at University College London. She is a *behavioural psychologist* and another filthy rich 'Marxist' who praised China's draconian lockdown. She was known by fellow students at Oxford University as 'Stalin's nanny' for her extreme Marxism. Michie is an influential member of the UK government's Scientific Advisory Group for Emergencies (SAGE) and behavioural manipulation groups which have dominated 'Covid' policy. She is a consultant adviser to the World Health Organization on 'Covid-19' and behaviour. Why the hell are lockdowns anything to do with her when they are claimed to be about health? Why does a behavioural psychologist from a group charged with changing the behaviour of the public want lockdown, human isolation and mandatory masks? Does that question really need an answer? Michie *absolutely* has to explain herself before a Nuremberg court when humanity takes back its world again and even more so when you see the consequences of masks that she demands are compulsory. This is a Michie classic:

The benefits of getting primary school children to wear masks is that regardless of what little degree of transmission is occurring in those age groups it could help normalise the practice. Young children wearing masks may be more likely to get their families to accept masks.

Those words alone should carry a prison sentence when you ponder on the callous disregard for children involved and what a statement it makes about the mind and motivations of Susan Michie. What a lovely lady and what she said there encapsulates the mentality of the psychopaths behind the 'Covid' horror. Let us compare what Michie said with a countrywide study in Germany published at [researchsquare.com](https://www.researchsquare.com) involving 25,000 school children and 17,854 health complaints submitted by parents. Researchers

found that masks are harming children physically, psychologically, and behaviourally with 24 health issues associated with mask wearing. They include: shortness of breath (29.7%); dizziness (26.4%); increased headaches (53%); difficulty concentrating (50%); drowsiness or fatigue (37%); and malaise (42%). Nearly a third of children experienced more sleep issues than before and a quarter developed new fears. Researchers found health issues and other impairments in 68 percent of masked children covering their faces for an average of 4.5 hours a day. Hundreds of those taking part experienced accelerated respiration, tightness in the chest, weakness, and short-term impairment of consciousness. A reminder of what Michie said again:

The benefits of getting primary school children to wear masks is that regardless of what little degree of transmission is occurring in those age groups it could help normalise the practice. Young children wearing masks may be more likely to get their families to accept masks.

Psychopaths in government and psychology now have children and young people – plus all the adults – wearing masks for hours on end while clueless teachers impose the will of the psychopaths on the young they should be protecting. What the hell are parents doing?

Cult lab rats

We have some schools already imposing on students microchipped buzzers that activate when they get 'too close' to their pals in the way they do with lab rats. How apt. To the Cult and its brain-dead servants our children *are* lab rats being conditioned to be unquestioning, dehumanised slaves for the rest of their lives.

Children and young people are being weaned and frightened away from the most natural human instincts including closeness and touch. I have tracked in the books over the years how schools were banning pupils from greeting each other with a hug and the whole Cult-induced Me Too movement has terrified men and boys from a relaxed and natural interaction with female friends and work colleagues to the point where many men try never to be in a room

alone with a woman that's not their partner. Airhead celebrities have as always played their virtue-signalling part in making this happen with their gross exaggeration. For every monster like Harvey Weinstein there are at least tens of thousands of men that don't treat women like that; but everyone must be branded the same and policy changed for them as well as the monster. I am going to be using the word 'dehumanise' many times in this chapter because that is what the Cult is seeking to do and it goes very deep as we shall see. Don't let them kid you that social distancing is planned to end one day. That's not the idea. We are seeing more governments and companies funding and producing wearable gadgets to keep people apart and they would not be doing that if this was meant to be short-term. A tech start-up company backed by GCHQ, the British Intelligence and military surveillance headquarters, has created a social distancing wrist sensor that alerts people when they get too close to others. The CIA has also supported tech companies developing similar devices. The wearable sensor was developed by Tended, one of a number of start-up companies supported by GCHQ (see the CIA and DARPA). The device can be worn on the wrist or as a tag on the waistband and will vibrate whenever someone wearing the device breaches social distancing and gets anywhere near natural human contact. The company had a lucky break in that it was developing a distancing sensor when the 'Covid' hoax arrived which immediately provided a potentially enormous market. How fortunate. The government in big-time Cult-controlled Ontario in Canada is investing \$2.5 million in wearable contact tracing technology that 'will alert users if they may have been exposed to the Covid-19 in the workplace and will beep or vibrate if they are within six feet of another person'. Facedrive Inc., the technology company behind this, was founded in 2016 with funding from the Ontario Together Fund and obviously they, too, had a prophet on the board of directors. The human surveillance and control technology is called TraceSCAN and would be worn by the human cyborgs in places such as airports, workplaces, construction sites, care homes and ... *schools*.

I emphasise schools with children and young people the prime targets. You know what is planned for society as a whole if you keep your eyes on the schools. They have always been places where the state program the next generation of slaves to be its compliant worker-ants – or Woker-ants these days; but in the mist of the ‘Covid’ madness they have been transformed into mind laboratories on a scale never seen before. Teachers and head teachers are just as programmed as the kids – often more so. Children are kept apart from human interaction by walk lanes, classroom distancing, staggered meal times, masks, and the rolling-out of buzzer systems. Schools are now physically laid out as a laboratory maze for lab-rats. Lunatics at a school in Anchorage, Alaska, who should be prosecuted for child abuse, took away desks and forced children to kneel (know your place) on a mat for five hours a day while wearing a mask and using their chairs as a desk. How this was supposed to impact on a ‘virus’ only these clinically insane people can tell you and even then it would be clap-trap. The school banned recess (interaction), art classes (creativity), and physical exercise (getting body and mind moving out of inertia). Everyone behind this outrage should be in jail or better still a mental institution. The behavioural manipulators are all for this dystopian approach to schools. Professor Susan Michie, the mind-doctor and British Communist Party member, said it was wrong to say that schools were safe. They had to be made so by ‘distancing’, masks and ventilation (sitting all day in the cold). I must ask this lady round for dinner on a night I know I am going to be out and not back for weeks. She probably wouldn’t be able to make it, anyway, with all the visits to her own psychologist she must have block-booked.

Masking identity

I know how shocking it must be for you that a behaviour manipulator like Michie wants everyone to wear masks which have long been a feature of mind-control programs like the infamous MKUltra in the United States, but, there we are. We live and learn. I spent many years from 1996 to right across the millennium

researching mind control in detail on both sides of the Atlantic and elsewhere. I met a large number of mind-control survivors and many had been held captive in body and mind by MKUltra. MK stands for mind-control, but employs the German spelling in deference to the Nazis spirited out of Germany at the end of World War Two by Operation Paperclip in which the US authorities, with help from the Vatican, transported Nazi mind-controllers and engineers to America to continue their work. Many of them were behind the creation of NASA and they included Nazi scientist and SS officer Wernher von Braun who swapped designing V-2 rockets to bombard London with designing the Saturn V rockets that powered the NASA moon programme's Apollo craft. I think I may have mentioned that the Cult has no borders. Among Paperclip escapees was Josef Mengele, the Angel of Death in the Nazi concentration camps where he conducted mind and genetic experiments on children often using twins to provide a control twin to measure the impact of his 'work' on the other. If you want to observe the Cult mentality in all its extremes of evil then look into the life of Mengele. I have met many people who suffered mercilessly under Mengele in the United States where he operated under the name Dr Greene and became a stalwart of MKUltra programming and torture. Among his locations was the underground facility in the Mojave Desert in California called the China Lake Naval Weapons Station which is almost entirely below the surface. My books *The Biggest Secret*, *Children of the Matrix* and *The Perception Deception* have the detailed background to MKUltra.

The best-known MKUltra survivor is American Cathy O'Brien. I first met her and her late partner Mark Phillips at a conference in Colorado in 1996. Mark helped her escape and deprogram from decades of captivity in an offshoot of MKUltra known as Project Monarch in which 'sex slaves' were provided for the rich and famous including Father George Bush, Dick Cheney and the Clintons. Read Cathy and Mark's book *Trance-Formation of America* and if you are new to this you will be shocked to the core. I read it in 1996 shortly before, with the usual synchronicity of my life, I found

myself given a book table at the conference right next to hers. MKUltra never ended despite being very publicly exposed (only a small part of it) in the 1970s and continues in other guises. I am still in touch with Cathy. She contacted me during 2020 after masks became compulsory in many countries to tell me how they were used as part of MKUltra programming. I had been observing 'Covid regulations' and the relationship between authority and public for months. I saw techniques that I knew were employed on individuals in MKUltra being used on the global population. I had read many books and manuals on mind control including one called *Silent Weapons for Quiet Wars* which came to light in the 1980s and was a guide on how to perceptually program on a mass scale. 'Silent Weapons' refers to mind-control. I remembered a line from the manual as governments, medical authorities and law enforcement agencies have so obviously talked to – or rather at – the adult population since the 'Covid' hoax began as if they are children. The document said:

If a person is spoken to by a T.V. advertiser as if he were a twelve-year-old, then, due to suggestibility, he will, with a certain probability, respond or react to that suggestion with the uncritical response of a twelve-year-old and will reach in to his economic reservoir and deliver its energy to buy that product on impulse when he passes it in the store.

That's why authority has spoken to adults like children since all this began.

Why did Michael Jackson wear masks?

Every aspect of the 'Covid' narrative has mind-control as its central theme. Cathy O'Brien wrote an article for davidicke.com about the connection between masks and mind control. Her daughter Kelly who I first met in the 1990s was born while Cathy was still held captive in MKUltra. Kelly was forced to wear a mask as part of her programming from the age of *two* to dehumanise her, target her sense of individuality and reduce the amount of oxygen her brain and body received. *Bingo*. This is the real reason for compulsory

masks, why they have been enforced en masse, and why they seek to increase the number they demand you wear. First one, then two, with one disgraceful alleged 'doctor' recommending four which is nothing less than a death sentence. Where and how often they must be worn is being expanded for the purpose of mass mind control and damaging respiratory health which they can call 'Covid-19'. Canada's government headed by the man-child Justin Trudeau, says it's fine for children of two and older to wear masks. An insane 'study' in Italy involving just 47 children concluded there was no problem for babies as young as *four months* wearing them. Even after people were 'vaccinated' they were still told to wear masks by the criminal that is Anthony Fauci. Cathy wrote that mandating masks is allowing the authorities literally to control the air we breathe which is what was done in MKUltra. You might recall how the singer Michael Jackson wore masks and there is a reason for that. He was subjected to MKUltra mind control through Project Monarch and his psyche was scrambled by these simpletons. Cathy wrote:

In MKUltra Project Monarch mind control, Michael Jackson had to wear a mask to silence his voice so he could not reach out for help. Remember how he developed that whisper voice when he wasn't singing? Masks control the mind from the outside in, like the redefining of words is doing. By controlling what we can and cannot say for fear of being labeled racist or beaten, for example, it ultimately controls thought that drives our words and ultimately actions (or lack thereof).

Likewise, a mask muffles our speech so that we are not heard, which controls voice ... words ... mind. This is Mind Control. Masks are an obvious mind control device, and I am disturbed so many people are complying on a global scale. Masks depersonalize while making a person feel as though they have no voice. It is a barrier to others. People who would never choose to comply but are forced to wear a mask in order to keep their job, and ultimately their family fed, are compromised. They often feel shame and are subdued. People have stopped talking with each other while media controls the narrative.

The 'no voice' theme has often become literal with train passengers told not to speak to each other in case they pass on the 'virus', singing banned for the same reason and bonkers California officials telling people riding roller coasters that they cannot shout and scream. Cathy said she heard every day from healed MKUltra survivors who cannot wear a mask without flashing back on ways

their breathing was controlled – ‘from ball gags and penises to water boarding’. She said that through the years when she saw images of people in China wearing masks ‘due to pollution’ that it was really to control their oxygen levels. ‘I knew it was as much of a population control mechanism of depersonalisation as are burkas’, she said. Masks are another Chinese communist/fascist method of control that has been swept across the West as the West becomes China at lightning speed since we entered 2020.

Mask-19

There are other reasons for mandatory masks and these include destroying respiratory health to call it ‘Covid-19’ and stunting brain development of children and the young. Dr Margarite Griesz-Brisson MD, PhD, is a Consultant Neurologist and Neurophysiologist and the Founder and Medical Director of the London Neurology and Pain Clinic. Her CV goes down the street and round the corner. She is clearly someone who cares about people and won’t parrot the propaganda. Griesz-Brisson has a PhD in pharmacology, with special interest in neurotoxicology, environmental medicine, neuroregeneration and neuroplasticity (the way the brain can change in the light of information received). She went public in October, 2020, with a passionate warning about the effects of mask-wearing laws:

The reinhalation of our exhaled air will without a doubt create oxygen deficiency and a flooding of carbon dioxide. We know that the human brain is very sensitive to oxygen deprivation. There are nerve cells for example in the hippocampus that can’t be longer than 3 minutes without oxygen – they cannot survive. The acute warning symptoms are headaches, drowsiness, dizziness, issues in concentration, slowing down of reaction time – reactions of the cognitive system.

Oh, I know, let’s tell bus, truck and taxi drivers to wear them and people working machinery. How about pilots, doctors and police? Griesz-Brisson makes the important point that while the symptoms she mentions may fade as the body readjusts this does not alter the fact that people continue to operate in oxygen deficit with long list of

potential consequences. She said it was well known that neurodegenerative diseases take years or decades to develop. 'If today you forget your phone number, the breakdown in your brain would have already started 20 or 30 years ago.' She said degenerative processes in your brain are getting amplified as your oxygen deprivation continues through wearing a mask. Nerve cells in the brain are unable to divide themselves normally in these circumstances and lost nerve cells will no longer be regenerated. 'What is gone is gone.' Now consider that people like shop workers and *schoolchildren* are wearing masks for hours every day. What in the name of sanity is going to be happening to them? 'I do not wear a mask, I need my brain to think', Griesz-Brisson said, 'I want to have a clear head when I deal with my patients and not be in a carbon dioxide-induced anaesthesia'. If you are told to wear a mask anywhere ask the organisation, police, store, whatever, for their risk assessment on the dangers and negative effects on mind and body of enforcing mask-wearing. They won't have one because it has never been done not even by government. All of them must be subject to class-action lawsuits as the consequences come to light. They don't do mask risk assessments for an obvious reason. They know what the conclusions would be and independent scientific studies that *have* been done tell a horror story of consequences.

'Masks are criminal'

Dr Griesz-Brisson said that for children and adolescents, masks are an absolute no-no. They had an extremely active and adaptive immune system and their brain was incredibly active with so much to learn. 'The child's brain, or the youth's brain, is thirsting for oxygen.' The more metabolically active an organ was, the more oxygen it required; and in children and adolescents every organ was metabolically active. Griesz-Brisson said that to deprive a child's or adolescent's brain of oxygen, or to restrict it in any way, was not only dangerous to their health, it was absolutely criminal. 'Oxygen deficiency inhibits the development of the brain, and the damage that has taken place as a result CANNOT be reversed.' Mind

manipulators of MKUltra put masks on two-year-olds they wanted to neurologically rewire and you can see why. Griesz-Brisson said a child needs the brain to learn and the brain needs oxygen to function. 'We don't need a clinical study for that. This is simple, indisputable physiology.' Consciously and purposely induced oxygen deficiency was an absolutely deliberate health hazard, and an absolute medical contraindication which means that 'this drug, this therapy, this method or measure should not be used, and is not allowed to be used'. To coerce an entire population to use an absolute medical contraindication by force, she said, there had to be definite and serious reasons and the reasons must be presented to competent interdisciplinary and independent bodies to be verified and authorised. She had this warning of the consequences that were coming if mask wearing continued:

When, in ten years, dementia is going to increase exponentially, and the younger generations couldn't reach their god-given potential, it won't help to say 'we didn't need the masks'. I know how damaging oxygen deprivation is for the brain, cardiologists know how damaging it is for the heart, pulmonologists know how damaging it is for the lungs. Oxygen deprivation damages every single organ. Where are our health departments, our health insurance, our medical associations? It would have been their duty to be vehemently against the lockdown and to stop it and stop it from the very beginning.

Why do the medical boards issue punishments to doctors who give people exemptions? Does the person or the doctor seriously have to prove that oxygen deprivation harms people? What kind of medicine are our doctors and medical associations representing? Who is responsible for this crime? The ones who want to enforce it? The ones who let it happen and play along, or the ones who don't prevent it?

All of the organisations and people she mentions there either answer directly to the Cult or do whatever hierarchical levels above them tell them to do. The outcome of both is the same. 'It's not about masks, it's not about viruses, it's certainly not about your health', Griesz-Brisson said. 'It is about much, much more. I am not participating. I am not afraid.' They were taking our air to breathe and there was no unfounded medical exemption from face masks. Oxygen deprivation was dangerous for every single brain. It had to be the free decision of every human being whether they want to

wear a mask that was absolutely ineffective to protect themselves from a virus. She ended by rightly identifying where the responsibility lies for all this:

The imperative of the hour is personal responsibility. We are responsible for what we think, not the media. We are responsible for what we do, not our superiors. We are responsible for our health, not the World Health Organization. And we are responsible for what happens in our country, not the government.

Halle-bloody-lujah.

But surgeons wear masks, right?

Independent studies of mask-wearing have produced a long list of reports detailing mental, emotional and physical dangers. What a definition of insanity to see police officers imposing mask-wearing on the public which will cumulatively damage their health while the police themselves wear masks that will cumulatively damage *their* health. It's utter madness and both public and police do this because 'the government says so' – yes a government of brain-donor idiots like UK Health Secretary Matt Hancock reading the 'follow the science' scripts of psychopathic, lunatic psychologists. The response you get from Stockholm syndrome sufferers defending the very authorities that are destroying them and their families is that 'surgeons wear masks'. This is considered the game, set and match that they must work and don't cause oxygen deficit. Well, actually, scientific studies have shown that they *do* and oxygen levels are monitored in operating theatres to compensate. Surgeons wear masks to stop spittle and such like dropping into open wounds – not to stop 'viral particles' which are so miniscule they can only be seen through an electron microscope. Holes in the masks are significantly bigger than 'viral particles' and if you sneeze or cough they will breach the mask. I watched an incredibly disingenuous 'experiment' that claimed to prove that masks work in catching 'virus' material from the mouth and nose. They did this with a slow motion camera and the mask did block big stuff which stayed inside the mask and

against the face to be breathed in or cause infections on the face as we have seen with many children. 'Viral particles', however, would never have been picked up by the camera as they came through the mask when they are far too small to be seen. The 'experiment' was therefore disingenuous *and* useless.

Studies have concluded that wearing masks in operating theatres (and thus elsewhere) make no difference to preventing infection while the opposite is true with toxic shite building up in the mask and this had led to an explosion in tooth decay and gum disease dubbed by dentists 'mask mouth'. You might have seen the Internet video of a furious American doctor urging people to take off their masks after a four-year-old patient had been rushed to hospital the night before and nearly died with a lung infection that doctors sourced to mask wearing. A study in the journal *Cancer Discovery* found that inhalation of harmful microbes can contribute to advanced stage lung cancer in adults and long-term use of masks can help breed dangerous pathogens. Microbiologists have said frequent mask wearing creates a moist environment in which microbes can grow and proliferate before entering the lungs. The Canadian Agency for Drugs and Technologies in Health, or CADTH, a Canadian national organisation that provides research and analysis to healthcare decision-makers, said this as long ago as 2013 in a report entitled 'Use of Surgical Masks in the Operating Room: A Review of the Clinical Effectiveness and Guidelines'. It said:

- No evidence was found to support the use of surgical face masks to reduce the frequency of surgical site infections
- No evidence was found on the effectiveness of wearing surgical face masks to protect staff from infectious material in the operating room.
- Guidelines recommend the use of surgical face masks by staff in the operating room to protect both operating room staff and patients (despite the lack of evidence).

We were told that the world could go back to 'normal' with the arrival of the 'vaccines'. When they came, fraudulent as they are, the story changed as I knew that it would. We are in the midst of transforming 'normal', not going back to it. Mary Ramsay, head of immunisation at Public Health England, echoed the words of US criminal Anthony Fauci who said masks and other regulations must stay no matter if people are vaccinated. The Fauci idiot continued to wear two masks – different colours so both could be clearly seen – after he *claimed* to have been vaccinated. Senator Rand Paul told Fauci in one exchange that his double-masks were 'theatre' and he was right. It's all theatre. Mary Ramsay back-tracked on the vaccine-return-to-normal theme when she said the public may need to wear masks and social-distance for years despite the jabs. 'People have got used to those lower-level restrictions now, and [they] can live with them', she said telling us what the idea has been all along. 'The vaccine does not give you a pass, even if you have had it, you must continue to follow all the guidelines' said a Public Health England statement which reneged on what we had been told before and made having the 'vaccine' irrelevant to 'normality' even by the official story. Spain's fascist government trumped everyone by passing a law mandating the wearing of masks on the beach and even when swimming in the sea. The move would have devastated what's left of the Spanish tourist industry, posed potential breathing dangers to swimmers and had Northern European sunbathers walking around with their forehead brown and the rest of their face white as a sheet. The ruling was so crazy that it had to be retracted after pressure from public and tourist industry, but it confirmed where the Cult wants to go with masks and how clinically insane authority has become. The determination to make masks permanent and hide the serious dangers to body and mind can be seen in the censorship of scientist Professor Denis Rancourt by Bill Gates-funded academic publishing website ResearchGate over his papers exposing the dangers and uselessness of masks. Rancourt said:

ResearchGate today has permanently locked my account, which I have had since 2015. Their reasons graphically show the nature of their attack against democracy, and their corruption of

science ... By their obscene non-logic, a scientific review of science articles reporting on harms caused by face masks has a 'potential to cause harm'. No criticism of the psychological device (face masks) is tolerated, if the said criticism shows potential to influence public policy.

This is what happens in a fascist world.

Where are the 'greens' (again)?

Other dangers of wearing masks especially regularly relate to the inhalation of minute plastic fibres into the lungs and the deluge of discarded masks in the environment and oceans. Estimates predicted that more than 1.5 billion disposable masks will end up in the world's oceans every year polluting the water with tons of plastic and endangering marine wildlife. Studies project that humans are using 129 billion face masks each month worldwide – about three million a minute. Most are disposable and made from plastic, non-biodegradable microfibers that break down into smaller plastic particles that become widespread in ecosystems. They are littering cities, clogging sewage channels and turning up in bodies of water. I have written in other books about the immense amounts of microplastics from endless sources now being absorbed into the body. Rolf Halden, director of the Arizona State University (ASU) Biodesign Center for Environmental Health Engineering, was the senior researcher in a 2020 study that analysed 47 human tissue samples and found microplastics in all of them. 'We have detected these chemicals of plastics in every single organ that we have investigated', he said. I wrote in *The Answer* about the world being deluged with microplastics. A study by the Worldwide Fund for Nature (WWF) found that people are consuming on average every week some 2,000 tiny pieces of plastic mostly through water and also through marine life and the air. Every year humans are ingesting enough microplastics to fill a heaped dinner plate and in a life-time of 79 years it is enough to fill two large waste bins. Marco Lambertini, WWF International director general said: 'Not only are plastics polluting our oceans and waterways and killing marine life – it's in all of us and we can't escape consuming plastics,' American

geologists found tiny plastic fibres, beads and shards in rainwater samples collected from the remote slopes of the Rocky Mountain National Park near Denver, Colorado. Their report was headed: 'It is raining plastic.' Rachel Adams, senior lecturer in Biomedical Science at Cardiff Metropolitan University, said that among health consequences are internal inflammation and immune responses to a 'foreign body'. She further pointed out that microplastics become carriers of toxins including mercury, pesticides and dioxins (a known cause of cancer and reproductive and developmental problems). These toxins accumulate in the fatty tissues once they enter the body through microplastics. Now this is being compounded massively by people putting plastic on their face and throwing it away.

Workers exposed to polypropylene plastic fibres known as 'flock' have developed 'flock worker's lung' from inhaling small pieces of the flock fibres which can damage lung tissue, reduce breathing capacity and exacerbate other respiratory problems. *Now ...* commonly used surgical masks have three layers of melt-blown textiles made of ... polypropylene. We have billions of people putting these microplastics against their mouth, nose and face for hours at a time day after day in the form of masks. How does anyone think that will work out? I mean – what could possibly go wrong? We posted a number of scientific studies on this at davidicke.com, but when I went back to them as I was writing this book the links to the science research website where they were hosted were dead. Anything that challenges the official narrative in any way is either censored or vilified. The official narrative is so unsupportable by the evidence that only deleting the truth can protect it. A study by Chinese scientists still survived – with the usual twist which it why it was still active, I guess. Yes, they found that virtually all the masks they tested increased the daily intake of microplastic fibres, but people should still wear them because the danger from the 'virus' was worse said the crazy 'team' from the Institute of Hydrobiology in Wuhan. Scientists first discovered microplastics in lung tissue of some patients who died of lung cancer

in the 1990s. Subsequent studies have confirmed the potential health damage with the plastic degrading slowly and remaining in the lungs to accumulate in volume. Wuhan researchers used a machine simulating human breathing to establish that masks shed up to nearly 4,000 microplastic fibres in a month with reused masks producing more. Scientists said some masks are laced with toxic chemicals and a variety of compounds seriously restricted for both health and environmental reasons. They include cobalt (used in blue dye) and formaldehyde known to cause watery eyes, burning sensations in the eyes, nose, and throat, plus coughing, wheezing and nausea. No – that must be ‘Covid-19’.

Mask ‘worms’

There is another and potentially even more sinister content of masks. Mostly new masks of different makes filmed under a microscope around the world have been found to contain strange black fibres or ‘worms’ that appear to move or ‘crawl’ by themselves and react to heat and water. The nearest I have seen to them are the self-replicating fibres that are pulled out through the skin of those suffering from Morgellons disease which has been connected to the phenomena of ‘chemtrails’ which I will bring into the story later on. Morgellons fibres continue to grow outside the body and have a form of artificial intelligence. Black ‘worm’ fibres in masks have that kind of feel to them and there is a nanotechnology technique called ‘worm micelles’ which carry and release drugs or anything else you want to deliver to the body. For sure the suppression of humanity by mind altering drugs is the Cult agenda big time and the more excuses they can find to gain access to the body the more opportunities there are to make that happen whether through ‘vaccines’ or masks pushed against the mouth and nose for hours on end.

So let us summarise the pros and cons of masks:

Against masks: Breathing in your own carbon dioxide; depriving the body and brain of sufficient oxygen; build-up of toxins in the mask that can be breathed into the lungs and cause rashes on the face and 'mask-mouth'; breathing microplastic fibres and toxic chemicals into the lungs; dehumanisation and deleting individualisation by literally making people faceless; destroying human emotional interaction through facial expression and deleting parental connection with their babies which look for guidance to their facial expression.

For masks: They don't protect you from a 'virus' that doesn't exist and even if it did 'viral' particles are so minute they are smaller than the holes in the mask.

Governments, police, supermarkets, businesses, transport companies, and all the rest who seek to impose masks have done no risk assessment on their consequences for health and psychology and are now open to group lawsuits when the impact becomes clear with a cumulative epidemic of respiratory and other disease. Authorities will try to exploit these effects and hide the real cause by dubbing them 'Covid-19'. Can you imagine setting out to force the population to wear health-destroying masks without doing any assessment of the risks? It is criminal and it is evil, but then how many people targeted in this way, who see their children told to wear them all day at school, have asked for a risk assessment? Billions can't be imposed upon by the few unless the billions allow it. Oh, yes, with just a tinge of irony, 85 percent of all masks made worldwide come from *China*.

Wash your hands in toxic shite

'Covid' rules include the use of toxic sanitisers and again the health consequences of constantly applying toxins to be absorbed through the skin is obvious to any level of Renegade Mind. America's Food and Drug Administration (FDA) said that sanitisers are drugs and issued a warning about 75 dangerous brands which contain

methanol used in antifreeze and can cause death, kidney damage and blindness. The FDA circulated the following warning even for those brands that it claims to be safe:

Store hand sanitizer out of the reach of pets and children, and children should use it only with adult supervision. Do not drink hand sanitizer. This is particularly important for young children, especially toddlers, who may be attracted by the pleasant smell or brightly colored bottles of hand sanitizer.

Drinking even a small amount of hand sanitizer can cause alcohol poisoning in children. (However, there is no need to be concerned if your children eat with or lick their hands after using hand sanitizer.) During this coronavirus pandemic, poison control centers have had an increase in calls about accidental ingestion of hand sanitizer, so it is important that adults monitor young children's use.

Do not allow pets to swallow hand sanitizer. If you think your pet has eaten something potentially dangerous, call your veterinarian or a pet poison control center right away. Hand sanitizer is flammable and should be stored away from heat and flames. When using hand sanitizer, rub your hands until they feel completely dry before performing activities that may involve heat, sparks, static electricity, or open flames.

There you go, perfectly safe, then, and that's without even a mention of the toxins absorbed through the skin. Come on kids – sanitise your hands everywhere you go. It will save you from the 'virus'. Put all these elements together of the 'Covid' normal and see how much health and psychology is being cumulatively damaged, even devastated, to 'protect your health'. Makes sense, right? They are only imposing these things because they care, right? *Right?*

Submitting to insanity

Psychological reframing of the population goes very deep and is done in many less obvious ways. I hear people say how contradictory and crazy 'Covid' rules are and how they are ever changing. This is explained away by dismissing those involved as idiots. It is a big mistake. The Cult is delighted if its cold calculation is perceived as incompetence and idiocy when it is anything but. Oh, yes, there are idiots within the system – lots of them – but they are *administering* the Cult agenda, mostly unknowingly. They are not deciding and dictating it. The bulwark against tyranny is self-

respect, always has been, always will be. It is self-respect that has broken every tyranny in history. By its very nature self-respect will not bow to oppression and its perpetrators. There is so little self-respect that it's always the few that overturn dictators. Many may eventually follow, but the few with the iron spines (self-respect) kick it off and generate the momentum. The Cult targets self-respect in the knowledge that once this has gone only submission remains. Crazy, contradictory, ever-changing 'Covid' rules are systematically applied by psychologists to delete self-respect. They *want* you to see that the rules make no sense. It is one thing to decide to do something when *you* have made the choice based on evidence and logic. You still retain your self-respect. It is quite another when you can see what you are being told to do is insane, ridiculous and makes no sense, and *yet you still do it*. Your self-respect is extinguished and this has been happening as ever more obviously stupid and nonsensical things have been demanded and the great majority have complied even when they can see they are stupid and nonsensical.

People walk around in face-nappies knowing they are damaging their health and make no difference to a 'virus'. They do it in fear of not doing it. I know it's daft, but I'll do it anyway. When that happens something dies inside of you and submissive reframing has begun. Next there's a need to hide from yourself that you have conceded your self-respect and you convince yourself that you have not really submitted to fear and intimidation. You begin to believe that you are complying with craziness because it's the right thing to do. When first you concede your self-respect of $2+2 = 4$ to $2+2 = 5$ you *know* you are compromising your self-respect. Gradually to avoid facing that fact you begin to *believe* that $2+2=5$. You have been reframed and I have been watching this process happening in the human psyche on an industrial scale. The Cult is working to break your spirit and one of its major tools in that war is humiliation. I read how former American soldier Bradley Manning (later Chelsea Manning after a sex-change) was treated after being jailed for supplying WikiLeaks with documents exposing the enormity of

government and elite mendacity. Manning was isolated in solitary confinement for eight months, put under 24-hour surveillance, forced to hand over clothing before going to bed, and stand naked for every roll call. This is systematic humiliation. The introduction of anal swab 'Covid' tests in China has been done for the same reason to delete self-respect and induce compliant submission. Anal swabs are mandatory for incoming passengers in parts of China and American diplomats have said they were forced to undergo the indignity which would have been calculated humiliation by the Cult-owned Chinese government that has America in its sights.

Government-people: An abusive relationship

Spirit-breaking psychological techniques include giving people hope and apparent respite from tyranny only to take it away again. This happened in the UK during Christmas, 2020, when the psycho-psychologists and their political lackeys announced an easing of restrictions over the holiday only to reimpose them almost immediately on the basis of yet another lie. There is a big psychological difference between getting used to oppression and being given hope of relief only to have that dashed. Psychologists know this and we have seen the technique used repeatedly. Then there is traumatising people before you introduce more extreme regulations that require compliance. A perfect case was the announcement by the dark and sinister Whitty and Vallance in the UK that 'new data' predicted that 4,000 could die every day over the winter of 2020/2021 if we did not lockdown again. I think they call it lying and after traumatising people with that claim out came Jackboot Johnson the next day with new curbs on human freedom. Psychologists know that a frightened and traumatised mind becomes suggestable to submission and behaviour reframing. Underpinning all this has been to make people fearful and suspicious of each other and see themselves as a potential danger to others. In league with deleted self-respect you have the perfect psychological recipe for self-loathing. The relationship between authority and public is now demonstrably the same as that of

subservience to an abusive partner. These are signs of an abusive relationship explained by psychologist Leslie Becker-Phelps:

Psychological and emotional abuse: Undermining a partner's self-worth with verbal attacks, name-calling, and belittling. Humiliating the partner in public, unjustly accusing them of having an affair, or interrogating them about their every behavior. Keeping partner confused or off balance by saying they were just kidding or blaming the partner for 'making' them act this way ... Feigning in public that they care while turning against them in private. This leads to victims frequently feeling confused, incompetent, unworthy, hopeless, and chronically self-doubting. [Apply these techniques to how governments have treated the population since New Year, 2020, and the parallels are obvious.]

Physical abuse: The abuser might physically harm their partner in a range of ways, such as grabbing, hitting, punching, or shoving them. They might throw objects at them or harm them with a weapon. [Observe the physical harm imposed by masks, lockdown, and so on.]

Threats and intimidation: One way abusers keep their partners in line is by instilling fear. They might be verbally threatening, or give threatening looks or gestures. Abusers often make it known that they are tracking their partner's every move. They might destroy their partner's possessions, threaten to harm them, or threaten to harm their family members. Not surprisingly, victims of this abuse often feel anxiety, fear, and panic. [No words necessary.]

Isolation: Abusers often limit their partner's activities, forbidding them to talk or interact with friends or family. They might limit access to a car or even turn off their phone. All of this might be done by physically holding them against their will, but is often accomplished through psychological abuse and intimidation. The more isolated a person feels, the fewer resources they have to help gain perspective on their situation and to escape from it. [No words necessary.]

Economic abuse: Abusers often make their partners beholden to them for money by controlling access to funds of any kind. They might prevent their partner from getting a job or withhold access to money they earn from a job. This creates financial dependency that makes leaving the relationship very difficult. [See destruction of livelihoods and the proposed meagre 'guaranteed income' so long as you do whatever you are told.]

Using children: An abuser might disparage their partner's parenting skills, tell their children lies about their partner, threaten to take custody of their children, or threaten to harm their children. These tactics instil fear and often elicit compliance. [See reframed social service mafia and how children are being mercilessly abused by the state over 'Covid' while their parents look on too frightened to do anything.]

A further recurring trait in an abusive relationship is the abused blaming themselves for their abuse and making excuses for the abuser. We have the public blaming each other for lockdown abuse by government and many making excuses for the government while attacking those who challenge the government. How often we have heard authorities say that rules are being imposed or reimposed only because people have refused to 'behave' and follow the rules. We don't want to do it – it's *you*.

Renegade Minds are an antidote to all of these things. They will never concede their self-respect no matter what the circumstances. Even when apparent humiliation is heaped upon them they laugh in its face and reflect back the humiliation on the abuser where it belongs. Renegade Minds will never wear masks they know are only imposed to humiliate, suppress and damage both physically and psychologically. Consequences will take care of themselves and they will never break their spirit or cause them to concede to tyranny. UK newspaper columnist Peter Hitchens was one of the few in the mainstream media to speak out against lockdowns and forced vaccinations. He then announced he had taken the jab. He wanted to see family members abroad and he believed vaccine passports were inevitable even though they had not yet been introduced. Hitchens

has a questioning and critical mind, but not a Renegade one. If he had no amount of pressure would have made him concede. Hitchens excused his action by saying that the battle has been lost. Renegade Minds never accept defeat when freedom is at stake and even if they are the last one standing the self-respect of not submitting to tyranny is more important than any outcome or any consequence.

That's why Renegade Minds are the only minds that ever changed anything worth changing.

CHAPTER EIGHT

'Reframing' insanity

Insanity is relative. It depends on who has who locked in what cage
Ray Bradbury

Reframing' a mind means simply to change its perception and behaviour. This can be done subconsciously to such an extent that subjects have no idea they have been 'reframed' while to any observer changes in behaviour and attitudes are obvious.

Human society is being reframed on a ginormous scale since the start of 2020 and here we have the reason why psychologists rather than doctors have been calling the shots. Ask most people who have succumbed to 'Covid' reframing if they have changed and most will say 'no'; but they *have* and fundamentally. The Cult's long-game has been preparing for these times since way back and crucial to that has been to prepare both population and officialdom mentally and emotionally. To use the mind-control parlance they had to reframe the population with a mentality that would submit to fascism and reframe those in government and law enforcement to impose fascism or at least go along with it. The result has been the fact-deleted mindlessness of 'Wokeness' and officialdom that has either enthusiastically or unquestioningly imposed global tyranny demanded by reframed politicians on behalf of psychopathic and deeply evil cultists. 'Cognitive reframing' identifies and challenges the way someone sees the world in the form of situations, experiences and emotions and then restructures those perceptions to view the same set of circumstances in a different way. This can have

benefits if the attitudes are personally destructive while on the other side it has the potential for individual and collective mind control which the subject has no idea has even happened.

Cognitive therapy was developed in the 1960s by Aaron T. Beck who was born in Rhode Island in 1921 as the son of Jewish immigrants from the Ukraine. He became interested in the techniques as a treatment for depression. Beck's daughter Judith S. Beck is prominent in the same field and they founded the Beck Institute for Cognitive Behavior Therapy in Philadelphia in 1994. Cognitive reframing, however, began to be used worldwide by those with a very dark agenda. The Cult reframes politicians to change their attitudes and actions until they are completely at odds with what they once appeared to stand for. The same has been happening to government administrators at all levels, law enforcement, military and the human population. Cultists love mind control for two main reasons: It allows them to control what people think, do and say to secure agenda advancement and, by definition, it calms their legendary insecurity and fear of the unexpected. I have studied mind control since the time I travelled America in 1996. I may have been talking to next to no one in terms of an audience in those years, but my goodness did I gather a phenomenal amount of information and knowledge about so many things including the techniques of mind control. I have described this in detail in other books going back to *The Biggest Secret* in 1998. I met a very large number of people recovering from MKUltra and its offshoots and successors and I began to see how these same techniques were being used on the population in general. This was never more obvious than since the 'Covid' hoax began.

Reframing the enforcers

I have observed over the last two decades and more the very clear transformation in the dynamic between the police, officialdom and the public. I tracked this in the books as the relationship mutated from one of serving the public to seeing them as almost the enemy and certainly a lower caste. There has always been a class divide

based on income and always been some psychopathic, corrupt, and big-I-am police officers. This was different. Wholesale change was unfolding in the collective dynamic; it was less about money and far more about position and perceived power. An us-and-them was emerging. Noses were lifted skyward by government administration and law enforcement and their attitude to the public they were *supposed* to be serving changed to one of increasing contempt, superiority and control. The transformation was so clear and widespread that it had to be planned. Collective attitudes and dynamics do not change naturally and organically that quickly on that scale. I then came across an organisation in Britain called Common Purpose created in the late 1980s by Julia Middleton who would work in the office of Deputy Prime Minister John Prescott during the long and disastrous premiership of war criminal Tony Blair. When Blair speaks the Cult is speaking and the man should have been in jail a long time ago. Common Purpose proclaims itself to be one of the biggest 'leadership development' organisations in the world while functioning as a *charity* with all the financial benefits which come from that. It hosts 'leadership development' courses and programmes all over the world and claims to have 'brought together' what it calls 'leaders' from more than 100 countries on six continents. The modus operandi of Common Purpose can be compared with the work of the UK government's reframing network that includes the Behavioural Insights Team 'nudge unit' and 'Covid' reframing specialists at SPI-B. WikiLeaks described Common Purpose long ago as 'a hidden virus in our government and schools' which is unknown to the general public: 'It recruits and trains "leaders" to be loyal to the directives of Common Purpose and the EU, instead of to their own departments, which they then undermine or subvert, the NHS [National Health Service] being an example.' This is a vital point to understand the 'Covid' hoax. The NHS, and its equivalent around the world, has been utterly reframed in terms of administrators and much of the medical personnel with the transformation underpinned by recruitment policies. The outcome has been the criminal and psychopathic behaviour of the

NHS over 'Covid' and we have seen the same in every other major country. WikiLeaks said Common Purpose trainees are 'learning to rule without regard to democracy' and to usher in a police state (current events explained). Common Purpose operated like a 'glue' and had members in the NHS, BBC, police, legal profession, church, many of Britain's 7,000 quangos, local councils, the Civil Service, government ministries and Parliament, and controlled many RDA's (Regional Development Agencies). Here we have one answer for how and why British institutions and their like in other countries have changed so negatively in relation to the public. This further explains how and why the beyond-disgraceful reframed BBC has become a propaganda arm of 'Covid' fascism. They are all part of a network pursuing the same goal.

By 2019 Common Purpose was quoting a figure of 85,000 'leaders' that had attended its programmes. These 'students' of all ages are known as Common Purpose 'graduates' and they consist of government, state and local government officials and administrators, police chiefs and officers, and a whole range of others operating within the national, local and global establishment. Cressida Dick, Commissioner of the London Metropolitan Police, is the Common Purpose graduate who was the 'Gold Commander' that oversaw what can only be described as the murder of Brazilian electrician Jean Charles de Menezes in 2005. He was held down by psychopathic police and shot seven times in the head by a psychopathic lunatic after being mistaken for a terrorist when he was just a bloke going about his day. Dick authorised officers to pursue and keep surveillance on de Menezes and ordered that he be stopped from entering the underground train system. Police psychopaths took her at her word clearly. She was 'disciplined' for this outrage by being *promoted* – eventually to the top of the 'Met' police where she has been a disaster. Many Chief Constables controlling the police in different parts of the UK are and have been Common Purpose graduates. I have heard the 'graduate' network described as a sort of Mafia or secret society operating within the fabric of government at all levels pursuing a collective policy

ingrained at Common Purpose training events. Founder Julia Middleton herself has said:

Locally and internationally, Common Purpose graduates will be 'lighting small fires' to create change in their organisations and communities ... The Common Purpose effect is best illustrated by the many stories of small changes brought about by leaders, who themselves have changed.

A Common Purpose mission statement declared:

Common Purpose aims to improve the way society works by expanding the vision, decision-making ability and influence of all kinds of leaders. The organisation runs a variety of educational programmes for leaders of all ages, backgrounds and sectors, in order to provide them with the inspirational, information and opportunities they need to change the world.

Yes, but into what? Since 2020 the answer has become clear.

NLP and the Delphi technique

Common Purpose would seem to be a perfect name or would common programming be better? One of the foundation methods of reaching 'consensus' (group think) is by setting the agenda theme and then encouraging, cajoling or pressuring everyone to agree a 'consensus' in line with the core theme promoted by Common Purpose. The methodology involves the 'Delphi technique', or an adaption of it, in which opinions are expressed that are summarised by a 'facilitator or change agent' at each stage. Participants are 'encouraged' to modify their views in the light of what others have said. Stage by stage the former individual opinions are merged into group consensus which just happens to be what Common Purpose wants them to believe. A key part of this is to marginalise anyone refusing to concede to group think and turn the group against them to apply pressure to conform. We are seeing this very technique used on the general population to make 'Covid' group-thinkers hostile to those who have seen through the bullshit. People can be reframed by using perception manipulation methods such as Neuro-Linguistic Programming (NLP) in which you change perception with the use of

carefully constructed language. An NLP website described the technique this way:

... A method of influencing brain behaviour (the 'neuro' part of the phrase) through the use of language (the 'linguistic' part) and other types of communication to enable a person to 'recode' the way the brain responds to stimuli (that's the 'programming') and manifest new and better behaviours. Neuro-Linguistic Programming often incorporates hypnosis and self-hypnosis to help achieve the change (or 'programming') that is wanted.

British alternative media operation UKColumn has done very detailed research into Common Purpose over a long period. I quoted co-founder and former naval officer Brian Gerrish in my book *Remember Who You Are*, published in 2011, as saying the following years before current times:

It is interesting that many of the mothers who have had children taken by the State speak of the Social Services people being icily cool, emotionless and, as two ladies said in slightly different words, '... like little robots'. We know that NLP is cumulative, so people can be given small imperceptible doses of NLP in a course here, another in a few months, next year etc. In this way, major changes are accrued in their personality, but the day by day change is almost unnoticeable.

In these and other ways 'graduates' have had their perceptions uniformly reframed and they return to their roles in the institutions of government, law enforcement, legal profession, military, 'education', the UK National Health Service and the whole swathe of the establishment structure to pursue a common agenda preparing for the 'post-industrial', 'post-democratic' society. I say 'preparing' but we are now there. 'Post-industrial' is code for the Great Reset and 'post-democratic' is 'Covid' fascism. UKColumn has spoken to partners of those who have attended Common Purpose 'training'. They have described how personalities and attitudes of 'graduates' changed very noticeably for the worse by the time they had completed the course. They had been 'reframed' and told they are the 'leaders' – the special ones – who know better than the population. There has also been the very demonstrable recruitment of psychopaths and narcissists into government administration at all

levels and law enforcement. If you want psychopathy hire psychopaths and you get a simple cause and effect. If you want administrators, police officers and 'leaders' to perceive the public as lesser beings who don't matter then employ narcissists. These personalities are identified using 'psychometrics' that identifies knowledge, abilities, attitudes and personality traits, mostly through carefully-designed questionnaires and tests. As this policy has passed through the decades we have had power-crazy, power-trippers appointed into law enforcement, security and government administration in preparation for current times and the dynamic between public and law enforcement/officialdom has been transformed. UKColumn's Brian Gerrish said of the narcissistic personality:

Their love of themselves and power automatically means that they will crush others who get in their way. I received a major piece of the puzzle when a friend pointed out that when they made public officials re-apply for their own jobs several years ago they were also required to do psychometric tests. This was undoubtedly the start of the screening process to get 'their' sort of people in post.

How obvious that has been since 2020 although it was clear what was happening long before if people paid attention to the changing public-establishment dynamic.

Change agents

At the centre of events in 'Covid' Britain is the National Health Service (NHS) which has behaved disgracefully in slavishly following the Cult agenda. The NHS management structure is awash with Common Purpose graduates or 'change agents' working to a common cause. Helen Bevan, a Chief of Service Transformation at the NHS Institute for Innovation and Improvement, co-authored a document called 'Towards a million change agents, a review of the social movements literature: implications for large scale change in the NHS'. The document compared a project management approach to that of change and social movements where 'people change

themselves and each other – peer to peer’. Two definitions given for a ‘social movement’ were:

A group of people who consciously attempt to build a radically new social order; involves people of a broad range of social backgrounds; and deploys politically confrontational and socially disruptive tactics – Cyrus Zirakzadeh 1997

Collective challenges, based on common purposes and social solidarities, in sustained interaction with elites, opponents, and authorities – Sidney Tarrow 1994

Helen Bevan wrote another NHS document in which she defined ‘framing’ as ‘the process by which leaders construct, articulate and put across their message in a powerful and compelling way in order to win people to their cause and call them to action’. I think I could come up with another definition that would be rather more accurate. The National Health Service and institutions of Britain and the wider world have been taken over by reframed ‘change agents’ and that includes everything from the United Nations to national governments, local councils and social services which have been kidnapping children from loving parents on an extraordinary and gathering scale on the road to the end of parenthood altogether. Children from loving homes are stolen and kidnapped by the state and put into the ‘care’ (inversion) of the local authority through council homes, foster parents and forced adoption. At the same time children are allowed to be abused without response while many are under council ‘care’. UKColumn highlighted the Common Purpose connection between South Yorkshire Police and Rotherham council officers in the case of the scandal in that area of the sexual exploitation of children to which the authorities turned not one blind eye, but both:

We were alarmed to discover that the Chief Executive, the Strategic Director of Children and Young People's Services, the Manager for the Local Strategic Partnership, the Community Cohesion Manager, the Cabinet Member for Cohesion, the Chief Constable and his predecessor had all attended Leadership training courses provided by the pseudo-charity Common Purpose.

Once 'change agents' have secured positions of hire and fire within any organisation things start to move very quickly. Personnel are then hired and fired on the basis of whether they will work towards the agenda the change agent represents. If they do they are rapidly promoted even though they may be incompetent. Those more qualified and skilled who are pre-Common Purpose 'old school' see their careers stall and even disappear. This has been happening for decades in every institution of state, police, 'health' and social services and all of them have been transformed as a result in their attitudes to their jobs and the public. Medical professions, including nursing, which were once vocations for the caring now employ many cold, callous and couldn't give a shit personality types. The UKColumn investigation concluded:

By blurring the boundaries between people, professions, public and private sectors, responsibility and accountability, Common Purpose encourages 'graduates' to believe that as new selected leaders, they can work together, outside of the established political and social structures, to achieve a paradigm shift or CHANGE – so called 'Leading Beyond Authority'. In doing so, the allegiance of the individual becomes 'reframed' on CP colleagues and their NETWORK.

Reframing the Face-Nappies

Nowhere has this process been more obvious than in the police where recruitment of psychopaths and development of unquestioning mind-controlled group-thinkers have transformed law enforcement into a politically-correct 'Woke' joke and a travesty of what should be public service. Today they wear their face-nappies like good little gofers and enforce 'Covid' rules which are fascism under another name. Alongside the specifically-recruited psychopaths we have software minds incapable of free thought. Brian Gerrish again:

An example is the policeman who would not get on a bike for a press photo because he had not done the cycling proficiency course. Normal people say this is political correctness gone mad. Nothing could be further from the truth. The policeman has been reframed, and in his reality it is perfect common sense not to get on the bike 'because he hasn't done the cycling course'.

Another example of this is where the police would not rescue a boy from a pond until they had taken advice from above on the 'risk assessment'. A normal person would have arrived, perhaps thought of the risk for a moment, and dived in. To the police now 'reframed', they followed 'normal' procedure.

There are shocking cases of reframed ambulance crews doing the same. Sheer unthinking stupidity of London Face-Nappies headed by Common Purpose graduate Cressida Dick can be seen in their behaviour at a vigil in March, 2021, for a murdered woman, Sarah Everard. A police officer had been charged with the crime. Anyone with a brain would have left the vigil alone in the circumstances. Instead they 'manhandled' women to stop them breaking 'Covid rules' to betray classic reframing. Minds in the thrall of perception control have no capacity for seeing a situation on its merits and acting accordingly. 'Rules is rules' is their only mind-set. My father used to say that rules and regulations are for the guidance of the intelligent and the blind obedience of the idiot. Most of the intelligent, decent, coppers have gone leaving only the other kind and a few old school for whom the job must be a daily nightmare. The combination of psychopaths and rule-book software minds has been clearly on public display in the 'Covid' era with automaton robots in uniform imposing fascistic 'Covid' regulations on the population without any personal initiative or judging situations on their merits. There are thousands of examples around the world, but I'll make my point with the infamous Derbyshire police in the English East Midlands – the ones who think pouring dye into beauty spots and using drones to track people walking in the countryside away from anyone is called 'policing'. To them there are rules decreed by the government which they have to enforce and in their bewildered state a group gathering in a closed space and someone walking alone in the countryside are the same thing. It is beyond idiocy and enters the realm of clinical insanity.

Police officers in Derbyshire said they were 'horrified' – *horrified* – to find 15 to 20 'irresponsible' kids playing a football match at a closed leisure centre 'in breach of coronavirus restrictions'. When they saw the police the kids ran away leaving their belongings behind and the reframed men and women of Derbyshire police were seeking to establish their identities with a view to fining their parents. The most natural thing for youngsters to do – kicking a ball about – is turned into a criminal activity and enforced by the moronic software programs of Derbyshire police. You find the same mentality in every country. These barely conscious 'horrified' officers said they had to take action because 'we need to ensure these rules are being followed' and 'it is of the utmost importance that you ensure your children are following the rules and regulations for Covid-19'. Had any of them done ten seconds of research to see if this parroting of their masters' script could be supported by any evidence? Nope. Reframed people don't think – others think for them and that's the whole idea of reframing. I have seen police officers one after the other repeating without question word for word what officialdom tells them just as I have seen great swathes of the public doing the same. Ask either for 'their' opinion and out spews what they have been told to think by the official narrative. Police and public may seem to be in different groups, but their mentality is the same. Most people do whatever they are told in fear not doing so or because they believe what officialdom tells them; almost the entirety of the police do what they are told for the same reason. Ultimately it's the tiny inner core of the global Cult that's telling both what to do.

So Derbyshire police were 'horrified'. Oh, really? Why did they think those kids were playing football? It was to relieve the psychological consequences of lockdown and being denied human contact with their friends and interaction, touch and discourse vital to human psychological health. Being denied this month after month has dismantled the psyche of many children and young people as depression and suicide have exploded. Were Derbyshire police *horrified by that*? Are you kidding? Reframed people don't have those

mental and emotional processes that can see how the impact on the psychological health of youngsters is far more dangerous than any 'virus' even if you take the mendacious official figures to be true. The reframed are told (programmed) how to act and so they do. The Derbyshire Chief Constable in the first period of lockdown when the black dye and drones nonsense was going on was Peter Goodman. He was the man who severed the connection between his force and the Derbyshire Constabulary *Male Voice* Choir when he decided that it was not inclusive enough to allow women to join. The fact it was a male voice choir making a particular sound produced by male voices seemed to elude a guy who terrifyingly ran policing in Derbyshire. He retired weeks after his force was condemned as disgraceful by former Supreme Court Justice Jonathan Sumption for their behaviour over extreme lockdown impositions. Goodman was replaced by his deputy Rachel Swann who was in charge when her officers were 'horrificed'. The police statement over the boys committing the hanging-offence of playing football included the line about the youngsters being 'irresponsible in the times we are all living through' missing the point that the real relevance of the 'times we are all living through' is the imposition of fascism enforced by psychopaths and reframed minds of police officers playing such a vital part in establishing the fascist tyranny that their own children and grandchildren will have to live in their entire lives. As a definition of insanity that is hard to beat although it might be run close by imposing masks on people that can have a serious effect on their health while wearing a face nappy all day themselves. Once again public and police do it for the same reason – the authorities tell them to and who are they to have the self-respect to say no?

Wokers in uniform

How reframed do you have to be to arrest a *six-year-old* and take him to court for *picking a flower* while waiting for a bus? Brain dead police and officialdom did just that in North Carolina where criminal proceedings happen regularly for children under nine. Attorney Julie Boyer gave the six-year-old crayons and a colouring book

during the 'flower' hearing while the 'adults' decided his fate. County Chief District Court Judge Jay Corpening asked: 'Should a child that believes in Santa Claus, the Easter Bunny and the tooth fairy be making life-altering decisions?' Well, of course not, but common sense has no meaning when you have a common purpose and a reframed mind. Treating children in this way, and police operating in American schools, is all part of the psychological preparation for children to accept a police state as normal all their adult lives. The same goes for all the cameras and biometric tracking technology in schools. Police training is focused on reframing them as snowflake Wokers and this is happening in the military. Pentagon top brass said that 'training sessions on extremism' were needed for troops who asked why they were so focused on the Capitol Building riot when Black Lives Matter riots were ignored. What's the difference between them some apparently and rightly asked. Actually, there is a difference. Five people died in the Capitol riot, only one through violence, and that was a police officer shooting an unarmed protestor. BLM riots killed at least 25 people and cost billions. Asking the question prompted the psychopaths and reframed minds that run the Pentagon to say that more 'education' (programming) was needed. Troop training is all based on psychological programming to make them fodder for the Cult – 'Military men are just dumb, stupid animals to be used as pawns in foreign policy' as Cult-to-his-DNA former Secretary of State Henry Kissinger famously said. Governments see the police in similar terms and it's time for those among them who can see this to defend the people and stop being enforcers of the Cult agenda upon the people.

The US military, like the country itself, is being targeted for destruction through a long list of Woke impositions. Cult-owned gaga 'President' Biden signed an executive order when he took office to allow taxpayer money to pay for transgender surgery for active military personnel and veterans. Are you a man soldier? No, I'm a LGBTQIA+ with a hint of Skoliosexual and Spectrasexual. Oh, good man. Bad choice of words you bigot. The Pentagon announced in March, 2021, the appointment of the first 'diversity and inclusion

officer' for US Special Forces. Richard Torres-Estrada arrived with the publication of a 'D&I Strategic Plan which will guide the enterprise-wide effort to institutionalize and sustain D&I'. If you think a Special Forces 'Strategic Plan' should have something to do with defending America you haven't been paying attention. Defending Woke is now the military's new role. Torres-Estrada has posted images comparing Donald Trump with Adolf Hitler and we can expect no bias from him as a representative of the supposedly non-political Pentagon. Cable news host Tucker Carlson said: 'The Pentagon is now the Yale faculty lounge but with cruise missiles.' Meanwhile Secretary of Defense Lloyd Austin, a board member of weapons-maker Raytheon with stock and compensation interests in October, 2020, worth \$1.4 million, said he was purging the military of the 'enemy within' – anyone who isn't Woke and supports Donald Trump. Austin refers to his targets as 'racist extremists' while in true Woke fashion being himself a racist extremist. Pentagon documents pledge to 'eradicate, eliminate and conquer all forms of racism, sexism and homophobia'. The definitions of these are decided by 'diversity and inclusion committees' peopled by those who see racism, sexism and homophobia in every situation and opinion. Woke (the Cult) is dismantling the US military and purging testosterone as China expands its military and gives its troops 'masculinity training'. How do we think that is going to end when this is all Cult coordinated? The US military, like the British military, is controlled by Woke and spineless top brass who just go along with it out of personal career interests.

'Woke' means fast asleep

Mind control and perception manipulation techniques used on individuals to create group-think have been unleashed on the global population in general. As a result many have no capacity to see the obvious fascist agenda being installed all around them or what 'Covid' is really all about. Their brains are firewalled like a computer system not to process certain concepts, thoughts and realisations that are bad for the Cult. The young are most targeted as the adults they

will be when the whole fascist global state is planned to be fully implemented. They need to be prepared for total compliance to eliminate all pushback from entire generations. The Cult has been pouring billions into taking complete control of 'education' from schools to universities via its operatives and corporations and not least Bill Gates as always. The plan has been to transform 'education' institutions into programming centres for the mentality of 'Woke'. James McConnell, professor of psychology at the University of Michigan, wrote in *Psychology Today* in 1970:

The day has come when we can combine sensory deprivation with drugs, hypnosis, and astute manipulation of reward and punishment, to gain almost absolute control over an individual's behaviour. It should then be possible to achieve a very rapid and highly effective type of brainwashing that would allow us to make dramatic changes in a person's behaviour and personality ...

... We should reshape society so that we all would be trained from birth to want to do what society wants us to do. We have the techniques to do it... no-one owns his own personality you acquired, and there's no reason to believe you should have the right to refuse to acquire a new personality if your old one is anti-social.

This was the potential for mass brainwashing in 1970 and the mentality there displayed captures the arrogant psychopathy that drives it forward. I emphasise that not all young people have succumbed to Woke programming and those that haven't are incredibly impressive people given that today's young are the most perceptually-targeted generations in history with all the technology now involved. Vast swathes of the young generations, however, have fallen into the spell – and that's what it is – of Woke. The Woke mentality and perceptual program is founded on *inversion* and you will appreciate later why that is so significant. Everything with Woke is inverted and the opposite of what it is claimed to be. Woke was a term used in African-American culture from the 1900s and referred to an awareness of social and racial justice. This is not the meaning of the modern version or 'New Woke' as I call it in *The Answer*. Oh, no, Woke today means something very different no matter how much Wokers may seek to hide that and insist Old Woke and New

Woke are the same. See if you find any 'awareness of social justice' here in the modern variety:

- Woke demands 'inclusivity' while excluding anyone with a different opinion and calls for mass censorship to silence other views.
- Woke claims to stand against oppression when imposing oppression is the foundation of all that it does. It is the driver of political correctness which is nothing more than a Cult invention to manipulate the population to silence itself.
- Woke believes itself to be 'liberal' while pursuing a global society that can only be described as fascist (see 'anti-fascist' fascist Antifa).
- Woke calls for 'social justice' while spreading injustice wherever it goes against the common 'enemy' which can be easily identified as a differing view.
- Woke is supposed to be a metaphor for 'awake' when it is solid-gold asleep and deep in a Cult-induced coma that meets the criteria for 'off with the fairies'.

I state these points as obvious facts if people only care to look. I don't do this with a sense of condemnation. We need to appreciate that the onslaught of perceptual programming on the young has been incessant and merciless. I can understand why so many have been reframed, or, given their youth, framed from the start to see the world as the Cult demands. The Cult has had access to their minds day after day in its 'education' system for their entire formative years. Perception is formed from information received and the Cult-created system is a life-long download of information delivered to elicit a particular perception, thus behaviour. The more this has expanded into still new extremes in recent decades and ever-increasing censorship has deleted other opinions and information why wouldn't that lead to a perceptual reframing on a mass scale? I

have described already cradle-to-grave programming and in more recent times the targeting of young minds from birth to adulthood has entered the stratosphere. This has taken the form of skewing what is 'taught' to fit the Cult agenda and the omnipresent techniques of group-think to isolate non-believers and pressure them into line. There has always been a tendency to follow the herd, but we really are in a new world now in relation to that. We have parents who can see the 'Covid' hoax told by their children not to stop them wearing masks at school, being 'Covid' tested or having the 'vaccine' in fear of the peer-pressure consequences of being different. What is 'peer-pressure' if not pressure to conform to group-think? Renegade Minds never group-think and always retain a set of perceptions that are unique to them. Group-think is always underpinned by consequences for not group-thinking. Abuse now aimed at those refusing DNA-manipulating 'Covid vaccines' are a potent example of this. The biggest pressure to conform comes from the very group which is itself being manipulated. 'I am programmed to be part of a hive mind and so you must be.'

Woke control structures in 'education' now apply to every mainstream organisation. Those at the top of the 'education' hierarchy (the Cult) decide the policy. This is imposed on governments through the Cult network; governments impose it on schools, colleges and universities; their leadership impose the policy on teachers and academics and they impose it on children and students. At any level where there is resistance, perhaps from a teacher or university lecturer, they are targeted by the authorities and often fired. Students themselves regularly demand the dismissal of academics (increasingly few) at odds with the narrative that the students have been programmed to believe in. It is quite a thought that students who are being targeted by the Cult become so consumed by programmed group-think that they launch protests and demand the removal of those who are trying to push back against those targeting the students. Such is the scale of perceptual inversion. We see this with 'Covid' programming as the Cult imposes the rules via psycho-psychologists and governments on

shops, transport companies and businesses which impose them on their staff who impose them on their customers who pressure Pushbackers to conform to the will of the Cult which is in the process of destroying them and their families. Scan all aspects of society and you will see the same sequence every time.

Fact free Woke and hijacking the 'left'

There is no more potent example of this than 'Woke', a mentality only made possible by the deletion of factual evidence by an 'education' system seeking to produce an ever more uniform society. Why would you bother with facts when you don't know any? Deletion of credible history both in volume and type is highly relevant. Orwell said: 'Who controls the past controls the future: who controls the present controls the past.' They who control the perception of the past control the perception of the future and they who control the present control the perception of the past through the writing and deleting of history. Why would you oppose the imposition of Marxism in the name of Wokeism when you don't know that Marxism cost at least 100 million lives in the 20th century alone? Watch videos and read reports in which Woker generations are asked basic historical questions – it's mind-blowing. A survey of 2,000 people found that six percent of millennials (born approximately early 1980s to early 2000s) believed the Second World War (1939-1945) broke out with the assassination of President Kennedy (in 1963) and one in ten thought Margaret Thatcher was British Prime Minister at the time. She was in office between 1979 and 1990. We are in a post-fact society. Provable facts are no defence against the fascism of political correctness or Silicon Valley censorship. Facts don't matter anymore as we have witnessed with the 'Covid' hoax. Sacrificing uniqueness to the Woke group-think religion is all you are required to do and that means thinking for yourself is the biggest Woke no, no. All religions are an expression of group-think and censorship and Woke is just another religion with an orthodoxy defended by group-think and censorship. Burned at

the stake becomes burned on Twitter which leads back eventually to burned at the stake as Woke humanity regresses to ages past.

The biggest Woke inversion of all is its creators and funders. I grew up in a traditional left of centre political household on a council estate in Leicester in the 1950s and 60s – you know, the left that challenged the power of wealth-hoarding elites and threats to freedom of speech and opinion. In those days students went on marches defending freedom of speech while today's Wokers march for its deletion. What on earth could have happened? Those very elites (collectively the Cult) that we opposed in my youth and early life have funded into existence the antithesis of that former left and hijacked the 'brand' while inverting everything it ever stood for. We have a mentality that calls itself 'liberal' and 'progressive' while acting like fascists. Cult billionaires and their corporations have funded themselves into control of 'education' to ensure that Woke programming is unceasing throughout the formative years of children and young people and that non-Wokers are isolated (that word again) whether they be students, teachers or college professors. The Cult has funded into existence the now colossal global network of Woke organisations that have spawned and promoted all the 'causes' on the Cult wish-list for global transformation and turned Wokers into demanders of them. Does anyone really think it's a coincidence that the Cult agenda for humanity is a carbon (sorry) copy of the societal transformations desired by Woke?? These are only some of them:

Political correctness: The means by which the Cult deletes all public debates that it knows it cannot win if we had the free-flow of information and evidence.

Human-caused 'climate change': The means by which the Cult seeks to transform society into a globally-controlled dictatorship imposing its will over the fine detail of everyone's lives 'to save the planet' which doesn't actually need saving.

Transgender obsession: Preparing collective perception to accept the 'new human' which would not have genders because it would be created technologically and not through procreation. I'll have much more on this in Human 2.0.

Race obsession: The means by which the Cult seeks to divide and rule the population by triggering racial division through the perception that society is more racist than ever when the opposite is the case. Is it perfect in that regard? No. But to compare today with the racism of apartheid and segregation brought to an end by the civil rights movement in the 1960s is to insult the memory of that movement and inspirations like Martin Luther King. Why is the 'anti-racism' industry (which it is) so dominated by privileged white people?

White supremacy: This is a label used by privileged white people to demonise poor and deprived white people pushing back on tyranny to marginalise and destroy them. White people are being especially targeted as the dominant race by number within Western society which the Cult seeks to transform in its image. If you want to change a society you must weaken and undermine its biggest group and once you have done that by using the other groups you next turn on them to do the same ... 'Then they came for the Jews and I was not a Jew so I did nothing.'

Mass migration: The mass movement of people from the Middle East, Africa and Asia into Europe, from the south into the United States and from Asia into Australia are another way the Cult seeks to dilute the racial, cultural and political influence of white people on Western society. White people ask why their governments appear to be working against them while being politically and culturally biased towards incoming cultures. Well, here's your answer. In the same way sexually 'straight' people, men and women, ask why the

authorities are biased against them in favour of other sexualities. The answer is the same – that's the way the Cult wants it to be for very sinister motives.

These are all central parts of the Cult agenda and central parts of the Woke agenda and Woke was created and continues to be funded to an immense degree by Cult billionaires and corporations. If anyone begins to say 'coincidence' the syllables should stick in their throat.

Billionaire 'social justice warriors'

Joe Biden is a 100 percent-owned asset of the Cult and the Wokers' man in the White House whenever he can remember his name and for however long he lasts with his rapidly diminishing cognitive function. Even walking up the steps of an aircraft without falling on his arse would appear to be a challenge. He's not an empty-shell puppet or anything. From the minute Biden took office (or the Cult did) he began his executive orders promoting the Woke wish-list. You will see the Woke agenda imposed ever more severely because it's really the *Cult* agenda. Woke organisations and activist networks spawned by the Cult are funded to the extreme so long as they promote what the Cult wants to happen. Woke is funded to promote 'social justice' by billionaires who become billionaires by destroying social justice. The social justice mantra is only a cover for dismantling social justice and funded by billionaires that couldn't give a damn about social justice. Everything makes sense when you see that. One of Woke's premier funders is Cult billionaire financier George Soros who said: 'I am basically there to make money, I cannot and do not look at the social consequences of what I do.' This is the same Soros who has given more than \$32 billion to his Open Society Foundations global Woke network and funded Black Lives Matter, mass immigration into Europe and the United States, transgender activism, climate change activism, political correctness and groups targeting 'white supremacy' in the form of privileged white thugs that dominate Antifa. What a scam it all is and when

you are dealing with the unquestioning fact-free zone of Woke scamming them is child's play. All you need to pull it off in all these organisations are a few in-the-know agents of the Cult and an army of naïve, reframed, uninformed, narcissistic, know-nothings convinced of their own self-righteousness, self-purity and virtue.

Soros and fellow billionaires and billionaire corporations have poured hundreds of millions into Black Lives Matter and connected groups and promoted them to a global audience. None of this is motivated by caring about black people. These are the billionaires that have controlled and exploited a system that leaves millions of black people in abject poverty and deprivation which they do absolutely nothing to address. The same Cult networks funding BLM were behind the *slave trade*! Black Lives Matter hijacked a phrase that few would challenge and they have turned this laudable concept into a political weapon to divide society. You know that BLM is a fraud when it claims that *All Lives Matter*, the most inclusive statement of all, is 'racist'. BLM and its Cult masters don't want to end racism. To them it's a means to an end to control all of humanity never mind the colour, creed, culture or background. What has destroying the nuclear family got to do with ending racism? Nothing – but that is one of the goals of BLM and also happens to be a goal of the Cult as I have been exposing in my books for decades. Stealing children from loving parents and giving schools ever more power to override parents is part of that same agenda. BLM is a Marxist organisation and why would that not be the case when the Cult created Marxism *and* BLM? Patrisse Cullors, a BLM co-founder, said in a 2015 video that she and her fellow organisers, including co-founder Alicia Garza, are 'trained Marxists'. The lady known after marriage as Patrisse Khan-Cullors bought a \$1.4 million home in 2021 in one of the whitest areas of California with a black population of just 1.6 per cent and has so far bought *four* high-end homes for a total of \$3.2 million. How very Marxist. There must be a bit of spare in the BLM coffers, however, when Cult corporations and billionaires have handed over the best part of \$100 million. Many black people can see that Black Lives Matter is not

working for them, but against them, and this is still more confirmation. Black journalist Jason Whitlock, who had his account suspended by Twitter for simply linking to the story about the 'Marxist's' home buying spree, said that BLM leaders are 'making millions of dollars off the backs of these dead black men who they wouldn't spit on if they were on fire and alive'.

Black Lies Matter

Cult assets and agencies came together to promote BLM in the wake of the death of career criminal George Floyd who had been jailed a number of times including for forcing his way into the home of a black woman with others in a raid in which a gun was pointed at her stomach. Floyd was filmed being held in a Minneapolis street in 2020 with the knee of a police officer on his neck and he subsequently died. It was an appalling thing for the officer to do, but the same technique has been used by police on peaceful protestors of lockdown without any outcry from the Woke brigade. As unquestioning supporters of the Cult agenda Wokers have supported lockdown and all the 'Covid' claptrap while attacking anyone standing up to the tyranny imposed in its name. Court documents would later include details of an autopsy on Floyd by County Medical Examiner Dr Andrew Baker who concluded that Floyd had taken a fatal level of the drug fentanyl. None of this mattered to fact-free, question-free, Woke. Floyd's death was followed by worldwide protests against police brutality amid calls to defund the police. Throwing babies out with the bathwater is a Woke speciality. In the wake of the murder of British woman Sarah Everard a Green Party member of the House of Lords, Baroness Jones of Moulsecoomb (Nincompoopia would have been better), called for a 6pm curfew for all men. This would be in breach of the Geneva Conventions on war crimes which ban collective punishment, but that would never have crossed the black and white Woke mind of Baroness Nincompoopia who would have been far too convinced of her own self-righteousness to compute such details. Many American cities did defund the police in the face of Floyd riots

and after \$15 million was deleted from the police budget in Washington DC under useless Woke mayor Muriel Bowser car-jacking alone rose by 300 percent and within six months the US capital recorded its highest murder rate in 15 years. The same happened in Chicago and other cities in line with the Cult/Soros plan to bring fear to streets and neighbourhoods by reducing the police, releasing violent criminals and not prosecuting crime. This is the mob-rule agenda that I have warned in the books was coming for so long. Shootings in the area of Minneapolis where Floyd was arrested increased by 2,500 percent compared with the year before. Defunding the police over George Floyd has led to a big increase in dead people with many of them black. Police protection for politicians making these decisions stayed the same or increased as you would expect from professional hypocrites. The Cult doesn't actually want to abolish the police. It wants to abolish local control over the police and hand it to federal government as the psychopaths advance the Hunger Games Society. Many George Floyd protests turned into violent riots with black stores and businesses destroyed by fire and looting across America fuelled by Black Lives Matter. Woke doesn't do irony. If you want civil rights you must loot the liquor store and the supermarket and make off with a smart TV. It's the only way.

It's not a race war – it's a class war

Black people are patronised by privileged blacks and whites alike and told they are victims of white supremacy. I find it extraordinary to watch privileged blacks supporting the very system and bloodline networks behind the slave trade and parroting the same Cult-serving manipulative crap of their privileged white, often billionaire, associates. It is indeed not a race war but a class war and colour is just a diversion. Black Senator Cory Booker and black Congresswoman Maxine Waters, more residents of Nincompoopia, personify this. Once you tell people they are victims of someone else you devalue both their own responsibility for their plight and the power they have to impact on their reality and experience. Instead

we have: 'You are only in your situation because of whiteness – turn on them and everything will change.' It won't change. Nothing changes in our lives unless *we* change it. Crucial to that is never seeing yourself as a victim and always as the creator of your reality. Life is a simple sequence of choice and consequence. Make different choices and you create different consequences. *You* have to make those choices – not Black Lives Matter, the Woke Mafia and anyone else that seeks to dictate your life. Who are they these Wokers, an emotional and psychological road traffic accident, to tell you what to do? Personal empowerment is the last thing the Cult and its Black Lives Matter want black people or anyone else to have. They claim to be defending the underdog while *creating* and perpetuating the underdog. The Cult's worst nightmare is human unity and if they are going to keep blacks, whites and every other race under economic servitude and control then the focus must be diverted from what they have in common to what they can be manipulated to believe divides them. Blacks have to be told that their poverty and plight is the fault of the white bloke living on the street in the same poverty and with the same plight they are experiencing. The difference is that your plight black people is due to him, a white supremacist with 'white privilege' living on the street. Don't unite as one human family against your mutual oppressors and suppressors – fight the oppressor with the white face who is as financially deprived as you are. The Cult knows that as its 'Covid' agenda moves into still new levels of extremism people are going to respond and it has been spreading the seeds of disunity everywhere to stop a united response to the evil that targets *all of us*.

Racist attacks on 'whiteness' are getting ever more outrageous and especially through the American Democratic Party which has an appalling history for anti-black racism. Barack Obama, Joe Biden, Hillary Clinton and Nancy Pelosi all eulogised about Senator Robert Byrd at his funeral in 2010 after a nearly 60-year career in Congress. Byrd was a brutal Ku Klux Klan racist and a violent abuser of Cathy O'Brien in MKUltra. He said he would never fight in the military 'with a negro by my side' and 'rather I should die a thousand times,

and see Old Glory trampled in the dirt never to rise again, than to see this beloved land of ours become degraded by race mongrels, a throwback to the blackest specimen from the wilds'. Biden called Byrd a 'very close friend and mentor'. These 'Woke' hypocrites are not anti-racist they are anti-poor and anti-people not of their perceived class. Here is an illustration of the scale of anti-white racism to which we have now descended. Seriously Woke and moronic *New York Times* contributor Damon Young described whiteness as a 'virus' that 'like other viruses will not die until there are no bodies left for it to infect'. He went on: '... the only way to stop it is to locate it, isolate it, extract it, and kill it.' Young can say that as a black man with no consequences when a white man saying the same in reverse would be facing a jail sentence. *That's* racism. We had super-Woke numbskull senators Tammy Duckworth and Mazie Hirono saying they would object to future Biden Cabinet appointments if he did not nominate more Asian Americans and Pacific Islanders. Never mind the ability of the candidate what do they look like? Duckworth said: 'I will vote for racial minorities and I will vote for LGBTQ, but anyone else I'm not voting for.' Appointing people on the grounds of race is illegal, but that was not a problem for this ludicrous pair. They were on-message and that's a free pass in any situation.

Critical race racism

White children are told at school they are intrinsically racist as they are taught the divisive 'critical race theory'. This claims that the law and legal institutions are inherently racist and that race is a socially constructed concept used by white people to further their economic and political interests at the expense of people of colour. White is a 'virus' as we've seen. Racial inequality results from 'social, economic, and legal differences that white people create between races to maintain white interests which leads to poverty and criminality in minority communities'. I must tell that to the white guy sleeping on the street. The principal of East Side Community School in New York sent white parents a manifesto that called on

them to become 'white traitors' and advocate for full 'white abolition'. These people are teaching your kids when they urgently need a psychiatrist. The 'school' included a chart with 'eight white identities' that ranged from 'white supremacist' to 'white abolition' and defined the behaviour white people must follow to end 'the regime of whiteness'. Woke blacks and their privileged white associates are acting exactly like the slave owners of old and Ku Klux Klan racists like Robert Byrd. They are too full of their own self-purity to see that, but it's true. Racism is not a body type; it's a state of mind that can manifest through any colour, creed or culture.

Another racial fraud is '*equity*'. Not equality of treatment and opportunity – equity. It's a term spun as equality when it means something very different. Equality in its true sense is a raising up while 'equity' is a race to the bottom. Everyone in the same level of poverty is 'equity'. Keep everyone down – that's equity. The Cult doesn't want anyone in the human family to be empowered and BLM leaders, like all these 'anti-racist' organisations, continue their privileged, pampered existence by perpetuating the perception of gathering racism. When is the last time you heard an 'anti-racist' or 'anti-Semitism' organisation say that acts of racism and discrimination have *fallen*? It's not in the interests of their fundraising and power to influence and the same goes for the professional soccer anti-racism operation, Kick It Out. Two things confirmed that the Black Lives Matter riots in the summer of 2020 were Cult creations. One was that while anti-lockdown protests were condemned in this same period for 'transmitting 'Covid' the authorities supported mass gatherings of Black Lives Matter supporters. I even saw self-deluding people claiming to be doctors say the two types of protest were not the same. No – the non-existent 'Covid' was in favour of lockdowns and attacked those that protested against them while 'Covid' supported Black Lives Matter and kept well away from its protests. The whole thing was a joke and as lockdown protestors were arrested, often brutally, by reframed Face-Nappies we had the grotesque sight of police officers taking the knee to Black Lives Matter, a Cult-funded Marxist

organisation that supports violent riots and wants to destroy the nuclear family and white people.

He's not white? Shucks!

Woke obsession with race was on display again when ten people were shot dead in Boulder, Colorado, in March, 2021. Cult-owned Woke TV channels like CNN said the shooter appeared to be a white man and Wokers were on Twitter condemning 'violent white men' with the usual mantras. Then the shooter's name was released as Ahmad Al Aliwi Alissa, an anti-Trump Arab-American, and the sigh of disappointment could be heard five miles away. Never mind that ten people were dead and what that meant for their families. Race baiting was all that mattered to these sick Cult-serving people like Barack Obama who exploited the deaths to further divide America on racial grounds which is his job for the Cult. This is the man that 'racist' white Americans made the first black president of the United States and then gave him a second term. Not-very-bright Obama has become filthy rich on the back of that and today appears to have a big influence on the Biden administration. Even so he's still a downtrodden black man and a victim of white supremacy. This disingenuous fraud reveals the contempt he has for black people when he puts on a Deep South Alabama accent whenever he talks to them, no, *at* them.

Another BLM red flag was how the now fully-Woke (fully-Cult) and fully-virtue-signalled professional soccer authorities had their teams taking the knee before every match in support of Marxist Black Lives Matter. Soccer authorities and clubs displayed 'Black Lives Matter' on the players' shirts and flashed the name on electronic billboards around the pitch. Any fans that condemned what is a Freemasonic taking-the-knee ritual were widely condemned as you would expect from the Woke virtue-signallers of professional sport and the now fully-Woke media. We have reverse racism in which you are banned from criticising any race or culture except for white people for whom anything goes – say what you like, no problem. What has this got to do with racial harmony and

equality? We've had black supremacists from Black Lives Matter telling white people to fall to their knees in the street and apologise for their white supremacy. Black supremacists acting like white supremacist slave owners of the past couldn't breach their self-obsessed, race-obsessed sense of self-purity. Joe Biden appointed a race-obsessed black supremacist Kristen Clarke to head the Justice Department Civil Rights Division. Clarke claimed that blacks are endowed with 'greater mental, physical and spiritual abilities' than whites. If anyone reversed that statement they would be vilified. Clarke is on-message so no problem. She's never seen a black-white situation in which the black figure is anything but a virtuous victim and she heads the Civil Rights Division which should treat everyone the same or it isn't civil rights. Another perception of the Renegade Mind: If something or someone is part of the Cult agenda they will be supported by Woke governments and media no matter what. If they're not, they will be condemned and censored. It really is that simple and so racist Clarke prospers despite (make that because of) her racism.

The end of culture

Biden's administration is full of such racial, cultural and economic bias as the Cult requires the human family to be divided into warring factions. We are now seeing racially-segregated graduations and everything, but everything, is defined through the lens of perceived 'racism'. We have 'racist' mathematics, 'racist' food and even 'racist' *plants*. World famous Kew Gardens in London said it was changing labels on plants and flowers to tell its pre-'Covid' more than two million visitors a year how racist they are. Kew director Richard Deverell said this was part of an effort to 'move quickly to decolonise collections' after they were approached by one Ajay Chhabra 'an actor with an insight into how sugar cane was linked to slavery'. They are *plants* you idiots. 'Decolonisation' in the Woke manual really means colonisation of society with its mentality and by extension colonisation by the Cult. We are witnessing a new Chinese-style 'Cultural Revolution' so essential to the success of all

Marxist takeovers. Our cultural past and traditions have to be swept away to allow a new culture to be built-back-better. Woke targeting of long-standing Western cultural pillars including historical monuments and cancelling of historical figures is what happened in the Mao revolution in China which 'purged remnants of capitalist and traditional elements from Chinese society' and installed Maoism as the dominant ideology'. For China see the Western world today and for 'dominant ideology' see Woke. Better still see Marxism or Maoism. The 'Covid' hoax has specifically sought to destroy the arts and all elements of Western culture from people meeting in a pub or restaurant to closing theatres, music venues, sports stadiums, places of worship and even banning *singing*. Destruction of Western society is also why criticism of any religion is banned except for Christianity which again is the dominant religion as white is the numerically-dominant race. Christianity may be fading rapidly, but its history and traditions are weaved through the fabric of Western society. Delete the pillars and other structures will follow until the whole thing collapses. I am not a Christian defending that religion when I say that. I have no religion. It's just a fact. To this end Christianity has itself been turned Woke to usher its own downfall and its ranks are awash with 'change agents' – knowing and unknowing – at every level including Pope Francis (*definitely* knowing) and the clueless Archbishop of Canterbury Justin Welby (possibly not, but who can be sure?). Woke seeks to coordinate attacks on Western culture, traditions, and ways of life through 'intersectionality' defined as 'the complex, cumulative way in which the effects of multiple forms of discrimination (such as racism, sexism, and classism) combine, overlap, or intersect especially in the experiences of marginalised individuals or groups'. Wade through the Orwellian Woke-speak and this means coordinating disparate groups in a common cause to overthrow freedom and liberal values.

The entire structure of public institutions has been infested with Woke – government at all levels, political parties, police, military, schools, universities, advertising, media and trade unions. This abomination has been achieved through the Cult web by appointing

Workers to positions of power and battering non-Workers into line through intimidation, isolation and threats to their job. Many have been fired in the wake of the empathy-deleted, vicious hostility of 'social justice' Workers and the desire of gutless, spineless employers to virtue-signal their Wokeness. Corporations are filled with Workers today, most notably those in Silicon Valley. Ironically at the top they are not Woke at all. They are only exploiting the mentality their Cult masters have created and funded to censor and enslave while the Workers cheer them on until it's their turn. Thus the Woke 'liberal left' is an inversion of the traditional liberal left. Campaigning for justice on the grounds of power and wealth distribution has been replaced by campaigning for identity politics. The genuine traditional left would never have taken money from today's billionaire abusers of fairness and justice and nor would the billionaires have wanted to fund that genuine left. It would not have been in their interests to do so. The division of opinion in those days was between the haves and have nots. This all changed with Cult manipulated and funded identity politics. The division of opinion today is between Workers and non-Workers and not income brackets. Cult corporations and their billionaires may have taken wealth disparity to cataclysmic levels of injustice, but as long as they speak the language of Woke, hand out the dosh to the Woke network and censor the enemy they are 'one of us'. Billionaires who don't give a damn about injustice are laughing at them till their bellies hurt. Workers are not even close to self-aware enough to see that. The transformed 'left' dynamic means that Workers who drone on about 'social justice' are funded by billionaires that have destroyed social justice the world over. It's *why* they are billionaires.

The climate con

Nothing encapsulates what I have said more comprehensively than the hoax of human-caused global warming. I have detailed in my books over the years how Cult operatives and organisations were the pump-primers from the start of the climate con. A purpose-built vehicle for this is the Club of Rome established by the Cult in 1968

with the Rockefellers and Rothschilds centrally involved all along. Their gofer frontman Maurice Strong, a Canadian oil millionaire, hosted the Earth Summit in Rio de Janeiro, Brazil, in 1992 where the global 'green movement' really expanded in earnest under the guiding hand of the Cult. The Earth Summit established Agenda 21 through the Cult-created-and-owned United Nations to use the illusion of human-caused climate change to justify the transformation of global society to save the world from climate disaster. It is a No-Problem-Reaction-Solution sold through governments, media, schools and universities as whole generations have been terrified into believing that the world was going to end in their lifetimes unless what old people had inflicted upon them was stopped by a complete restructuring of how everything is done. Chill, kids, it's all a hoax. Such restructuring is precisely what the Cult agenda demands (purely by coincidence of course). Today this has been given the codename of the Great Reset which is only an updated term for Agenda 21 and its associated Agenda 2030. The latter, too, is administered through the UN and was voted into being by the General Assembly in 2015. Both 21 and 2030 seek centralised control of all resources and food right down to the raindrops falling on your own land. These are some of the demands of Agenda 21 established in 1992. See if you recognise this society emerging today:

- End national sovereignty
- State planning and management of all land resources, ecosystems, deserts, forests, mountains, oceans and fresh water; agriculture; rural development; biotechnology; and ensuring '*equity*'
- The state to 'define the role' of business and financial resources
- Abolition of private property
- 'Restructuring' the family unit (see BLM)
- Children raised by the state
- People told what their job will be
- Major restrictions on movement
- Creation of 'human settlement zones'

- Mass resettlement as people are forced to vacate land where they live
- Dumbing down education
- Mass global depopulation in pursuit of all the above

The United Nations was created as a Trojan horse for world government. With the climate con of critical importance to promoting that outcome you would expect the UN to be involved. Oh, it's involved all right. The UN is promoting Agenda 21 and Agenda 2030 justified by 'climate change' while also driving the climate hoax through its Intergovernmental Panel on Climate Change (IPCC), one of the world's most corrupt organisations. The IPCC has been lying ferociously and constantly since the day it opened its doors with the global media hanging unquestioningly on its every mendacious word. The Green movement is entirely Woke and has long lost its original environmental focus since it was co-opted by the Cult. An obsession with 'global warming' has deleted its values and scrambled its head. I experienced a small example of what I mean on a beautiful country walk that I have enjoyed several times a week for many years. The path merged into the fields and forests and you felt at one with the natural world. Then a 'Green' organisation, the Hampshire and Isle of Wight Wildlife Trust, took over part of the land and proceeded to cut down a large number of trees, including mature ones, to install a horrible big, bright steel 'this-is-ours-stay-out' fence that destroyed the whole atmosphere of this beautiful place. No one with a feel for nature would do that. Day after day I walked to the sound of chainsaws and a magnificent mature weeping willow tree that I so admired was cut down at the base of the trunk. When I challenged a Woke young girl in a green shirt (of course) about this vandalism she replied: 'It's a weeping willow – it will grow back.' This is what people are paying for when they donate to the Hampshire and Isle of Wight Wildlife Trust and many other 'green' organisations today. It is not the environmental movement that I knew and instead has become a support-system – as with Extinction Rebellion – for a very dark agenda.

Private jets for climate justice

The Cult-owned, Gates-funded, World Economic Forum and its founder Klaus Schwab were behind the emergence of Greta Thunberg to harness the young behind the climate agenda and she was invited to speak to the world at ... the UN. Schwab published a book, *Covid-19: The Great Reset* in 2020 in which he used the 'Covid' hoax and the climate hoax to lay out a new society straight out of Agenda 21 and Agenda 2030. Bill Gates followed in early 2021 when he took time out from destroying the world to produce a book in his name about the way to save it. Gates flies across the world in private jets and admitted that 'I probably have one of the highest greenhouse gas footprints of anyone on the planet ... my personal flying alone is gigantic.' He has also bid for the planet's biggest private jet operator. Other climate change saviours who fly in private jets include John Kerry, the US Special Presidential Envoy for Climate, and actor Leonardo DiCaprio, a 'UN Messenger of Peace with special focus on climate change'. These people are so full of bullshit they could corner the market in manure. We mustn't be sceptical, though, because the Gates book, *How to Avoid a Climate Disaster: The Solutions We Have and the Breakthroughs We Need*, is a genuine attempt to protect the world and not an obvious pile of excrement attributed to a mega-psychopath aimed at selling his masters' plans for humanity. The Gates book and the other shite-pile by Klaus Schwab could have been written by the same person and may well have been. Both use 'climate change' and 'Covid' as the excuses for their new society and by coincidence the Cult's World Economic Forum and Bill and Melinda Gates Foundation promote the climate hoax and hosted Event 201 which pre-empted with a 'simulation' the very 'coronavirus' hoax that would be simulated for real on humanity within weeks. The British 'royal' family is promoting the 'Reset' as you would expect through Prince 'climate change caused the war in Syria' Charles and his hapless son Prince William who said that we must 'reset our relationship with nature and our trajectory as a species' to avoid a climate disaster. Amazing how many promoters of the 'Covid' and 'climate change' control

systems are connected to Gates and the World Economic Forum. A 'study' in early 2021 claimed that carbon dioxide emissions must fall by the equivalent of a global lockdown roughly every two years for the next decade to save the planet. The 'study' appeared in the same period that the Schwab mob claimed in a video that lockdowns destroying the lives of billions are good because they make the earth 'quieter' with less 'ambient noise'. They took down the video amid a public backlash for such arrogant, empathy-deleted stupidity. You see, however, where they are going with this. Corinne Le Quéré, a professor at the Tyndall Centre for Climate Change Research, University of East Anglia, was lead author of the climate lockdown study, and she writes for ... the World Economic Forum. Gates calls in 'his' book for changing 'every aspect of the economy' (long-time Cult agenda) and for humans to eat synthetic 'meat' (predicted in my books) while cows and other farm animals are eliminated. Australian TV host and commentator Alan Jones described what carbon emission targets would mean for farm animals in Australia alone if emissions were reduced as demanded by 35 percent by 2030 and zero by 2050:

Well, let's take agriculture, the total emissions from agriculture are about 75 million tonnes of carbon dioxide, equivalent. Now reduce that by 35 percent and you have to come down to 50 million tonnes, I've done the maths. So if you take for example 1.5 million cows, you're going to have to reduce the herd by 525,000 [by] 2030, nine years, that's 58,000 cows a year. The beef herd's 30 million, reduce that by 35 percent, that's 10.5 million, which means 1.2 million cattle have to go every year between now and 2030. This is insanity!

There are 75 million sheep. Reduce that by 35 percent, that's 26 million sheep, that's almost 3 million a year. So under the Paris Agreement over 30 million beasts, dairy cows, cattle, pigs and sheep would go. More than 8,000 every minute of every hour for the next decade, do these people know what they're talking about?

Clearly they don't at the level of campaigners, politicians and administrators. The Cult *does* know; that's the outcome it wants. We are faced with not just a war on humanity. Animals and the natural world are being targeted and I have been saying since the 'Covid' hoax began that the plan eventually was to claim that the 'deadly virus' is able to jump from animals, including farm animals and

domestic pets, to humans. Just before this book went into production came this story: 'Russia registers world's first Covid-19 vaccine for cats & dogs as makers of Sputnik V warn pets & farm animals could spread virus'. The report said 'top scientists warned that the deadly pathogen could soon begin spreading through homes and farms' and 'the next stage is the infection of farm and domestic animals'. Know the outcome and you'll see the journey. Think what that would mean for animals and keep your eye on a term called zoonosis or zoonotic diseases which transmit between animals and humans. The Cult wants to break the connection between animals and people as it does between people and people. Farm animals fit with the Cult agenda to transform food from natural to synthetic.

The gas of life is killing us

There can be few greater examples of Cult inversion than the condemnation of carbon dioxide as a dangerous pollutant when it is the gas of life. Without it the natural world would be dead and so we would all be dead. We breathe in oxygen and breathe out carbon dioxide while plants produce oxygen and absorb carbon dioxide. It is a perfect symbiotic relationship that the Cult wants to dismantle for reasons I will come to in the final two chapters. Gates, Schwab, other Cult operatives and mindless repeaters, want the world to be 'carbon neutral' by at least 2050 and the earlier the better. 'Zero carbon' is the cry echoed by lunatics calling for 'Zero Covid' when we already have it. These carbon emission targets will deindustrialise the world in accordance with Cult plans – the post-industrial, post-democratic society – and with so-called renewables like solar and wind not coming even close to meeting human energy needs blackouts and cold are inevitable. Texans got the picture in the winter of 2021 when a snow storm stopped wind turbines and solar panels from working and the lights went down along with water which relies on electricity for its supply system. Gates wants everything to be powered by electricity to ensure that his masters have the kill switch to stop all human activity, movement, cooking, water and warmth any time they like. The climate lie is so

stupendously inverted that it claims we must urgently reduce carbon dioxide when we *don't have enough*.

Co2 in the atmosphere is a little above 400 parts per million when the optimum for plant growth is 2,000 ppm and when it falls anywhere near 150 ppm the natural world starts to die and so do we. It fell to as low as 280 ppm in an 1880 measurement in Hawaii and rose to 413 ppm in 2019 with industrialisation which is why the planet has become *greener* in the industrial period. How insane then that psychopathic madman Gates is not satisfied only with blocking the rise of Co2. He's funding technology to suck it out of the atmosphere. The reason why will become clear. The industrial era is not destroying the world through Co2 and has instead turned around a potentially disastrous ongoing fall in Co2. Greenpeace co-founder and scientist Patrick Moore walked away from Greenpeace in 1986 and has exposed the green movement for fear-mongering and lies. He said that 500 million years ago there was *17 times* more Co2 in the atmosphere than we have today and levels have been falling for hundreds of millions of years. In the last 150 million years Co2 levels in Earth's atmosphere had reduced by *90 percent*. Moore said that by the time humanity began to unlock carbon dioxide from fossil fuels we were at '38 seconds to midnight' and in that sense: 'Humans are [the Earth's] salvation.' Moore made the point that only half the Co2 emitted by fossil fuels stays in the atmosphere and we should remember that all pollution pouring from chimneys that we are told is carbon dioxide is in fact nothing of the kind. It's pollution. Carbon dioxide is an invisible gas.

William Happer, Professor of Physics at Princeton University and long-time government adviser on climate, has emphasised the Co2 deficiency for maximum growth and food production. Greenhouse growers don't add carbon dioxide for a bit of fun. He said that most of the warming in the last 100 years, after the earth emerged from the super-cold period of the 'Little Ice Age' into a natural warming cycle, was over by 1940. Happer said that a peak year for warming in 1988 can be explained by a 'monster El Nino' which is a natural and cyclical warming of the Pacific that has nothing to do with 'climate

change'. He said the effect of Co2 could be compared to painting a wall with red paint in that once two or three coats have been applied it didn't matter how much more you slapped on because the wall will not get much redder. Almost all the effect of the rise in Co2 has already happened, he said, and the volume in the atmosphere would now have to *double* to increase temperature by a single degree. Climate hoaxers know this and they have invented the most ridiculously complicated series of 'feedback' loops to try to overcome this rather devastating fact. You hear puppet Greta going on cluelessly about feedback loops and this is why.

The Sun affects temperature? No you *climate denier*

Some other nonsense to contemplate: Climate graphs show that rises in temperature do not follow rises in Co2 – *it's the other way round* with a lag between the two of some 800 years. If we go back 800 years from present time we hit the Medieval Warm Period when temperatures were higher than now without any industrialisation and this was followed by the Little Ice Age when temperatures plummeted. The world was still emerging from these centuries of serious cold when many climate records began which makes the ever-repeated line of the 'hottest year since records began' meaningless when you are not comparing like with like. The coldest period of the Little Ice Age corresponded with the lowest period of sunspot activity when the Sun was at its least active. Proper scientists will not be at all surprised by this when it confirms the obvious fact that earth temperature is affected by the scale of Sun activity and the energetic power that it subsequently emits; but when is the last time you heard a climate hoaxer talking about the Sun as a source of earth temperature?? Everything has to be focussed on Co2 which makes up just 0.117 percent of so-called greenhouse gases and only a fraction of even that is generated by human activity. The rest is natural. More than 90 percent of those greenhouse gases are water vapour and clouds ([Fig 9](#)). Ban moisture I say. Have you noticed that the climate hoaxers no longer use the polar bear as their promotion image? That's because far from becoming extinct polar

bear communities are stable or thriving. Joe Bastardi, American meteorologist, weather forecaster and outspoken critic of the climate lie, documents in his book *The Climate Chronicles* how weather patterns and events claimed to be evidence of climate change have been happening since long before industrialisation: 'What happened before naturally is happening again, as is to be expected given the cyclical nature of the climate due to the design of the planet.' If you read the detailed background to the climate hoax in my other books you will shake your head and wonder how anyone could believe the crap which has spawned a multi-trillion dollar industry based on absolute garbage (see HIV causes AIDs and Sars-Cov-2 causes 'Covid-19'). Climate and 'Covid' have much in common given they have the same source. They both have the contradictory *everything* factor in which everything is explained by reference to them. It's hot – 'it's climate change'. It's cold – 'it's climate change'. I got a sniffle – 'it's Covid'. I haven't got a sniffle – 'it's Covid'. Not having a sniffle has to be a symptom of 'Covid'. Everything is and not having a sniffle is especially dangerous if you are a slow walker. For sheer audacity I offer you a Cambridge University 'study' that actually linked 'Covid' to 'climate change'. It had to happen eventually. They concluded that climate change played a role in 'Covid-19' spreading from animals to humans because ... wait for it ... I kid you not ... *the two groups were forced closer together as populations grow*. Er, that's it. The whole foundation on which this depended was that 'Bats are the likely zoonotic origin of SARS-CoV-1 and SARS-CoV-2'. Well, they are not. They are nothing to do with it. Apart from bats not being the origin and therefore 'climate change' effects on bats being irrelevant I am in awe of their academic insight. Where would we be without them? Not where we are that's for sure.

Figure 9: The idea that the gas of life is disastrously changing the climate is an insult to brain cell activity.

One other point about the weather is that climate modification is now well advanced and not every major weather event is natural – or earthquake come to that. I cover this subject at some length in other books. China is openly planning a rapid expansion of its weather modification programme which includes changing the climate in an area more than one and a half times the size of India. China used weather manipulation to ensure clear skies during the 2008 Olympics in Beijing. I have quoted from US military documents detailing how to employ weather manipulation as a weapon of war and they did that in the 1960s and 70s during the conflict in Vietnam with Operation Popeye manipulating monsoon rains for military purposes. Why would there be international treaties on weather modification if it wasn't possible? Of course it is. Weather is energetic information and it can be changed.

How was the climate hoax pulled off? See 'Covid'

If you can get billions to believe in a 'virus' that doesn't exist you can get them to believe in human-caused climate change that doesn't exist. Both are being used by the Cult to transform global society in the way it has long planned. Both hoaxes have been achieved in pretty much the same way. First you declare a lie is a fact. There's a

'virus' you call SARS-Cov-2 or humans are warming the planet with their behaviour. Next this becomes, via Cult networks, the foundation of government, academic and science policy and belief. Those who parrot the mantra are given big grants to produce research that confirms the narrative is true and ever more 'symptoms' are added to make the 'virus'/'climate change' sound even more scary. Scientists and researchers who challenge the narrative have their grants withdrawn and their careers destroyed. The media promote the lie as the unquestionable truth and censor those with an alternative view or evidence. A great percentage of the population believe what they are told as the lie becomes an everybody-knows-that and the believing-masses turn on those with a mind of their own. The technique has been used endlessly throughout human history. Wokers are the biggest promoters of the climate lie *and* 'Covid' fascism because their minds are owned by the Cult; their sense of self-righteous self-purity knows no bounds; and they exist in a bubble of reality in which facts are irrelevant and only get in the way of looking without seeing.

Running through all of this like veins in a blue cheese is control of information, which means control of perception, which means control of behaviour, which collectively means control of human society. The Cult owns the global media and Silicon Valley fascists for the simple reason that it *has* to. Without control of information it can't control perception and through that human society. Examine every facet of the Cult agenda and you will see that anything supporting its introduction is never censored while anything pushing back is always censored. I say again: Psychopaths that know why they are doing this must go before Nuremberg trials and those that follow their orders must trot along behind them into the same dock. 'I was just following orders' didn't work the first time and it must not work now. Nuremberg trials must be held all over the world before public juries for politicians, government officials, police, compliant doctors, scientists and virologists, and all Cult operatives such as Gates, Tedros, Fauci, Vallance, Whitty, Ferguson, Zuckerberg, Wojcicki, Brin, Page, Dorsey, the whole damn lot of

them – including, no *especially*, the psychopath psychologists. Without them and the brainless, gutless excuses for journalists that have repeated their lies, none of this could be happening. Nobody can be allowed to escape justice for the psychological and economic Armageddon they are all responsible for visiting upon the human race.

As for the compliant, unquestioning, swathes of humanity, and the self-obsessed, all-knowing ignorance of the Wokers ... don't start me. God help their kids. God help their grandkids. God *help them*.

CHAPTER NINE

We must have it? So what is it?

*Well I won't back down. No, I won't back down. You can stand me
up at the Gates of Hell. But I won't back down*

Tom Petty

I will now focus on the genetically-manipulating 'Covid vaccines' which do not meet this official definition of a vaccine by the US Centers for Disease Control (CDC): 'A product that stimulates a person's immune system to produce immunity to a specific disease, protecting the person from that disease.' On that basis 'Covid vaccines' are not a vaccine in that the makers don't even claim they stop infection or transmission.

They are instead part of a multi-levelled conspiracy to change the nature of the human body and what it means to be 'human' and to depopulate an enormous swathe of humanity. What I shall call Human 1.0 is on the cusp of becoming Human 2.0 and for very sinister reasons. Before I get to the 'Covid vaccine' in detail here's some background to vaccines in general. Government regulators do not test vaccines – the makers do – and the makers control which data is revealed and which isn't. Children in America are given 50 vaccine doses by age six and 69 by age 19 and the effect of the whole combined schedule has never been tested. Autoimmune diseases when the immune system attacks its own body have soared in the mass vaccine era and so has disease in general in children and the young. Why wouldn't this be the case when vaccines target the *immune system*? The US government gave Big Pharma drug

companies immunity from prosecution for vaccine death and injury in the 1986 National Childhood Vaccine Injury Act (NCVIA) and since then the government (taxpayer) has been funding compensation for the consequences of Big Pharma vaccines. The criminal and satanic drug giants can't lose and the vaccine schedule has increased dramatically since 1986 for this reason. There is no incentive to make vaccines safe and a big incentive to make money by introducing ever more. Even against a ridiculously high bar to prove vaccine liability, and with the government controlling the hearing in which it is being challenged for compensation, the vaccine court has so far paid out more than \$4 billion. These are the vaccines we are told are safe and psychopaths like Zuckerberg censor posts saying otherwise. The immunity law was even justified by a ruling that vaccines by their nature were 'unavoidably unsafe'.

Check out the ingredients of vaccines and you will be shocked if you are new to this. *They put that in children's bodies?? What??* Try aluminium, a brain toxin connected to dementia, aborted foetal tissue and formaldehyde which is used to embalm corpses. World-renowned aluminium expert Christopher Exley had his research into the health effect of aluminium in vaccines shut down by Keele University in the UK when it began taking funding from the Bill and Melinda Gates Foundation. Research when diseases 'eradicated' by vaccines began to decline and you will find the fall began long *before* the vaccine was introduced. Sometimes the fall even plateaued after the vaccine. Diseases like scarlet fever for which there was no vaccine declined in the same way because of environmental and other factors. A perfect case in point is the polio vaccine. Polio began when lead arsenate was first sprayed as an insecticide and residues remained in food products. Spraying started in 1892 and the first US polio epidemic came in Vermont in 1894. The simple answer was to stop spraying, but Rockefeller-created Big Pharma had a better idea. Polio was decreed to be caused by the *poliovirus* which 'spreads from person to person and can infect a person's spinal cord'. Lead arsenate was replaced by the lethal DDT which had the same effect of causing paralysis by damaging the brain and central nervous

system. Polio plummeted when DDT was reduced and then banned, but the vaccine is still given the credit for something it didn't do. Today by far the biggest cause of polio is the vaccines promoted by Bill Gates. Vaccine justice campaigner Robert Kennedy Jr, son of assassinated (by the Cult) US Attorney General Robert Kennedy, wrote:

In 2017, the World Health Organization (WHO) reluctantly admitted that the global explosion in polio is predominantly vaccine strain. The most frightening epidemics in Congo, Afghanistan, and the Philippines, are all linked to vaccines. In fact, by 2018, 70% of global polio cases were vaccine strain.

Vaccines make fortunes for Cult-owned Gates and Big Pharma while undermining the health and immune systems of the population. We had a glimpse of the mentality behind the Big Pharma cartel with a report on WION (World is One News), an international English language TV station based in India, which exposed the extraordinary behaviour of US drug company Pfizer over its 'Covid vaccine'. The WION report told how Pfizer had made fantastic demands of Argentina, Brazil and other countries in return for its 'vaccine'. These included immunity from prosecution, even for Pfizer negligence, government insurance to protect Pfizer from law suits and handing over as collateral sovereign assets of the country to include Argentina's bank reserves, military bases and embassy buildings. Pfizer demanded the same of Brazil in the form of waiving sovereignty of its assets abroad; exempting Pfizer from Brazilian laws; and giving Pfizer immunity from all civil liability. This is a 'vaccine' developed with government funding. Big Pharma is evil incarnate as a creation of the Cult and all must be handed tickets to Nuremberg.

Phantom 'vaccine' for a phantom 'disease'

I'll expose the 'Covid vaccine' fraud and then go on to the wider background of why the Cult has set out to 'vaccinate' every man, woman and child on the planet for an alleged 'new disease' with a survival rate of 99.77 percent (or more) even by the grotesquely-

manipulated figures of the World Health Organization and Johns Hopkins University. The 'infection' to 'death' ratio is 0.23 to 0.15 percent according to Stanford epidemiologist Dr John Ioannidis and while estimates vary the danger remains tiny. I say that if the truth be told the fake infection to fake death ratio is zero. Never mind all the evidence I have presented here and in *The Answer* that there is no 'virus' let us just focus for a moment on that death-rate figure of say 0.23 percent. The figure includes all those worldwide who have tested positive with a test not testing for the 'virus' and then died within 28 days or even longer of any other cause – *any other cause*. Now subtract all those illusory 'Covid' deaths on the global data sheets from the 0.23 percent. What do you think you would be left with? *Zero*. A vaccination has never been successfully developed for a so-called coronavirus. They have all failed at the animal testing stage when they caused hypersensitivity to what they were claiming to protect against and made the impact of a disease far worse. Cult-owned vaccine corporations got around that problem this time by bypassing animal trials, going straight to humans and making the length of the 'trials' before the public rollout as short as they could get away with. Normally it takes five to ten years or more to develop vaccines that still cause demonstrable harm to many people and that's without including the long-term effects that are never officially connected to the vaccination. 'Covid' non-vaccines have been officially produced and approved in a matter of months from a standing start and part of the reason is that (a) they were developed before the 'Covid' hoax began and (b) they are based on computer programs and not natural sources. Official non-trials were so short that government agencies gave *emergency*, not full, approval. 'Trials' were not even completed and full approval cannot be secured until they are. Public 'Covid vaccination' is actually a *continuation of the trial*. Drug company 'trials' are not scheduled to end until 2023 by which time a lot of people are going to be dead. Data on which government agencies gave this emergency approval was supplied by the Big Pharma corporations themselves in the form of Pfizer/BioNTech, AstraZeneca, Moderna, Johnson & Johnson, and

others, and this is the case with all vaccines. By its very nature *emergency* approval means drug companies do not have to prove that the 'vaccine' is 'safe and effective'. How could they with trials way short of complete? Government regulators only have to *believe* that they *could* be safe and effective. It is criminal manipulation to get products in circulation with no testing worth the name. Agencies giving that approval are infested with Big Pharma-connected place-people and they act in the interests of Big Pharma (the Cult) and not the public about whom they do not give a damn.

More human lab rats

'Covid vaccines' produced in record time by Pfizer/BioNTech and Moderna employ a technique *never approved before for use on humans*. They are known as mRNA 'vaccines' and inject a synthetic version of 'viral' mRNA or 'messenger RNA'. The key is in the term 'messenger'. The body works, or doesn't, on the basis of information messaging. Communications are constantly passing between and within the genetic system and the brain. Change those messages and you change the state of the body and even its very nature and you can change psychology and behaviour by the way the brain processes information. I think you are going to see significant changes in personality and perception of many people who have had the 'Covid vaccine' synthetic potions. Insider Aldous Huxley predicted the following in 1961 and mRNA 'vaccines' can be included in the term 'pharmacological methods':

There will be, in the next generation or so, a pharmacological method of making people love their servitude, and producing dictatorship without tears, so to speak, producing a kind of painless concentration camp for entire societies, so that people will in fact have their own liberties taken away from them, but rather enjoy it, because they will be distracted from any desire to rebel by propaganda or brainwashing, or brainwashing enhanced by pharmacological methods. And this seems to be the final revolution.

Apologists claim that mRNA synthetic 'vaccines' don't change the DNA genetic blueprint because RNA does not affect DNA only the other way round. This is so disingenuous. A process called 'reverse

transcription' can convert RNA into DNA and be integrated into DNA in the cell nucleus. This was highlighted in December, 2020, by scientists at Harvard and Massachusetts Institute of Technology (MIT). Geneticists report that more than 40 percent of mammalian genomes results from reverse transcription. On the most basic level if messaging changes then that sequence must lead to changes in DNA which is receiving and transmitting those communications. How can introducing synthetic material into cells not change the cells where DNA is located? The process is known as transfection which is defined as 'a technique to insert foreign nucleic acid (DNA or RNA) into a cell, typically with the intention of altering the properties of the cell'. Researchers at the Sloan Kettering Institute in New York found that changes in messenger RNA can deactivate tumour-suppressing proteins and thereby promote cancer. This is what happens when you mess with messaging. 'Covid vaccine' maker Moderna was founded in 2010 by Canadian stem cell biologist Derrick J. Rossi after his breakthrough discovery in the field of transforming and reprogramming stem cells. These are neutral cells that can be programmed to become any cell including sperm cells. Moderna was therefore founded on the principle of genetic manipulation and has never produced any vaccine or drug before its genetically-manipulating synthetic 'Covid' shite. Look at the name – Mode-RNA or Modify-RNA. Another important point is that the US Supreme Court has ruled that genetically-modified DNA, or complementary DNA (cDNA) synthesized in the laboratory from messenger RNA, can be patented and owned. These psychopaths are doing this to the human body.

Cells replicate synthetic mRNA in the 'Covid vaccines' and in theory the body is tricked into making antigens which trigger antibodies to target the 'virus spike proteins' which as Dr Tom Cowan said have *never been seen*. Cut the crap and these 'vaccines' deliver *self-replicating* synthetic material to the cells with the effect of changing human DNA. The more of them you have the more that process is compounded while synthetic material is all the time self-replicating. 'Vaccine'-maker Moderna describes mRNA as 'like

software for the cell' and so they are messing with the body's software. What happens when you change the software in a computer? Everything changes. For this reason the Cult is preparing a production line of mRNA 'Covid vaccines' and a long list of excuses to use them as with all the 'variants' of a 'virus' never shown to exist. The plan is further to transfer the mRNA technique to other vaccines mostly given to children and young people. The cumulative consequences will be a transformation of human DNA through a constant infusion of synthetic genetic material which will kill many and change the rest. Now consider that governments that have given emergency approval for a vaccine that's not a vaccine; never been approved for humans before; had no testing worth the name; and the makers have been given immunity from prosecution for any deaths or adverse effects suffered by the public. The UK government awarded *permanent legal indemnity* to itself and its employees for harm done when a patient is being treated for 'Covid-19' or 'suspected Covid-19'. That is quite a thought when these are possible 'side-effects' from the 'vaccine' (they are not 'side', they are effects) listed by the US Food and Drug Administration:

Guillain-Barre syndrome; acute disseminated encephalomyelitis; transverse myelitis; encephalitis; myelitis; encephalomyelitis; meningoencephalitis; meningitis; encephalopathy; convulsions; seizures; stroke; narcolepsy; cataplexy; anaphylaxis; acute myocardial infarction (heart attack); myocarditis; pericarditis; autoimmune disease; death; implications for pregnancy, and birth outcomes; other acute demyelinating diseases; non anaphylactic allergy reactions; thrombocytopenia ; disseminated intravascular coagulation; venous thromboembolism; arthritis; arthralgia; joint pain; Kawasaki disease; multisystem inflammatory syndrome in children; vaccine enhanced disease. The latter is the way the 'vaccine' has the potential to make diseases far worse than they would otherwise be.

UK doctor and freedom campaigner Vernon Coleman described the conditions in this list as 'all unpleasant, most of them very serious, and you can't get more serious than death'. The thought that anyone at all has had the 'vaccine' in these circumstances is testament to the potential that humanity has for clueless, unquestioning, stupidity and for many that programmed stupidity has already been terminal.

An insider speaks

Dr Michael Yeadon is a former Vice President, head of research and Chief Scientific Adviser at vaccine giant Pfizer. Yeadon worked on the inside of Big Pharma, but that did not stop him becoming a vocal critic of 'Covid vaccines' and their potential for multiple harms, including infertility in women. By the spring of 2021 he went much further and even used the no, no, term 'conspiracy'. When you begin to see what is going on it is impossible not to do so. Yeadon spoke out in an interview with freedom campaigner James Delingpole and I mentioned earlier how he said that no one had samples of 'the virus'. He explained that the mRNA technique originated in the anti-cancer field and ways to turn on and off certain genes which could be advantageous if you wanted to stop cancer growing out of control. 'That's the origin of them. They are a very unusual application, really.' Yeadon said that treating a cancer patient with an aggressive procedure might be understandable if the alternative was dying, but it was quite another thing to use the same technique as a public health measure. Most people involved wouldn't catch the infectious agent you were vaccinating against and if they did they probably wouldn't die:

If you are really using it as a public health measure you really want to as close as you can get to zero side-effects ... I find it odd that they chose techniques that were really cutting their teeth in the field of oncology and I'm worried that in using gene-based vaccines that have to be injected in the body and spread around the body, get taken up into some cells, and the regulators haven't quite told us which cells they get taken up into ... you are going to be generating a wide range of responses ... with multiple steps each of which could go well or badly.

I doubt the Cult intends it to go well. Yeadon said that you can put any gene you like into the body through the 'vaccine'. 'You can certainly give them a gene that would do them some harm if you wanted.' I was intrigued when he said that when used in the cancer field the technique could turn genes on and off. I explore this process in *The Answer* and with different genes having different functions you could create mayhem – physically and psychologically – if you turned the wrong ones on and the right ones off. I read reports of an experiment by researchers at the University of Washington's school of computer science and engineering in which they encoded DNA to infect computers. The body is itself a biological computer and if human DNA can inflict damage on a computer why can't the computer via synthetic material mess with the human body? It can. The Washington research team said it was possible to insert malicious malware into 'physical DNA strands' and corrupt the computer system of a gene sequencing machine as it 'reads gene letters and stores them as binary digits 0 and 1'. They concluded that hackers could one day use blood or spit samples to access computer systems and obtain sensitive data from police forensics labs or infect genome files. It is at this level of digital interaction that synthetic 'vaccines' need to be seen to get the full picture and that will become very clear later on. Michael Yeadon said it made no sense to give the 'vaccine' to younger people who were in no danger from the 'virus'. What was the benefit? It was all downside with potential effects:

The fact that my government in what I thought was a civilised, rational country, is raining [the 'vaccine'] on people in their 30s and 40s, even my children in their 20s, they're getting letters and phone calls, I know this is not right and any of you doctors who are vaccinating you know it's not right, too. They are not at risk. They are not at risk from the disease, so you are now hoping that the side-effects are so rare that you get away with it. You don't give new technology ... that you don't understand to 100 percent of the population.

Blood clot problems with the AstraZeneca 'vaccine' have been affecting younger people to emphasise the downside risks with no benefit. AstraZeneca's version, produced with Oxford University, does not use mRNA, but still gets its toxic cocktail inside cells where

it targets DNA. The Johnson & Johnson 'vaccine' which uses a similar technique has also produced blood clot effects to such an extent that the United States paused its use at one point. They are all 'gene therapy' (cell modification) procedures and not 'vaccines'. The truth is that once the content of these injections enter cells we have no idea what the effect will be. People can speculate and some can give very educated opinions and that's good. In the end, though, only the makers know what their potions are designed to do and even they won't know every last consequence. Michael Yeadon was scathing about doctors doing what they knew to be wrong. 'Everyone's mute', he said. Doctors in the NHS must know this was not right, coming into work and injecting people. 'I don't know how they sleep at night. I know I couldn't do it. I know that if I were in that position I'd have to quit.' He said he knew enough about toxicology to know this was not a good risk-benefit. Yeadon had spoken to seven or eight university professors and all except two would not speak out publicly. Their universities had a policy that no one said anything that countered the government and its medical advisors. They were afraid of losing their government grants. This is how intimidation has been used to silence the truth at every level of the system. I say silence, but these people could still speak out if they made that choice. Yeadon called them 'moral cowards' – 'This is about your children and grandchildren's lives and you have just buggered off and left it.'

'Variant' nonsense

Some of his most powerful comments related to the alleged 'variants' being used to instil more fear, justify more lockdowns, and introduce more 'vaccines'. He said government claims about 'variants' were nonsense. He had checked the alleged variant 'codes' and they were 99.7 percent identical to the 'original'. This was the human identity difference equivalent to putting a baseball cap on and off or wearing it the other way round. A 0.3 percent difference would make it impossible for that 'variant' to escape immunity from the 'original'. This made no sense of having new 'vaccines' for

‘variants’. He said there would have to be at least a *30 percent* difference for that to be justified and even then he believed the immune system would still recognise what it was. Gates-funded ‘variant modeller’ and ‘vaccine’-pusher John Edmunds might care to comment. Yeadon said drug companies were making new versions of the ‘vaccine’ as a ‘top up’ for ‘variants’. Worse than that, he said, the ‘regulators’ around the world like the MHRA in the UK had got together and agreed that because ‘vaccines’ for ‘variants’ were so similar to the first ‘vaccines’ *they did not have to do safety studies*. How transparently sinister that is. This is when Yeadon said: ‘There is a conspiracy here.’ There was no need for another vaccine for ‘variants’ and yet we were told that there was and the country had shut its borders because of them. ‘They are going into hundreds of millions of arms without passing ‘go’ or any regulator. Why did they do that? Why did they pick this method of making the vaccine?’

The reason had to be something bigger than that it seemed and ‘it’s not protection against the virus’. It’s was a far bigger project that meant politicians and advisers were willing to do things and not do things that knowingly resulted in avoidable deaths – ‘that’s already happened when you think about lockdown and deprivation of health care for a year.’ He spoke of people prepared to do something that results in the avoidable death of their fellow human beings and it not bother them. This is the penny-drop I have been working to get across for more than 30 years – the level of pure evil we are dealing with. Yeadon said his friends and associates could not believe there could be that much evil, but he reminded them of Stalin, Pol Pot and Hitler and of what Stalin had said: ‘One death is a tragedy. A million? A statistic.’ He could not think of a benign explanation for why you need top-up vaccines ‘which I’m sure you don’t’ and for the regulators ‘to just get out of the way and wave them through’. Why would the regulators do that when they were still wrestling with the dangers of the ‘parent’ vaccine? He was clearly shocked by what he had seen since the ‘Covid’ hoax began and now he was thinking the previously unthinkable:

If you wanted to depopulate a significant proportion of the world and to do it in a way that doesn't involve destruction of the environment with nuclear weapons, poisoning everyone with anthrax or something like that, and you wanted plausible deniability while you had a multi-year infectious disease crisis, I actually don't think you could come up with a better plan of work than seems to be in front of me. I can't say that's what they are going to do, but I can't think of a benign explanation why they are doing it.

He said he never thought that they would get rid of 99 percent of humans, but now he wondered. 'If you wanted to that this would be a hell of a way to do it – it would be unstoppable folks.' Yeadon had concluded that those who submitted to the 'vaccine' would be allowed to have some kind of normal life (but for how long?) while screws were tightened to coerce and mandate the last few percent. 'I think they'll put the rest of them in a prison camp. I wish I was wrong, but I don't think I am.' Other points he made included: There were no coronavirus vaccines then suddenly they all come along at the same time; we have no idea of the long term affect with trials so short; coercing or forcing people to have medical procedures is against the Nuremberg Code instigated when the Nazis did just that; people should at least delay having the 'vaccine'; a quick Internet search confirms that masks don't reduce respiratory viral transmission and 'the government knows that'; they have smashed civil society and they know that, too; two dozen peer-reviewed studies show no connection between lockdown and reducing deaths; he knew from personal friends the elite were still flying around and going on holiday while the public were locked down; the elite were not having the 'vaccines'. He was also asked if 'vaccines' could be made to target difference races. He said he didn't know, but the document by the Project for the New American Century in September, 2000, said developing 'advanced forms of biological warfare that can target *specific genotypes* may transform biological warfare from the realm of terror to a politically useful tool.' Oh, they're evil all right. Of that we can be *absolutely* sure.

Another cull of old people

We have seen from the CDC definition that the mRNA 'Covid vaccine' is not a vaccine and nor are the others that *claim* to reduce 'severity of symptoms' in *some* people, but not protect from infection or transmission. What about all the lies about returning to 'normal' if people were 'vaccinated'? If they are not claimed to stop infection and transmission of the alleged 'virus', how does anything change? This was all lies to manipulate people to take the jabs and we are seeing that now with masks and distancing still required for the 'vaccinated'. How did they think that elderly people with fragile health and immune responses were going to be affected by infusing their cells with synthetic material and other toxic substances? They *knew* that in the short and long term it would be devastating and fatal as the culling of the old that began with the first lockdowns was continued with the 'vaccine'. Death rates in care homes soared immediately residents began to be 'vaccinated' – infused with synthetic material. Brave and committed whistleblower nurses put their careers at risk by exposing this truth while the rest kept their heads down and their mouths shut to put their careers before those they are supposed to care for. A long-time American Certified Nursing Assistant who gave his name as James posted a video in which he described emotionally what happened in his care home when vaccination began. He said that during 2020 very few residents were sick with 'Covid' and no one died during the entire year; but shortly after the Pfizer mRNA injections 14 people died within two weeks and many others were near death. 'They're dropping like flies', he said. Residents who walked on their own before the shot could no longer and they had lost their ability to conduct an intelligent conversation. The home's management said the sudden deaths were caused by a 'super-spreader' of 'Covid-19'. Then how come, James asked, that residents who refused to take the injections were not sick? It was a case of inject the elderly with mRNA synthetic potions and blame their illness and death that followed on the 'virus'. James described what was happening in care homes as 'the greatest crime of genocide this country has ever seen'. Remember the NHS staff nurse from earlier who used the same

word 'genocide' for what was happening with the 'vaccines' and that it was an 'act of human annihilation'. A UK care home whistleblower told a similar story to James about the effect of the 'vaccine' in deaths and 'outbreaks' of illness dubbed 'Covid' after getting the jab. She told how her care home management and staff had zealously imposed government regulations and no one was allowed to even question the official narrative let alone speak out against it. She said the NHS was even worse. Again we see the results of reframing. A worker at a local care home where I live said they had not had a single case of 'Covid' there for almost a year and when the residents were 'vaccinated' they had 19 positive cases in two weeks with eight dying.

It's not the 'vaccine' – honest

The obvious cause and effect was being ignored by the media and most of the public. Australia's health minister Greg Hunt (a former head of strategy at the World Economic Forum) was admitted to hospital after he had the 'vaccine'. He was suffering according to reports from the skin infection 'cellulitis' and it must have been a severe case to have warranted days in hospital. Immediately the authorities said this was nothing to do with the 'vaccine' when an effect of some vaccines is a 'cellulitis-like reaction'. We had families of perfectly healthy old people who died after the 'vaccine' saying that if only they had been given the 'vaccine' earlier they would still be alive. As a numbskull rating that is off the chart. A father of four 'died of Covid' at aged 48 when he was taken ill two days after having the 'vaccine'. The man, a health administrator, had been 'shielding during the pandemic' and had 'not really left the house' until he went for the 'vaccine'. Having the 'vaccine' and then falling ill and dying does not seem to have qualified as a possible cause and effect and 'Covid-19' went on his death certificate. His family said they had no idea how he 'caught the virus'. A family member said: 'Tragically, it could be that going for a vaccination ultimately led to him catching Covid ...The sad truth is that they are never going to know where it came from.' The family warned people to remember

that the virus still existed and was 'very real'. So was their stupidity. Nurses and doctors who had the first round of the 'vaccine' were collapsing, dying and ending up in a hospital bed while they or their grieving relatives were saying they'd still have the 'vaccine' again despite what happened. I kid you not. You mean if your husband returned from the dead he'd have the same 'vaccine' again that killed him??

Doctors at the VCU Medical Center in Richmond, Virginia, said the Johnson & Johnson 'vaccine' was to blame for a man's skin peeling off. Patient Richard Terrell said: 'It all just happened so fast. My skin peeled off. It's still coming off on my hands now.' He said it was stinging, burning and itching and when he bent his arms and legs it was very painful with 'the skin swollen and rubbing against itself'. Pfizer/BioNTech and Moderna vaccines use mRNA to change the cell while the Johnson & Johnson version uses DNA in a process similar to AstraZeneca's technique. Johnson & Johnson and AstraZeneca have both had their 'vaccines' paused by many countries after causing serious blood problems. Terrell's doctor Fnu Nutan said he could have died if he hadn't got medical attention. It sounds terrible so what did Nutan and Terrell say about the 'vaccine' now? Oh, they still recommend that people have it. A nurse in a hospital bed 40 minutes after the vaccination and unable to swallow due to throat swelling was told by a doctor that he lost mobility in his arm for 36 hours following the vaccination. What did he say to the ailing nurse? 'Good for you for getting the vaccination.' We are dealing with a serious form of cognitive dissonance madness in both public and medical staff. There is a remarkable correlation between those having the 'vaccine' and trumpeting the fact and suffering bad happenings shortly afterwards. Witold Rogiewicz, a Polish doctor, made a video of his 'vaccination' and ridiculed those who were questioning its safety and the intentions of Bill Gates: 'Vaccinate yourself to protect yourself, your loved ones, friends and also patients. And to mention quickly I have info for anti-vaxxers and anti-Covidors if you want to contact Bill Gates you can do this through me.' He further ridiculed the dangers of 5G. Days later he

was dead, but naturally the vaccination wasn't mentioned in the verdict of 'heart attack'.

Lies, lies and more lies

So many members of the human race have slipped into extreme states of insanity and unfortunately they include reframed doctors and nursing staff. Having a 'vaccine' and dying within minutes or hours is not considered a valid connection while death from any cause within 28 days or longer of a positive test with a test not testing for the 'virus' means 'Covid-19' goes on the death certificate. How could that 'vaccine'-death connection not have been made except by calculated deceit? US figures in the initial rollout period to February 12th, 2020, revealed that a third of the deaths reported to the CDC after 'Covid vaccines' happened within 48 hours. Five men in the UK suffered an 'extremely rare' blood clot problem after having the AstraZeneca 'vaccine', but no causal link was established said the Gates-funded Medicines and Healthcare products Regulatory Agency (MHRA) which had given the 'vaccine' emergency approval to be used. Former Pfizer executive Dr Michael Yeadon explained in his interview how the procedures could cause blood coagulation and clots. People who should have been at no risk were dying from blood clots in the brain and he said he had heard from medical doctor friends that people were suffering from skin bleeding and massive headaches. The AstraZeneca 'shot' was stopped by some 20 countries over the blood clotting issue and still the corrupt MHRA, the European Medicines Agency (EMA) and the World Health Organization said that it should continue to be given even though the EMA admitted that it 'still cannot rule out definitively' a link between blood clotting and the 'vaccine'. Later Marco Cavaleri, head of EMA vaccine strategy, said there was indeed a clear link between the 'vaccine' and thrombosis, but they didn't know why. So much for the trials showing the 'vaccine' is safe. Blood clots were affecting younger people who would be under virtually no danger from 'Covid' even if it existed which makes it all the more stupid and sinister.

The British government responded to public alarm by wheeling out June Raine, the terrifyingly weak infant school headmistress sound-alike who heads the UK MHRA drug 'regulator'. The idea that she would stand up to Big Pharma and government pressure is laughable and she told us that all was well in the same way that she did when allowing untested, never-used-on-humans-before, genetically-manipulating 'vaccines' to be exposed to the public in the first place. Mass lying is the new normal of the 'Covid' era. The MHRA later said 30 cases of rare blood clots had by then been connected with the AstraZeneca 'vaccine' (that means a lot more in reality) while stressing that the benefits of the jab in preventing 'Covid-19' outweighed any risks. A more ridiculous and disingenuous statement with callous disregard for human health it is hard to contemplate. Immediately after the mendacious 'all-clears' two hospital workers in Denmark experienced blood clots and cerebral haemorrhaging following the AstraZeneca jab and one died. Top Norwegian health official Pål Andre Holme said the 'vaccine' was the only common factor: 'There is nothing in the patient history of these individuals that can give such a powerful immune response ... I am confident that the antibodies that we have found are the cause, and I see no other explanation than it being the vaccine which triggers it.' Strokes, a clot or bleed in the brain, were clearly associated with the 'vaccine' from word of mouth and whistleblower reports. Similar consequences followed with all these 'vaccines' that we were told were so safe and as the numbers grew by the day it was clear we were witnessing human carnage.

Learning the hard way

A woman interviewed by UKColumn told how her husband suffered dramatic health effects after the vaccine when he'd been in good health all his life. He went from being a little unwell to losing all feeling in his legs and experiencing 'excruciating pain'. Misdiagnosis followed twice at Accident and Emergency (an 'allergy' and 'sciatica') before he was admitted to a neurology ward where doctors said his serious condition had been caused by the

'vaccine'. Another seven 'vaccinated' people were apparently being treated on the same ward for similar symptoms. The woman said he had the 'vaccine' because they believed media claims that it was safe. 'I didn't think the government would give out a vaccine that does this to somebody; I believed they would be bringing out a vaccination that would be safe.' What a tragic way to learn that lesson. Another woman posted that her husband was transporting stroke patients to hospital on almost every shift and when he asked them if they had been 'vaccinated' for 'Covid' they all replied 'yes'. One had a 'massive brain bleed' the day after his second dose. She said her husband reported the 'just been vaccinated' information every time to doctors in A and E only for them to ignore it, make no notes and appear annoyed that it was even mentioned. This particular report cannot be verified, but it expresses a common theme that confirms the monumental underreporting of 'vaccine' consequences. Interestingly as the 'vaccines' and their brain blood clot/stroke consequences began to emerge the UK National Health Service began a publicity campaign telling the public what to do in the event of a stroke. A Scottish NHS staff nurse who quit in disgust in March, 2021, said:

I have seen traumatic injuries from the vaccine, they're not getting reported to the yellow card [adverse reaction] scheme, they're treating the symptoms, not asking why, why it's happening. It's just treating the symptoms and when you speak about it you're dismissed like you're crazy, I'm not crazy, I'm not crazy because every other colleague I've spoken to is terrified to speak out, they've had enough.

Videos appeared on the Internet of people uncontrollably shaking after the 'vaccine' with no control over muscles, limbs and even their face. A Scottish mother broke out in a severe rash all over her body almost immediately after she was given the AstraZeneca 'vaccine'. The pictures were horrific. Leigh King, a 41-year-old hairdresser from Lanarkshire said: 'Never in my life was I prepared for what I was about to experience ... My skin was so sore and constantly hot ... I have never felt pain like this ...' But don't you worry, the 'vaccine' is perfectly safe. Then there has been the effect on medical

staff who have been pressured to have the 'vaccine' by psychopathic 'health' authorities and government. A London hospital consultant who gave the name K. Polyakova wrote this to the *British Medical Journal* or *BMJ*:

I am currently struggling with ... the failure to report the reality of the morbidity caused by our current vaccination program within the health service and staff population. The levels of sickness after vaccination is unprecedented and staff are getting very sick and some with neurological symptoms which is having a huge impact on the health service function. Even the young and healthy are off for days, some for weeks, and some requiring medical treatment. Whole teams are being taken out as they went to get vaccinated together.

Mandatory vaccination in this instance is stupid, unethical and irresponsible when it comes to protecting our staff and public health. We are in the voluntary phase of vaccination, and encouraging staff to take an unlicensed product that is impacting on their immediate health ... it is clearly stated that these vaccine products do not offer immunity or stop transmission. In which case why are we doing it?

Not to protect health that's for sure. Medical workers are lauded by governments for agenda reasons when they couldn't give a toss about them any more than they can for the population in general. Schools across America faced the same situation as they closed due to the high number of teachers and other staff with bad reactions to the Pfizer/BioNTech, Moderna, and Johnson & Johnson 'Covid vaccines' all of which were linked to death and serious adverse effects. The *BMJ* took down the consultant's comments pretty quickly on the grounds that they were being used to spread 'disinformation'. They were exposing the truth about the 'vaccine' was the real reason. The cover-up is breathtaking.

Hiding the evidence

The scale of the 'vaccine' death cover-up worldwide can be confirmed by comparing official figures with the personal experience of the public. I heard of many people in my community who died immediately or soon after the vaccine that would never appear in the media or even likely on the official totals of 'vaccine' fatalities and adverse reactions when only about ten percent are estimated to be

reported and I have seen some estimates as low as one percent in a Harvard study. In the UK alone by April 29th, 2021, some 757,654 adverse reactions had been officially reported from the Pfizer/BioNTech, Oxford/AstraZeneca and Moderna 'vaccines' with more than a thousand deaths linked to jabs and that means an estimated ten times this number in reality from a ten percent reporting rate percentage. That's seven million adverse reactions and 10,000 potential deaths and a one percent reporting rate would be ten times *those* figures. In 1976 the US government pulled the swine flu vaccine after 53 deaths. The UK data included a combined 10,000 eye disorders from the 'Covid vaccines' with more than 750 suffering visual impairment or blindness and again multiply by the estimated reporting percentages. As 'Covid cases' officially fell hospitals virtually empty during the 'Covid crisis' began to fill up with a range of other problems in the wake of the 'vaccine' rollout. The numbers across America have also been catastrophic. Deaths linked to *all* types of vaccine increased by 6,000 *percent* in the first quarter of 2021 compared with 2020. A 39-year-old woman from Ogden, Utah, died four days after receiving a second dose of Moderna's 'Covid vaccine' when her liver, heart and kidneys all failed despite the fact that she had no known medical issues or conditions. Her family sought an autopsy, but Dr Erik Christensen, Utah's chief medical examiner, said proving vaccine injury as a cause of death almost never happened. He could think of only one instance where an autopsy would name a vaccine as the official cause of death and that would be anaphylaxis where someone received a vaccine and died almost instantaneously. 'Short of that, it would be difficult for us to definitively say this is the vaccine,' Christensen said. If that is true this must be added to the estimated ten percent (or far less) reporting rate of vaccine deaths and serious reactions and the conclusion can only be that vaccine deaths and serious reactions – including these 'Covid' potions' – are phenomenally understated in official figures. The same story can be found everywhere. Endless accounts of deaths and serious reactions among the public, medical

and care home staff while official figures did not even begin to reflect this.

Professional script-reader Dr David Williams, a 'top public-health official' in Ontario, Canada, insulted our intelligence by claiming only four serious adverse reactions and no deaths from the more than 380,000 vaccine doses then given. This bore no resemblance to what people knew had happened in their own circles and we had Dirk Huyer in charge of getting millions vaccinated in Ontario while at the same time he was Chief Coroner for the province investigating causes of death including possible death from the vaccine. An aide said he had stepped back from investigating deaths, but evidence indicated otherwise. Rosemary Frei, who secured a Master of Science degree in molecular biology at the Faculty of Medicine at Canada's University of Calgary before turning to investigative journalism, was one who could see that official figures for 'vaccine' deaths and reactions made no sense. She said that doctors seldom reported adverse events and when people got really sick or died after getting a vaccination they would attribute that to anything except the vaccines. It had been that way for years and anyone who wondered aloud whether the 'Covid vaccines' or other shots cause harm is immediately branded as 'anti-vax' and 'anti-science'. This was 'career-threatening' for health professionals. Then there was the huge pressure to support the push to 'vaccinate' billions in the quickest time possible. Frei said:

So that's where we're at today. More than half a million vaccine doses have been given to people in Ontario alone. The rush is on to vaccinate all 15 million of us in the province by September. And the mainstream media are screaming for this to be sped up even more. That all adds up to only a very slim likelihood that we're going to be told the truth by officials about how many people are getting sick or dying from the vaccines.

What is true of Ontario is true of everywhere.

They KNEW – and still did it

The authorities knew what was going to happen with multiple deaths and adverse reactions. The UK government's Gates-funded

and Big Pharma-dominated Medicines and Healthcare products Regulatory Agency (MHRA) hired a company to employ AI in compiling the projected reactions to the 'vaccine' that would otherwise be uncountable. The request for applications said: 'The MHRA urgently seeks an Artificial Intelligence (AI) software tool to process the expected high volume of Covid-19 vaccine Adverse Drug Reaction ...' This was from the agency, headed by the disingenuous June Raine, that gave the 'vaccines' emergency approval and the company was hired before the first shot was given. 'We are going to kill and maim you – is that okay?' 'Oh, yes, perfectly fine – I'm very grateful, thank you, doctor.' The range of 'Covid vaccine' adverse reactions goes on for page after page in the MHRA criminally underreported 'Yellow Card' system and includes affects to eyes, ears, skin, digestion, blood and so on. Raine's MHRA amazingly claimed that the 'overall safety experience ... is so far as expected from the clinical trials'. The death, serious adverse effects, deafness and blindness were *expected*? When did they ever mention that? If these human tragedies were expected then those that gave approval for the use of these 'vaccines' must be guilty of crimes against humanity including murder – a definition of which is 'killing a person with malice aforethought or with recklessness manifesting extreme indifference to the value of human life.' People involved at the MHRA, the CDC in America and their equivalent around the world must go before Nuremberg trials to answer for their callous inhumanity. We are only talking here about the immediate effects of the 'vaccine'. The longer-term impact of the DNA synthetic manipulation is the main reason they are so hysterically desperate to inoculate the entire global population in the shortest possible time.

Africa and the developing world are a major focus for the 'vaccine' depopulation agenda and a mass vaccination sales-pitch is underway thanks to caring people like the Rockefellers and other Cult assets. The Rockefeller Foundation, which pre-empted the 'Covid pandemic' in a document published in 2010 that 'predicted' what happened a decade later, announced an initial \$34.95 million grant in February, 2021, 'to ensure more equitable access to Covid-19

testing and vaccines' among other things in Africa in collaboration with '24 organizations, businesses, and government agencies'. The pan-Africa initiative would focus on 10 countries: Burkina Faso, Ethiopia, Ghana, Kenya, Nigeria, Rwanda, South Africa, Tanzania, Uganda, and Zambia'. Rajiv Shah, President of the Rockefeller Foundation and former administrator of CIA-controlled USAID, said that if Africa was not mass-vaccinated (to change the DNA of its people) it was a 'threat to all of humanity' and not fair on Africans. When someone from the Rockefeller Foundation says they want to do something to help poor and deprived people and countries it is time for a belly-laugh. They are doing this out of the goodness of their 'heart' because 'vaccinating' the entire global population is what the 'Covid' hoax set out to achieve. Official 'decolonisation' of Africa by the Cult was merely a prelude to financial colonisation on the road to a return to physical colonisation. The 'vaccine' is vital to that and the sudden and convenient death of the 'Covid' sceptic president of Tanzania can be seen in its true light. A lot of people in Africa are aware that this is another form of colonisation and exploitation and they need to stand their ground.

The 'vaccine is working' scam

A potential problem for the Cult was that the 'vaccine' is meant to change human DNA and body messaging and not to protect anyone from a 'virus' never shown to exist. The vaccine couldn't work because it was not designed to work and how could they make it *appear* to be working so that more people would have it? This was overcome by lowering the amplification rate of the PCR test to produce fewer 'cases' and therefore fewer 'deaths'. Some of us had been pointing out since March, 2020, that the amplification rate of the test not testing for the 'virus' had been made artificially high to generate positive tests which they could call 'cases' to justify lockdowns. The World Health Organization recommended an absurdly high 45 amplification cycles to ensure the high positives required by the Cult and then remained silent on the issue until January 20th, 2021 – Biden's Inauguration Day. This was when the

'vaccinations' were seriously underway and on that day the WHO recommended after discussions with America's CDC that laboratories *lowered their testing amplification*. Dr David Samadi, a certified urologist and health writer, said the WHO was encouraging all labs to reduce their cycle count for PCR tests. He said the current cycle was much too high and was 'resulting in any particle being declared a positive case'. Even one mainstream news report I saw said this meant the number of 'Covid' infections may have been 'dramatically inflated'. Oh, just a little bit. The CDC in America issued new guidance to laboratories in April, 2021, to use 28 cycles *but only for 'vaccinated' people*. The timing of the CDC/WHO interventions were cynically designed to make it appear the 'vaccines' were responsible for falling cases and deaths when the real reason can be seen in the following examples. New York's state lab, the Wadsworth Center, identified 872 positive tests in July, 2020, based on a threshold of 40 cycles. When the figure was lowered to 35 cycles 43 percent of the 872 were no longer 'positives'. At 30 cycles the figure was 63 percent. A Massachusetts lab found that between 85 to 90 percent of people who tested positive in July with a cycle threshold of 40 would be negative at 30 cycles, Ashish Jha, MD, director of the Harvard Global Health Institute, said: 'I'm really shocked that it could be that high ... Boy, does it really change the way we need to be thinking about testing.' I'm shocked that I could see the obvious in the spring of 2020, with no medical background, and most medical professionals still haven't worked it out. No, that's not shocking – it's terrifying.

Three weeks after the WHO directive to lower PCR cycles the London *Daily Mail* ran this headline: 'Why ARE Covid cases plummeting? New infections have fallen 45% in the US and 30% globally in the past 3 weeks but experts say vaccine is NOT the main driver because only 8% of Americans and 13% of people worldwide have received their first dose.' They acknowledged that the drop could not be attributed to the 'vaccine', but soon this morphed throughout the media into the 'vaccine' has caused cases and deaths to fall when it was the PCR threshold. In December, 2020, there was

chaos at English Channel ports with truck drivers needing negative 'Covid' tests before they could board a ferry home for Christmas. The government wanted to remove the backlog as fast as possible and they brought in troops to do the 'testing'. Out of 1,600 drivers just 36 tested positive and the rest were given the all clear to cross the Channel. I guess the authorities thought that 36 was the least they could get away with without the unquestioning catching on. The amplification trick which most people believed in the absence of information in the mainstream applied more pressure on those refusing the 'vaccine' to succumb when it 'obviously worked'. The truth was the exact opposite with deaths in care homes soaring with the 'vaccine' and in Israel the term used was 'skyrocket'. A re-analysis of published data from the Israeli Health Ministry led by Dr Hervé Seligmann at the Medicine Emerging Infectious and Tropical Diseases at Aix-Marseille University found that Pfizer's 'Covid vaccine' killed 'about 40 times more [elderly] people than the disease itself would have killed' during a five-week vaccination period and *260 times* more younger people than would have died from the 'virus' even according to the manipulated 'virus' figures. Dr Seligmann and his co-study author, Haim Yativ, declared after reviewing the Israeli 'vaccine' death data: 'This is a new Holocaust.'

Then, in mid-April, 2021, after vast numbers of people worldwide had been 'vaccinated', the story changed with clear coordination. The UK government began to prepare the ground for more future lockdowns when Nuremberg-destined Boris Johnson told yet another whopper. He said that cases had fallen because of *lockdowns* not 'vaccines'. Lockdowns are irrelevant when *there is no 'virus'* and the test and fraudulent death certificates are deciding the number of 'cases' and 'deaths'. Study after study has shown that lockdowns don't work and instead kill and psychologically destroy people. Meanwhile in the United States Anthony Fauci and Rochelle Walensky, the ultra-Zionist head of the CDC, peddled the same line. More lockdown was the answer and not the 'vaccine', a line repeated on cue by the moron that is Canadian Prime Minister Justin Trudeau. Why all the hysteria to get everyone 'vaccinated' if lockdowns and

not 'vaccines' made the difference? None of it makes sense on the face of it. Oh, but it does. The Cult wants lockdowns *and* the 'vaccine' and if the 'vaccine' is allowed to be seen as the total answer lockdowns would no longer be justified when there are still livelihoods to destroy. 'Variants' and renewed upward manipulation of PCR amplification are planned to instigate never-ending lockdown *and* more 'vaccines'.

You *must* have it – we're desperate

Israel, where the Jewish and Arab population are ruled by the Sabbatian Cult, was the front-runner in imposing the DNA-manipulating 'vaccine' on its people to such an extent that Jewish refusers began to liken what was happening to the early years of Nazi Germany. This would seem to be a fantastic claim. Why would a government of Jewish people be acting like the Nazis did? If you realise that the Sabbatian Cult was behind the Nazis and that Sabbatians hate Jews the pieces start to fit and the question of why a 'Jewish' government would treat Jews with such callous disregard for their lives and freedom finds an answer. Those controlling the government of Israel *aren't Jewish* – they're Sabbatian. Israeli lawyer Tamir Turgal was one who made the Nazi comparison in comments to German lawyer Reiner Fuellmich who is leading a class action lawsuit against the psychopaths for crimes against humanity. Turgal described how the Israeli government was vaccinating children and pregnant women on the basis that there was no evidence that this was dangerous when they had no evidence that it *wasn't* dangerous either. They just had no evidence. This was medical experimentation and Turgal said this breached the Nuremberg Code about medical experimentation and procedures requiring informed consent and choice. Think about that. A Nuremberg Code developed because of Nazi experimentation on Jews and others in concentration camps by people like the evil-beyond-belief Josef Mengele is being breached by the *Israeli* government; but when you know that it's a *Sabbatian* government along with its intelligence and military agencies like Mossad, Shin Bet and the Israeli Defense Forces, and that Sabbatians

were the force behind the Nazis, the kaleidoscope comes into focus. What have we come to when Israeli Jews are suing their government for violating the Nuremberg Code by essentially making Israelis subject to a medical experiment using the controversial 'vaccines'? It's a shocker that this has to be done in the light of what happened in Nazi Germany. The Anshe Ha-Emet, or 'People of the Truth', made up of Israeli doctors, lawyers, campaigners and public, have launched a lawsuit with the International Criminal Court. It says:

When the heads of the Ministry of Health as well as the prime minister presented the vaccine in Israel and began the vaccination of Israeli residents, the vaccinated were not advised, that, in practice, they are taking part in a medical experiment and that their consent is required for this under the Nuremberg Code.

The irony is unbelievable, but easily explained in one word: Sabbatians. The foundation of Israeli 'Covid' apartheid is the 'green pass' or 'green passport' which allows Jews and Arabs who have had the DNA-manipulating 'vaccine' to go about their lives – to work, fly, travel in general, go to shopping malls, bars, restaurants, hotels, concerts, gyms, swimming pools, theatres and sports venues, while non-'vaccinated' are banned from all those places and activities. Israelis have likened the 'green pass' to the yellow stars that Jews in Nazi Germany were forced to wear – the same as the yellow stickers that a branch of UK supermarket chain Morrisons told exempt mask-wearers they had to display when shopping. How very sensitive. The Israeli system is blatant South African-style apartheid on the basis of compliance or non-compliance to fascism rather than colour of the skin. How appropriate that the Sabbatian Israeli government was so close to the pre-Mandela apartheid regime in Pretoria. The Sabbatian-instigated 'vaccine passport' in Israel is planned for everywhere. Sabbatians struck a deal with Pfizer that allowed them to lead the way in the percentage of a national population infused with synthetic material and the result was catastrophic. Israeli freedom activist Shai Dannon told me how chairs were appearing on beaches that said 'vaccinated only'. Health Minister Yuli Edelstein said that anyone unwilling or unable to get

the jabs that 'confer immunity' will be 'left behind'. The man's a liar. Not even the makers claim the 'vaccines' confer immunity. When you see those figures of 'vaccine' deaths these psychopaths were saying that you must take the chance the 'vaccine' will kill you or maim you while knowing it will change your DNA or lockdown for you will be permanent. That's fascism. The Israeli parliament passed a law to allow personal information of the non-vaccinated to be shared with local and national authorities for three months. This was claimed by its supporters to be a way to 'encourage' people to be vaccinated. Hadas Ziv from Physicians for Human Rights described this as a 'draconian law which crushed medical ethics and the patient rights'. But that's the idea, the Sabbatians would reply.

Your papers, please

Sabbatian Israel was leading what has been planned all along to be a global 'vaccine pass' called a 'green passport' without which you would remain in permanent lockdown restriction and unable to do anything. This is how badly – *desperately* – the Cult is to get everyone 'vaccinated'. The term and colour 'green' was not by chance and related to the psychology of fusing the perception of the green climate hoax with the 'Covid' hoax and how the 'solution' to both is the same Great Reset. Lying politicians, health officials and psychologists denied there were any plans for mandatory vaccinations or restrictions based on vaccinations, but they knew that was exactly what was meant to happen with governments of all countries reaching agreements to enforce a global system. 'Free' Denmark and 'free' Sweden unveiled digital vaccine certification. Cyprus, Czech Republic, Estonia, Greece, Hungary, Iceland, Italy, Poland, Portugal, Slovakia, and Spain have all committed to a vaccine passport system and the rest including the whole of the EU would follow. The satanic UK government will certainly go this way despite mendacious denials and at the time of writing it is trying to manipulate the public into having the 'vaccine' so they could go abroad on a summer holiday. How would that work without something to prove you had the synthetic toxicity injected into you?

Documents show that the EU's European Commission was moving towards 'vaccine certificates' in 2018 and 2019 before the 'Covid' hoax began. They knew what was coming. Abracadabra – Ursula von der Leyen, the German President of the Commission, announced in March, 2021, an EU 'Digital Green Certificate' – green again – to track the public's 'Covid status'. The passport sting is worldwide and the Far East followed the same pattern with South Korea ruling that only those with 'vaccination' passports – again the *green* pass – would be able to 'return to their daily lives'.

Bill Gates has been preparing for this 'passport' with other Cult operatives for years and beyond the paper version is a Gates-funded 'digital tattoo' to identify who has been vaccinated and who hasn't. The 'tattoo' is reported to include a substance which is externally readable to confirm who has been vaccinated. This is a bio-luminous light-generating enzyme (think fireflies) called ... *Luciferase*. Yes, named after the Cult 'god' Lucifer the 'light bringer' of whom more to come. Gates said he funded the readable tattoo to ensure children in the developing world were vaccinated and no one was missed out. He cares so much about poor kids as we know. This was just the cover story to develop a vaccine tagging system for everyone on the planet. Gates has been funding the ID2020 'alliance' to do just that in league with other lovely people at Microsoft, GAVI, the Rockefeller Foundation, Accenture and IDEO.org. He said in interviews in March, 2020, before any 'vaccine' publicly existed, that the world must have a globalised digital certificate to track the 'virus' and who had been vaccinated. Gates knew from the start that the mRNA vaccines were coming and when they would come and that the plan was to tag the 'vaccinated' to marginalise the intelligent and stop them doing anything including travel. Evil just doesn't suffice. Gates was exposed for offering a \$10 million bribe to the Nigerian House of Representatives to invoke compulsory 'Covid' vaccination of all Nigerians. Sara Cunial, a member of the Italian Parliament, called Gates a 'vaccine criminal'. She urged the Italian President to hand him over to the International Criminal Court for crimes against

humanity and condemned his plans to 'chip the human race' through ID2020.

You know it's a long-planned agenda when war criminal and Cult gofer Tony Blair is on the case. With the scale of arrogance only someone as dark as Blair can muster he said: 'Vaccination in the end is going to be your route to liberty.' Blair is a disgusting piece of work and he confirms that again. The media has given a lot of coverage to a bloke called Charlie Mullins, founder of London's biggest independent plumbing company, Pimlico Plumbers, who has said he won't employ anyone who has not been vaccinated or have them go to any home where people are not vaccinated. He said that if he had his way no one would be allowed to walk the streets if they have not been vaccinated. Gates was cheering at the time while I was alerting the white coats. The plan is that people will qualify for 'passports' for having the first two doses and then to keep it they will have to have all the follow ups and new ones for invented 'variants' until human genetics is transformed and many are dead who can't adjust to the changes. Hollywood celebrities – the usual propaganda stunt – are promoting something called the WELL Health-Safety Rating to verify that a building or space has 'taken the necessary steps to prioritize the health and safety of their staff, visitors and other stakeholders'. They included Lady Gaga, Jennifer Lopez, Michael B. Jordan, Robert DeNiro, Venus Williams, Wolfgang Puck, Deepak Chopra and 17th Surgeon General Richard Carmona. Yawn. WELL Health-Safety has big connections with China. Parent company Delos is headed by former Goldman Sachs partner Paul Scialla. This is another example – and we will see so many others – of using the excuse of 'health' to dictate the lives and activities of the population. I guess one confirmation of the 'safety' of buildings is that only 'vaccinated' people can go in, right?

Electronic concentration camps

I wrote decades ago about the plans to restrict travel and here we are for those who refuse to bow to tyranny. This can be achieved in one go with air travel if the aviation industry makes a blanket decree.

The 'vaccine' and guaranteed income are designed to be part of a global version of China's social credit system which tracks behaviour 24/7 and awards or deletes 'credits' based on whether your behaviour is supported by the state or not. I mean your entire lifestyle – what you do, eat, say, everything. Once your credit score falls below a certain level consequences kick in. In China tens of millions have been denied travel by air and train because of this. All the locations and activities denied to refusers by the 'vaccine' passports will be included in one big mass ban on doing almost anything for those that don't bow their head to government. It's beyond fascist and a new term is required to describe its extremes – I guess fascist technocracy will have to do. The way the Chinese system of technological – technocratic – control is sweeping the West can be seen in the Los Angeles school system and is planned to be expanded worldwide. Every child is required to have a 'Covid'-tracking app scanned daily before they can enter the classroom. The so-called Daily Pass tracking system is produced by Gates' Microsoft which I'm sure will shock you rigid. The pass will be scanned using a barcode (one step from an inside-the-body barcode) and the information will include health checks, 'Covid' tests and vaccinations. Entry codes are for one specific building only and access will only be allowed if a student or teacher has a negative test with a test not testing for the 'virus', has no symptoms of anything alleged to be related to 'Covid' (symptoms from a range of other illness), and has a temperature under 100 degrees. No barcode, no entry, is planned to be the case for everywhere and not only schools.

Kids are being psychologically prepared to accept this as 'normal' their whole life which is why what they can impose in schools is so important to the Cult and its gofers. Long-time American freedom campaigner John Whitehead of the Rutherford Institute was not exaggerating when he said: 'Databit by databit, we are building our own electronic concentration camps.' Canada under its Cult gofer prime minister Justin Trudeau has taken a major step towards the real thing with people interned against their will if they test positive with a test not testing for the 'virus' when they arrive at a Canadian

airport. They are jailed in internment hotels often without food or water for long periods and with many doors failing to lock there have been sexual assaults. The interned are being charged sometimes \$2,000 for the privilege of being abused in this way. Trudeau is fully on board with the Cult and says the 'Covid pandemic' has provided an opportunity for a global 'reset' to permanently change Western civilisation. His number two, Deputy Prime Minister Chrystia Freeland, is a trustee of the World Economic Forum and a Rhodes Scholar. The Trudeau family have long been servants of the Cult. See *The Biggest Secret* and Cathy O'Brien's book *Trance-Formation of America* for the horrific background to Trudeau's father Pierre Trudeau another Canadian prime minister. Hide your fascism behind the façade of a heart-on-the-sleeve liberal. It's a well-honed Cult technique.

What can the 'vaccine' really do?

We have a 'virus' never shown to exist and 'variants' of the 'virus' that have also never been shown to exist except, like the 'original', as computer-generated fictions. Even if you believe there's a 'virus' the 'case' to 'death' rate is in the region of 0.23 to 0.15 percent and those 'deaths' are concentrated among the very old around the same average age that people die anyway. In response to this lack of threat (in truth none) psychopaths and idiots, knowingly and unknowingly answering to Gates and the Cult, are seeking to 'vaccinate' every man, woman and child on Planet Earth. Clearly the 'vaccine' is not about 'Covid' – none of this ever has been. So what is it all about *really*? Why the desperation to infuse genetically-manipulating synthetic material into everyone through mRNA fraudulent 'vaccines' with the intent of doing this over and over with the excuses of 'variants' and other 'virus' inventions? Dr Sherri Tenpenny, an osteopathic medical doctor in the United States, has made herself an expert on vaccines and their effects as a vehement campaigner against their use. Tenpenny was board certified in emergency medicine, the director of a level two trauma centre for 12 years, and moved to Cleveland in 1996 to start an integrative

medicine practice which has treated patients from all 50 states and some 17 other countries. Weaning people off pharmaceutical drugs is a speciality.

She became interested in the consequences of vaccines after attending a meeting at the National Vaccine Information Center in Washington DC in 2000 where she 'sat through four days of listening to medical doctors and scientists and lawyers and parents of vaccine injured kids' and asked: 'What's going on?' She had never been vaccinated and never got ill while her father was given a list of vaccines to be in the military and was 'sick his entire life'. The experience added to her questions and she began to examine vaccine documents from the Centers for Disease Control (CDC). After reading the first one, the 1998 version of *The General Recommendations of Vaccination*, she thought: 'This is it?' The document was poorly written and bad science and Tenpenny began 20 years of research into vaccines that continues to this day. She began her research into 'Covid vaccines' in March, 2020, and she describes them as 'deadly'. For many, as we have seen, they already have been. Tenpenny said that in the first 30 days of the 'vaccine' rollout in the United States there had been more than 40,000 adverse events reported to the vaccine adverse event database. A document had been delivered to her the day before that was 172 pages long. 'We have over 40,000 adverse events; we have over 3,100 cases of [potentially deadly] anaphylactic shock; we have over 5,000 neurological reactions.' Effects ranged from headaches to numbness, dizziness and vertigo, to losing feeling in hands or feet and paraesthesia which is when limbs 'fall asleep' and people have the sensation of insects crawling underneath their skin. All this happened in the first 30 days and remember that only about *ten percent* (or far less) of adverse reactions and vaccine-related deaths are estimated to be officially reported. Tenpenny said:

So can you think of one single product in any industry, any industry, for as long as products have been made on the planet that within 30 days we have 40,000 people complaining of side effects that not only is still on the market but ... we've got paid actors telling us how great

they are for getting their vaccine. We're offering people \$500 if they will just get their vaccine and we've got nurses and doctors going; 'I got the vaccine, I got the vaccine'.

Tenpenny said they were not going to be 'happy dancing folks' when they began to suffer Bell's palsy (facial paralysis), neuropathies, cardiac arrhythmias and autoimmune reactions that kill through a blood disorder. 'They're not going to be so happy, happy then, but we're never going to see pictures of those people' she said. Tenpenny described the 'vaccine' as 'a well-designed killing tool'.

No off-switch

Bad as the initial consequences had been Tenpenny said it would be maybe 14 months before we began to see the 'full ravage' of what is going to happen to the 'Covid vaccinated' with full-out consequences taking anything between two years and 20 years to show. You can understand why when you consider that variations of the 'Covid vaccine' use mRNA (messenger RNA) to in theory activate the immune system to produce protective antibodies without using the actual 'virus'. How can they when it's a computer program and they've never isolated what they claim is the 'real thing'? Instead they use *synthetic* mRNA. They are inoculating synthetic material into the body which through a technique known as the Trojan horse is absorbed into cells to change the nature of DNA. Human DNA is changed by an infusion of messenger RNA and with each new 'vaccine' of this type it is changed even more. Say so and you are banned by Cult Internet platforms. The contempt the contemptuous Mark Zuckerberg has for the truth and human health can be seen in an internal Facebook video leaked to the Project Veritas investigative team in which he said of the 'Covid vaccines': '... I share some caution on this because we just don't know the long term side-effects of basically modifying people's DNA and RNA.' At the same time this disgusting man's Facebook was censoring and banning anyone saying exactly the same. He must go before a Nuremberg trial for crimes against humanity when he *knows* that he

is censoring legitimate concerns and denying the right of informed consent on behalf of the Cult that owns him. People have been killed and damaged by the very 'vaccination' technique he cast doubt on himself when they may not have had the 'vaccine' with access to information that he denied them. The plan is to have at least annual 'Covid vaccinations', add others to deal with invented 'variants', and change all other vaccines into the mRNA system. Pfizer executives told shareholders at a virtual Barclays Global Healthcare Conference in March, 2021, that the public may need a third dose of 'Covid vaccine', plus regular yearly boosters and the company planned to hike prices to milk the profits in a 'significant opportunity for our vaccine'. These are the professional liars, cheats and opportunists who are telling you their 'vaccine' is safe. Given this volume of mRNA planned to be infused into the human body and its ability to then replicate we will have a transformation of human genetics from biological to synthetic biological – exactly the long-time Cult plan for reasons we'll see – and many will die. Sherri Tenpenny said of this replication:

It's like having an on-button but no off-button and that whole mechanism ... they actually give it a name and they call it the Trojan horse mechanism, because it allows that [synthetic] virus and that piece of that [synthetic] virus to get inside of your cells, start to replicate and even get inserted into other parts of your DNA as a Trojan-horse.

Ask the overwhelming majority of people who have the 'vaccine' what they know about the contents and what they do and they would reply: 'The government says it will stop me getting the virus.' Governments give that false impression on purpose to increase take-up. You can read Sherri Tenpenny's detailed analysis of the health consequences in her blog at [Vaxxter.com](https://vaxxter.com), but in summary these are some of them. She highlights the statement by Bill Gates about how human beings can become their own 'vaccine manufacturing machine'. The man is insane. ['Vaccine'-generated] 'antibodies' carry synthetic messenger RNA into the cells and the damage starts, Tenpenny contends, and she says that lungs can be adversely affected through varying degrees of pus and bleeding which

obviously affects breathing and would be dubbed 'Covid-19'. Even more sinister was the impact of 'antibodies' on macrophages, a white blood cell of the immune system. They consist of Type 1 and Type 2 which have very different functions. She said Type 1 are 'hyper-vigilant' white blood cells which 'gobble up' bacteria etc. However, in doing so, this could cause inflammation and in extreme circumstances be fatal. She says these affects are mitigated by Type 2 macrophages which kick in to calm down the system and stop it going rogue. They clear up dead tissue debris and reduce inflammation that the Type 1 'fire crews' have caused. Type 1 kills the infection and Type 2 heals the damage, she says. This is her punchline with regard to 'Covid vaccinations': She says that mRNA 'antibodies' block Type 2 macrophages by attaching to them and deactivating them. This meant that when the Type 1 response was triggered by infection there was nothing to stop that getting out of hand by calming everything down. There's an on-switch, but no off-switch, she says. What follows can be 'over and out, see you when I see you'.

Genetic suicide

Tenpenny also highlights the potential for autoimmune disease – the body attacking itself – which has been associated with vaccines since they first appeared. Infusing a synthetic foreign substance into cells could cause the immune system to react in a panic believing that the body is being overwhelmed by an invader (it is) and the consequences can again be fatal. There is an autoimmune response known as a 'cytokine storm' which I have likened to a homeowner panicked by an intruder and picking up a gun to shoot randomly in all directions before turning the fire on himself. The immune system unleashes a storm of inflammatory response called cytokines to a threat and the body commits hara-kiri. The lesson is that you mess with the body's immune response at your peril and these 'vaccines' seriously – fundamentally – mess with immune response. Tenpenny refers to a consequence called anaphylactic shock which is a severe and highly dangerous allergic reaction when the immune system

floods the body with chemicals. She gives the example of having a bee sting which primes the immune system and makes it sensitive to those chemicals. When people are stung again maybe years later the immune response can be so powerful that it leads to anaphylactic shock. Tenpenny relates this 'shock' with regard to the 'Covid vaccine' to something called polyethylene glycol or PEG. Enormous numbers of people have become sensitive to this over decades of use in a whole range of products and processes including food, drink, skin creams and 'medicine'. Studies have claimed that some 72 percent of people have antibodies triggered by PEG compared with two percent in the 1960s and allergic hypersensitive reactions to this become a gathering cause for concern. Tenpenny points out that the 'mRNA vaccine' is coated in a 'bubble' of polyethylene glycol which has the potential to cause anaphylactic shock through immune sensitivity. Many reports have appeared of people reacting this way after having the 'Covid vaccine'. What do we think is going to happen as humanity has more and more of these 'vaccines'? Tenpenny said: 'All these pictures we have seen with people with these rashes ... these weepy rashes, big reactions on their arms and things like that – it's an acute allergic reaction most likely to the polyethylene glycol that you've been previously primed and sensitised to.'

Those who have not studied the conspiracy and its perpetrators at length might think that making the population sensitive to PEG and then putting it in these 'vaccines' is just a coincidence. It is not. It is instead testament to how carefully and coldly-planned current events have been and the scale of the conspiracy we are dealing with. Tenpenny further explains that the 'vaccine' mRNA procedure can breach the blood-brain barrier which protects the brain from toxins and other crap that will cause malfunction. In this case they could make two proteins corrupt brain function to cause Amyotrophic lateral sclerosis (ALS), a progressive nervous system disease leading to loss of muscle control, and frontal lobe degeneration – Alzheimer's and dementia. Immunologist J. Bart Classon published a paper connecting mRNA 'vaccines' to prion

disease which can lead to Alzheimer's and other forms of neurogenerative disease while others have pointed out the potential to affect the placenta in ways that make women infertile. This will become highly significant in the next chapter when I will discuss other aspects of this non-vaccine that relate to its nanotechnology and transmission from the injected to the uninjected.

Qualified in idiocy

Tenpenny describes how research has confirmed that these 'vaccine'-generated antibodies can interact with a range of other tissues in the body and attack many other organs including the lungs. 'This means that if you have a hundred people standing in front of you that all got this shot they could have a hundred different symptoms.' Anyone really think that Cult gofers like the Queen, Tony Blair, Christopher Whitty, Anthony Fauci, and all the other psychopaths have really had this 'vaccine' in the pictures we've seen? Not a bloody chance. Why don't doctors all tell us about all these dangers and consequences of the 'Covid vaccine'? Why instead do they encourage and pressure patients to have the shot? Don't let's think for a moment that doctors and medical staff can't be stupid, lazy, and psychopathic and that's without the financial incentives to give the jab. Tenpenny again:

Some people are going to die from the vaccine directly but a large number of people are going to start to get horribly sick and get all kinds of autoimmune diseases 42 days to maybe a year out. What are they going to do, these stupid doctors who say; 'Good for you for getting that vaccine.' What are they going to say; 'Oh, it must be a mutant, we need to give an extra dose of that vaccine.'

Because now the vaccine, instead of one dose or two doses we need three or four because the stupid physicians aren't taking the time to learn anything about it. If I can learn this sitting in my living room reading a 19 page paper and several others so can they. There's nothing special about me, I just take the time to do it.

Remember how Sara Kayat, the NHS and TV doctor, said that the 'Covid vaccine' would '100 percent prevent hospitalisation and death'. Doctors can be idiots like every other profession and they

should not be worshipped as infallible. They are not and far from it. Behind many medical and scientific 'experts' lies an uninformed prat trying to hide themselves from you although in the 'Covid' era many have failed to do so as with UK narrative-repeating 'TV doctor' Hilary Jones. Pushing back against the minority of proper doctors and scientists speaking out against the 'vaccine' has been the entire edifice of the Cult global state in the form of governments, medical systems, corporations, mainstream media, Silicon Valley, and an army of compliant doctors, medical staff and scientists willing to say anything for money and to enhance their careers by promoting the party line. If you do that you are an 'expert' and if you won't you are an 'anti-vaxxer' and 'Covidiot'. The pressure to be 'vaccinated' is incessant. We have even had reports claiming that the 'vaccine' can help cure cancer and Alzheimer's and make the lame walk. I am waiting for the announcement that it can bring you coffee in the morning and cook your tea. Just as the symptoms of 'Covid' seem to increase by the week so have the miracles of the 'vaccine'. American supermarket giant Kroger Co. offered nearly 500,000 employees in 35 states a \$100 bonus for having the 'vaccine' while donut chain Krispy Kreme promised 'vaccinated' customers a free glazed donut every day for the rest of 2021. Have your DNA changed and you will get a doughnut although we might not have to give you them for long. Such offers and incentives confirm the desperation.

Perhaps the worse vaccine-stunt of them all was UK 'Health' Secretary Matt-the-prat Hancock on live TV after watching a clip of someone being 'vaccinated' when the roll-out began. Hancock faked tears so badly it was embarrassing. Brain-of-Britain Piers Morgan, the lockdown-supporting, 'vaccine' supporting, 'vaccine' passport-supporting, TV host played along with Hancock – 'You're quite emotional about that' he said in response to acting so atrocious it would have been called out at a school nativity which will presumably today include Mary and Jesus in masks, wise men keeping their camels six feet apart, and shepherds under tent arrest. System-serving Morgan tweeted this: 'Love the idea of covid vaccine passports for everywhere: flights, restaurants, clubs, football, gyms,

shops etc. It's time covid-denying, anti-vaxxer loonies had their bullsh*t bluff called & bar themselves from going anywhere that responsible citizens go.' If only I could aspire to his genius. To think that Morgan, who specialises in shouting over anyone he disagrees with, was lauded as a free speech hero when he lost his job after storming off the set of his live show like a child throwing his dolly out of the pram. If he is a free speech hero we are in real trouble. I have no idea what 'bullsh*t' means, by the way, the * throws me completely.

The Cult is desperate to infuse its synthetic DNA-changing concoction into everyone and has been using every lie, trick and intimidation to do so. The question of '*Why?*' we shall now address.

CHAPTER TEN

Human 2.0

I believe that at the end of the century the use of words and general educated opinion will have altered so much that one will be able to speak of machines thinking without expecting to be contradicted –
Alan Turing (1912-1954), the ‘Father of artificial intelligence’

I have been exposing for decades the plan to transform the human body from a biological to a synthetic-biological state. The new human that I will call Human 2.0 is planned to be connected to artificial intelligence and a global AI ‘Smart Grid’ that would operate as one global system in which AI would control everything from your fridge to your heating system to your car to your mind. Humans would no longer be ‘human’, but post-human and sub-human, with their thinking and emotional processes replaced by AI.

What I said sounded crazy and beyond science fiction and I could understand that. To any balanced, rational, mind it *is* crazy. Today, however, that world is becoming reality and it puts the ‘Covid vaccine’ into its true context. Ray Kurzweil is the ultra-Zionist ‘computer scientist, inventor and futurist’ and co-founder of the Singularity University. Singularity refers to the merging of humans with machines or ‘transhumanism’. Kurzweil has said humanity would be connected to the cyber ‘cloud’ in the period of the ever-recurring year of 2030:

Our thinking ... will be a hybrid of biological and non-biological thinking ... humans will be able to extend their limitations and ‘think in the cloud’ ... We’re going to put gateways to the

cloud in our brains ... We're going to gradually merge and enhance ourselves ... In my view, that's the nature of being human – we transcend our limitations. As the technology becomes vastly superior to what we are then the small proportion that is still human gets smaller and smaller and smaller until it's just utterly negligible.

They are trying to sell this end-of-humanity-as-we-know-it as the next stage of 'evolution' when we become super-human and 'like the gods'. They are lying to you. Shocked, eh? The population, and again especially the young, have been manipulated into addiction to technologies designed to enslave them for life. First they induced an addiction to smartphones (holdables); next they moved to technology on the body (wearables); and then began the invasion of the body (implantables). I warned way back about the plan for microchipped people and we are now entering that era. We should not be diverted into thinking that this refers only to chips we can see. Most important are the nanochips known as smart dust, neural dust and nanobots which are far too small to be seen by the human eye. Nanotechnology is everywhere, increasingly in food products, and released into the atmosphere by the geoengineering of the skies funded by Bill Gates to 'shut out the Sun' and 'save the planet from global warming'. Gates has been funding a project to spray millions of tonnes of chalk (calcium carbonate) into the stratosphere over Sweden to 'dim the Sun' and cool the Earth. Scientists warned the move could be disastrous for weather systems in ways no one can predict and opposition led to the Swedish space agency announcing that the 'experiment' would not be happening as planned in the summer of 2021; but it shows where the Cult is going with dimming the impact of the Sun and there's an associated plan to change the planet's atmosphere. Who gives psychopath Gates the right to dictate to the entire human race and dismantle planetary systems? The world will not be safe while this man is at large.

The global warming hoax has made the Sun, like the gas of life, something to fear when both are essential to good health and human survival (more inversion). The body transforms sunlight into vital vitamin D through a process involving ... *cholesterol*. This is the cholesterol we are also told to fear. We are urged to take Big Pharma

statin drugs to reduce cholesterol and it's all systematic. Reducing cholesterol means reducing vitamin D uptake with all the multiple health problems that will cause. At least if you take statins long term it saves the government from having to pay you a pension. The delivery system to block sunlight is widely referred to as chemtrails although these have a much deeper agenda, too. They appear at first to be contrails or condensation trails streaming from aircraft into cold air at high altitudes. Contrails disperse very quickly while chemtrails do not and spread out across the sky before eventually their content falls to earth. Many times I have watched aircraft cross-cross a clear blue sky releasing chemtrails until it looks like a cloudy day. Chemtrails contain many things harmful to humans and the natural world including toxic heavy metals, aluminium (see Alzheimer's) and nanotechnology. Ray Kurzweil reveals the reason without actually saying so: 'Nanobots will infuse all the matter around us with information. Rocks, trees, everything will become these intelligent creatures.' How do you deliver that? *From the sky*. Self-replicating nanobots would connect everything to the Smart Grid. The phenomenon of Morgellons disease began in the chemtrail era and the correlation has led to it being dubbed the 'chemtrail disease'. Self-replicating fibres appear in the body that can be pulled out through the skin. Morgellons fibres continue to grow outside the body and have a form of artificial intelligence. I cover this at greater length in *Phantom Self*.

'Vaccine' operating system

'Covid vaccines' with their self-replicating synthetic material are also designed to make the connection between humanity and Kurzweil's 'cloud'. American doctor and dedicated campaigner for truth, Carrie Madej, an Internal Medicine Specialist in Georgia with more than 20 years medical experience, has highlighted the nanotechnology aspect of the fake 'vaccines'. She explains how one of the components in at least the Moderna and Pfizer synthetic potions are 'lipid nanoparticles' which are 'like little tiny computer bits' – a 'sci-fi substance' known as nanobots and hydrogel which can be 'triggered

at any moment to deliver its payload' and act as 'biosensors'. The synthetic substance had 'the ability to accumulate data from your body like your breathing, your respiration, thoughts and emotions, all kind of things' and each syringe could carry a *million* nanobots:

This substance because it's like little bits of computers in your body, crazy, but it's true, it can do that, [and] obviously has the ability to act through Wi-Fi. It can receive and transmit energy, messages, frequencies or impulses. That issue has never been addressed by these companies. What does that do to the human?

Just imagine getting this substance in you and it can react to things all around you, the 5G, your smart device, your phones, what is happening with that? What if something is triggering it, too, like an impulse, a frequency? We have something completely foreign in the human body.

Madej said her research revealed that electromagnetic (EMF) frequencies emitted by phones and other devices had increased dramatically in the same period of the 'vaccine' rollout and she was seeing more people with radiation problems as 5G and other electromagnetic technology was expanded and introduced to schools and hospitals. She said she was 'floored with the EMF coming off' the devices she checked. All this makes total sense and syncs with my own work of decades when you think that Moderna refers in documents to its mRNA 'vaccine' as an 'operating system':

Recognizing the broad potential of mRNA science, we set out to create an mRNA technology platform that functions very much like an operating system on a computer. It is designed so that it can plug and play interchangeably with different programs. In our case, the 'program' or 'app' is our mRNA drug – the unique mRNA sequence that codes for a protein ...

... Our MRNA Medicines – 'The 'Software Of Life': When we have a concept for a new mRNA medicine and begin research, fundamental components are already in place. Generally, the only thing that changes from one potential mRNA medicine to another is the coding region – the actual genetic code that instructs ribosomes to make protein. Utilizing these instruction sets gives our investigational mRNA medicines a software-like quality. We also have the ability to combine different mRNA sequences encoding for different proteins in a single mRNA investigational medicine.

Who needs a real ‘virus’ when you can create a computer version to justify infusing your operating system into the entire human race on the road to making living, breathing people into cyborgs? What is missed with the ‘vaccines’ is the *digital* connection between synthetic material and the body that I highlighted earlier with the study that hacked a computer with human DNA. On one level the body is digital, based on mathematical codes, and I’ll have more about that in the next chapter. Those who ridiculously claim that mRNA ‘vaccines’ are not designed to change human genetics should explain the words of Dr Tal Zaks, chief medical officer at Moderna, in a 2017 TED talk. He said that over the last 30 years ‘we’ve been living this phenomenal digital scientific revolution, and I’m here today to tell you, that we are actually *hacking the software of life*, and that it’s changing the way we think about prevention and treatment of disease’:

In every cell there’s this thing called messenger RNA, or mRNA for short, that transmits the critical information from the DNA in our genes to the protein, which is really the stuff we’re all made out of. This is the critical information that determines what the cell will do. So we think about it as an operating system. So if you could change that, if you could introduce a line of code, or change a line of code, it turns out, that has profound implications for everything, from the flu to cancer.

Zaks should more accurately have said that this has profound implications for the human genetic code and the nature of DNA. Communications within the body go both ways and not only one. But, hey, no, the ‘Covid vaccine’ will not affect your genetics. Cult fact-checkers say so even though the man who helped to develop the mRNA technique says that it does. Zaks said in 2017:

If you think about what it is we’re trying to do. We’ve taken information and our understanding of that information and how that information is transmitted in a cell, and we’ve taken our understanding of medicine and how to make drugs, and we’re fusing the two. We think of it as information therapy.

I have been writing for decades that the body is an information field communicating with itself and the wider world. This is why

radiation which is information can change the information field of body and mind through phenomena like 5G and change their nature and function. 'Information therapy' means to change the body's information field and change the way it operates. DNA is a receiver-transmitter of information and can be mutated by information like mRNA synthetic messaging. Technology to do this has been ready and waiting in the underground bases and other secret projects to be rolled out when the 'Covid' hoax was played. 'Trials' of such short and irrelevant duration were only for public consumption. When they say the 'vaccine' is 'experimental' that is not true. It may appear to be 'experimental' to those who don't know what's going on, but the trials have already been done to ensure the Cult gets the result it desires. Zaks said that it took decades to sequence the human genome, completed in 2003, but now they could do it in a week. By 'they' he means scientists operating in the public domain. In the secret projects they were sequencing the genome in a week long before even 2003.

Deluge of mRNA

Highly significantly the Moderna document says the guiding premise is that if using mRNA as a medicine works for one disease then it should work for many diseases. They were leveraging the flexibility afforded by their platform and the fundamental role mRNA plays in protein synthesis to pursue mRNA medicines for a broad spectrum of diseases. Moderna is confirming what I was saying through 2020 that multiple 'vaccines' were planned for 'Covid' (and later invented 'variants') and that previous vaccines would be converted to the mRNA system to infuse the body with massive amounts of genetically-manipulating synthetic material to secure a transformation to a synthetic-biological state. The 'vaccines' are designed to kill stunning numbers as part of the long-exposed Cult depopulation agenda and transform the rest. Given this is the goal you can appreciate why there is such hysterical demand for every human to be 'vaccinated' for an alleged 'disease' that has an estimated 'infection' to 'death' ratio of 0.23-0.15 percent. As I write

children are being given the 'vaccine' in trials (their parents are a disgrace) and ever-younger people are being offered the vaccine for a 'virus' that even if you believe it exists has virtually zero chance of harming them. Horrific effects of the 'trials' on a 12-year-old girl were revealed by a family member to be serious brain and gastric problems that included a bowel obstruction and the inability to swallow liquids or solids. She was unable to eat or drink without throwing up, had extreme pain in her back, neck and abdomen, and was paralysed from the waist down which stopped her urinating unaided. When the girl was first taken to hospital doctors said it was all in her mind. She was signed up for the 'trial' by her parents for whom no words suffice. None of this 'Covid vaccine' insanity makes any sense unless you see what the 'vaccine' really is – a body-changer. Synthetic biology or 'SynBio' is a fast-emerging and expanding scientific discipline which includes everything from genetic and molecular engineering to electrical and computer engineering. Synthetic biology is defined in these ways:

- A multidisciplinary area of research that seeks to create new biological parts, devices, and systems, or to redesign systems that are already found in nature.
- The use of a mixture of physical engineering and genetic engineering to create new (and therefore synthetic) life forms.
- An emerging field of research that aims to combine the knowledge and methods of biology, engineering and related disciplines in the design of chemically-synthesized DNA to create organisms with novel or enhanced characteristics and traits (synthetic organisms including humans).

We now have synthetic blood, skin, organs and limbs being developed along with synthetic body parts produced by 3D printers. These are all elements of the synthetic human programme and this comment by Kurzweil's co-founder of the Singularity University,

Peter Diamandis, can be seen in a whole new light with the 'Covid' hoax and the sanctions against those that refuse the 'vaccine':

Anybody who is going to be resisting the progress forward [to transhumanism] is going to be resisting evolution and, fundamentally, they will die out. It's not a matter of whether it's good or bad. It's going to happen.

'Resisting evolution'? What absolute bollocks. The arrogance of these people is without limit. His 'it's going to happen' mantra is another way of saying 'resistance is futile' to break the spirit of those pushing back and we must not fall for it. Getting this genetically-transforming 'vaccine' into everyone is crucial to the Cult plan for total control and the desperation to achieve that is clear for anyone to see. Vaccine passports are a major factor in this and they, too, are a form of resistance is futile. It's NOT. The paper funded by the Rockefeller Foundation for the 2013 'health conference' in China said:

We will interact more with artificial intelligence. The use of robotics, bio-engineering to augment human functioning is already well underway and will advance. Re-engineering of humans into potentially separate and unequal forms through genetic engineering or mixed human-robots raises debates on ethics and equality.

A new demography is projected to emerge after 2030 [that year again] of technologies (robotics, genetic engineering, nanotechnology) producing robots, engineered organisms, 'nanobots' and artificial intelligence (AI) that can self-replicate. Debates will grow on the implications of an impending reality of human designed life.

What is happening today is so long planned. The world army enforcing the will of the world government is intended to be a robot army, not a human one. Today's military and its technologically 'enhanced' troops, pilotless planes and driverless vehicles are just stepping stones to that end. Human soldiers are used as Cult fodder and its time they woke up to that and worked for the freedom of the population instead of their own destruction and their family's destruction – the same with the police. Join us and let's sort this out. The phenomenon of enforce my own destruction is widespread in the 'Covid' era with Woker 'luvvies' in the acting and entertainment

industries supporting 'Covid' rules which have destroyed their profession and the same with those among the public who put signs on the doors of their businesses 'closed due to Covid – stay safe' when many will never reopen. It's a form of masochism and most certainly insanity.

Transgender = transhumanism

When something explodes out of nowhere and is suddenly everywhere it is always the Cult agenda and so it is with the tidal wave of claims and demands that have infiltrated every aspect of society under the heading of 'transgenderism'. The term 'trans' is so 'in' and this is the dictionary definition:

A prefix meaning 'across', 'through', occurring ... in loanwords from Latin, used in particular for denoting movement or conveyance from place to place (transfer; transmit; transplant) or complete change (transform; transmute), or to form adjectives meaning 'crossing', 'on the other side of', or 'going beyond' the place named (transmontane; transnational; trans-Siberian).

Transgender means to go beyond gender and transhuman means to go beyond human. Both are aspects of the Cult plan to transform the human body to a synthetic state with *no gender*. Human 2.0 is not designed to procreate and would be produced technologically with no need for parents. The new human would mean the end of parents and so men, and increasingly women, are being targeted for the deletion of their rights and status. Parental rights are disappearing at an ever-quickenning speed for the same reason. The new human would have no need for men or women when there is no procreation and no gender. Perhaps the transgender movement that appears to be in a permanent state of frenzy might now contemplate on how it is being used. This was never about transgender rights which are only the interim excuse for confusing gender, particularly in the young, on the road to *fusing* gender. Transgender activism is not an end; it is a *means* to an end. We see again the technique of creative destruction in which you destroy the status quo to 'build back better' in the form that you want. The gender status quo had to be

destroyed by persuading the Cult-created Woke mentality to believe that you can have 100 genders or more. A programme for 9 to 12 year olds produced by the Cult-owned BBC promoted the 100 genders narrative. The very idea may be the most monumental nonsense, but it is not what is true that counts, only what you can make people *believe* is true. Once the gender of $2 + 2 = 4$ has been dismantled through indoctrination, intimidation and $2 + 2 = 5$ then the new no-gender normal can take its place with Human 2.0.

Aldous Huxley revealed the plan in his prophetic *Brave New World* in 1932:

Natural reproduction has been done away with and children are created, decanted', and raised in 'hatcheries and conditioning centres'. From birth, people are genetically designed to fit into one of five castes, which are further split into 'Plus' and 'Minus' members and designed to fulfil predetermined positions within the social and economic strata of the World State.

How could Huxley know this in 1932? For the same reason George Orwell knew about the Big Brother state in 1948, Cult insiders I have quoted knew about it in 1969, and I have known about it since the early 1990s. If you are connected to the Cult or you work your balls off to uncover the plan you can predict the future. The process is simple. If there is a plan for the world and nothing intervenes to stop it then it will happen. Thus if you communicate the plan ahead of time you are perceived to have predicted the future, but you haven't. You have revealed the plan which without intervention will become the human future. The whole reason I have done what I have is to alert enough people to inspire an intervention and maybe at last that time has come with the Cult and its intentions now so obvious to anyone with a brain in working order.

The future is here

Technological wombs that Huxley described to replace parent procreation are already being developed and they are only the projects we know about in the public arena. Israeli scientists told *The Times of Israel* in March, 2021, that they have grown 250-cell embryos

into mouse fetuses with fully formed organs using artificial wombs in a development they say could pave the way for gestating humans outside the womb. Professor Jacob Hanna of the Weizmann Institute of Science said:

We took mouse embryos from the mother at day five of development, when they are just of 250 cells, and had them in the incubator from day five until day 11, by which point they had grown all their organs.

By day 11 they make their own blood and have a beating heart, a fully developed brain. Anybody would look at them and say, 'this is clearly a mouse foetus with all the characteristics of a mouse.' It's gone from being a ball of cells to being an advanced foetus.

A special liquid is used to nourish embryo cells in a laboratory dish and they float on the liquid to duplicate the first stage of embryonic development. The incubator creates all the right conditions for its development, Hanna said. The liquid gives the embryo 'all the nutrients, hormones and sugars they need' along with a custom-made electronic incubator which controls gas concentration, pressure and temperature. The cutting-edge in the underground bases and other secret locations will be light years ahead of that, however, and this was reported by the London *Guardian* in 2017:

We are approaching a biotechnological breakthrough. Ectogenesis, the invention of a complete external womb, could completely change the nature of human reproduction. In April this year, researchers at the Children's Hospital of Philadelphia announced their development of an artificial womb.

The article was headed 'Artificial wombs could soon be a reality. What will this mean for women?' What would it mean for children is an even bigger question. No mother to bond with only a machine in preparation for a life of soulless interaction and control in a world governed by machines (see the *Matrix* movies). Now observe the calculated manipulations of the 'Covid' hoax as human interaction and warmth has been curtailed by distancing, isolation and fear with people communicating via machines on a scale never seen before.

These are all dots in the same picture as are all the personal assistants, gadgets and children's toys through which kids and adults communicate with AI as if it is human. The AI 'voice' on Sat-Nav should be included. All these things are psychological preparation for the Cult endgame. Before you can make a physical connection with AI you have to make a psychological connection and that is what people are being conditioned to do with this ever gathering human-AI interaction. Movies and TV programmes depicting the transhuman, robot dystopia relate to a phenomenon known as 'pre-emptive programming' in which the world that is planned is portrayed everywhere in movies, TV and advertising. This is conditioning the conscious and subconscious mind to become familiar with the planned reality to dilute resistance when it happens for real. What would have been a shock such is the change is made less so. We have young children put on the road to transgender transition surgery with puberty blocking drugs at an age when they could never be able to make those life-changing decisions.

Rachel Levine, a professor of paediatrics and psychiatry who believes in treating children this way, became America's highest-ranked openly-transgender official when she was confirmed as US Assistant Secretary at the Department of Health and Human Services after being nominated by Joe Biden (the Cult). Activists and governments press for laws to deny parents a say in their children's transition process so the kids can be isolated and manipulated into agreeing to irreversible medical procedures. A Canadian father Robert Hoogland was denied bail by the Vancouver Supreme Court in 2021 and remained in jail for breaching a court order that he stay silent over his young teenage daughter, a minor, who was being offered life-changing hormone therapy without parental consent. At the age of 12 the girl's 'school counsellor' said she may be transgender, referred her to a doctor and told the school to treat her like a boy. This is another example of state-serving schools imposing ever more control over children's lives while parents have ever less.

Contemptible and extreme child abuse is happening all over the world as the Cult gender-fusion operation goes into warp-speed.

Why the war on men – and now women?

The question about what artificial wombs mean for women should rightly be asked. The answer can be seen in the deletion of women's rights involving sport, changing rooms, toilets and status in favour of people in male bodies claiming to identify as women. I can identify as a mountain climber, but it doesn't mean I can climb a mountain any more than a biological man can be a biological woman. To believe so is a triumph of belief over factual reality which is the very perceptual basis of everything Woke. Women's sport is being destroyed by allowing those with male bodies who say they identify as female to 'compete' with girls and women. Male body 'women' dominate 'women's' competition with their greater muscle mass, bone density, strength and speed. With that disadvantage sport for women loses all meaning. To put this in perspective nearly 300 American high school boys can run faster than the quickest woman sprinter in the world. Women are seeing their previously protected spaces invaded by male bodies simply because they claim to identify as women. That's all they need to do to access all women's spaces and activities under the Biden 'Equality Act' that destroys equality for women with the usual Orwellian Woke inversion. Male sex offenders have already committed rapes in women's prisons after claiming to identify as women to get them transferred. Does this not matter to the Woke 'equality' hypocrites? Not in the least. What matters to Cult manipulators and funders behind transgender activists is to advance gender fusion on the way to the no-gender 'human'. When you are seeking to impose transparent nonsense like this, or the 'Covid' hoax, the only way the nonsense can prevail is through censorship and intimidation of dissenters, deletion of factual information, and programming of the unquestioning, bewildered and naive. You don't have to scan the world for long to see that all these things are happening.

Many women's rights organisations have realised that rights and status which took such a long time to secure are being eroded and that it is systematic. Kara Dansky of the global Women's Human Rights Campaign said that Biden's transgender executive order immediately he took office, subsequent orders, and Equality Act legislation that followed 'seek to erase women and girls in the law as a category'. *Exactly*. I said during the long ago-started war on men (in which many women play a crucial part) that this was going to turn into a war on them. The Cult is phasing out *both* male and female genders. To get away with that they are brought into conflict so they are busy fighting each other while the Cult completes the job with no unity of response. Unity, people, *unity*. We need unity everywhere. Transgender is the only show in town as the big step towards the no-gender human. It's not about rights for transgender people and never has been. Woke political correctness is deleting words relating to genders to the same end. Wokers believe this is to be 'inclusive' when the opposite is true. They are deleting words describing gender because gender *itself* is being deleted by Human 2.0. Terms like 'man', 'woman', 'mother' and 'father' are being deleted in the universities and other institutions to be replaced by the *no*-gender, not trans-gender, 'individuals' and 'guardians'. Women's rights campaigner Maria Keffler of Partners for Ethical Care said: 'Children are being taught from kindergarten upward that some boys have a vagina, some girls have a penis, and that kids can be any gender they want to be.' Do we really believe that suddenly countries all over the world at the same time had the idea of having drag queens go into schools or read transgender stories to very young children in the local library? It's coldly-calculated confusion of gender on the way to the fusion of gender. Suzanne Vierling, a psychologist from Southern California, made another important point:

Yesterday's slave woman who endured gynecological medical experiments is today's girl-child being butchered in a booming gender-transitioning sector. Ovaries removed, pushing her into menopause and osteoporosis, uncharted territory, and parents' rights and authority decimated.

The erosion of parental rights is a common theme in line with the Cult plans to erase the very concept of parents and 'ovaries removed, pushing her into menopause' means what? Those born female lose the ability to have children – another way to discontinue humanity as we know it.

Eliminating Human 1.0 (before our very eyes)

To pave the way for Human 2.0 you must phase out Human 1.0. This is happening through plummeting sperm counts and making women infertile through an onslaught of chemicals, radiation (including smartphones in pockets of men) and mRNA 'vaccines'. Common agriculture pesticides are also having a devastating impact on human fertility. I have been tracking collapsing sperm counts in the books for a long time and in 2021 came a book by fertility scientist and reproductive epidemiologist Shanna Swan, *Count Down: How Our Modern World Is Threatening Sperm Counts, Altering Male and Female Reproductive Development and Imperiling the Future of the Human Race*. She reports how the global fertility rate dropped by *half* between 1960 and 2016 with America's birth rate 16 percent below where it needs to be to sustain the population. Women are experiencing declining egg quality, more miscarriages, and more couples suffer from infertility. Other findings were an increase in erectile dysfunction, infant boys developing more genital abnormalities, male problems with conception, and plunging levels of the male hormone testosterone which would explain why so many men have lost their backbone and masculinity. This has been very evident during the 'Covid' hoax when women have been prominent among the Pushbackers and big strapping blokes have bowed their heads, covered their faces with a nappy and quietly submitted. Mind control expert Cathy O'Brien also points to how global education introduced the concept of 'we're all winners' in sport and classrooms: 'Competition was defused, and it in turn defused a sense of fighting back.' This is another version of the 'equity' doctrine in which you drive down rather than raise up. What a contrast in Cult-controlled China with its global ambitions

where the government published plans in January, 2021, to 'cultivate masculinity' in boys from kindergarten through to high school in the face of a 'masculinity crisis'. A government adviser said boys would be soon become 'delicate, timid and effeminate' unless action was taken. Don't expect any similar policy in the targeted West. A 2006 study showed that a 65-year-old man in 2002 had testosterone levels 15 percent lower than a 65-year-old man in 1987 while a 2020 study found a similar story with young adults and adolescents. Men are getting prescriptions for testosterone replacement therapy which causes an even greater drop in sperm count with up to 99 percent seeing sperm counts drop to zero during the treatment. More sperm is defective and malfunctioning with some having two heads or not pursuing an egg.

A class of *synthetic* chemicals known as phthalates are being blamed for the decline. These are found everywhere in plastics, shampoos, cosmetics, furniture, flame retardants, personal care products, pesticides, canned foods and even receipts. Why till receipts? Everyone touches them. Let no one delude themselves that all this is not systematic to advance the long-time agenda for human body transformation. Phthalates mimic hormones and disrupt the hormone balance causing testosterone to fall and genital birth defects in male infants. Animals and fish have been affected in the same way due to phthalates and other toxins in rivers. When fish turn gay or change sex through chemicals in rivers and streams it is a pointer to why there has been such an increase in gay people and the sexually confused. It doesn't matter to me what sexuality people choose to be, but if it's being affected by chemical pollution and consumption then we need to know. Does anyone really think that this is not connected to the transgender agenda, the war on men and the condemnation of male 'toxic masculinity'? You watch this being followed by 'toxic femininity'. It's already happening. When breastfeeding becomes 'chest-feeding', pregnant women become pregnant people along with all the other Woke claptrap you know that the world is going insane and there's a Cult scam in progress. Transgender activists are promoting the Cult agenda while Cult

billionaires support and fund the insanity as they laugh themselves to sleep at the sheer stupidity for which humans must be infamous in galaxies far, far away.

‘Covid vaccines’ and female infertility

We can now see why the ‘vaccine’ has been connected to potential infertility in women. Dr Michael Yeadon, former Vice President and Chief Scientific Advisor at Pfizer, and Dr Wolfgang Wodarg in Germany, filed a petition with the European Medicines Agency in December, 2020, urging them to stop trials for the Pfizer/BioNTech shot and all other mRNA trials until further studies had been done. They were particularly concerned about possible effects on fertility with ‘vaccine’-produced antibodies attacking the protein Syncytin-1 which is responsible for developing the placenta. The result would be infertility ‘of indefinite duration’ in women who have the ‘vaccine’ with the placenta failing to form. Section 10.4.2 of the Pfizer/BioNTech trial protocol says that pregnant women or those who might become so should not have mRNA shots. Section 10.4 warns men taking mRNA shots to ‘be abstinent from heterosexual intercourse’ and not to donate sperm. The UK government said that it *did not know* if the mRNA procedure had an effect on fertility. *Did not know?* These people have to go to jail. UK government advice did not recommend at the start that pregnant women had the shot and said they should avoid pregnancy for at least two months after ‘vaccination’. The ‘advice’ was later updated to pregnant women should only have the ‘vaccine’ if the benefits outweighed the risks to mother and foetus. What the hell is that supposed to mean? Then ‘spontaneous abortions’ began to appear and rapidly increase on the adverse reaction reporting schemes which include only a fraction of adverse reactions. Thousands and ever-growing numbers of ‘vaccinated’ women are describing changes to their menstrual cycle with heavier blood flow, irregular periods and menstruating again after going through the menopause – all links to reproduction effects. Women are passing blood clots and the lining of their uterus while men report erectile dysfunction and blood effects. Most

significantly of all *unvaccinated* women began to report similar menstrual changes after interaction with '*vaccinated*' people and men and children were also affected with bleeding noses, blood clots and other conditions. 'Shedding' is when vaccinated people can emit the content of a vaccine to affect the unvaccinated, but this is different. 'Vaccinated' people were not shedding a 'live virus' allegedly in 'vaccines' as before because the fake 'Covid vaccines' involve synthetic material and other toxicity. Doctors exposing what is happening prefer the term 'transmission' to shedding. Somehow those that have had the shots are transmitting effects to those that haven't. Dr Carrie Madej said the nano-content of the 'vaccines' can 'act like an antenna' to others around them which fits perfectly with my own conclusions. This 'vaccine' transmission phenomenon was becoming known as the book went into production and I deal with this further in the Postscript.

Vaccine effects on sterility are well known. The World Health Organization was accused in 2014 of sterilising millions of women in Kenya with the evidence confirmed by the content of the vaccines involved. The same WHO behind the 'Covid' hoax admitted its involvement for more than ten years with the vaccine programme. Other countries made similar claims. Charges were lodged by Tanzania, Nicaragua, Mexico, and the Philippines. The Gardasil vaccine claimed to protect against a genital 'virus' known as HPV has also been linked to infertility. Big Pharma and the WHO (same thing) are criminal and satanic entities. Then there's the Bill Gates Foundation which is connected through funding and shared interests with 20 pharmaceutical giants and laboratories. He stands accused of directing the policy of United Nations Children's Fund (UNICEF), vaccine alliance GAVI, and other groupings, to advance the vaccine agenda and silence opposition at great cost to women and children. At the same time Gates wants to reduce the global population. Coincidence?

Great Reset = Smart Grid = new human

The Cult agenda I have been exposing for 30 years is now being openly promoted by Cult assets like Gates and Klaus Schwab of the World Economic Forum under code-terms like the 'Great Reset', 'Build Back Better' and 'a rare but narrow window of opportunity to reflect, reimagine, and reset our world'. What provided this 'rare but narrow window of opportunity'? The 'Covid' hoax did. Who created that? *They* did. My books from not that long ago warned about the planned 'Internet of Things' (IoT) and its implications for human freedom. This was the plan to connect all technology to the Internet and artificial intelligence and today we are way down that road with an estimated 36 billion devices connected to the World Wide Web and that figure is projected to be 76 billion by 2025. I further warned that the Cult planned to go beyond that to the Internet of *Everything* when the human brain was connected via AI to the Internet and Kurzweil's 'cloud'. Now we have Cult operatives like Schwab calling for precisely that under the term 'Internet of Bodies', a fusion of the physical, digital and biological into one centrally-controlled Smart Grid system which the Cult refers to as the 'Fourth Industrial Revolution'. They talk about the 'biological', but they really mean the synthetic-biological which is required to fully integrate the human body and brain into the Smart Grid and artificial intelligence planned to replace the human mind. We have everything being synthetically manipulated including the natural world through GMO and smart dust, the food we eat and the human body itself with synthetic 'vaccines'. I said in *The Answer* that we would see the Cult push for synthetic meat to replace animals and in February, 2021, the so predictable psychopath Bill Gates called for the introduction of synthetic meat to save us all from 'climate change'. The climate hoax just keeps on giving like the 'Covid' hoax. The war on meat by vegan activists is a carbon (oops, sorry) copy of the manipulation of transgender activists. They have no idea (except their inner core) that they are being used to promote and impose the agenda of the Cult or that they are only the *vehicle* and not the *reason*. This is not to say those who choose not to eat meat shouldn't be respected and supported in that right, but there are ulterior motives

for those in power. A *Forbes* article in December, 2019, highlighted the plan so beloved of Schwab and the Cult under the heading: 'What Is The Internet of Bodies? And How Is It Changing Our World?' The article said the human body is the latest data platform (remember 'our vaccine is an operating system'). *Forbes* described the plan very accurately and the words could have come straight out of my books from long before:

The Internet of Bodies (IoB) is an extension of the IoT and basically connects the human body to a network through devices that are ingested, implanted, or connected to the body in some way. Once connected, data can be exchanged, and the body and device can be remotely monitored and controlled.

They were really describing a human hive mind with human perception centrally-dictated via an AI connection as well as allowing people to be 'remotely monitored and controlled'. Everything from a fridge to a human mind could be directed from a central point by these insane psychopaths and 'Covid vaccines' are crucial to this. *Forbes* explained the process I mentioned earlier of holdable and wearable technology followed by implantable. The article said there were three generations of the Internet of Bodies that include:

- Body external: These are wearable devices such as Apple Watches or Fitbits that can monitor our health.
- Body internal: These include pacemakers, cochlear implants, and digital pills that go inside our bodies to monitor or control various aspects of health.
- Body embedded: The third generation of the Internet of Bodies is embedded technology where technology and the human body are melded together and have a real-time connection to a remote machine.

Forbes noted the development of the Brain Computer Interface (BCI) which merges the brain with an external device for monitoring and controlling in real-time. 'The ultimate goal is to help restore function to individuals with disabilities by using brain signals rather than conventional neuromuscular pathways.' Oh, do fuck off. The goal of brain interface technology is controlling human thought and emotion from the central point in a hive mind serving its masters wishes. Many people are now agreeing to be chipped to open doors without a key. You can recognise them because they'll be wearing a mask, social distancing and lining up for the 'vaccine'. The Cult plans a Great Reset money system after they have completed the demolition of the global economy in which 'money' will be exchanged through communication with body operating systems. Rand Corporation, a Cult-owned think tank, said of the Internet of Bodies or IoB:

Internet of Bodies technologies fall under the broader IoT umbrella. But as the name suggests, IoB devices introduce an even more intimate interplay between humans and gadgets. IoB devices monitor the human body, collect health metrics and other personal information, and transmit those data over the Internet. Many devices, such as fitness trackers, are already in use ... IoB devices ... and those in development can track, record, and store users' whereabouts, bodily functions, and what they see, hear, and even think.

Schwab's World Economic Forum, a long-winded way of saying 'fascism' or 'the Cult', has gone full-on with the Internet of Bodies in the 'Covid' era. 'We're entering the era of the Internet of Bodies', it declared, 'collecting our physical data via a range of devices that can be implanted, swallowed or worn'. The result would be a huge amount of health-related data that could improve human wellbeing around the world, and prove crucial in fighting the 'Covid-19 pandemic'. Does anyone think these clowns care about 'human wellbeing' after the death and devastation their pandemic hoax has purposely caused? Schwab and co say we should move forward with the Internet of Bodies because 'Keeping track of symptoms could help us stop the spread of infection, and quickly detect new cases'. How wonderful, but keeping track' is all they are really bothered

about. Researchers were investigating if data gathered from smartwatches and similar devices could be used as viral infection alerts by tracking the user's heart rate and breathing. Schwab said in his 2018 book *Shaping the Future of the Fourth Industrial Revolution*:

The lines between technologies and beings are becoming blurred and not just by the ability to create lifelike robots or synthetics. Instead it is about the ability of new technologies to literally become part of us. Technologies already influence how we understand ourselves, how we think about each other, and how we determine our realities. As the technologies ... give us deeper access to parts of ourselves, we may begin to integrate digital technologies into our bodies.

You can see what the game is. Twenty-four hour control and people – if you could still call them that – would never know when something would go ping and take them out of circulation. It's the most obvious rush to a global fascist dictatorship and the complete submission of humanity and yet still so many are locked away in their Cult-induced perceptual coma and can't see it.

Smart Grid control centres

The human body is being transformed by the 'vaccines' and in other ways into a synthetic cyborg that can be attached to the global Smart Grid which would be controlled from a central point and other sub-locations of Grid manipulation. Where are these planned to be? Well, China for a start which is one of the Cult's biggest centres of operation. The technological control system and technocratic rule was incubated here to be unleashed across the world after the 'Covid' hoax came out of China in 2020. Another Smart Grid location that will surprise people new to this is Israel. I have exposed in *The Trigger* how Sabbatian technocrats, intelligence and military operatives were behind the horrors of 9/11 and not 19 Arab hijackers' who somehow manifested the ability to pilot big passenger airliners when instructors at puddle-jumping flying schools described some of them as a joke. The 9/11 attacks were made possible through control of civilian and military air computer systems and those of the White House, Pentagon and connected agencies. See *The Trigger* – it

will blow your mind. The controlling and coordinating force were the Sabbatian networks in Israel and the United States which by then had infiltrated the entire US government, military and intelligence system. The real name of the American Deep State is 'Sabbatian State'. Israel is a tiny country of only nine million people, but it is one of the global centres of cyber operations and fast catching Silicon Valley in importance to the Cult. Israel is known as the 'start-up nation' for all the cyber companies spawned there with the Sabbatian specialisation of 'cyber security' that I mentioned earlier which gives those companies access to computer systems of their clients in real time through 'backdoors' written into the coding when security software is downloaded. The Sabbatian centre of cyber operations outside Silicon Valley is the Israeli military Cyber Intelligence Unit, the biggest infrastructure project in Israel's history, headquartered in the desert-city of Beersheba and involving some 20,000 'cyber soldiers'. Here are located a literal army of Internet trolls scanning social media, forums and comment lists for anyone challenging the Cult agenda. The UK military has something similar with its 77th Brigade and associated operations. The Beersheba complex includes research and development centres for other Cult operations such as Intel, Microsoft, IBM, Google, Apple, Hewlett-Packard, Cisco Systems, Facebook and Motorola. Techcrunch.com ran an article about the Beersheba global Internet technology centre headlined 'Israel's desert city of Beersheba is turning into a cybertech oasis':

The military's massive relocation of its prestigious technology units, the presence of multinational and local companies, a close proximity to Ben Gurion University and generous government subsidies are turning Beersheba into a major global cybertech hub. Beersheba has all of the ingredients of a vibrant security technology ecosystem, including Ben Gurion University with its graduate program in cybersecurity and Cyber Security Research Center, and the presence of companies such as EMC, Deutsche Telekom, PayPal, Oracle, IBM, and Lockheed Martin. It's also the future home of the INCB (Israeli National Cyber Bureau); offers a special income tax incentive for cyber security companies, and was the site for the relocation of the army's intelligence corps units.

Sabbatians have taken over the cyber world through the following process: They scan the schools for likely cyber talent and develop them at Ben Gurion University and their period of conscription in the Israeli Defense Forces when they are stationed at the Beersheba complex. When the cyber talented officially leave the army they are funded to start cyber companies with technology developed by themselves or given to them by the state. Much of this is stolen through backdoors of computer systems around the world with America top of the list. Others are sent off to Silicon Valley to start companies or join the major ones and so we have many major positions filled by apparently 'Jewish' but really Sabbatian operatives. Google, YouTube and Facebook are all run by 'Jewish' CEOs while Twitter is all but run by ultra-Zionist hedge-fund shark Paul Singer. At the centre of the Sabbatian global cyber web is the Israeli army's Unit 8200 which specialises in hacking into computer systems of other countries, inserting viruses, gathering information, instigating malfunction, and even taking control of them from a distance. A long list of Sabbatians involved with 9/11, Silicon Valley and Israeli cyber security companies are operatives of Unit 8200. This is not about Israel. It's about the Cult. Israel is planned to be a Smart Grid hub as with China and what is happening at Beersheba is not for the benefit of Jewish people who are treated disgustingly by the Sabbatian elite that control the country. A glance at the Nuremberg Codes will tell you that.

The story is much bigger than 'Covid', important as that is to where we are being taken. Now, though, it's time to really strap in. There's more ... much more ...

CHAPTER ELEVEN

Who controls the Cult?

Awake, arise or be forever fall'n
John Milton, *Paradise Lost*

I have exposed this far the level of the Cult conspiracy that operates in the world of the seen and within the global secret society and satanic network which operates in the shadows one step back from the seen. The story, however, goes much deeper than that.

The 'Covid' hoax is major part of the Cult agenda, but only part, and to grasp the biggest picture we have to expand our attention beyond the realm of human sight and into the infinity of possibility that we cannot see. It is from here, ultimately, that humanity is being manipulated into a state of total control by the force which dictates the actions of the Cult. How much of reality can we see? Next to damn all is the answer. We may appear to see all there is to see in the 'space' our eyes survey and observe, but little could be further from the truth. The human 'world' is only a tiny band of frequency that the body's visual and perceptual systems can decode into *perception* of a 'world'. According to mainstream science the electromagnetic spectrum is 0.005 percent of what exists in the Universe ([Fig 10](#)). The maximum estimate I have seen is 0.5 percent and either way it's miniscule. I say it is far, far, smaller even than 0.005 percent when you compare reality we see with the totality of reality that we don't. Now get this if you are new to such information: Visible light, the only band of frequency that we can see, is a *fraction* of the 0.005

percent (Fig 11 overleaf). Take this further and realise that our universe is one of infinite universes and that universes are only a fragment of overall reality – *infinite* reality. Then compare that with the almost infinitesimal frequency band of visible light or human sight. You see that humans are as near blind as it is possible to be without actually being so. Artist and filmmaker, Sergio Toporek, said:

Figure 10: Humans can perceive such a tiny band of visual reality it's laughable.

Figure 11: We can see a smear of the 0.005 percent electromagnetic spectrum, but we still know it all. Yep, makes sense.

Consider that you can see less than 1% of the electromagnetic spectrum and hear less than 1% of the acoustic spectrum. 90% of the cells in your body carry their own microbial DNA and are not 'you'. The atoms in your body are 99.9999999999999999% empty space and none of them are the ones you were born with ... Human beings have 46 chromosomes, two less than a potato.

The existence of the rainbow depends on the conical photoreceptors in your eyes; to animals without cones, the rainbow does not exist. So you don't just look at a rainbow, you create it. This is pretty amazing, especially considering that all the beautiful colours you see represent less than 1% of the electromagnetic spectrum.

Suddenly the 'world' of humans looks a very different place. Take into account, too, that Planet Earth when compared with the projected size of this single universe is the equivalent of a billionth of a pinhead. Imagine the ratio that would be when compared to infinite reality. To think that Christianity once insisted that Earth and humanity were the centre of everything. This background is vital if we are going to appreciate the nature of 'human' and how we can be manipulated by an unseen force. To human visual reality virtually *everything* is unseen and yet the prevailing perception within the institutions and so much of the public is that if we can't see it, touch it, hear it, taste it and smell it then it cannot exist. Such perception is indoctrinated and encouraged by the Cult and its agents because it isolates believers in the strictly limited, village-idiot, realm of the five senses where perceptions can be firewalled and information controlled. Most of those perpetuating the 'this-world-is-all-there-is' insanity are themselves indoctrinated into believing the same delusion. While major players and influencers know that official reality is laughable most of those in science, academia and medicine really believe the nonsense they peddle and teach succeeding generations. Those who challenge the orthodoxy are dismissed as nutters and freaks to protect the manufactured illusion from exposure. Observe the dynamic of the 'Covid' hoax and you will see how that takes the same form. The inner-circle psychopaths knows it's a gigantic scam, but almost the entirety of those imposing their fascist rules believe that 'Covid' is all that they're told it is.

Stolen identity

Ask people who they are and they will give you their name, place of birth, location, job, family background and life story. Yet that is not who they are – it is what they are *experiencing*. The difference is *absolutely crucial*. The true 'I', the eternal, infinite 'I', is consciousness,

a state of being aware. Forget 'form'. That is a vehicle for a brief experience. Consciousness does not come *from* the brain, but *through* the brain and even that is more symbolic than literal. We are awareness, pure awareness, and this is what withdraws from the body at what we call 'death' to continue our eternal beingness, *isness*, in other realms of reality within the limitlessness of infinity or the Biblical 'many mansions in my father's house'. Labels of a human life, man, woman, transgender, black, white, brown, nationality, circumstances and income are not who we are. They are what we are – awareness – is *experiencing* in a brief connection with a band of frequency we call 'human'. The labels are not the self; they are, to use the title of one of my books, a *Phantom Self*. I am not David Icke born in Leicester, England, on April 29th, 1952. I am the consciousness *having that experience*. The Cult and its non-human masters seek to convince us through the institutions of 'education', science, medicine, media and government that what we are *experiencing* is who we *are*. It's so easy to control and direct perception locked away in the bewildered illusions of the five senses with no expanded radar. Try, by contrast, doing the same with a humanity aware of its true self and its true power to consciously create its reality and experience. How is it possible to do this? We do it all day every day. If you perceive yourself as 'little me' with no power to impact upon your life and the world then your life experience will reflect that. You will hand the power you don't think you have to authority in all its forms which will use it to control your experience. This, in turn, will appear to confirm your perception of 'little me' in a self-fulfilling feedback loop. But that is what 'little me' really is – a *perception*. We are all 'big-me', infinite me, and the Cult has to make us forget that if its will is to prevail. We are therefore manipulated and pressured into self-identifying with human labels and not the consciousness/awareness *experiencing* those human labels.

The phenomenon of identity politics is a Cult-instigated manipulation technique to sub-divide previous labels into even smaller ones. A United States university employs this list of letters to

describe student identity: LGBTTQQFAGPBDSM or lesbian, gay, bisexual, transgender, transsexual, queer, questioning, flexual, asexual, gender-fuck, polyamorous, bondage/discipline, dominance/submission and sadism/masochism. I'm sure other lists are even longer by now as people feel the need to self-identity the 'I' with the minutiae of race and sexual preference. Wokers programmed by the Cult for generations believe this is about 'inclusivity' when it's really the Cult locking them away into smaller and smaller versions of Phantom Self while firewalling them from the influence of their true self, the infinite, eternal 'I'. You may notice that my philosophy which contends that we are all unique points of attention/awareness within the same infinite whole or Oneness is the ultimate non-racism. The very sense of Oneness makes the judgement of people by their body-type, colour or sexuality utterly ridiculous and confirms that racism has no understanding of reality (including anti-white racism). Yet despite my perception of life Cult agents and fast-asleep Wokers label me racist to discredit my information while they are themselves phenomenally racist and sexist. All they see is race and sexuality and they judge people as good or bad, demons or untouchables, by their race and sexuality. All they see is *Phantom Self* and perceive themselves in terms of Phantom Self. They are pawns and puppets of the Cult agenda to focus attention and self-identity in the five senses and play those identities against each other to divide and rule. Columbia University has introduced segregated graduations in another version of social distancing designed to drive people apart and teach them that different racial and cultural groups have nothing in common with each other. The last thing the Cult wants is unity. Again the pump-primers of this will be Cult operatives in the knowledge of what they are doing, but the rest are just the Phantom Self blind leading the Phantom Self blind. We *do* have something in common – we are all *the same consciousness* having different temporary experiences.

What is this 'human'?

Yes, what *is* 'human'? That is what we are supposed to be, right? I mean 'human'? True, but 'human' is the experience not the 'I'. Break it down to basics and 'human' is the way that information is processed. If we are to experience and interact with this band of frequency we call the 'world' we must have a vehicle that operates within that band of frequency. Our consciousness in its prime form cannot do that; it is way beyond the frequency of the human realm. My consciousness or awareness could not tap these keys and pick up the cup in front of me in the same way that radio station A cannot interact with radio station B when they are on different frequencies. The human body is the means through which we have that interaction. I have long described the body as a biological computer which processes information in a way that allows consciousness to experience this reality. The body is a receiver, transmitter and processor of information in a particular way that we call human. We visually perceive only the world of the five senses in a wakened state – that is the limit of the body's visual decoding system. In truth it's not even visual in the way we experience 'visual reality' as I will come to in a moment. We are 'human' because the body processes the information sources of human into a reality and behaviour system that we *perceive* as human. Why does an elephant act like an elephant and not like a human or a duck? The elephant's biological computer is a different information field and processes information according to that program into a visual and behaviour type we call an elephant. The same applies to everything in our reality. These body information fields are perpetuated through procreation (like making a copy of a software program). The Cult wants to break that cycle and intervene technologically to transform the human information field into one that will change what we call humanity. If it can change the human information field it will change the way that field processes information and change humanity both 'physically' and psychologically. Hence the *messenger* (information) RNA 'vaccines' and so much more that is targeting human genetics by changing the body's information – *messaging* – construct through food, drink, radiation, toxicity and other means.

Reality that we experience is nothing like reality as it really is in the same way that the reality people experience in virtual reality games is not the reality they are really living in. The game is only a decoded source of information that appears to be a reality. Our world is also an information construct – a *simulation* (more later). In its base form our reality is a wavefield of information much the same in theme as Wi-Fi. The five senses decode wavefield information into electrical information which they communicate to the brain to decode into holographic (illusory ‘physical’) information. Different parts of the brain specialise in decoding different senses and the information is fused into a reality that appears to be outside of us but is really inside the brain and the genetic structure in general ([Fig 12](#) overleaf). DNA is a receiver-transmitter of information and a vital part of this decoding process and the body’s connection to other realities. Change DNA and you change the way we decode and connect with reality – see ‘Covid vaccines’. Think of computers decoding Wi-Fi. You have information encoded in a radiation field and the computer decodes that information into a very different form on the screen. You can’t see the Wi-Fi until its information is made manifest on the screen and the information on the screen is inside the computer and not outside. I have just described how we decode the ‘human world’. All five senses decode the waveform ‘Wi-Fi’ field into electrical signals and the brain (computer) constructs reality inside the brain and not outside – ‘You don’t just look at a rainbow, you create it’. Sound is a simple example. We don’t hear sound until the brain decodes it. Waveform sound waves are picked up by the hearing sense and communicated to the brain in an electrical form to be decoded into the sounds that we hear. Everything we hear is inside the brain along with everything we see, feel, smell and taste. Words and language are waveform fields generated by our vocal chords which pass through this process until they are decoded by the brain into words that we hear. Different languages are different frequency fields or sound waves generated by vocal chords. Late British philosopher Alan Watts said:

Figure 12: The brain receives information from the five senses and constructs from that our perceived reality.

[Without the brain] the world is devoid of light, heat, weight, solidity, motion, space, time or any other imaginable feature. All these phenomena are interactions, or transactions, of vibrations with a certain arrangement of neurons.

That's exactly what they are and scientist Robert Lanza describes in his book, *Biocentrism*, how we decode electromagnetic waves and energy into visual and 'physical' experience. He uses the example of a flame emitting photons, electromagnetic energy, each pulsing electrically and magnetically:

... these ... invisible electromagnetic waves strike a human retina, and if (and only if) the waves happen to measure between 400 and 700 nano meters in length from crest to crest, then their energy is just right to deliver a stimulus to the 8 million cone-shaped cells in the retina.

Each in turn send an electrical pulse to a neighbour neuron, and on up the line this goes, at 250 mph, until it reaches the ... occipital lobe of the brain, in the back of the head. There, a cascading complex of neurons fire from the incoming stimuli, and we subjectively perceive this experience as a yellow brightness occurring in a place we have been conditioned to call the 'external world'.

You hear what you decode

If a tree falls or a building collapses they make no noise unless someone is there to decode the energetic waves generated by the disturbance into what we call sound. Does a falling tree make a noise? Only if you hear it – *decode* it. Everything in our reality is a frequency field of information operating within the overall ‘Wi-Fi’ field that I call The Field. A vibrational disturbance is generated in The Field by the fields of the falling tree or building. These disturbance waves are what we decode into the sound of them falling. If no one is there to do that then neither will make any noise. Reality is created by the observer – *decoder* – and the *perceptions* of the observer affect the decoding process. For this reason different people – different *perceptions* – will perceive the same reality or situation in a different way. What one may perceive as a nightmare another will see as an opportunity. The question of why the Cult is so focused on controlling human perception now answers itself. All experienced reality is the act of decoding and we don’t experience Wi-Fi until it is decoded on the computer screen. The sight and sound of an Internet video is encoded in the Wi-Fi all around us, but we don’t see or hear it until the computer decodes that information. Taste, smell and touch are all phenomena of the brain as a result of the same process. We don’t taste, smell or feel anything except in the brain and there are pain relief techniques that seek to block the signal from the site of discomfort to the brain because if the brain doesn’t decode that signal we don’t feel pain. Pain is in the brain and only appears to be at the point of impact thanks to the feedback loop between them. We don’t see anything until electrical information from the sight senses is decoded in an area at the back of the brain. If that area is damaged we can go blind when our eyes are perfectly okay. So why do we go blind if we damage an eye? We damage the information processing between the waveform visual information and the visual decoding area of the brain. If information doesn’t reach the brain in a form it can decode then we can’t see the visual reality that it represents. What’s more the brain is decoding only a fraction of the information it receives and the rest is absorbed by the

sub-conscious mind. This explanation is from the science magazine, *Wonderpedia*:

Every second, 11 million sensations crackle along these [brain] pathways ... The brain is confronted with an alarming array of images, sounds and smells which it rigorously filters down until it is left with a manageable list of around 40. Thus 40 sensations per second make up what we perceive as reality.

The 'world' is not what people are told to believe that is it and the inner circles of the Cult *know that*.

Illusory 'physical' reality

We can only see a smear of 0.005 percent of the Universe which is only one of a vast array of universes – 'mansions' – within infinite reality. Even then the brain decodes only 40 pieces of information ('sensations') from a potential *11 million* that we receive every second. Two points strike you from this immediately: The sheer breathtaking stupidity of believing we know anything so rigidly that there's nothing more to know; and the potential for these processes to be manipulated by a malevolent force to control the reality of the population. One thing I can say for sure with no risk of contradiction is that when you can perceive an almost indescribable fraction of infinite reality there is always more to know as in tidal waves of it. Ancient Greek philosopher Socrates was so right when he said that wisdom is to know how little we know. How obviously true that is when you think that we are experiencing a physical world of solidity that is neither physical nor solid and a world of apartness when everything is connected. Cult-controlled 'science' dismisses the so-called 'paranormal' and all phenomena related to that when the 'para'-normal is perfectly normal and explains the alleged 'great mysteries' which dumbfound scientific minds. There is a reason for this. A 'scientific mind' in terms of the mainstream is a material mind, a five-sense mind imprisoned in see it, touch it, hear it, smell it and taste it. Phenomena and happenings that can't be explained that way leave the 'scientific mind' bewildered and the rule is that if they

can't account for why something is happening then it can't, by definition, be happening. I beg to differ. Telepathy is thought waves passing through The Field (think wave disturbance again) to be decoded by someone able to connect with that wavelength (information). For example: You can pick up the thought waves of a friend at any distance and at the very least that will bring them to mind. A few minutes later the friend calls you. 'My god', you say, 'that's incredible – I was just thinking of you.' Ah, but *they* were thinking of *you* before they made the call and that's what you decoded. Native peoples not entrapped in five-sense reality do this so well it became known as the 'bush telegraph'. Those known as psychics and mediums (genuine ones) are doing the same only across dimensions of reality. 'Mind over matter' comes from the fact that matter and mind are the *same*. The state of one influences the state of the other. Indeed one *and* the other are illusions. They are aspects of the same field. Paranormal phenomena are all explainable so why are they still considered 'mysteries' or not happening? Once you go down this road of understanding you begin to expand awareness beyond the five senses and that's the nightmare for the Cult.

Figure 13: Holograms are not solid, but the best ones appear to be.

Figure 14: How holograms are created by capturing a waveform version of the subject image.

Holographic 'solidity'

Our reality is not solid, it is holographic. We are now well aware of holograms which are widely used today. Two-dimensional information is decoded into a three-dimensional reality that is not solid although can very much appear to be (Fig 13). Holograms are created with a laser divided into two parts. One goes directly onto a holographic photographic print ('reference beam') and the other takes a waveform image of the subject ('working beam') before being directed onto the print where it 'collides' with the other half of the laser (Fig 14). This creates a *waveform* interference pattern which contains the wavefield information of whatever is being photographed (Fig 15 overleaf). The process can be likened to dropping pebbles in a pond. Waves generated by each one spread out across the water to collide with the others and create a wave representation of where the stones fell and at what speed, weight and distance. A waveform interference pattern of a hologram is akin to the waveform information in The Field which the five senses decode into electrical signals to be decoded by the brain into a holographic illusory 'physical' reality. In the same way when a laser (think human attention) is directed at the waveform interference pattern a three-dimensional version of the subject is projected into apparently 'solid' reality (Fig 16). An amazing trait of holograms reveals more 'paranormal mysteries'. Information of the *whole*

hologram is encoded in waveform in every part of the interference pattern by the way they are created. This means that every *part* of a hologram is a smaller version of the whole. Cut the interference wave-pattern into four and you won't get four parts of the image. You get quarter-sized versions of the *whole* image. The body is a hologram and the same applies. Here we have the basis of acupuncture, reflexology and other forms of healing which identify representations of the whole body in all of the parts, hands, feet, ears, everywhere. Skilled palm readers can do what they do because the information of whole body is encoded in the hand. The concept of as above, so below, comes from this.

Figure 15: A waveform interference pattern that holds the information that transforms into a hologram.

Figure 16: Holographic people including 'Elvis' holographically inserted to sing a duet with Celine Dion.

The question will be asked of why, if solidity is illusory, we can't just walk through walls and each other. The resistance is not solid against solid; it is electromagnetic field against electromagnetic field and we decode this into the *experience* of solid against solid. We should also not underestimate the power of belief to dictate reality. What you believe is impossible *will be*. Your belief impacts on your decoding processes and they won't decode what you think is impossible. What we believe we perceive and what we perceive we experience. 'Can't dos' and 'impossibles' are like a firewall in a computer system that won't put on the screen what the firewall blocks. How vital that is to understanding how human experience has been hijacked. I explain in *The Answer, Everything You Need To Know But Have Never Been Told* and other books a long list of 'mysteries' and 'paranormal' phenomena that are not mysterious and perfectly normal once you realise what reality is and how it works. 'Ghosts' can be seen to pass through 'solid' walls because the walls are not solid and the ghost is a discarnate entity operating on a frequency so different to that of the wall that it's like two radio stations sharing the same space while never interfering with each other. I have seen ghosts do this myself. The apartness of people and objects is also an illusion. Everything is connected by the Field like all sea life is connected by the sea. It's just that within the limits of our visual reality we only 'see' holographic information and not the field of information that connects everything and from which the holographic world is made manifest. If you can only see holographic 'objects' and not the field that connects them they will appear to you as unconnected to each other in the same way that we see the computer while not seeing the Wi-Fi.

What you don't know *can* hurt you

Okay, we return to those 'two worlds' of human society and the Cult with its global network of interconnecting secret societies and satanic groups which manipulate through governments, corporations, media, religions, etc. The fundamental difference between them is *knowledge*. The idea has been to keep humanity

ignorant of the plan for its total enslavement underpinned by a crucial ignorance of reality – who we are and where we are – and how we interact with it. ‘Human’ should be the interaction between our expanded eternal consciousness and the five-sense body experience. We are meant to be *in* this world in terms of the five senses but not *of* this world in relation to our greater consciousness and perspective. In that state we experience the small picture of the five senses within the wider context of the big picture of awareness beyond the five senses. Put another way the five senses see the dots and expanded awareness connects them into pictures and patterns that give context to the apparently random and unconnected. Without the context of expanded awareness the five senses see only apartness and randomness with apparently no meaning. The Cult and its other-dimensional controllers seek to intervene in the frequency realm where five-sense reality is supposed to connect with expanded reality and to keep the two apart (more on this in the final chapter). When that happens five-sense mental and emotional processes are no longer influenced by expanded awareness, or the True ‘I’, and instead are driven by the isolated perceptions of the body’s decoding systems. They are in the world *and* of it. Here we have the human plight and why humanity with its potential for infinite awareness can be so easily manipulatable and descend into such extremes of stupidity.

Once the Cult isolates five-sense mind from expanded awareness it can then program the mind with perceptions and beliefs by controlling information that the mind receives through the ‘education’ system of the formative years and the media perceptual bombardment and censorship of an entire lifetime. Limit perception and a sense of the possible through limiting knowledge by limiting and skewing information while censoring and discrediting that which could set people free. As the title of another of my books says ... *And The Truth Shall Set You Free*. For this reason the last thing the Cult wants in circulation is the truth about anything – especially the reality of the eternal ‘I’ – and that’s why it is desperate to control information. The Cult knows that information becomes perception

which becomes behaviour which, collectively, becomes human society. Cult-controlled and funded mainstream 'science' denies the existence of an eternal 'I' and seeks to dismiss and trash all evidence to the contrary. Cult-controlled mainstream religion has a version of 'God' that is little more than a system of control and dictatorship that employs threats of damnation in an afterlife to control perceptions and behaviour in the here and now through fear and guilt. Neither is true and it's the 'neither' that the Cult wishes to suppress. This 'neither' is that everything is an expression, a point of attention, within an infinite state of consciousness which is the real meaning of the term 'God'.

Perceptual obsession with the 'physical body' and five-senses means that 'God' becomes personified as a bearded bloke sitting among the clouds or a raging bully who loves us if we do what 'he' wants and condemns us to the fires of hell if we don't. These are no more than a 'spiritual' fairy tales to control and dictate events and behaviour through fear of this 'God' which has bizarrely made 'God-fearing' in religious circles a state to be desired. I would suggest that fearing *anything* is not to be encouraged and celebrated, but rather deleted. You can see why 'God fearing' is so beneficial to the Cult and its religions when *they* decide what 'God' wants and what 'God' demands (the Cult demands) that everyone do. As the great American comedian Bill Hicks said satirising a Christian zealot: 'I think what God meant to say.' How much of this infinite awareness ('God') that we access is decided by how far we choose to expand our perceptions, self-identity and sense of the possible. The scale of self-identity reflects itself in the scale of awareness that we can connect with and are influenced by – how much knowing and insight we have instead of programmed perception. You cannot expand your awareness into the infinity of possibility when you believe that you are little me Peter the postman or Mary in marketing and nothing more. I'll deal with this in the concluding chapter because it's crucial to how we turnaround current events.

Where the Cult came from

When I realised in the early 1990s there was a Cult network behind global events I asked the obvious question: When did it start? I took it back to ancient Rome and Egypt and on to Babylon and Sumer in Mesopotamia, the 'Land Between Two Rivers', in what we now call Iraq. The two rivers are the Tigris and Euphrates and this region is of immense historical and other importance to the Cult, as is the land called Israel only 550 miles away by air. There is much more going on with deep esoteric meaning across this whole region. It's not only about 'wars for oil'. Priceless artefacts from Mesopotamia were stolen or destroyed after the American and British invasion of Iraq in 2003 justified by the lies of Boy Bush and Tony Blair (their Cult masters) about non-existent 'weapons of mass destruction'.

Mesopotamia was the location of Sumer (about 5,400BC to 1,750BC), and Babylon (about 2,350BC to 539BC). Sabbatians may have become immensely influential in the Cult in modern times but they are part of a network that goes back into the mists of history. Sumer is said by historians to be the 'cradle of civilisation'. I disagree. I say it was the re-start of what we call human civilisation after cataclysmic events symbolised in part as the 'Great Flood' destroyed the world that existed before. These fantastic upheavals that I have been describing in detail in the books since the early 1990s appear in accounts and legends of ancient cultures across the world and they are supported by geological and biological evidence. Stone tablets found in Iraq detailing the Sumer period say the cataclysms were caused by non-human 'gods' they call the Anunnaki. These are described in terms of extraterrestrial visitations in which knowledge supplied by the Anunnaki is said to have been the source of at least one of the world's oldest writing systems and developments in astronomy, mathematics and architecture that were way ahead of their time. I have covered this subject at length in *The Biggest Secret* and *Children of the Matrix* and the same basic 'Anunnaki' story can be found in Zulu accounts in South Africa where the late and very great Zulu high shaman Credo Mutwa told me that the Sumerian Anunnaki were known by Zulus as the Chitauri or 'children of the serpent'. See my six-hour video interview with Credo on this subject entitled *The*

Reptilian Agenda recorded at his then home near Johannesburg in 1999 which you can watch on the Ickonic media platform.

The Cult emerged out of Sumer, Babylon and Egypt (and elsewhere) and established the Roman Empire before expanding with the Romans into northern Europe from where many empires were savagely imposed in the form of Cult-controlled societies all over the world. Mass death and destruction was their calling card. The Cult established its centre of operations in Europe and European Empires were Cult empires which allowed it to expand into a global force. Spanish and Portuguese colonialists headed for Central and South America while the British and French targeted North America. Africa was colonised by Britain, France, Belgium, the Netherlands, Portugal, Spain, Italy, and Germany. Some like Britain and France moved in on the Middle East. The British Empire was by far the biggest for a simple reason. By now Britain was the headquarters of the Cult from which it expanded to form Canada, the United States, Australia and New Zealand. The Sun never set on the British Empire such was the scale of its occupation. London remains a global centre for the Cult along with Rome and the Vatican although others have emerged in Israel and China. It is no accident that the 'virus' is alleged to have come out of China while Italy was chosen as the means to terrify the Western population into compliance with 'Covid' fascism. Nor that Israel has led the world in 'Covid' fascism and mass 'vaccination'.

You would think that I would mention the United States here, but while it has been an important means of imposing the Cult's will it is less significant than would appear and is currently in the process of having what power it does have deleted. The Cult in Europe has mostly loaded the guns for the US to fire. America has been controlled from Europe from the start through Cult operatives in Britain and Europe. The American Revolution was an illusion to make it appear that America was governing itself while very different forces were pulling the strings in the form of Cult families such as the Rothschilds through the Rockefellers and other subordinates. The Rockefellers are extremely close to Bill Gates and

established both scalpel and drug 'medicine' and the World Health Organization. They play a major role in the development and circulation of vaccines through the Rockefeller Foundation on which Bill Gates said his Foundation is based. Why wouldn't this be the case when the Rockefellers and Gates are on the same team? Cult infiltration of human society goes way back into what we call history and has been constantly expanding and centralising power with the goal of establishing a global structure to dictate everything. Look how this has been advanced in great leaps with the 'Covid' hoax.

The non-human dimension

I researched and observed the comings and goings of Cult operatives through the centuries and even thousands of years as they were born, worked to promote the agenda within the secret society and satanic networks, and then died for others to replace them. Clearly there had to be a coordinating force that spanned this entire period while operatives who would not have seen the end goal in their lifetimes came and went advancing the plan over millennia. I went in search of that coordinating force with the usual support from the extraordinary synchronicity of my life which has been an almost daily experience since 1990. I saw common themes in religious texts and ancient cultures about a non-human force manipulating human society from the hidden. Christianity calls this force Satan, the Devil and demons; Islam refers to the Jinn or Djinn; Zulus have their Chitauri (spelt in other ways in different parts of Africa); and the Gnostic people in Egypt in the period around and before 400AD referred to this phenomena as the 'Archons', a word meaning rulers in Greek. Central American cultures speak of the 'Predators' among other names and the same theme is everywhere. I will use 'Archons' as a collective name for all of them. When you see how their nature and behaviour is described all these different sources are clearly talking about the same force. Gnostics described the Archons in terms of 'luminous fire' while Islam relates the Jinn to 'smokeless fire'. Some refer to beings in form that could occasionally be seen, but the most common of common theme is that they operate from

unseen realms which means almost all existence to the visual processes of humans. I had concluded that this was indeed the foundation of human control and that the Cult was operating within the human frequency band on behalf of this hidden force when I came across the writings of Gnostics which supported my conclusions in the most extraordinary way.

A sealed earthen jar was found in 1945 near the town of Nag Hammadi about 75-80 miles north of Luxor on the banks of the River Nile in Egypt. Inside was a treasure trove of manuscripts and texts left by the Gnostic people some 1,600 years earlier. They included 13 leather-bound papyrus codices (manuscripts) and more than 50 texts written in Coptic Egyptian estimated to have been hidden in the jar in the period of 400AD although the source of the information goes back much further. Gnostics oversaw the Great or Royal Library of Alexandria, the fantastic depository of ancient texts detailing advanced knowledge and accounts of human history. The Library was dismantled and destroyed in stages over a long period with the death-blow delivered by the Cult-established Roman Church in the period around 415AD. The Church of Rome was the Church of Babylon relocated as I said earlier. Gnostics were not a race. They were a way of perceiving reality. Whenever they established themselves and their information circulated the terrorists of the Church of Rome would target them for destruction. This happened with the Great Library and with the Gnostic Cathars who were burned to death by the psychopaths after a long period of oppression at the siege of the Castle of Monségur in southern France in 1244. The Church has always been terrified of Gnostic information which demolishes the official Christian narrative although there is much in the Bible that supports the Gnostic view if you read it in another way. To anyone studying the texts of what became known as the Nag Hammadi Library it is clear that great swathes of Christian and Biblical belief has its origin with Gnostics sources going back to Sumer. Gnostic themes have been twisted to manipulate the perceived reality of Bible believers. Biblical texts have been in the open for centuries where they could be changed while Gnostic

documents found at Nag Hammadi were sealed away and untouched for 1,600 years. What you see is what they wrote.

Use your *pneuma* not your *nous*

Gnosticism and Gnostic come from 'gnosis' which means knowledge, or rather *secret* knowledge, in the sense of spiritual awareness – knowledge about reality and life itself. The desperation of the Cult's Church of Rome to destroy the Gnostics can be understood when the knowledge they were circulating was the last thing the Cult wanted the population to know. Sixteen hundred years later the same Cult is working hard to undermine and silence me for the same reason. The dynamic between knowledge and ignorance is a constant. 'Time' appears to move on, but essential themes remain the same. We are told to 'use your nous', a Gnostic word for head/brain/intelligence. They said, however, that spiritual awakening or 'salvation' could only be secured by expanding awareness *beyond* what they called *nous* and into *pneuma* or Infinite Self. Obviously as I read these texts the parallels with what I have been saying since 1990 were fascinating to me. There is a universal truth that spans human history and in that case why wouldn't we be talking the same language 16 centuries apart? When you free yourself from the perception program of the five senses and explore expanded realms of consciousness you are going to connect with the same information no matter what the perceived 'era' within a manufactured timeline of a single and tiny range of manipulated frequency. Humans working with 'smart' technology or knocking rocks together in caves is only a timeline appearing to operate within the human frequency band. Expanded awareness and the knowledge it holds have always been there whether the era be Stone Age or computer age. We can only access that knowledge by opening ourselves to its frequency which the five-sense prison cell is designed to stop us doing. Gates, Fauci, Whitty, Vallance, Zuckerberg, Brin, Page, Wojcicki, Bezos, and all the others behind the 'Covid' hoax clearly have a long wait before their range of frequency can make that connection given that an open heart is

crucial to that as we shall see. Instead of accessing knowledge directly through expanded awareness it is given to Cult operatives by the secret society networks of the Cult where it has been passed on over thousands of years outside the public arena. Expanded realms of consciousness is where great artists, composers and writers find their inspiration and where truth awaits anyone open enough to connect with it. We need to go there fast.

Archon hijack

A fifth of the Nag Hammadi texts describe the existence and manipulation of the Archons led by a 'Chief Archon' they call 'Yaldabaoth', or the 'Demiurge', and this is the Christian 'Devil', 'Satan', 'Lucifer', and his demons. Archons in Biblical symbolism are the 'fallen ones' which are also referred to as fallen angels after the angels expelled from heaven according to the Abrahamic religions of Judaism, Christianity and Islam. These angels are claimed to tempt humans to 'sin' ongoing and you will see how accurate that symbolism is during the rest of the book. The theme of 'original sin' is related to the 'Fall' when Adam and Eve were 'tempted by the serpent' and fell from a state of innocence and 'obedience' (connection) with God into a state of disobedience (disconnection). The Fall is said to have brought sin into the world and corrupted everything including human nature. Yaldabaoth, the 'Lord Archon', is described by Gnostics as a 'counterfeit spirit', 'The Blind One', 'The Blind God', and 'The Foolish One'. The Jewish name for Yaldabaoth in Talmudic writings is Samael which translates as 'Poison of God', or 'Blindness of God'. You see the parallels. Yaldabaoth in Islamic belief is the Muslim Jinn devil known as Shaytan – Shaytan is Satan as the same themes are found all over the world in every religion and culture. The 'Lord God' of the Old Testament is the 'Lord Archon' of Gnostic manuscripts and that's why he's such a bloodthirsty bastard. Satan is known by Christians as 'the Demon of Demons' and Gnostics called Yaldabaoth the 'Archon of Archons'. Both are known as 'The Deceiver'. We are talking about the same 'bloke' for sure and these common themes

using different names, storylines and symbolism tell a common tale of the human plight.

Archons are referred to in Nag Hammadi documents as mind parasites, inverters, guards, gatekeepers, detainers, judges, pitiless ones and deceivers. The 'Covid' hoax alone is a glaring example of all these things. The Biblical 'God' is so different in the Old and New Testaments because they are not describing the same phenomenon. The vindictive, angry, hate-filled, 'God' of the Old Testament, known as Yahweh, is Yaldabaoth who is depicted in Cult-dictated popular culture as the 'Dark Lord', 'Lord of Time', Lord (Darth) Vader and Dormammu, the evil ruler of the 'Dark Dimension' trying to take over the 'Earth Dimension' in the Marvel comic movie, *Dr Strange*. Yaldabaoth is both the Old Testament 'god' and the Biblical 'Satan'. Gnostics referred to Yaldabaoth as the 'Great Architect of the Universe' and the Cult-controlled Freemason network calls their god 'the 'Great Architect of the Universe' (also Grand Architect). The 'Great Architect' Yaldabaoth is symbolised by the Cult as the all-seeing eye at the top of the pyramid on the Great Seal of the United States and the dollar bill. Archon is encoded in *arch*-itect as it is in *arch*-angels and *arch*-bishops. All religions have the theme of a force for good and force for evil in some sort of spiritual war and there is a reason for that – the theme is true. The Cult and its non-human masters are quite happy for this to circulate. They present themselves as the force for good fighting evil when they are really the force of evil (absence of love). The whole foundation of Cult modus operandi is inversion. They promote themselves as a force for good and anyone challenging them in pursuit of peace, love, fairness, truth and justice is condemned as a satanic force for evil. This has been the game plan throughout history whether the Church of Rome inquisitions of non-believers or 'conspiracy theorists' and 'anti-vaxxers' of today. The technique is the same whatever the timeline era.

Yaldabaoth is revolting (true)

Yaldabaoth and the Archons are said to have revolted against God with Yaldabaoth claiming to *be* God – the *All That Is*. The Old Testament ‘God’ (Yaldabaoth) demanded to be worshipped as such: ‘*I am the LORD, and there is none else, there is no God beside me*’ (Isaiah 45:5). I have quoted in other books a man who said he was the unofficial son of the late Baron Philippe de Rothschild of the Mouton-Rothschild wine producing estates in France who died in 1988 and he told me about the Rothschild ‘revolt from God’. The man said he was given the name Phillip Eugene de Rothschild and we shared long correspondence many years ago while he was living under another identity. He said that he was conceived through ‘occult incest’ which (within the Cult) was ‘normal and to be admired’. ‘Phillip’ told me about his experience attending satanic rituals with rich and famous people whom he names and you can see them and the wider background to Cult Satanism in my other books starting with *The Biggest Secret*. Cult rituals are interactions with Archontic ‘gods’. ‘Phillip’ described Baron Philippe de Rothschild as ‘a master Satanist and hater of God’ and he used the same term ‘revolt from God’ associated with Yaldabaoth/Satan/Lucifer/the Devil in describing the Sabbatian Rothschild dynasty. ‘I played a key role in my family’s revolt from God’, he said. That role was to infiltrate in classic Sabbatian style the Christian Church, but eventually he escaped the mind-prison to live another life. The Cult has been targeting religion in a plan to make worship of the Archons the global one-world religion. Infiltration of Satanism into modern ‘culture’, especially among the young, through music videos, stage shows and other means, is all part of this.

Nag Hammadi texts describe Yaldabaoth and the Archons in their prime form as energy – consciousness – and say they can take form if they choose in the same way that consciousness takes form as a human. Yaldabaoth is called ‘formless’ and represents a deeply inverted, distorted and chaotic state of consciousness which seeks to attached to humans and turn them into a likeness of itself in an attempt at assimilation. For that to happen it has to manipulate

humans into low frequency mental and emotional states that match its own. Archons can certainly appear in human form and this is the origin of the psychopathic personality. The energetic distortion Gnostics called Yaldabaoth is psychopathy. When psychopathic Archons take human form that human will be a psychopath as an expression of Yaldabaoth consciousness. Cult psychopaths are Archons in human form. The principle is the same as that portrayed in the 2009 *Avatar* movie when the American military travelled to a fictional Earth-like moon called Pandora in the Alpha Centauri star system to infiltrate a society of blue people, or Na'vi, by hiding within bodies that looked like the Na'vi. Archons posing as humans have a particular hybrid information field, part human, part Archon, (the ancient 'demigods') which processes information in a way that manifests behaviour to match their psychopathic evil, lack of empathy and compassion, and stops them being influenced by the empathy, compassion and love that a fully-human information field is capable of expressing. Cult bloodlines interbreed, be they royalty or dark suits, for this reason and you have their obsession with incest. Interbreeding with full-blown humans would dilute the Archontic energy field that guarantees psychopathy in its representatives in the human realm.

Gnostic writings say the main non-human forms that Archons take are *serpentine* (what I have called for decades 'reptilian' amid unbounded ridicule from the Archontically-programmed) and what Gnostics describe as 'an unborn baby or foetus with grey skin and dark, unmoving eyes'. This is an excellent representation of the ET 'Greys' of UFO folklore which large numbers of people claim to have seen and been abducted by – Zulu shaman Credo Mutwa among them. I agree with those that believe in extraterrestrial or interdimensional visitations today and for thousands of years past. No wonder with their advanced knowledge and technological capability they were perceived and worshipped as gods for technological and other 'miracles' they appeared to perform. Imagine someone arriving in a culture disconnected from the modern world with a smartphone and computer. They would be

seen as a 'god' capable of 'miracles'. The Renegade Mind, however, wants to know the source of everything and not only the way that source manifests as human or non-human. In the same way that a Renegade Mind seeks the original source material for the 'Covid virus' to see if what is claimed is true. The original source of Archons in form is consciousness – the distorted state of consciousness known to Gnostics as Yaldabaoth.

'Revolt from God' is energetic disconnection

Where I am going next will make a lot of sense of religious texts and ancient legends relating to 'Satan', Lucifer' and the 'gods'. Gnostic descriptions sync perfectly with the themes of my own research over the years in how they describe a consciousness distortion seeking to impose itself on human consciousness. I've referred to the core of infinite awareness in previous books as Infinite Awareness in Awareness of Itself. By that I mean a level of awareness that knows that it is all awareness and is aware of all awareness. From here comes the frequency of love in its true sense and balance which is what love is on one level – the balance of all forces into a single whole called Oneness and Isness. The more we disconnect from this state of love that many call 'God' the constituent parts of that Oneness start to unravel and express themselves as a part and not a whole. They become individualised as intellect, mind, selfishness, hatred, envy, desire for power over others, and such like. This is not a problem in the greater scheme in that 'God', the *All That Is*, can experience all these possibilities through different expressions of itself including humans. What we as expressions of the whole experience the *All That Is* experiences. We are the *All That Is* experiencing itself. As we withdraw from that state of Oneness we disconnect from its influence and things can get very unpleasant and very stupid. Archontic consciousness is at the extreme end of that. It has so disconnected from the influence of Oneness that it has become an inversion of unity and love, an inversion of everything, an inversion of life itself. Evil is appropriately live written backwards. Archontic consciousness is obsessed with death, an inversion of life,

and so its manifestations in Satanism are obsessed with death. They use inverted symbols in their rituals such as the inverted pentagram and cross. Sabbatians as Archontic consciousness incarnate invert Judaism and every other religion and culture they infiltrate. They seek disunity and chaos and they fear unity and harmony as they fear love like garlic to a vampire. As a result the Cult, Archons incarnate, act with such evil, psychopathy and lack of empathy and compassion disconnected as they are from the source of love. How could Bill Gates and the rest of the Archontic psychopaths do what they have to human society in the 'Covid' era with all the death, suffering and destruction involved and have no emotional consequence for the impact on others? Now you know. Why have Zuckerberg, Brin, Page, Wojcicki and company callously censored information warning about the dangers of the 'vaccine' while thousands have been dying and having severe, sometimes life-changing reactions? Now you know. Why have Tedros, Fauci, Whitty, Vallance and their like around the world been using case and death figures they're aware are fraudulent to justify lockdowns and all the deaths and destroyed lives that have come from that? Now you know. Why did Christian Drosten produce and promote a 'testing' protocol that he knew couldn't test for infectious disease which led to a global human catastrophe. Now you know. The Archontic mind doesn't give a shit ([Fig 17](#)). I personally think that Gates and major Cult insiders are a form of AI cyborg that the Archons want humans to become.

these.' The statement was true in all respects. We do live in a technologically-generated virtual reality simulation (more very shortly) and we have been manipulated to be an energy source for Archontic consciousness. The Disney-Pixar animated movie *Monsters, Inc.* in 2001 symbolised the dynamic when monsters in their world had no energy source and they would enter the human world to terrify children in their beds, catch the child's scream, terror (low-vibrational frequencies), and take that energy back to power the monster world. The lead character you might remember was a single giant eye and the symbolism of the Cult's all-seeing eye was obvious. Every thought and emotion is broadcast as a frequency unique to that thought and emotion. Feelings of love and joy, empathy and compassion, are high, quick, frequencies while fear, depression, anxiety, suffering and hate are low, slow, dense frequencies. Which kind do you think Archontic consciousness can connect with and absorb? In such a low and dense frequency state there's no way it can connect with the energy of love and joy. Archons can only feed off energy compatible with their own frequency and they and their Cult agents want to delete the human world of love and joy and manipulate the transmission of low vibrational frequencies through low-vibrational human mental and emotional states. *We are their energy source.* Wars are energetic banquets to the Archons – a world war even more so – and think how much low-frequency mental and emotional energy has been generated from the consequences for humanity of the 'Covid' hoax orchestrated by Archons incarnate like Gates.

The ancient practice of human sacrifice 'to the gods', continued in secret today by the Cult, is based on the same principle. 'The gods' are Archontic consciousness in different forms and the sacrifice is induced into a state of intense terror to generate the energy the Archontic frequency can absorb. Incarnate Archons in the ritual drink the blood which contains an adrenaline they crave which floods into the bloodstream when people are terrorised. Most of the sacrifices, ancient and modern, are children and the theme of 'sacrificing young virgins to the gods' is just code for children. They

have a particular pre-puberty energy that Archons want more than anything and the energy of the young in general is their target. The California Department of Education wants students to chant the names of Aztec gods (Archontic gods) once worshipped in human sacrifice rituals in a curriculum designed to encourage them to 'challenge racist, bigoted, discriminatory, imperialist/colonial beliefs', join 'social movements that struggle for social justice', and 'build new possibilities for a post-racist, post-systemic racism society'. It's the usual Woke crap that inverts racism and calls it anti-racism. In this case solidarity with 'indigenous tribes' is being used as an excuse to chant the names of 'gods' to which people were sacrificed (and still are in secret). What an example of Woke's inability to see beyond black and white, us and them, They condemn the colonisation of these tribal cultures by Europeans (quite right), but those cultures sacrificing people including children to their 'gods', and mass murdering untold numbers as the Aztecs did, is just fine. One chant is to the Aztec god Tezcatlipoca who had a man sacrificed to him in the 5th month of the Aztec calendar. His heart was cut out and he was eaten. Oh, that's okay then. Come on children ... after three ... Other sacrificial 'gods' for the young to chant their allegiance include Quetzalcoatl, Huitzilopochtli and Xipe Totec. The curriculum says that 'chants, affirmations, and energizers can be used to bring the class together, build unity around ethnic studies principles and values, and to reinvigorate the class following a lesson that may be emotionally taxing or even when student engagement may appear to be low'. Well, that's the cover story, anyway. Chanting and mantras are the repetition of a particular frequency generated from the vocal cords and chanting the names of these Archontic 'gods' tunes you into their frequency. That is the last thing you want when it allows for energetic synchronisation, attachment and perceptual influence. Initiates chant the names of their 'Gods' in their rituals for this very reason.

Vampires of the Woke

Paedophilia is another way that Archons absorb the energy of children. Paedophiles possessed by Archontic consciousness are used as the conduit during sexual abuse for discarnate Archons to vampire the energy of the young they desire so much. Stupendous numbers of children disappear every year never to be seen again although you would never know from the media. Imagine how much low-vibrational energy has been generated by children during the 'Covid' hoax when so many have become depressed and psychologically destroyed to the point of killing themselves. Shocking numbers of children are now taken by the state from loving parents to be handed to others. I can tell you from long experience of researching this since 1996 that many end up with paedophiles and assets of the Cult through corrupt and Cult-owned social services which in the reframing era has hired many psychopaths and emotionless automatons to do the job. Children are even stolen to order using spurious reasons to take them by the corrupt and secret (because they're corrupt) 'family courts'. I have written in detail in other books, starting with *The Biggest Secret* in 1997, about the ubiquitous connections between the political, corporate, government, intelligence and military elites (Cult operatives) and Satanism and paedophilia. If you go deep enough both networks have an interlocking leadership. The Woke mentality has been developed by the Cult for many reasons: To promote almost every aspect of its agenda; to hijack the traditional political left and turn it fascist; to divide and rule; and to target agenda pushbackers. But there are other reasons which relate to what I am describing here. How many happy and joyful Wokers do you ever see especially at the extreme end? They are a mental and psychological mess consumed by emotional stress and constantly emotionally cocked for the next explosion of indignation at someone referring to a female as a female. They are walking, talking, batteries as Morpheus might say emitting frequencies which both enslave them in low-vibrational bubbles of perceptual limitation and feed the Archons. Add to this the hatred claimed to be love; fascism claimed to 'anti-fascism', racism claimed to be 'anti-racism';

exclusion claimed to inclusion; and the abuse-filled Internet trolling. You have a purpose-built Archontic energy system with not a wind turbine in sight and all founded on Archontic *inversion*. We have whole generations now manipulated to serve the Archons with their actions and energy. They will be doing so their entire adult lives unless they snap out of their Archon-induced trance. Is it really a surprise that Cult billionaires and corporations put so much money their way? Where is the energy of joy and laughter, including laughing at yourself which is confirmation of your own emotional security? Mark Twain said: 'The human race has one really effective weapon, and that is laughter.' We must use it all the time. Woke has destroyed comedy because it has no humour, no joy, sense of irony, or self-deprecation. Its energy is dense and intense. *Mmmmm*, lunch says the Archontic frequency. Rudolf Steiner (1861-1925) was the Austrian philosopher and famous esoteric thinker who established Waldorf education or Steiner schools to treat children like unique expressions of consciousness and not minds to be programmed with the perceptions determined by authority. I'd been writing about this energy vampiring for decades when I was sent in 2016 a quote by Steiner. He was spot on:

There are beings in the spiritual realms for whom anxiety and fear emanating from human beings offer welcome food. When humans have no anxiety and fear, then these creatures starve. If fear and anxiety radiates from people and they break out in panic, then these creatures find welcome nutrition and they become more and more powerful. These beings are hostile towards humanity. Everything that feeds on negative feelings, on anxiety, fear and superstition, despair or doubt, are in reality hostile forces in super-sensible worlds, launching cruel attacks on human beings, while they are being fed ... These are exactly the feelings that belong to contemporary culture and materialism; because it estranges people from the spiritual world, it is especially suited to evoke hopelessness and fear of the unknown in people, thereby calling up the above mentioned hostile forces against them.

Pause for a moment from this perspective and reflect on what has happened in the world since the start of 2020. Not only will pennies drop, but billion dollar bills. We see the same theme from Don Juan Matus, a Yaqui Indian shaman in Mexico and the information source for Peruvian-born writer, Carlos Castaneda, who wrote a series of

books from the 1960s to 1990s. Don Juan described the force manipulating human society and his name for the Archons was the predator:

We have a predator that came from the depths of the cosmos and took over the rule of our lives. Human beings are its prisoners. The predator is our lord and master. It has rendered us docile, helpless. If we want to protest, it suppresses our protest. If we want to act independently, it demands that we don't do so ... indeed we are held prisoner!

They took us over because we are food to them, and they squeeze us mercilessly because we are their sustenance. Just as we rear chickens in coops, the predators rear us in human coops, humaneros. Therefore, their food is always available to them.

Different cultures, different eras, same recurring theme.

The 'ennoia' dilemma

Nag Hammadi Gnostic manuscripts say that Archon consciousness has no 'ennoia'. This is directly translated as 'intentionality', but I'll use the term 'creative imagination'. The *All That Is* in awareness of itself is the source of all creativity – all possibility – and the more disconnected you are from that source the more you are subsequently denied 'creative imagination'. Given that Archon consciousness is almost entirely disconnected it severely lacks creativity and has to rely on far more mechanical processes of thought and exploit the creative potential of those that do have 'ennoia'. You can see cases of this throughout human society. Archon consciousness almost entirely dominates the global banking system and if we study how that system works you will appreciate what I mean. Banks manifest 'money' out of nothing by issuing lines of 'credit' which is 'money' that has never, does not, and will never exist except in theory. It's a confidence trick. If you think 'credit' figures-on-a-screen 'money' is worth anything you accept it as payment. If you don't then the whole system collapses through lack of confidence in the value of that 'money'. Archontic bankers with no 'ennoia' are 'lending' 'money' that doesn't exist to humans that *do* have creativity – those that have the inspired ideas and create businesses and products. Archon banking feeds off human creativity

which it controls through 'money' creation and debt. Humans have the creativity and Archons exploit that for their own benefit and control while having none themselves. Archon Internet platforms like Facebook claim joint copyright of everything that creative users post and while Archontic minds like Zuckerberg may officially head that company it will be human creatives on the staff that provide the creative inspiration. When you have limitless 'money' you can then buy other companies established by creative humans. Witness the acquisition record of Facebook, Google and their like. Survey the Archon-controlled music industry and you see non-creative dark suit executives making their fortune from the human creativity of their artists. The cases are endless. Research the history of people like Gates and Zuckerberg and how their empires were built on exploiting the creativity of others. Archon minds cannot create out of nothing, but they are skilled (because they have to be) in what Gnostic texts call 'countermimicry'. They can imitate, but not innovate. Sabbatians trawl the creativity of others through backdoors they install in computer systems through their cybersecurity systems. Archon-controlled China is globally infamous for stealing intellectual property and I remember how Hong Kong, now part of China, became notorious for making counterfeit copies of the creativity of others – 'countermimicry'. With the now pervasive and all-seeing surveillance systems able to infiltrate any computer you can appreciate the potential for Archons to vampire the creativity of humans. Author John Lamb Lash wrote in his book about the Nag Hammadi texts, *Not In His Image*:

Although they cannot originate anything, because they lack the divine factor of ennoia (intentionality), Archons can imitate with a vengeance. Their expertise is simulation (HAL, virtual reality). The Demiurge [Yaldabaoth] fashions a heaven world copied from the fractal patterns [of the original] ... His construction is celestial kitsch, like the fake Italianate villa of a Mafia don complete with militant angels to guard every portal.

This brings us to something that I have been speaking about since the turn of the millennium. Our reality is a simulation; a virtual reality that we think is real. No, I'm not kidding.

Human reality? Well, virtually

I had pondered for years about whether our reality is 'real' or some kind of construct. I remembered being immensely affected on a visit as a small child in the late 1950s to the then newly-opened Planetarium on the Marylebone Road in London which is now closed and part of the adjacent Madame Tussauds wax museum. It was in the middle of the day, but when the lights went out there was the night sky projected in the Planetarium's domed ceiling and it appeared to be so real. The experience never left me and I didn't know why until around the turn of the millennium when I became certain that our 'night sky' and entire reality is a projection, a virtual reality, akin to the illusory world portrayed in the *Matrix* movies. I looked at the sky one day in this period and it appeared to me like the domed roof of the Planetarium. The release of the first *Matrix* movie in 1999 also provided a synchronistic and perfect visual representation of where my mind had been going for a long time. I hadn't come across the Gnostic Nag Hammadi texts then. When I did years later the correlation was once again astounding. As I read Gnostic accounts from 1,600 years and more earlier it was clear that they were describing the same simulation phenomenon. They tell how the Yaldabaoth 'Demiurge' and Archons created a 'bad copy' of original reality to rule over all that were captured by its illusions and the body was a prison to trap consciousness in the 'bad copy' fake reality. Read how Gnostics describe the 'bad copy' and update that to current times and they are referring to what we would call today a virtual reality simulation.

Author John Lamb Lash said 'the Demiurge fashions a heaven world copied from the fractal patterns' of the original through expertise in 'HAL' or virtual reality simulation. Fractal patterns are part of the energetic information construct of our reality, a sort of blueprint. If these patterns were copied in computer terms it would indeed give you a copy of a 'natural' reality in a non-natural frequency and digital form. The principle is the same as making a copy of a website. The original website still exists, but now you can change the copy version to make it whatever you like and it can

become very different to the original website. Archons have done this with our reality, a *synthetic* copy of prime reality that still exists beyond the frequency walls of the simulation. Trapped within the illusions of this synthetic Matrix, however, were and are human consciousness and other expressions of prime reality and this is why the Archons via the Cult are seeking to make the human body synthetic and give us synthetic AI minds to complete the job of turning the entire reality synthetic including what we perceive to be the natural world. To quote Kurzweil: 'Nanobots will infuse all the matter around us with information. Rocks, trees, everything will become these intelligent creatures.' Yes, *synthetic* 'creatures' just as 'Covid' and other genetically-manipulating 'vaccines' are designed to make the human body synthetic. From this perspective it is obvious why Archons and their Cult are so desperate to infuse synthetic material into every human with their 'Covid' scam.

Let there be (electromagnetic) light

Yaldabaoth, the force that created the simulation, or Matrix, makes sense of the Gnostic reference to 'The Great Architect' and its use by Cult Freemasonry as the name of its deity. The designer of the Matrix in the movies is called 'The Architect' and that trilogy is jam-packed with symbolism relating to these subjects. I have contended for years that the angry Old Testament God (Yaldabaoth) is the 'God' being symbolically 'quoted' in the opening of Genesis as 'creating the world'. This is not the creation of prime reality – it's the creation of the *simulation*. The Genesis 'God' says: 'Let there be Light: and there was light.' But what is this 'Light'? I have said for decades that the speed of light (186,000 miles per second) is not the fastest speed possible as claimed by mainstream science and is in fact the frequency walls or outer limits of the Matrix. You can't have a fastest or slowest anything within all possibility when everything is possible. The human body is encoded to operate within the speed of light or *within the simulation* and thus we see only the tiny frequency band of visible *light*. Near-death experiencers who perceive reality outside the body during temporary 'death' describe a very different

form of light and this is supported by the Nag Hammadi texts. Prime reality beyond the simulation ('Upper Aeons' to the Gnostics) is described as a realm of incredible beauty, bliss, love and harmony – a realm of 'watery light' that is so powerful 'there are no shadows'. Our false reality of Archon control, which Gnostics call the 'Lower Aeons', is depicted as a realm with a different kind of 'light' and described in terms of chaos, 'Hell', 'the Abyss' and 'Outer Darkness', where trapped souls are tormented and manipulated by demons (relate that to the 'Covid' hoax alone). The watery light theme can be found in near-death accounts and it is not the same as *simulation* 'light' which is electromagnetic or radiation light within the speed of light – the 'Lower Aeons'. Simulation 'light' is the 'luminous fire' associated by Gnostics with the Archons. The Bible refers to Yaldabaoth as 'that old serpent, called the Devil, and Satan, which deceiveth the whole world' (Revelation 12:9). I think that making a simulated copy of prime reality ('countermimicry') and changing it dramatically while all the time manipulating humanity to believe it to be real could probably meet the criteria of deceiving the whole world. Then we come to the Cult god Lucifer – the *Light Bringer*. Lucifer is symbolic of Yaldabaoth, the bringer of radiation light that forms the bad copy simulation within the speed of light. 'He' is symbolised by the lighted torch held by the Statue of Liberty and in the name 'Illuminati'. Sabbatian-Frankism declares that Lucifer is the true god and Lucifer is the real god of Freemasonry honoured as their 'Great or Grand Architect of the Universe' (simulation).

I would emphasise, too, the way Archontic technologically-generated luminous fire of radiation has deluged our environment since I was a kid in the 1950s and changed the nature of The Field with which we constantly interact. Through that interaction technological radiation is changing us. The Smart Grid is designed to operate with immense levels of communication power with 5G expanding across the world and 6G, 7G, in the process of development. Radiation is the simulation and the Archontic manipulation system. Why wouldn't the Archon Cult wish to unleash radiation upon us to an ever-greater extreme to form

Kurzweil's 'cloud'? The plan for a synthetic human is related to the need to cope with levels of radiation beyond even anything we've seen so far. Biological humans would not survive the scale of radiation they have in their script. The Smart Grid is a technological sub-reality within the technological simulation to further disconnect five-sense perception from expanded consciousness. It's a technological prison of the mind.

Infusing the 'spirit of darkness'

A recurring theme in religion and native cultures is the manipulation of human genetics by a non-human force and most famously recorded as the biblical 'sons of god' (the gods plural in the original) who interbred with the daughters of men. The Nag Hammadi *Apocryphon of John* tells the same story this way:

He [Yaldabaoth] sent his angels [Archons/demons] to the daughters of men, that they might take some of them for themselves and raise offspring for their enjoyment. And at first they did not succeed. When they had no success, they gathered together again and they made a plan together ... And the angels changed themselves in their likeness into the likeness of their mates, filling them with the spirit of darkness, which they had mixed for them, and with evil ... And they took women and begot children out of the darkness according to the likeness of their spirit.

Possession when a discarnate entity takes over a human body is an age-old theme and continues today. It's very real and I've seen it. Satanic and secret society rituals can create an energetic environment in which entities can attach to initiates and I've heard many stories of how people have changed their personality after being initiated even into lower levels of the Freemasons. I have been inside three Freemasonic temples, one at a public open day and two by just walking in when there was no one around to stop me. They were in Ryde, the town where I live, Birmingham, England, when I was with a group, and Boston, Massachusetts. They all felt the same energetically – dark, dense, low-vibrational and sinister. Demonic attachment can happen while the initiate has no idea what is going on. To them it's just a ritual to get in the Masons and do a bit of good

business. In the far more extreme rituals of Satanism human possession is even more powerful and they are designed to make possession possible. The hierarchy of the Cult is dictated by the power and perceived status of the possessing Archon. In this way the Archon hierarchy becomes the Cult hierarchy. Once the entity has attached it can influence perception and behaviour and if it attaches to the extreme then so much of its energy (information) infuses into the body information field that the hologram starts to reflect the nature of the possessing entity. This is the *Exorcist* movie type of possession when facial features change and it's known as shapeshifting. Islam's Jinn are said to be invisible tricksters who change shape, 'whisper', confuse and take human form. These are all traits of the Archons and other versions of the same phenomenon. Extreme possession could certainly infuse the 'spirit of darkness' into a partner during sex as the Nag Hammadi texts appear to describe. Such an infusion can change genetics which is also energetic information. Human genetics is information and the 'spirit of darkness' is information. Mix one with the other and change must happen. Islam has the concept of a 'Jinn baby' through possession of the mother and by Jinn taking human form. There are many ways that human genetics can be changed and remember that Archons have been aware all along of advanced techniques to do this. What is being done in human society today – and far more – was known about by Archons at the time of the 'fallen ones' and their other versions described in religions and cultures.

Archons and their human-world Cult are obsessed with genetics as we see today and they know this dictates how information is processed into perceived reality during a human life. They needed to produce a human form that would decode the simulation and this is symbolically known as 'Adam and Eve' who left the 'garden' (prime reality) and 'fell' into Matrix reality. The simulation is not a 'physical' construct (there is no 'physical'); it is a source of information. Think Wi-Fi again. The simulation is an energetic field encoded with information and body-brain systems are designed to decode that information encoded in wave or frequency form which

is transmitted to the brain as electrical signals. These are decoded by the brain to construct our sense of reality – an illusory ‘physical’ world that only exists in the brain or the mind. Virtual reality games mimic this process using the same sensory decoding system. Information is fed to the senses to decode a virtual reality that can appear so real, but isn’t (Figs 18 and 19). Some scientists believe – and I agree with them – that what we perceive as ‘physical’ reality only exists when we are looking or observing. The act of perception or focus triggers the decoding systems which turn waveform information into holographic reality. When we are not observing something our reality reverts from a holographic state to a waveform state. This relates to the same principle as a falling tree not making a noise unless someone is there to hear it or decode it. The concept makes sense from the simulation perspective. A computer is not decoding all the information in a Wi-Fi field all the time and only decodes or brings into reality on the screen that part of Wi-Fi that it’s decoding – focusing upon – at that moment.

Figure 18: Virtual reality technology ‘hacks’ into the body’s five-sense decoding system.

Figure 19: The result can be experienced as very ‘real’.

Interestingly, Professor Donald Hoffman at the Department of Cognitive Sciences at the University of California, Irvine, says that our experienced reality is like a computer interface that shows us only the level with which we interact while hiding all that exists beyond it: 'Evolution shaped us with a user interface that hides the truth. Nothing that we see is the truth – the very language of space and time and objects is the wrong language to describe reality.' He is correct in what he says on so many levels. Space and time are not a universal reality. They are a phenomenon of decoded *simulation* reality as part of the process of enslaving our sense of reality. Near-death experiencers report again and again how space and time did not exist as we perceive them once they were free of the body – body decoding systems. You can appreciate from this why Archons and their Cult are so desperate to entrap human attention in the five senses where we are in the Matrix and of the Matrix. Opening your mind to expanded states of awareness takes you beyond the information confines of the simulation and you become aware of knowledge and insights denied to you before. This is what we call 'awakening' – *awakening from the Matrix* – and in the final chapter I will relate this to current events.

Where are the 'aliens'?

A simulation would explain the so-called 'Fermi Paradox' named after Italian physicist Enrico Fermi (1901-1954) who created the first nuclear reactor. He considered the question of why there is such a lack of extraterrestrial activity when there are so many stars and planets in an apparently vast universe; but what if the night sky that we see, or think we do, is a simulated projection as I say? If you control the simulation and your aim is to hold humanity fast in essential ignorance would you want other forms of life including advanced life coming and going sharing information with humanity? Or would you want them to believe they were isolated and apparently alone? Themes of human isolation and apartness are common whether they be the perception of a lifeless universe or the fascist isolation laws of the 'Covid' era. Paradoxically the very

existence of a simulation means that we are not alone when some force had to construct it. My view is that experiences that people have reported all over the world for centuries with Reptilians and Grey entities are Archon phenomena as Nag Hammadi texts describe; and that benevolent 'alien' interactions are non-human groups that come in and out of the simulation by overcoming Archon attempts to keep them out. It should be highlighted, too, that Reptilians and Greys are obsessed with *genetics* and *technology* as related by cultural accounts and those who say they have been abducted by them. Technology is their way of overcoming some of the limitations in their creative potential and our technology-driven and controlled human society of today is *archetypical* Archon-Reptilian-Grey *modus operandi*. Technocracy is really *Archontocracy*. The Universe does not have to be as big as it appears with a simulation. There is no space or distance only information decoded into holographic reality. What we call 'space' is only the absence of holographic 'objects' and that 'space' is The Field of energetic information which connects everything into a single whole. The same applies with the artificially-generated information field of the simulation. The Universe is not big or small as a physical reality. It is decoded information, that's all, and its perceived size is decided by the way the simulation is encoded to make it appear. The entire night sky as we perceive it only exists in our brain and so where are those 'millions of light years'? The 'stars' on the ceiling of the Planetarium looked a vast distance away.

There's another point to mention about 'aliens'. I have been highlighting since the 1990s the plan to stage a fake 'alien invasion' to justify the centralisation of global power and a world military. Nazi scientist Werner von Braun, who was taken to America by Operation Paperclip after World War Two to help found NASA, told his American assistant Dr Carol Rosin about the Cult agenda when he knew he was dying in 1977. Rosin said that he told her about a sequence that would lead to total human control by a one-world government. This included threats from terrorism, rogue nations, meteors and asteroids before finally an 'alien invasion'. All of these

things, von Braun said, would be bogus and what I would refer to as a No-Problem-Reaction-Solution. Keep this in mind when 'the aliens are coming' is the new mantra. The aliens are not coming – they are *already here* and they have infiltrated human society while looking human. French-Canadian investigative journalist Serge Monast said in 1994 that he had uncovered a NASA/military operation called Project Blue Beam which fits with what Werner von Braun predicted. Monast died of a 'heart attack' in 1996 the day after he was arrested and spent a night in prison. He was 51. He said Blue Beam was a plan to stage an alien invasion that would include religious figures beamed holographically into the sky as part of a global manipulation to usher in a 'new age' of worshipping what I would say is the Cult 'god' Yaldabaoth in a one-world religion. Fake holographic asteroids are also said to be part of the plan which again syncs with von Braun. How could you stage an illusory threat from asteroids unless they were holographic inserts? This is pretty straightforward given the advanced technology outside the public arena and the fact that our 'physical' reality is holographic anyway. Information fields would be projected and we would decode them into the illusion of a 'physical' asteroid. If they can sell a global 'pandemic' with a 'virus' that doesn't exist what will humans not believe if government and media tell them?

All this is particularly relevant as I write with the Pentagon planning to release in June, 2021, information about 'UFO sightings'. I have been following the UFO story since the early 1990s and the common theme throughout has been government and military denials and cover up. More recently, however, the Pentagon has suddenly become more talkative and apparently open with Air Force pilot radar images released of unexplained craft moving and changing direction at speeds well beyond anything believed possible with human technology. Then, in March, 2021, former Director of National Intelligence John Ratcliffe said a Pentagon report months later in June would reveal a great deal of information about UFO sightings unknown to the public. He said the report would have 'massive implications'. The order to do this was included bizarrely

in a \$2.3 trillion 'coronavirus' relief and government funding bill passed by the Trump administration at the end of 2020. I would add some serious notes of caution here. I have been pointing out since the 1990s that the US military and intelligence networks have long had craft – 'flying saucers' or anti-gravity craft – which any observer would take to be extraterrestrial in origin. Keeping this knowledge from the public allows craft flown by *humans* to be perceived as alien visitations. I am not saying that 'aliens' do not exist. I would be the last one to say that, but we have to be streetwise here. President Ronald Reagan told the UN General Assembly in 1987: 'I occasionally think how quickly our differences worldwide would vanish if we were facing an alien threat from outside this world.' That's the idea. Unite against a common 'enemy' with a common purpose behind your 'saviour force' (the Cult) as this age-old technique of mass manipulation goes global.

Science moves this way ...

I could find only one other person who was discussing the simulation hypothesis publicly when I concluded it was real. This was Nick Bostrom, a Swedish-born philosopher at the University of Oxford, who has explored for many years the possibility that human reality is a computer simulation although his version and mine are not the same. Today the simulation and holographic reality hypothesis have increasingly entered the scientific mainstream. Well, the more open-minded mainstream, that is. Here are a few of the ever-gathering examples. American nuclear physicist Silas Beane led a team of physicists at the University of Bonn in Germany pursuing the question of whether we live in a simulation. They concluded that we probably do and it was likely based on a lattice of cubes. They found that cosmic rays align with that specific pattern. The team highlighted the Greisen–Zatsepin–Kuzmin (GZK) limit which refers to cosmic ray particle interaction with cosmic background radiation that creates an apparent boundary for cosmic ray particles. They say in a paper entitled 'Constraints on the Universe as a Numerical Simulation' that this 'pattern of constraint' is exactly what you

would find with a computer simulation. They also made the point that a simulation would create its own 'laws of physics' that would limit possibility. I've been making the same point for decades that the *perceived* laws of physics relate only to this reality, or what I would later call the simulation. When designers write codes to create computer and virtual reality games they are the equivalent of the laws of physics for that game. Players interact within the limitations laid out by the coding. In the same way those who wrote the codes for the simulation decided the laws of physics that would apply. These can be overridden by expanded states of consciousness, but not by those enslaved in only five-sense awareness where simulation codes rule. Overriding the codes is what people call 'miracles'. They are not. They are bypassing the encoded limits of the simulation. A population caught in simulation perception would have no idea that this was their plight. As the Bonn paper said: 'Like a prisoner in a pitch-black cell we would not be able to see the "walls" of our prison,' That's true if people remain mesmerised by the five senses. Open to expanded awareness and those walls become very clear. The main one is the speed of light.

American theoretical physicist James Gates is another who has explored the simulation question and found considerable evidence to support the idea. Gates was Professor of Physics at the University of Maryland, Director of The Center for String and Particle Theory, and on Barack Obama's Council of Advisors on Science and Technology. He and his team found *computer codes* of digital data embedded in the fabric of our reality. They relate to on-off electrical charges of 1 and 0 in the binary system used by computers. 'We have no idea what they are doing there', Gates said. They found within the energetic fabric mathematical sequences known as error-correcting codes or block codes that 'reboot' data to its original state or 'default settings' when something knocks it out of sync. Gates was asked if he had found a set of equations embedded in our reality indistinguishable from those that drive search engines and browsers and he said: 'That is correct.' Rich Terrile, director of the Centre for Evolutionary Computation and Automated Design at NASA's Jet

Propulsion Laboratory, has said publicly that he believes the Universe is a digital hologram that must have been created by a form of intelligence. I agree with that in every way. Waveform information is delivered electrically by the senses to the brain which constructs a *digital* holographic reality that we call the 'world'. This digital level of reality can be read by the esoteric art of numerology. Digital holograms are at the cutting edge of holographics today. We have digital technology everywhere designed to access and manipulate our digital level of perceived reality. Synthetic mRNA in 'Covid vaccines' has a digital component to manipulate the body's digital 'operating system'.

Reality is numbers

How many know that our reality can be broken down to numbers and codes that are the same as computer games? Max Tegmark, a physicist at the Massachusetts Institute of Technology (MIT), is the author of *Our Mathematical Universe* in which he lays out how reality can be entirely described by numbers and maths in the way that a video game is encoded with the 'physics' of computer games. Our world and computer virtual reality are essentially the same.

Tegmark imagines the perceptions of characters in an advanced computer game when the graphics are so good they don't know they are in a game. They think they can bump into real objects (electromagnetic resistance in our reality), fall in love and feel emotions like excitement. When they began to study the apparently 'physical world' of the video game they would realise that everything was made of pixels (which have been found in our energetic reality as must be the case when on one level our world is digital). What computer game characters thought was physical 'stuff', Tegmark said, could actually be broken down into numbers:

And we're exactly in this situation in our world. We look around and it doesn't seem that mathematical at all, but everything we see is made out of elementary particles like quarks and electrons. And what properties does an electron have? Does it have a smell or a colour or a texture? No! ... We physicists have come up with geeky names for [Electron] properties, like

electric charge, or spin, or lepton number, but the electron doesn't care what we call it, the properties are just numbers.

This is the illusory reality Gnostics were describing. This is the simulation. The A, C, G, and T codes of DNA have a binary value – A and C = 0 while G and T = 1. This has to be when the simulation is digital and the body must be digital to interact with it. Recurring mathematical sequences are encoded throughout reality and the body. They include the Fibonacci sequence in which the two previous numbers are added to get the next one, as in ... 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, etc. The sequence is encoded in the human face and body, proportions of animals, DNA, seed heads, pine cones, trees, shells, spiral galaxies, hurricanes and the number of petals in a flower. The list goes on and on. There are fractal patterns – a 'never-ending pattern that is infinitely complex and self-similar across all scales in the as above, so below, principle of holograms. These and other famous recurring geometrical and mathematical sequences such as Phi, Pi, Golden Mean, Golden Ratio and Golden Section are *computer codes* of the simulation. I had to laugh and give my head a shake the day I finished this book and it went into the production stage. I was sent an article in *Scientific American* published in April, 2021, with the headline 'Confirmed! We Live in a Simulation'. Two decades after I first said our reality is a simulation and the speed of light is its outer limit the article suggested that we do live in a simulation and that the speed of light is its outer limit. I left school at 15 and never passed a major exam in my life while the writer was up to his eyes in qualifications. As I will explain in the final chapter *knowing* is far better than thinking and they come from very different sources. The article rightly connected the speed of light to the processing speed of the 'Matrix' and said what has been in my books all this time ... 'If we are in a simulation, as it appears, then space is an abstract property written in code. It is not real'. No it's not and if we live in a simulation something created it and it wasn't *us*. 'That David Icke says we are manipulated by aliens' – he's crackers.'

Wow ...

The reality that humanity thinks is so real is an illusion. Politicians, governments, scientists, doctors, academics, law enforcement, media, school and university curriculums, on and on, are all founded on a world that *does not exist* except as a simulated prison cell. Is it such a stretch to accept that 'Covid' doesn't exist when our entire 'physical' reality doesn't exist? Revealed here is the knowledge kept under raps in the Cult networks of compartmentalised secrecy to control humanity's sense of reality by inducing the population to believe in a reality that's not real. If it wasn't so tragic in its experiential consequences the whole thing would be hysterically funny. None of this is new to Renegade Minds. Ancient Greek philosopher Plato (about 428 to about 347BC) was a major influence on Gnostic belief and he described the human plight thousands of years ago with his Allegory of the Cave. He told the symbolic story of prisoners living in a cave who had never been outside. They were chained and could only see one wall of the cave while behind them was a fire that they could not see. Figures walked past the fire casting shadows on the prisoners' wall and those moving shadows became their sense of reality. Some prisoners began to study the shadows and were considered experts on them (today's academics and scientists), but what they studied was only an illusion (today's academics and scientists). A prisoner escaped from the cave and saw reality as it really is. When he returned to report this revelation they didn't believe him, called him mad and threatened to kill him if he tried to set them free. Plato's tale is not only a brilliant analogy of the human plight and our illusory reality. It describes, too, the dynamics of the 'Covid' hoax. I have only skimmed the surface of these subjects here. The aim of this book is to crisply connect all essential dots to put what is happening today into its true context. All subject areas and their connections in this chapter are covered in great evidential detail in *Everything You Need To Know, But Have Never Been Told* and *The Answer*.

They say that bewildered people 'can't see the forest for the trees'. Humanity, however, can't see the forest for the *twigs*. The five senses

see only twigs while Renegade Minds can see the forest and it's the forest where the answers lie with the connections that reveals.

Breaking free of perceptual programming so the forest can be seen is the way we turn all this around. Not breaking free is how humanity got into this mess. The situation may seem hopeless, but I promise you it's not. We are a perceptual heartbeat from paradise if only we knew.

CHAPTER TWELVE

Escaping Wetiko

Life is simply a vacation from the infinite
Dean Cavanagh

Renegade Minds weave the web of life and events and see common themes in the apparently random. They are always there if you look for them and their pursuit is aided by incredible synchronicity that comes when your mind is open rather than mesmerised by what it thinks it can see.

Infinite awareness is infinite possibility and the more of infinite possibility that we access the more becomes infinitely possible. That may be stating the apparently obvious, but it is a devastatingly-powerful fact that can set us free. We are a point of attention within an infinity of consciousness. The question is how much of that infinity do we choose to access? How much knowledge, insight, awareness, wisdom, do we want to connect with and explore? If your focus is only in the five senses you will be influenced by a fraction of infinite awareness. I mean a range so tiny that it gives new meaning to infinitesimal. Limitation of self-identity and a sense of the possible limit accordingly your range of consciousness. We are what we think we are. Life is what we think it is. The dream is the dreamer and the dreamer is the dream. Buddhist philosophy puts it this way: 'As a thing is viewed, so it appears.' Most humans live in the realm of touch, taste, see, hear, and smell and that's the limit of their sense of the possible and sense of self. Many will follow a religion and speak of a God in his heaven, but their lives are still

dominated by the five senses in their perceptions and actions. The five senses become the arbiter of everything. When that happens all except a smear of infinity is sealed away from influence by the rigid, unyielding, reality bubbles that are the five-sense human or Phantom Self. Archon Cult methodology is to isolate consciousness within five-sense reality – the simulation – and then program that consciousness with a sense of self and the world through a deluge of life-long information designed to instil the desired perception that allows global control. Efforts to do this have increased dramatically with identity politics as identity bubbles are squeezed into the minutiae of five-sense detail which disconnect people even more profoundly from the infinite 'I'.

Five-sense focus and self-identity are like a firewall that limits access to the infinite realms. You only perceive one radio or television station and no other. We'll take that literally for a moment. Imagine a vast array of stations giving different information and angles on reality, but you only ever listen to one. Here we have the human plight in which the population is overwhelmingly confined to CultFM. This relates only to the frequency range of CultFM and limits perception and insight to that band – limits *possibility* to that band. It means you are connecting with an almost imperceptibly minuscule range of possibility and creative potential within the infinite Field. It's a world where everything seems apart from everything else and where synchronicity is rare. Synchronicity is defined in the dictionary as 'the happening by chance of two or more related or similar events at the same time'. Use of 'by chance' betrays a complete misunderstanding of reality. Synchronicity is not 'by chance'. As people open their minds, or 'awaken' to use the term, they notice more and more coincidences in their lives, bits of 'luck', apparently miraculous happenings that put them in the right place at the right time with the right people. Days become peppered with 'fancy meeting you here' and 'what are the chances of that?' My entire life has been lived like this and ever more so since my own colossal awakening in 1990 and 91 which transformed my sense of reality. Synchronicity is not 'by chance'; it is by accessing expanded

realms of possibility which allow expanded potential for manifestation. People broadcasting the same vibe from the same openness of mind tend to be drawn 'by chance' to each other through what I call frequency magnetism and it's not only people. In the last more than 30 years incredible synchronicity has also led me through the Cult maze to information in so many forms and to crucial personal experiences. These 'coincidences' have allowed me to put the puzzle pieces together across an enormous array of subjects and situations. Those who have breached the bubble of five-sense reality will know exactly what I mean and this escape from the perceptual prison cell is open to everyone whenever they make that choice. This may appear super-human when compared with the limitations of 'human', but it's really our natural state. 'Human' as currently experienced is consciousness in an unnatural state of induced separation from the infinity of the whole. I'll come to how this transformation into unity can be made when I have described in more detail the force that holds humanity in servitude by denying this access to infinite self.

The Wetiko factor

I have been talking and writing for decades about the way five-sense mind is systematically barricaded from expanded awareness. I have used the analogy of a computer (five-sense mind) and someone at the keyboard (expanded awareness). Interaction between the computer and the operator is symbolic of the interaction between five-sense mind and expanded awareness. The computer directly experiences the Internet and the operator experiences the Internet via the computer which is how it's supposed to be – the two working as one. Archons seek to control that point where the operator connects with the computer to stop that interaction ([Fig 20](#)). Now the operator is banging the keyboard and clicking the mouse, but the computer is not responding and this happens when the computer is taken over – *possessed* – by an appropriately-named computer 'virus'. The operator has lost all influence over the computer which goes its own way making decisions under the control of the 'virus'. I have

just described the dynamic through which the force known to Gnostics as Yaldabaoth and Archons disconnects five-sense mind from expanded awareness to imprison humanity in perceptual servitude.

Figure 20: The mind ‘virus’ I have been writing about for decades seeks to isolate five-sense mind (the computer) from the true ‘I’. (Image by Neil Hague).

About a year ago I came across a Native American concept of Wetiko which describes precisely the same phenomenon. Wetiko is the spelling used by the Cree and there are other versions including wintiko and windigo used by other tribal groups. They spell the name with lower case, but I see Wetiko as a proper noun as with Archons and prefer a capital. I first saw an article about Wetiko by writer and researcher Paul Levy which so synced with what I had been writing about the computer/operator disconnection and later the Archons. I then read his book, the fascinating *Dispelling Wetiko, Breaking the Spell of Evil*. The parallels between what I had concluded long before and the Native American concept of Wetiko were so clear and obvious that it was almost funny. For Wetiko see the Gnostic Archons for sure and the Jinn, the Predators, and every other name for a force of evil, inversion and chaos. Wetiko is the Native American name for the force that divides the computer from

the operator (Fig 21). Indigenous author Jack D. Forbes, a founder of the Native American movement in the 1960s, wrote another book about Wetiko entitled *Columbus And Other Cannibals – The Wetiko Disease of Exploitation, Imperialism, and Terrorism* which I also read. Forbes says that Wetiko refers to an evil person or spirit ‘who terrorizes other creatures by means of terrible acts, including cannibalism’. Zulu shaman Credo Mutwa told me that African accounts tell how cannibalism was brought into the world by the Chitauri ‘gods’ – another manifestation of Wetiko. The distinction between ‘evil person or spirit’ relates to Archons/Wetiko possessing a human or acting as pure consciousness. Wetiko is said to be a sickness of the soul or spirit and a state of being that takes but gives nothing back – the Cult and its operatives perfectly described. Black Hawk, a Native American war leader defending their lands from confiscation, said European invaders had ‘poisoned hearts’ – Wetiko hearts – and that this would spread to native societies. Mention of the heart is very significant as we shall shortly see. Forbes writes: ‘Tragically, the history of the world for the past 2,000 years is, in great part, the story of the epidemiology of the wetiko disease.’ Yes, and much longer. Forbes is correct when he says: ‘The wetikos destroyed Egypt and Babylon and Athens and Rome and Tenochtitlan [capital of the Aztec empire] and perhaps now they will destroy the entire earth.’ Evil, he said, is the number one export of a Wetiko culture – see its globalisation with ‘Covid’. Constant war, mass murder, suffering of all kinds, child abuse, Satanism, torture and human sacrifice are all expressions of Wetiko and the Wetiko possessed. The world is Wetiko made manifest, *but it doesn’t have to be*. There is a way out of this even now.

Figure 21: The mind 'virus' is known to Native Americans as 'Wetiko'. (Image by Neil Hague).

Cult of Wetiko

Wetiko is the Yaldabaoth frequency distortion that seeks to attach to human consciousness and absorb it into its own. Once this connection is made Wetiko can drive the perceptions of the target which they believe to be coming from their own mind. All the horrors of history and today from mass killers to Satanists, paedophiles like Jeffrey Epstein and other psychopaths, are the embodiment of Wetiko and express its state of being in all its grotesqueness. The Cult is Wetiko incarnate, Yaldabaoth incarnate, and it seeks to facilitate Wetiko assimilation of humanity in totality into its distortion by manipulating the population into low frequency states that match its own. Paul Levy writes:

'Holographically enforced within the psyche of every human being the wetiko virus pervades and underlies the entire field of consciousness, and can therefore potentially manifest through any one of us at any moment if we are not mindful.' The 'Covid' hoax has achieved this with many people, but others have not fallen into Wetiko's frequency lair. Players in the 'Covid' human catastrophe including Gates, Schwab, Tedros, Fauci, Whitty, Vallance, Johnson, Hancock, Ferguson, Drosten, and all the rest, including the psychopath psychologists, are expressions of Wetiko. This is why

they have no compassion or empathy and no emotional consequence for what they do that would make them stop doing it. Observe all the people who support the psychopaths in authority against the Pushbackers despite the damaging impact the psychopaths have on their own lives and their family's lives. You are again looking at Wetiko possession which prevents them seeing through the lies to the obvious scam going on. *Why can't they see it?* Wetiko won't let them see it. The perceptual divide that has now become a chasm is between the Wetikoed and the non-Wetikoed.

Paul Levy describes Wetiko in the same way that I have long described the Archontic force. They are the same distorted consciousness operating across dimensions of reality: '... the subtle body of wetiko is not located in the third dimension of space and time, literally existing in another dimension ... it is able to affect ordinary lives by mysteriously interpenetrating into our three-dimensional world.' Wetiko does this through its incarnate representatives in the Cult and by weaving itself into The Field which on our level of reality is the electromagnetic information field of the simulation or Matrix. More than that, the simulation *is* Wetiko / Yaldabaoth. Caleb Scharf, Director of Astrobiology at Columbia University, has speculated that 'alien life' could be so advanced that it has transcribed itself into the quantum realm to become what we call physics. He said intelligence indistinguishable from the fabric of the Universe would solve many of its greatest mysteries:

Perhaps hyper-advanced life isn't just external. Perhaps it's already all around. It is embedded in what we perceive to be physics itself, from the root behaviour of particles and fields to the phenomena of complexity and emergence ... In other words, life might not just be in the equations. It might BE the equations [My emphasis].

Scharf said it is possible that 'we don't recognise advanced life because it forms an integral and unsuspecting part of what we've considered to be the natural world'. I agree. Wetiko/Yaldabaoth *is* the simulation. We are literally in the body of the beast. But that doesn't mean it has to control us. We all have the power to overcome Wetiko

influence and the Cult knows that. I doubt it sleeps too well because it knows that.

Which Field?

This, I suggest, is how it all works. There are two Fields. One is the fierce electromagnetic light of the Matrix within the speed of light; the other is the 'watery light' of The Field beyond the walls of the Matrix that connects with the Great Infinity. Five-sense mind and the decoding systems of the body attach us to the Field of Matrix light. They have to or we could not experience this reality. Five-sense mind sees only the Matrix Field of information while our expanded consciousness is part of the Infinity Field. When we open our minds, and most importantly our hearts, to the Infinity Field we have a mission control which gives us an expanded perspective, a road map, to understand the nature of the five-sense world. If we are isolated only in five-sense mind there is no mission control. We're on our own trying to understand a world that's constantly feeding us information to ensure we do not understand. People in this state can feel 'lost' and bewildered with no direction or radar. You can see ever more clearly those who are influenced by the Fields of Big Infinity or little five-sense mind simply by their views and behaviour with regard to the 'Covid' hoax. We have had this division throughout known human history with the mass of the people on one side and individuals who could see and intuit beyond the walls of the simulation – Plato's prisoner who broke out of the cave and saw reality for what it is. Such people have always been targeted by Wetiko/Archon-possessed authority, burned at the stake or demonised as mad, bad and dangerous. The Cult today and its global network of 'anti-hate', 'anti-fascist' Woke groups are all expressions of Wetiko attacking those exposing the conspiracy, 'Covid' lies and the 'vaccine' agenda.

Woke as a whole is Wetiko which explains its black and white mentality and how at one it is with the Wetiko-possessed Cult. Paul Levy said: 'To be in this paradigm is to still be under the thrall of a two-valued logic – where things are either true or false – of a

wetikoized mind.’ Wetiko consciousness is in a permanent rage, therefore so is Woke, and then there is Woke inversion and contradiction. ‘Anti-fascists’ act like fascists because fascists *and* ‘anti-fascists’ are both Wetiko at work. Political parties act the same while claiming to be different for the same reason. Secret society and satanic rituals are attaching initiates to Wetiko and the cold, ruthless, psychopathic mentality that secures the positions of power all over the world is Wetiko. Reframing ‘training programmes’ have the same cumulative effect of attaching Wetiko and we have their graduates described as automatons and robots with a cold, psychopathic, uncaring demeanour. They are all traits of Wetiko possession and look how many times they have been described in this book and elsewhere with regard to personnel behind ‘Covid’ including the police and medical profession. Climbing the greasy pole in any profession in a Wetiko society requires traits of Wetiko to get there and that is particularly true of politics which is not about fair competition and pre-eminence of ideas. It is founded on how many backs you can stab and arses you can lick. This culminated in the global ‘Covid’ coordination between the Wetiko possessed who pulled it off in all the different countries without a trace of empathy and compassion for their impact on humans. Our sight sense can see only holographic form and not the Field which connects holographic form. Therefore we perceive ‘physical’ objects with ‘space’ in between. In fact that ‘space’ is energy/consciousness operating on multiple frequencies. One of them is Wetiko and that connects the Cult psychopaths, those who submit to the psychopaths, and those who serve the psychopaths in the media operations of the world. Wetiko is Gates. Wetiko is the mask-wearing submissive. Wetiko is the fake journalist and ‘fact-checker’. The Wetiko Field is coordinating the whole thing. Psychopaths, gofers, media operatives, ‘anti-hate’ hate groups, ‘fact-checkers’ and submissive people work as one unit *even without human coordination* because they are attached to the *same* Field which is organising it all ([Fig 22](#)). Paul Levy is here describing how Wetiko-possessed people are drawn together and refuse to let any information breach their rigid

perceptions. He was writing long before 'Covid', but I think you will recognise followers of the 'Covid' religion *oh just a little bit*:

People who are channelling the vibratory frequency of wetiko align with each other through psychic resonance to reinforce their unspoken shared agreement so as to uphold their deranged view of reality. Once an unconscious content takes possession of certain individuals, it irresistibly draws them together by mutual attraction and knits them into groups tied together by their shared madness that can easily swell into an avalanche of insanity.

A psychic epidemic is a closed system, which is to say that it is insular and not open to any new information or informing influences from the outside world which contradict its fixed, limited, and limiting perspective.

There we have the Woke mind and the 'Covid' mind. Compatible resonance draws the awakening together, too, which is clearly happening today.

Figure 22: The Wetiko Field from which the Cult pyramid and its personnel are made manifest. (Image by Neil Hague).

Spiritual servitude

Wetiko doesn't care about humans. It's not human; it just possesses humans for its own ends and the effect (depending on the scale of

possession) can be anything from extreme psychopathy to unquestioning obedience. Wetiko's worst nightmare is for human consciousness to expand beyond the simulation. Everything is focussed on stopping that happening through control of information, thus perception, thus frequency. The 'education system', media, science, medicine, academia, are all geared to maintaining humanity in five-sense servitude as is the constant stimulation of low-vibrational mental and emotional states (see 'Covid'). Wetiko seeks to dominate those subconscious spaces between five-sense perception and expanded consciousness where the computer meets the operator. From these subconscious hiding places Wetiko speaks to us to trigger urges and desires that we take to be our own and manipulate us into anything from low-vibrational to psychopathic states. Remember how Islam describes the Jinn as invisible tricksters that 'whisper' and confuse. Wetiko is the origin of the 'trickster god' theme that you find in cultures all over the world. Jinn, like the Archons, are Wetiko which is terrified of humans awakening and reconnecting with our true self for then its energy source has gone. With that the feedback loop breaks between Wetiko and human perception that provides the energetic momentum on which its very existence depends as a force of evil. Humans are both its target and its source of survival, but only if we are operating in low-vibrational states of fear, hate, depression and the background anxiety that most people suffer. We are Wetiko's target because we are its key to survival. It needs us, not the other way round. Paul Levy writes:

A vampire has no intrinsic, independent, substantial existence in its own right; it only exists in relation to us. The pathogenic, vampiric mind-parasite called wetiko is nothing in itself – not being able to exist from its own side – yet it has a 'virtual reality' such that it can potentially destroy our species ...

...The fact that a vampire is not reflected by a mirror can also mean that what we need to see is that there's nothing, no-thing to see, other than ourselves. The fact that wetiko is the expression of something inside of us means that the cure for wetiko is with us as well. The critical issue is finding this cure within us and then putting it into effect.

Evil begets evil because if evil does not constantly expand and find new sources of energetic sustenance its evil, its *distortion*, dies with the assimilation into balance and harmony. Love is the garlic to Wetiko's vampire. Evil, the absence of love, cannot exist in the presence of love. I think I see a way out of here. I have emphasised so many times over the decades that the Archons/Wetiko and their Cult are not all powerful. *They are not*. I don't care how it looks even now *they are not*. I have not called them little boys in short trousers for effect. I have said it because it is true. Wetiko's insatiable desire for power over others is not a sign of its omnipotence, but its insecurity. Paul Levy writes: 'Due to the primal fear which ultimately drives it and which it is driven to cultivate, wetiko's body politic has an intrinsic and insistent need for centralising power and control so as to create imagined safety for itself.' *Yeeeeeees!* Exactly! Why does Wetiko want humans in an ongoing state of fear? Wetiko itself *is* fear and it is petrified of love. As evil is an absence of love, so love is an absence of fear. Love conquers all and *especially* Wetiko which *is* fear. Wetiko brought fear into the world when it wasn't here before. *Fear* was the 'fall', the fall into low-frequency ignorance and illusion – fear is **False Emotion Appearing Real**. The simulation is driven and energised by fear because Wetiko/Yaldabaoth (fear) *are* the simulation. Fear is the absence of love and Wetiko is the absence of love.

Wetiko today

We can now view current events from this level of perspective. The 'Covid' hoax has generated momentous amounts of ongoing fear, anxiety, depression and despair which have empowered Wetiko. No wonder people like Gates have been the instigators when they are Wetiko incarnate and exhibit every trait of Wetiko in the extreme. See how cold and unemotional these people are like Gates and his cronies, how dead of eye they are. That's Wetiko. Sabbatians are Wetiko and everything they control including the World Health Organization, Big Pharma and the 'vaccine' makers, national 'health'

hierarchies, corporate media, Silicon Valley, the banking system, and the United Nations with its planned transformation into world government. All are controlled and possessed by the Wetiko distortion into distorting human society in its image. We are with this knowledge at the gateway to understanding the world. Divisions of race, culture, creed and sexuality are diversions to hide the real division between those possessed and influenced by Wetiko and those that are not. The 'Covid' hoax has brought both clearly into view. Human behaviour is not about race. Tyrants and dictatorships come in all colours and creeds. What unites the US president bombing the innocent and an African tribe committing genocide against another as in Rwanda? What unites them? *Wetiko*. All wars are Wetiko, all genocide is Wetiko, all hunger over centuries in a world of plenty is Wetiko. Children going to bed hungry, including in the West, is Wetiko. Cult-generated Woke racial divisions that focus on the body are designed to obscure the reality that divisions in behaviour are manifestations of mind, not body. Obsession with body identity and group judgement is a means to divert attention from the real source of behaviour – mind and perception. Conflict sown by the Woke both within themselves and with their target groups are Wetiko providing lunch for itself through still more agents of the division, chaos, and fear on which it feeds. The Cult is seeking to assimilate the entirety of humanity and all children and young people into the Wetiko frequency by manipulating them into states of fear and despair. Witness all the suicide and psychological unravelling since the spring of 2020. Wetiko psychopaths want to impose a state of unquestioning obedience to authority which is no more than a conduit for Wetiko to enforce its will and assimilate humanity into itself. It needs us to believe that resistance is futile when it fears resistance and even more so the game-changing non-cooperation with its impositions. It can use violent resistance for its benefit. Violent impositions and violent resistance are *both* Wetiko. The Power of Love with its Power of No will sweep Wetiko from our world. Wetiko and its Cult know that. They just don't want us to know.

AI Wetiko

This brings me to AI or artificial intelligence and something else Wetikos don't want us to know. What is AI *really*? I know about computer code algorithms and AI that learns from data input. These, however, are more diversions, the expeditionary force, for the real AI that they want to connect to the human brain as promoted by Silicon Valley Wetikos like Kurzweil. What is this AI? It is the frequency of *Wetiko*, the frequency of the Archons. The connection of AI to the human brain is the connection of the Wetiko frequency to create a Wetiko hive mind and complete the job of assimilation. The hive mind is planned to be controlled from Israel and China which are both 100 percent owned by Wetiko Sabbatians. The assimilation process has been going on minute by minute in the 'smart' era which fused with the 'Covid' era. We are told that social media is scrambling the minds of the young and changing their personality. This is true, but what is social media? Look more deeply at how it works, how it creates divisions and conflict, the hostility and cruelty, the targeting of people until they are destroyed. That's Wetiko. Social media is manipulated to tune people to the Wetiko frequency with all the emotional exploitation tricks employed by platforms like Facebook and its Wetiko front man, Zuckerberg. Facebook's Instagram announced a new platform for children to overcome a legal bar on them using the main site. This is more Wetiko exploitation and manipulation of kids. Amnesty International likened the plan to foxes offering to guard the henhouse and said it was incompatible with human rights. Since when did Wetiko or Zuckerberg (I repeat myself) care about that? Would Brin and Page at Google, Wojcicki at YouTube, Bezos at Amazon and whoever the hell runs Twitter act as they do if they were not channelling Wetiko? Would those who are developing technologies for no other reason than human control? How about those designing and selling technologies to kill people and Big Pharma drug and 'vaccine' producers who know they will end or devastate lives? Quite a thought for these people to consider is that if you are Wetiko in a human life you are Wetiko on the 'other side' unless your frequency

changes and that can only change by a change of perception which becomes a change of behaviour. Where Gates is going does not bear thinking about although perhaps that's exactly where he wants to go. Either way, that's where he's going. His frequency will make it so.

The frequency lair

I have been saying for a long time that a big part of the addiction to smartphones and devices is that a frequency is coming off them that entraps the mind. People spend ages on their phones and sometimes even a minute or so after they put them down they pick them up again and it all repeats. 'Covid' lockdowns will have increased this addiction a million times for obvious reasons. Addictions to alcohol overindulgence and drugs are another way that Wetiko entraps consciousness to attach to its own. Both are symptoms of low-vibrational psychological distress which alcoholism and drug addiction further compound. Do we think it's really a coincidence that access to them is made so easy while potions that can take people into realms beyond the simulation are banned and illegal? I have explored smartphone addiction in other books, the scale is mind-blowing, and that level of addiction does not come without help. Tech companies that make these phones are Wetiko and they will have no qualms about destroying the minds of children. We are seeing again with these companies the Wetiko perceptual combination of psychopathic enforcers and weak and meek unquestioning compliance by the rank and file.

The global Smart Grid is the Wetiko Grid and it is crucial to complete the Cult endgame. The simulation is radiation and we are being deluged with technological radiation on a devastating scale. Wetiko frauds like Elon Musk serve Cult interests while occasionally criticising them to maintain his street-cred. 5G and other forms of Wi-Fi are being directed at the earth from space on a volume and scale that goes on increasing by the day. Elon Musk's (officially) SpaceX Starlink project is in the process of putting tens of thousands of satellites in low orbit to cover every inch of the planet with 5G and other Wi-Fi to create Kurzweil's global 'cloud' to which the

human mind is planned to be attached very soon. SpaceX has approval to operate 12,000 satellites with more than 1,300 launched at the time of writing and applications filed for 30,000 more. Other operators in the Wi-Fi, 5G, low-orbit satellite market include OneWeb (UK), Telesat (Canada), and AST & Science (US). Musk tells us that AI could be the end of humanity and then launches a company called Neuralink to connect the human brain to computers. Musk's (in theory) Tesla company is building electric cars and the driverless vehicles of the smart control grid. As frauds and bullshitters go Elon Musk in my opinion is Major League.

5G and technological radiation in general are destructive to human health, genetics and psychology and increasing the strength of artificial radiation underpins the five-sense perceptual bubbles which are themselves expressions of radiation or electromagnetism. Freedom activist John Whitehead was so right with his 'databit by databit, we are building our own electronic concentration camps'. The Smart Grid and 5G is a means to control the human mind and infuse perceptual information into The Field to influence anyone in sync with its frequency. You can change perception and behaviour en masse if you can manipulate the population into those levels of frequency and this is happening all around us today. The arrogance of Musk and his fellow Cult operatives knows no bounds in the way that we see with Gates. Musk's satellites are so many in number already they are changing the night sky when viewed from Earth. The astronomy community has complained about this and they have seen nothing yet. Some consequences of Musk's Wetiko hubris include: Radiation; visible pollution of the night sky; interference with astronomy and meteorology; ground and water pollution from intensive use of increasingly many spaceports; accumulating space debris; continual deorbiting and burning up of aging satellites, polluting the atmosphere with toxic dust and smoke; and ever-increasing likelihood of collisions. A collective public open letter of complaint to Musk said:

We are writing to you ... because SpaceX is in process of surrounding the Earth with a network of thousands of satellites whose very purpose is to irradiate every square inch of the

Earth. SpaceX, like everyone else, is treating the radiation as if it were not there. As if the mitochondria in our cells do not depend on electrons moving undisturbed from the food we digest to the oxygen we breathe.

As if our nervous systems and our hearts are not subject to radio frequency interference like any piece of electronic equipment. As if the cancer, diabetes, and heart disease that now afflict a majority of the Earth's population are not metabolic diseases that result from interference with our cellular machinery. As if insects everywhere, and the birds and animals that eat them, are not starving to death as a result.

People like Musk and Gates believe in their limitless Wetiko arrogance that they can do whatever they like to the world because they own it. Consequences for humanity are irrelevant. It's absolutely time that we stopped taking this shit from these self-styled masters of the Earth when you consider where this is going.

Why is the Cult so anti-human?

I hear this question often: Why would they do this when it will affect them, too? Ah, but will it? Who is this *them*? Forget their bodies. They are just vehicles for Wetiko consciousness. When you break it all down to the foundations we are looking at a state of severely distorted consciousness targeting another state of consciousness for assimilation. The rest is detail. The simulation is the fly-trap in which unique sensations of the five senses create a cycle of addiction called reincarnation. Renegade Minds see that everything which happens in our reality is a smaller version of the whole picture in line with the holographic principle. Addiction to the radiation of smart technology is a smaller version of addiction to the whole simulation. Connecting the body/brain to AI is taking that addiction on a giant step further to total ongoing control by assimilating human incarnate consciousness into Wetiko. I have watched during the 'Covid' hoax how many are becoming ever more profoundly attached to Wetiko's perceptual calling cards of aggressive response to any other point of view ('There is no other god but me'), psychopathic lack of compassion and empathy, and servile submission to the narrative and will of authority. Wetiko is the psychopaths *and* subservience to psychopaths. The Cult of Wetiko is

so anti-human because it is *not* human. It embarked on a mission to destroy human by targeting everything that it means to be human and to survive as human. 'Covid' is not the end, just a means to an end. The Cult with its Wetiko consciousness is seeking to change Earth systems, including the atmosphere, to suit them, not humans. The gathering bombardment of 5G alone from ground and space is dramatically changing The Field with which the five senses interact. There is so much more to come if we sit on our hands and hope it will all go away. It is not meant to go away. It is meant to get ever more extreme and we need to face that while we still can – just.

Carbon dioxide is the gas of life. Without that human is over. Kaput, gone, history. No natural world, no human. The Cult has created a cock and bull story about carbon dioxide and climate change to justify its reduction to the point where Gates and the ignoramus Biden 'climate chief' John Kerry want to suck it out of the atmosphere. Kerry wants to do this because his master Gates does. Wetikos have made the gas of life a demon with the usual support from the Wokers of Extinction Rebellion and similar organisations and the bewildered puppet-child that is Greta Thunberg who was put on the world stage by Klaus Schwab and the World Economic Forum. The name Extinction Rebellion is both ironic and as always Wetiko inversion. The gas that we need to survive must be reduced to save us from extinction. The most basic need of human is oxygen and we now have billions walking around in face nappies depriving body and brain of this essential requirement of human existence. More than that 5G at 60 gigahertz interacts with the oxygen molecule to reduce the amount of oxygen the body can absorb into the bloodstream. The obvious knock-on consequences of that for respiratory and cognitive problems and life itself need no further explanation. Psychopaths like Musk are assembling a global system of satellites to deluge the human atmosphere with this insanity. The man should be in jail. Here we have two most basic of human needs, oxygen and carbon dioxide, being dismantled.

Two others, water and food, are getting similar treatment with the United Nations Agendas 21 and 2030 – the Great Reset – planning to

centrally control all water and food supplies. People will not even own rain water that falls on their land. Food is affected at the most basic level by reducing carbon dioxide. We have genetic modification or GMO infiltrating the food chain on a mass scale, pesticides and herbicides polluting the air and destroying the soil. Freshwater fish that provide livelihoods for 60 million people and feed hundreds of millions worldwide are being 'pushed to the brink' according the conservationists while climate change is the only focus. Now we have Gates and Schwab wanting to dispense with current food sources all together and replace them with a synthetic version which the Wetiko Cult would control in terms of production and who eats and who doesn't. We have been on the Totalitarian Tiptoe to this for more than 60 years as food has become ever more processed and full of chemical shite to the point today when it's not natural food at all. As Dr Tom Cowan says: 'If it has a label don't eat it.' Bill Gates is now the biggest owner of farmland in the United States and he does nothing without an ulterior motive involving the Cult. Klaus Schwab wrote: 'To feed the world in the next 50 years we will need to produce as much food as was produced in the last 10,000 years ... food security will only be achieved, however, if regulations on genetically modified foods are adapted to reflect the reality that gene editing offers a precise, efficient and safe method of improving crops.' Liar. People and the world are being targeted with aluminium through vaccines, chemtrails, food, drink cans, and endless other sources when aluminium has been linked to many health issues including dementia which is increasing year after year. Insects, bees and wildlife essential to the food chain are being deleted by pesticides, herbicides and radiation which 5G is dramatically increasing with 6G and 7G to come. The pollinating bee population is being devastated while wildlife including birds, dolphins and whales are having their natural radar blocked by the effects of ever-increasing radiation. In the summer windscreens used to be splattered with insects so numerous were they. It doesn't happen now. Where have they gone?

Synthetic everything

The Cult is introducing genetically-modified versions of trees, plants and insects including a Gates-funded project to unleash hundreds of millions of genetically-modified, lab-altered and patented male mosquitoes to mate with wild mosquitoes and induce genetic flaws that cause them to die out. Clinically-insane Gates-funded Japanese researchers have developed mosquitos that spread vaccine and are dubbed 'flying vaccinators'. Gates is funding the modification of weather patterns in part to sell the myth that this is caused by carbon dioxide and he's funding geoengineering of the skies to change the atmosphere. Some of this came to light with the Gates-backed plan to release tonnes of chalk into the atmosphere to 'deflect the Sun and cool the planet'. Funny how they do this while the heating effect of the Sun is not factored into climate projections focussed on carbon dioxide. The reason is that they want to reduce carbon dioxide (so don't mention the Sun), but at the same time they do want to reduce the impact of the Sun which is so essential to human life and health. I have mentioned the sun-cholesterol-vitamin D connection as they demonise the Sun with warnings about skin cancer (caused by the chemicals in sun cream they tell you to splash on). They come from the other end of the process with statin drugs to reduce cholesterol that turns sunlight into vitamin D. A lack of vitamin D leads to a long list of health effects and how vitamin D levels must have fallen with people confined to their homes over 'Covid'. Gates is funding other forms of geoengineering and most importantly chemtrails which are dropping heavy metals, aluminium and self-replicating nanotechnology onto the Earth which is killing the natural world. See *Everything You Need To Know, But Have Never Been Told* for the detailed background to this.

Every human system is being targeted for deletion by a force that's not human. The Wetiko Cult has embarked on the process of transforming the human body from biological to synthetic biological as I have explained. Biological is being replaced by the artificial and synthetic – Archontic 'countermimicry' – right across human society. The plan eventually is to dispense with the human body altogether

and absorb human consciousness – which it wouldn't really be by then – into cyberspace (the simulation which is Wetiko/Yaldabaoth). Preparations for that are already happening if people would care to look. The alternative media rightly warns about globalism and 'the globalists', but this is far bigger than that and represents the end of the human race as we know it. The 'bad copy' of prime reality that Gnostics describe was a bad copy of harmony, wonder and beauty to start with before Wetiko/Yaldabaoth set out to change the simulated 'copy' into something very different. The process was slow to start with. Entrapped humans in the simulation timeline were not technologically aware and they had to be brought up to intellectual speed while being suppressed spiritually to the point where they could build their own prison while having no idea they were doing so. We have now reached that stage where technological intellect has the potential to destroy us and that's why events are moving so fast. Central American shaman Don Juan Matus said:

Think for a moment, and tell me how you would explain the contradictions between the intelligence of man the engineer and the stupidity of his systems of belief, or the stupidity of his contradictory behaviour. Sorcerers believe that the predators have given us our systems of beliefs, our ideas of good and evil; our social mores. They are the ones who set up our dreams of success or failure. They have given us covetousness, greed, and cowardice. It is the predator who makes us complacent, routinary, and egomaniacal.

In order to keep us obedient and meek and weak, the predators engaged themselves in a stupendous manoeuvre – stupendous, of course, from the point of view of a fighting strategist; a horrendous manoeuvre from the point of those who suffer it. They gave us their mind. The predators' mind is baroque, contradictory, morose, filled with the fear of being discovered any minute now.

For 'predators' see Wetiko, Archons, Yaldabaoth, Jinn, and all the other versions of the same phenomenon in cultures and religions all over the world. The theme is always the same because it's true and it's real. We have reached the point where we have to deal with it. The question is – how?

Don't fight – walk away

I thought I'd use a controversial subheading to get things moving in terms of our response to global fascism. What do you mean 'don't fight'? What do you mean 'walk away'? We've got to fight. We can't walk away. Well, it depends what we mean by fight and walk away. If fighting means physical combat we are playing Wetiko's game and falling for its trap. It wants us to get angry, aggressive, and direct hate and hostility at the enemy we think we must fight. Every war, every battle, every conflict, has been fought with Wetiko leading both sides. It's what it does. Wetiko wants a fight, anywhere, any place. Just hit me, son, so I can hit you back. Wetiko hits Wetiko and Wetiko hits Wetiko in return. I am very forthright as you can see in exposing Wetikos of the Cult, but I don't hate them. I refuse to hate them. It's what they want. What you hate you become. What you *fight* you become. Wokers, 'anti-haters' and 'anti-fascists' prove this every time they reach for their keyboards or don their balaclavas. By walk away I mean to disengage from Wetiko which includes ceasing to cooperate with its tyranny. Paul Levy says of Wetiko:

The way to 'defeat' evil is not to try to destroy it (for then, in playing evil's game, we have already lost), but rather, to find the invulnerable place within ourselves where evil is unable to vanquish us – this is to truly 'win' our battle with evil.

Wetiko is everywhere in human society and it's been on steroids since the 'Covid' hoax. Every shouting match over wearing masks has Wetiko wearing a mask and Wetiko not wearing one. It's an electrical circuit of push and resist, push and resist, with Wetiko pushing *and* resisting. Each polarity is Wetiko empowering itself. Dictionary definitions of 'resist' include 'opposing, refusing to accept or comply with' and the word to focus on is 'opposing'. What form does this take – setting police cars alight or 'refusing to accept or comply with'? The former is Wetiko opposing Wetiko while the other points the way forward. This is the difference between those aggressively demanding that government fascism must be obeyed who stand in stark contrast to the great majority of Pushbackers. We saw this clearly with a march by thousands of Pushbackers against lockdown in London followed days later by a Woker-hijacked

protest in Bristol in which police cars were set on fire. Masks were virtually absent in London and widespread in Bristol. Wetiko wants lockdown on every level of society and infuses its aggression to police it through its unknowing stooges. Lockdown protesters are the ones with the smiling faces and the hugs, The two blatantly obvious states of being – getting more obvious by the day – are the result of Wokers and their like becoming ever more influenced by the simulation Field of Wetiko and Pushbackers ever more influenced by The Field of a far higher vibration beyond the simulation. Wetiko can't invade the heart which is where most lockdown opponents are coming from. It's the heart that allows them to see through the lies to the truth in ways I will be highlighting.

Renegade Minds know that calmness is the place from which wisdom comes. You won't find wisdom in a hissing fit and wisdom is what we need in abundance right now. Calmness is not weakness – you don't have to scream at the top of your voice to be strong. Calmness is indeed a sign of strength. 'No' means I'm not doing it. NOOOO!!! doesn't mean you're not doing it even more. Volume does not advance 'No – I'm not doing it'. You are just not doing it. Wetiko possessed and influenced don't know how to deal with that. Wetiko wants a fight and we should not give it one. What it needs more than anything is our *cooperation* and we should not give that either. Mass rallies and marches are great in that they are a visual representation of feeling, but if it ends there they are irrelevant. You demand that Wetikos act differently? Well, they're not going to are they? They are Wetikos. We don't need to waste our time demanding that something doesn't happen when that will make no difference. We need to delete the means that *allows* it to happen. This, invariably, is our cooperation. You can demand a child stop firing a peashooter at the dog or you can refuse to buy the peashooter. If you provide the means you are cooperating with the dog being smacked on the nose with a pea. How can the authorities enforce mask-wearing if millions in a country refuse? What if the 74 million Pushbackers that voted for Trump in 2020 refused to wear masks, close their businesses or stay in their homes. It would be unenforceable. The

few control the many through the compliance of the many and that's always been the dynamic be it 'Covid' regulations or the Roman Empire. I know people can find it intimidating to say no to authority or stand out in a crowd for being the only one with a face on display; but it has to be done or it's over. I hope I've made clear in this book that where this is going will be far more intimidating than standing up now and saying 'No' – I will not cooperate with my own enslavement and that of my children. There might be consequences for some initially, although not so if enough do the same. The question that must be addressed is what is going to happen if we don't? It is time to be strong and unyieldingly so. No means no. Not here and there, but *everywhere* and *always*. I have refused to wear a mask and obey all the other nonsense. I will not comply with tyranny. I repeat: Fascism is not imposed by fascists – there are never enough of them. Fascism is imposed by the population acquiescing to fascism. *I will not do it*. I will die first, or my body will. Living meekly under fascism is a form of death anyway, the death of the spirit that Martin Luther King described.

Making things happen

We must not despair. This is not over till it's over and it's far from that. The 'fat lady' must refuse to sing. The longer the 'Covid' hoax has dragged on and impacted on more lives we have seen an awakening of phenomenal numbers of people worldwide to the realisation that what they have believed all their lives is not how the world really is. Research published by the system-serving University of Bristol and King's College London in February, 2021, concluded: 'One in every 11 people in Britain say they trust David Icke's take on the coronavirus pandemic.' It will be more by now and we have gathering numbers to build on. We must urgently progress from seeing the scam to ceasing to cooperate with it. Prominent German lawyer Reiner Fuellmich, also licenced to practice law in America, is doing a magnificent job taking the legal route to bring the psychopaths to justice through a second Nuremberg tribunal for crimes against humanity. Fuellmich has an impressive record of

beating the elite in court and he formed the German Corona Investigative Committee to pursue civil charges against the main perpetrators with a view to triggering criminal charges. Most importantly he has grasped the foundation of the hoax – the PCR test not testing for the ‘virus’ – and Christian Drosten is therefore on his charge sheet along with Gates frontman Tedros at the World Health Organization. Major players must not be allowed to inflict their horrors on the human race without being brought to book. A life sentence must follow for Bill Gates and the rest of them. A group of researchers has also indicted the government of Norway for crimes against humanity with copies sent to the police and the International Criminal Court. The lawsuit cites participation in an internationally-planned false pandemic and violation of international law and human rights, the European Commission’s definition of human rights by coercive rules, Nuremberg and Hague rules on fundamental human rights, and the Norwegian constitution. We must take the initiative from hereon and not just complain, protest and react.

There are practical ways to support vital mass non-cooperation. Organising in numbers is one. Lockdown marches in London in the spring in 2021 were mass non-cooperation that the authorities could not stop. There were too many people. Hundreds of thousands walked the London streets in the centre of the road for mile after mile while the Face-Nappies could only look on. They were determined, but calm, and just *did it* with no histrionics and lots of smiles. The police were impotent. Others are organising group shopping without masks for mutual support and imagine if that was happening all over. Policing it would be impossible. If the store refuses to serve people in these circumstances they would be faced with a long line of trolleys full of goods standing on their own and everything would have to be returned to the shelves. How would they cope with that if it kept happening? I am talking here about moving on from complaining to being pro-active; from watching things happen to making things happen. I include in this our relationship with the police. The behaviour of many Face-Nappies

has been disgraceful and anyone who thinks they would never find concentration camp guards in the 'enlightened' modern era have had that myth busted big-time. The period and setting may change – Wetikos never do. I watched film footage from a London march in which a police thug viciously kicked a protestor on the floor who had done nothing. His fellow Face-Nappies stood in a ring protecting him. What he did was a criminal assault and with a crowd far outnumbering the police this can no longer be allowed to happen unchallenged. I get it when people chant 'shame on you' in these circumstances, but that is no longer enough. They *have* no shame those who do this. Crowds needs to start making a citizen's arrest of the police who commit criminal offences and brutally attack innocent people and defenceless women. A citizen's arrest can be made under section 24A of the UK Police and Criminal Evidence (PACE) Act of 1984 and you will find something similar in other countries. I prefer to call it a Common Law arrest rather than citizen's for reasons I will come to shortly. Anyone can arrest a person committing an indictable offence or if they have reasonable grounds to suspect they are committing an indictable offence. On both counts the attack by the police thug would have fallen into this category. A citizen's arrest can be made to stop someone:

- Causing physical injury to himself or any other person
- Suffering physical injury
- Causing loss of or damage to property
- Making off before a constable can assume responsibility for him

A citizen's arrest may also be made to prevent a breach of the peace under Common Law and if they believe a breach of the peace will happen or anything related to harm likely to be done or already done in their presence. This is the way to go I think – the Common Law version. If police know that the crowd and members of the public will no longer be standing and watching while they commit

their thuggery and crimes they will think twice about acting like Brownshirts and Blackshirts.

Common Law – common sense

Mention of Common Law is very important. Most people think the law is the law as in one law. This is not the case. There are two bodies of law, Common Law and Statute Law, and they are not the same. Common Law is founded on the simple premise of do no harm. It does not recognise victimless crimes in which no harm is done while Statute Law does. There is a Statute Law against almost everything. So what is Statute Law? Amazingly it's the law of the *sea* that was brought ashore by the Cult to override the law of the land which is Common Law. They had no right to do this and as always they did it anyway. They had to. They could not impose their will on the people through Common Law which only applies to do no harm. How could you stitch up the fine detail of people's lives with that? Instead they took the law of the sea, or Admiralty Law, and applied it to the population. Statute Law refers to all the laws spewing out of governments and their agencies including all the fascist laws and regulations relating to 'Covid'. The key point to make is that Statute Law is *contract law*. It only applies between *contracting* corporations. Most police officers don't even know this. They have to be kept in the dark, too. Long ago when merchants and their sailing ships began to trade with different countries a contractual law was developed called Admiralty Law and other names. Again it only applied to *contracts* agreed between *corporate* entities. If there is no agreed contract the law of the sea had no jurisdiction *and that still applies to its new alias of Statute Law*. The problem for the Cult when the law of the sea was brought ashore was an obvious one. People were not corporations and neither were government entities. To overcome the latter they made governments and all associated organisations corporations. All the institutions are *private corporations* and I mean governments and their agencies, local councils, police, courts, military, US states, the whole lot. Go to the

Dun and Bradstreet corporate listings website for confirmation that they are all corporations. You are arrested by a private corporation called the police by someone who is really a private security guard and they take you to court which is another private corporation. Neither have jurisdiction over you unless you consent and *contract* with them. This is why you hear the mantra about law enforcement policing by *consent* of the people. In truth the people 'consent' only in theory through monumental trickery.

Okay, the Cult overcame the corporate law problem by making governments and institutions corporate entities; but what about people? They are not corporations are they? Ah ... well in a sense, and *only* a sense, they are. Not people exactly – the illusion of people. The Cult creates a corporation in the name of everyone at the time that their birth certificate is issued. Note birth/ *berth* certificate and when you go to court under the law of the sea on land you stand in a *dock*. These are throwbacks to the origin. My Common Law name is David Vaughan Icke. The name of the corporation created by the government when I was born is called Mr David Vaughan Icke usually written in capitals as MR DAVID VAUGHAN ICKE. That is not me, the living, breathing man. It is a fictitious corporate entity. The trick is to make you think that David Vaughan Icke and MR DAVID VAUGHAN ICKE are the same thing. *They are not*. When police charge you and take you to court they are prosecuting the corporate entity and not the living, breathing, man or woman. They have to trick you into identifying as the corporate entity and contracting with them. Otherwise they have no jurisdiction. They do this through a language known as legalese. Lawful and legal are not the same either. Lawful relates to Common Law and legal relates to Statute Law. Legalese is the language of Statue Law which uses terms that mean one thing to the public and another in legalese. Notice that when a police officer tells someone why they are being charged he or she will say at the end: 'Do you understand?' To the public that means 'Do you comprehend?' In legalese it means 'Do you stand under me?' Do you stand under my authority? If you say

yes to the question you are unknowingly agreeing to give them jurisdiction over you in a contract between two corporate entities.

This is a confidence trick in every way. Contracts have to be agreed between informed parties and if you don't know that David Vaughan Icke is agreeing to be the corporation MR DAVID VAUGHAN ICKE you cannot knowingly agree to contract. They are deceiving you and another way they do this is to ask for proof of identity. You usually show them a driving licence or other document on which your corporate name is written. In doing so you are accepting that you are that corporate entity when you are not. Referring to yourself as a 'person' or 'citizen' is also identifying with your corporate fiction which is why I made the Common Law point about the citizen's arrest. If you are approached by a police officer you identify yourself immediately as a living, breathing, man or woman and say 'I do not consent, I do not contract with you and I do not understand' or stand under their authority. I have a Common Law birth certificate as a living man and these are available at no charge from commonlawcourt.com. Businesses registered under the Statute Law system means that its laws apply. There are, however, ways to run a business under Common Law. Remember all 'Covid' laws and regulations are Statute Law – the law of *contracts* and you do not have to contract. This doesn't mean that you can kill someone and get away with it. Common Law says do no harm and that applies to physical harm, financial harm etc. Police are employees of private corporations and there needs to be a new system of non-corporate Common Law constables operating outside the Statute Law system. If you go to davidicke.com and put Common Law into the search engine you will find videos that explain Common Law in much greater detail. It is definitely a road we should walk.

With all my heart

I have heard people say that we are in a spiritual war. I don't like the term 'war' with its Wetiko dynamic, but I know what they mean. Sweep aside all the bodily forms and we are in a situation in which two states of consciousness are seeking very different realities.

Wetiko wants upheaval, chaos, fear, suffering, conflict and control. The other wants love, peace, harmony, fairness and freedom. That's where we are. We should not fall for the idea that Wetiko is all-powerful and there's nothing we can do. Wetiko is not all-powerful. It's a joke, pathetic. It doesn't have to be, but it has made that choice for now. A handful of times over the years when I have felt the presence of its frequency I have allowed it to attach briefly so I could consciously observe its nature. The experience is not pleasant, the energy is heavy and dark, but the ease with which you can kick it back out the door shows that its real power is in persuading us that it has power. It's all a con. Wetiko is a con. It's a trickster and not a power that can control us if we unleash our own. The con is founded on manipulating humanity to give its power to Wetiko which recycles it back to present the illusion that it has power when its power is *ours* that we gave away. This happens on an energetic level and plays out in the world of the seen as humanity giving its power to Wetiko authority which uses that power to control the population when the power is only the power the population has handed over. How could it be any other way for billions to be controlled by a relative few? I have had experiences with people possessed by Wetiko and again you can kick its arse if you do it with an open heart. Oh yes – the *heart* which can transform the world of perceived 'matter'.

We are receiver-transmitters and processors of information, but what information and where from? Information is processed into perception in three main areas – the brain, the heart and the belly. These relate to thinking, knowing, and emotion. Wetiko wants us to be head and belly people which means we think within the confines of the Matrix simulation and low-vibrational emotional reaction scrambles balance and perception. A few minutes on social media and you see how emotion is the dominant force. Woke is all emotion and is therefore thought-free and fact-free. Our heart is something different. It *knows* while the head *thinks* and has to try to work it out because it doesn't know. The human energy field has seven prime vortexes which connect us with wider reality ([Fig 23](#)). Chakra means

‘wheels of light’ in the Sanskrit language of ancient India. The main ones are: The crown chakra on top of the head; brow (or ‘third eye’) chakra in the centre of the forehead; throat chakra; heart chakra in the centre of the chest; solar plexus chakra below the sternum; sacral chakra beneath the navel; and base chakra at the bottom of the spine. Each one has a particular function or functions. We feel anxiety and nervousness in the belly where the sacral chakra is located and this processes emotion that can affect the colon to give people ‘the shits’ or make them ‘shit scared’ when they are nervous. Chakras all play an important role, but the Mr and Mrs Big is the heart chakra which sits at the centre of the seven, above the chakras that connect us to the ‘physical’ and below those that connect with higher realms (or at least should). Here in the heart chakra we feel love, empathy and compassion – ‘My heart goes out to you’. Those with closed hearts become literally ‘heart-less’ in their attitudes and behaviour (see Bill Gates). Native Americans portrayed Wetiko with what Paul Levy calls a ‘frigid, icy heart, devoid of mercy’ (see Bill Gates).

Figure 23: The chakra system which interpenetrates the human energy field. The heart chakra is the governor – or should be.

Wetiko trembles at the thought of heart energy which it cannot infiltrate. The frequency is too high. What it seeks to do instead is close the heart chakra vortex to block its perceptual and energetic influence. Psychopaths have ‘hearts of stone’ and emotionally-damaged people have ‘heartache’ and ‘broken hearts’. The astonishing amount of heart disease is related to heart chakra

disruption with its fundamental connection to the 'physical' heart. Dr Tom Cowan has written an outstanding book challenging the belief that the heart is a pump and making the connection between the 'physical' and spiritual heart. Rudolph Steiner who was way ahead of his time said the same about the fallacy that the heart is a pump. *What?* The heart is not a pump? That's crazy, right? Everybody knows that. Read Cowan's *Human Heart, Cosmic Heart* and you will realise that the very idea of the heart as a pump is ridiculous when you see the evidence. How does blood in the feet so far from the heart get pumped horizontally up the body by the heart?? Cowan explains in the book the real reason why blood moves as it does. Our 'physical' heart is used to symbolise love when the source is really the heart vortex or spiritual heart which is our most powerful energetic connection to 'out there' expanded consciousness. That's why we feel *knowing* – intuitive knowing – in the centre of the chest. Knowing doesn't come from a process of thoughts leading to a conclusion. It is there in an instant all in one go. Our heart knows because of its connection to levels of awareness that *do* know. This is the meaning and source of intuition – intuitive *knowing*.

For the last more than 30 years of uncovering the global game and the nature of reality my heart has been my constant antenna for truth and accuracy. An American intelligence insider once said that I had quoted a disinformant in one of my books and yet I had only quoted the part that was true. He asked: 'How do you do that?' By using my heart antenna was the answer and anyone can do it. Heart-centred is how we are meant to be. With a closed heart chakra we withdraw into a closed mind and the bubble of five-sense reality. If you take a moment to focus your attention on the centre of your chest, picture a spinning wheel of light and see it opening and expanding. You will feel it happening, too, and perceptions of the heart like joy and love as the heart impacts on the mind as they interact. The more the chakra opens the more you will feel expressions of heart consciousness and as the process continues, and becomes part of you, insights and knowings will follow. An open

heart is connected to that level of awareness that knows all is *One*. You will see from its perspective that the fault-lines that divide us are only illusions to control us. An open heart does not process the illusions of race, creed and sexuality except as brief experiences for a consciousness that is all. Our heart does not see division, only unity (Figs 24 and 25). There's something else, too. Our hearts love to laugh. Mark Twain's quote that says 'The human race has one really effective weapon, and that is laughter' is really a reference to the heart which loves to laugh with the joy of knowing the true nature of infinite reality and that all the madness of human society is an illusion of the mind. Twain also said: 'Against the assault of laughter nothing can stand.' This is so true of Wetiko and the Cult. Their insecurity demands that they be taken seriously and their power and authority acknowledged and feared. We should do nothing of the sort. We should not get aggressive or fearful which their insecurity so desires. We should laugh in their face. Even in their no-face as police come over in their face-nappies and expect to be taken seriously. They don't take themselves seriously looking like that so why should we? Laugh in the face of intimidation. Laugh in the face of tyranny. You will see by its reaction that you have pressed all of its buttons. Wetiko does not know what to do in the face of laughter or when its targets refuse to concede their joy to fear. We have seen many examples during the 'Covid' hoax when people have expressed their energetic power and the string puppets of Wetiko retreat with their tail limp between their knees. Laugh – the world is bloody mad after all and if it's a choice between laughter and tears I know which way I'm going.

Figure 24: Head consciousness without the heart sees division and everything apart from everything else.

Figure 25: Heart consciousness sees everything as One.

'Vaccines' and the soul

The foundation of Wetiko/Archon control of humans is the separation of incarnate five-sense mind from the infinite 'I' and closing the heart chakra where the True 'I' lives during a human life. The goal has been to achieve complete separation in both cases. I was interested therefore to read an account by a French energetic healer of what she said she experienced with a patient who had been given the 'Covid' vaccine. Genuine energy healers can sense information and consciousness fields at different levels of being which are referred to as 'subtle bodies'. She described treating the patient who later returned after having, without the healer's knowledge, two doses of the 'Covid vaccine'. The healer said:

I noticed immediately the change, very heavy energy emanating from [the] subtle bodies. The scariest thing was when I was working on the heart chakra, I connected with her soul: it was detached from the physical body, it had no contact and it was, as if it was floating in a state of total confusion: a damage to the consciousness that loses contact with the physical body, i.e. with our biological machine, there is no longer any communication between them.

I continued the treatment by sending light to the heart chakra, the soul of the person, but it seemed that the soul could no longer receive any light, frequency or energy. It was a very powerful experience for me. Then I understood that this substance is indeed used to detach consciousness so that this consciousness can no longer interact through this body that it possesses in life, where there is no longer any contact, no frequency, no light, no more energetic balance or mind.

This would create a human that is rudderless and at the extreme almost zombie-like operating with a fractional state of consciousness at the mercy of Wetiko. I was especially intrigued by what the healer said in the light of the prediction by the highly-informed Rudolf Steiner more than a hundred years ago. He said:

In the future, we will eliminate the soul with medicine. Under the pretext of a 'healthy point of view', there will be a vaccine by which the human body will be treated as soon as possible directly at birth, so that the human being cannot develop the thought of the existence of soul and Spirit. To materialistic doctors will be entrusted the task of removing the soul of humanity.

As today, people are vaccinated against this disease or that disease, so in the future, children will be vaccinated with a substance that can be produced precisely in such a way that people, thanks to this vaccination, will be immune to being subjected to the 'madness' of spiritual life. He would be extremely smart, but he would not develop a conscience, and that is the true goal of some materialistic circles.

Steiner said the vaccine would detach the physical body from the etheric body (subtle bodies) and 'once the etheric body is detached the relationship between the universe and the etheric body would become extremely unstable, and man would become an automaton'. He said 'the physical body of man must be polished on this Earth by spiritual will – so the vaccine becomes a kind of arymanique (Wetiko) force' and 'man can no longer get rid of a given materialistic feeling'. Humans would then, he said, become 'materialistic of constitution and can no longer rise to the spiritual'. I have been writing for years about DNA being a receiver-transmitter of information that connects us to other levels of reality and these 'vaccines' changing DNA can be likened to changing an antenna and what it can transmit and receive. Such a disconnection would clearly lead to changes in personality and perception. Steiner further predicted the arrival of AI. Big Pharma 'Covid vaccine' makers, expressions of Wetiko, are testing their DNA-manipulating evil on children as I write with a view to giving the 'vaccine' to babies. If it's a soul-body disconnecter – and I say that it is or can be – every child would be disconnected from 'soul' at birth and the 'vaccine' would create a closed system in which spiritual guidance from the greater self would play no part. This has been the ambition of Wetiko all

along. A Pentagon video from 2005 was leaked of a presentation explaining the development of vaccines to change behaviour by their effect on the brain. Those that believe this is not happening with the 'Covid' genetically-modifying procedure masquerading as a 'vaccine' should make an urgent appointment with Naivety Anonymous. Klaus Schwab wrote in 2018:

Neurotechnologies enable us to better influence consciousness and thought and to understand many activities of the brain. They include decoding what we are thinking in fine levels of detail through new chemicals and interventions that can influence our brains to correct for errors or enhance functionality.

The plan is clear and only the heart can stop it. With every heart that opens, every mind that awakens, Wetiko is weakened. Heart and love are far more powerful than head and hate and so nothing like a majority is needed to turn this around.

Beyond the Phantom

Our heart is the prime target of Wetiko and so it must be the answer to Wetiko. We *are* our heart which is part of one heart, the infinite heart. Our heart is where the true self lives in a human life behind firewalls of five-sense illusion when an imposter takes its place – *Phantom Self*; but our heart waits patiently to be set free any time we choose to see beyond the Phantom, beyond Wetiko. A Wetikoed Phantom Self can wreak mass death and destruction while the love of forever is locked away in its heart. The time is here to unleash its power and let it sweep away the fear and despair that is Wetiko. Heart consciousness does not seek manipulated, censored, advantage for its belief or religion, its activism and desires. As an expression of the One it treats all as One with the same rights to freedom and opinion. Our heart demands fairness for itself no more than for others. From this unity of heart we can come together in mutual support and transform this Wetikoed world into what reality is meant to be – a place of love, joy, happiness, fairness, justice and freedom. Wetiko has another agenda and that's why the world is as

it is, but enough of this nonsense. Wetiko can't stay where hearts are open and it works so hard to keep them closed. Fear is its currency and its food source and love in its true sense has no fear. Why would love have fear when it knows it is *All That Is, Has Been, And Ever Can Be* on an eternal exploration of all possibility? Love in this true sense is not the physical attraction that passes for love. This can be an expression of it, yes, but Infinite Love, a love without condition, goes far deeper to the core of all being. It *is* the core of all being. Infinite reality was born from love beyond the illusions of the simulation. Love infinitely expressed is the knowing that all is One and the swiftly-passing experience of separation is a temporary hallucination. You cannot disconnect from Oneness; you can only *perceive* that you have and withdraw from its influence. This is the most important of all perception trickery by the mind parasite that is Wetiko and the foundation of all its potential for manipulation.

If we open our hearts, open the sluice gates of the mind, and redefine self-identity amazing things start to happen. Consciousness expands or contracts in accordance with self-identity. When true self is recognised as infinite awareness and label self – Phantom Self – is seen as only a series of brief experiences life is transformed. Consciousness expands to the extent that self-identity expands and everything changes. You see unity, not division, the picture, not the pixels. From this we can play the long game. No more is an experience something in and of itself, but a fleeting moment in the eternity of forever. Suddenly people in uniform and dark suits are no longer intimidating. Doing what your heart knows to be right is no longer intimidating and consequences for those actions take on the same nature of a brief experience that passes in the blink of an infinite eye. Intimidation is all in the mind. Beyond the mind there is no intimidation.

An open heart does not consider consequences for what it knows to be right. To do so would be to consider not doing what it knows to be right and for a heart in its power that is never an option. The Renegade Mind is really the Renegade Heart. Consideration of consequences will always provide a getaway car for the mind and

the heart doesn't want one. What is right in the light of what we face today is to stop cooperating with Wetiko in all its forms and to do it without fear or compromise. You cannot compromise with tyranny when tyranny always demands more until it has everything. Life is your perception and you are your destiny. Change your perception and you change your life. Change collective perception and we change the world.

Come on people ... One human family, One heart, One goal ...
FREEEEEEEDOM!

We must settle for nothing less.

Postscript

The big scare story as the book goes to press is the 'Indian' variant and the world is being deluged with propaganda about the 'Covid catastrophe' in India which mirrors in its lies and misrepresentations what happened in Italy before the first lockdown in 2020.

The *New York Post* published a picture of someone who had 'collapsed in the street from Covid' in India in April, 2021, which was actually taken during a gas leak in May, 2020. Same old, same old. Media articles in mid-February were asking why India had been so untouched by 'Covid' and then as their vaccine rollout gathered pace the alleged 'cases' began to rapidly increase. Indian 'Covid vaccine' maker Bharat Biotech was funded into existence by the Bill and Melinda Gates Foundation (the pair announced their divorce in May, 2021, which is a pity because they so deserve each other). The Indian 'Covid crisis' was ramped up by the media to terrify the world and prepare people for submission to still more restrictions. The scam that worked the first time was being repeated only with far more people seeing through the deceit. Davidicke.com and Ickonic.com have sought to tell the true story of what is happening by talking to people living through the Indian nightmare which has nothing to do with 'Covid'. We posted a letter from 'Alisha' in Pune who told a very different story to government and media mendacity. She said scenes of dying people and overwhelmed hospitals were designed to hide what was really happening – genocide and starvation. Alisha said that millions had already died of starvation during the ongoing lockdowns while government and media were lying and making it look like the 'virus':

Restaurants, shops, gyms, theatres, basically everything is shut. The cities are ghost towns. Even so-called 'essential' businesses are only open till 11am in the morning. You basically have just an hour to buy food and then your time is up.

Inter-state travel and even inter-district travel is banned. The cops wait at all major crossroads to question why you are traveling outdoors or to fine you if you are not wearing a mask.

The medical community here is also complicit in genocide, lying about hospitals being full and turning away people with genuine illnesses, who need immediate care. They have even created a shortage of oxygen cylinders.

This is the classic Cult modus operandi played out in every country. Alisha said that people who would not have a PCR test not testing for the 'virus' were being denied hospital treatment. She said the people hit hardest were migrant workers and those in rural areas. Most businesses employed migrant workers and with everything closed there were no jobs, no income and no food. As a result millions were dying of starvation or malnutrition. All this was happening under Prime Minister Narendra Modi, a 100-percent asset of the Cult, and it emphasises yet again the scale of pure anti-human evil we are dealing with. Australia banned its people from returning home from India with penalties for trying to do so of up to five years in jail and a fine of £37,000. The manufactured 'Covid' crisis in India was being prepared to justify further fascism in the West. Obvious connections could be seen between the Indian 'vaccine' programme and increased 'cases' and this became a common theme. The Seychelles, the most per capita 'Covid vaccinated' population in the world, went back into lockdown after a 'surge of cases'.

Long ago the truly evil Monsanto agricultural biotechnology corporation with its big connections to Bill Gates devastated Indian farming with genetically-modified crops. Human rights activist Gurcharan Singh highlighted the efforts by the Indian government to complete the job by destroying the food supply to hundreds of millions with 'Covid' lockdowns. He said that 415 million people at the bottom of the disgusting caste system (still going whatever they say) were below the poverty line and struggled to feed themselves every year. Now the government was imposing lockdown at just the

time to destroy the harvest. This deliberate policy was leading to mass starvation. People may reel back at the suggestion that a government would do that, but Wetiko-controlled 'leaders' are capable of any level of evil. In fact what is described in India is in the process of being instigated worldwide. The food chain and food supply are being targeted at every level to cause world hunger and thus control. Bill Gates is not the biggest owner of farmland in America for no reason and destroying access to food aids both the depopulation agenda and the plan for synthetic 'food' already being funded into existence by Gates. Add to this the coming hyper-inflation from the suicidal creation of fake 'money' in response to 'Covid' and the breakdown of container shipping systems and you have a cocktail that can only lead one way and is meant to. The Cult plan is to crash the entire system to 'build back better' with the Great Reset.

'Vaccine' transmission

Reports from all over the world continue to emerge of women suffering menstrual and fertility problems after having the fake 'vaccine' and of the non-'vaccinated' having similar problems when interacting with the 'vaccinated'. There are far too many for 'coincidence' to be credible. We've had menopausal women getting periods, others having periods stop or not stopping for weeks, passing clots, sometimes the lining of the uterus, breast irregularities, and miscarriages (which increased by 400 percent in parts of the United States). Non-'vaccinated' men and children have suffered blood clots and nose bleeding after interaction with the 'vaccinated'. Babies have died from the effects of breast milk from a 'vaccinated' mother. Awake doctors – the small minority – speculated on the cause of non-'vaccinated' suffering the same effects as the 'vaccinated'. Was it nanotechnology in the synthetic substance transmitting frequencies or was it a straight chemical bioweapon that was being transmitted between people? I am not saying that some kind of chemical transmission is not one possible answer, but the foundation of all that the Cult does is frequency and

this is fertile ground for understanding how transmission can happen. American doctor Carrie Madej, an internal medicine physician and osteopath, has been practicing for the last 20 years, teaching medical students, and she says attending different meetings where the agenda for humanity was discussed. Madej, who operates out of Georgia, did not dismiss other possible forms of transmission, but she focused on frequency in search of an explanation for transmission. She said the Moderna and Pfizer 'vaccines' contained nano-lipid particles as a key component. This was a brand new technology never before used on humanity. 'They're using a nanotechnology which is pretty much little tiny computer bits ... nanobots or hydrogel.' Inside the 'vaccines' was 'this sci-fi kind of substance' which suppressed immune checkpoints to get into the cell. I referred to this earlier as the 'Trojan horse' technique that tricks the cell into opening a gateway for the self-replicating synthetic material and while the immune system is artificially suppressed the body has no defences. Madej said the substance served many purposes including an on-demand ability to 'deliver the payload' and using the nano 'computer bits' as biosensors in the body. 'It actually has the ability to accumulate data from your body, like your breathing, your respiration, thoughts, emotions, all kinds of things.'

She said the technology obviously has the ability to operate through Wi-Fi and transmit and receive energy, messages, frequencies or impulses. 'Just imagine you're getting this new substance in you and it can react to things all around you, the 5G, your smart device, your phones.' We had something completely foreign in the human body that had never been launched large scale at a time when we were seeing 5G going into schools and hospitals (plus the Musk satellites) and she believed the 'vaccine' transmission had something to do with this: '... if these people have this inside of them ... it can act like an antenna and actually transmit it outwardly as well.' The synthetic substance produced its own voltage and so it could have that kind of effect. This fits with my own contention that the nano receiver-transmitters are designed to connect people to the

Smart Grid and break the receiver-transmitter connection to expanded consciousness. That would explain the French energy healer's experience of the disconnection of body from 'soul' with those who have had the 'vaccine'. The nanobots, self-replicating inside the body, would also transmit the synthetic frequency which could be picked up through close interaction by those who have not been 'vaccinated'. Madej speculated that perhaps it was 5G and increased levels of other radiation that was causing the symptoms directly although interestingly she said that non-'vaccinated' patients had shown improvement when they were away from the 'vaccinated' person they had interacted with. It must be remembered that you can control frequency and energy with your mind and you can consciously create energetic barriers or bubbles with the mind to stop damaging frequencies from penetrating your field. American paediatrician Dr Larry Palevsky said the 'vaccine' was not a 'vaccine' and was never designed to protect from a 'viral' infection. He called it 'a massive, brilliant propaganda of genocide' because they didn't have to inject everyone to get the result they wanted. He said the content of the jabs was able to infuse any material into the brain, heart, lungs, kidneys, liver, sperm and female productive system. 'This is genocide; this is a weapon of mass destruction.' At the same time American colleges were banning students from attending if they didn't have this life-changing and potentially life-ending 'vaccine'. Class action lawsuits must follow when the consequences of this college fascism come to light. As the book was going to press came reports about fertility effects on sperm in 'vaccinated' men which would absolutely fit with what I have been saying and hospitals continued to fill with 'vaccine' reactions. Another question is what about transmission via blood transfusions? The NHS has extended blood donation restrictions from seven days after a 'Covid vaccination' to 28 days after even a sore arm reaction.

I said in the spring of 2020 that the then touted 'Covid vaccine' would be ongoing each year like the flu jab. A year later Pfizer CEO, the appalling Albert Bourla, said people would 'likely' need a 'booster dose' of the 'vaccine' within 12 months of getting 'fully

vaccinated' and then a yearly shot. 'Variants will play a key role', he said confirming the point. Johnson & Johnson CEO Alex Gorsky also took time out from his 'vaccine' disaster to say that people may need to be vaccinated against 'Covid-19' each year. UK Health Secretary, the psychopath Matt Hancock, said additional 'boosters' would be available in the autumn of 2021. This is the trap of the 'vaccine passport'. The public will have to accept every last 'vaccine' they introduce, including for the fake 'variants', or it would cease to be valid. The only other way in some cases would be continuous testing with a test not testing for the 'virus' and what is on the swabs constantly pushed up your nose towards the brain every time?

'Vaccines' changing behaviour

I mentioned in the body of the book how I believed we would see gathering behaviour changes in the 'vaccinated' and I am already hearing such comments from the non-'vaccinated' describing behaviour changes in friends, loved ones and work colleagues. This will only increase as the self-replicating synthetic material and nanoparticles expand in body and brain. An article in the *Guardian* in 2016 detailed research at the University of Virginia in Charlottesville which developed a new method for controlling brain circuits associated with complex animal behaviour. The method, dubbed 'magnetogenetics', involves genetically-engineering a protein called ferritin, which stores and releases iron, to create a magnetised substance – 'Magneto' – that can activate specific groups of nerve cells from a distance. This is claimed to be an advance on other methods of brain activity manipulation known as optogenetics and chemogenetics (the Cult has been developing methods of brain control for a long time). The ferritin technique is said to be non-invasive and able to activate neurons 'rapidly and reversibly'. In other words, human thought and perception. The article said that earlier studies revealed how nerve cell proteins 'activated by heat and mechanical pressure can be genetically engineered so that they become sensitive to radio waves and magnetic fields, by attaching them to an iron-storing protein called ferritin, or to inorganic

paramagnetic particles'. Sensitive to radio waves and magnetic fields? You mean like 5G, 6G and 7G? This is the human-AI Smart Grid hive mind we are talking about. The *Guardian* article said:

... the researchers injected Magneto into the striatum of freely behaving mice, a deep brain structure containing dopamine-producing neurons that are involved in reward and motivation, and then placed the animals into an apparatus split into magnetised and non-magnetised sections.

Mice expressing Magneto spent far more time in the magnetised areas than mice that did not, because activation of the protein caused the striatal neurons expressing it to release dopamine, so that the mice found being in those areas rewarding. This shows that Magneto can remotely control the firing of neurons deep within the brain, and also control complex behaviours.

Make no mistake this basic methodology will be part of the 'Covid vaccine' cocktail and using magnetics to change brain function through electromagnetic field frequency activation. The Pentagon is developing a 'Covid vaccine' using ferritin. Magnetism would explain changes in behaviour and why videos are appearing across the Internet as I write showing how magnets stick to the skin at the point of the 'vaccine' shot. Once people take these 'vaccines' anything becomes possible in terms of brain function and illness which will be blamed on 'Covid-19' and 'variants'. Magnetic field manipulation would further explain why the non-'vaccinated' are reporting the same symptoms as the 'vaccinated' they interact with and why those symptoms are reported to decrease when not in their company. Interestingly 'Magneto', a 'mutant', is a character in the Marvel Comic *X-Men* stories with the ability to manipulate magnetic fields and he believes that mutants should fight back against their human oppressors by any means necessary. The character was born Erik Lehnsherr to a Jewish family in Germany.

Cult-controlled courts

The European Court of Human Rights opened the door for mandatory 'Covid-19 vaccines' across the continent when it ruled in a Czech Republic dispute over childhood immunisation that legally

enforced vaccination could be 'necessary in a democratic society'. The 17 judges decided that compulsory vaccinations did not breach human rights law. On the face of it the judgement was so inverted you gasp for air. If not having a vaccine infused into your body is not a human right then what is? Ah, but they said human rights law which has been specifically written to delete all human rights at the behest of the state (the Cult). Article 8 of the European Convention on Human Rights relates to the right to a private life. The crucial word here is '*except*':

There shall be no interference by a public authority with the exercise of this right EXCEPT such as is in accordance with the law and is necessary in a democratic society in the interests of national security, public safety or the economic wellbeing of the country, for the prevention of disorder or crime, for the protection of health or morals, or for the protection of the rights and freedoms of others [My emphasis].

No interference *except* in accordance with the law means there *are* no 'human rights' *except* what EU governments decide you can have at their behest. 'As is necessary in a democratic society' explains that reference in the judgement and 'in the interests of national security, public safety or the economic well-being of the country, for the prevention of disorder or crime, for the protection of health or morals, or for the protection of the rights and freedoms of others' gives the EU a coach and horses to ride through 'human rights' and scatter them in all directions. The judiciary is not a check and balance on government extremism; it is a vehicle to enforce it. This judgement was almost laughably predictable when the last thing the Cult wanted was a decision that went against mandatory vaccination. Judges rule over and over again to benefit the system of which they are a part. Vaccination disputes that come before them are invariably delivered in favour of doctors and authorities representing the view of the state which owns the judiciary. Oh, yes, and we have even had calls to stop putting 'Covid-19' on death certificates within 28 days of a 'positive test' because it is claimed the practice makes the 'vaccine' appear not to work. They are laughing at you.

The scale of madness, inhumanity and things to come was highlighted when those not 'vaccinated' for 'Covid' were refused evacuation from the Caribbean island of St Vincent during massive volcanic eruptions. Cruise ships taking residents to the safety of another island allowed only the 'vaccinated' to board and the rest were left to their fate. Even in life and death situations like this we see 'Covid' stripping people of their most basic human instincts and the insanity is even more extreme when you think that fake 'vaccine'-makers are not even claiming their body-manipulating concoctions stop 'infection' and 'transmission' of a 'virus' that doesn't exist. St Vincent Prime Minister Ralph Gonsalves said: 'The chief medical officer will be identifying the persons already vaccinated so that we can get them on the ship.' Note again the power of the chief medical officer who, like Whitty in the UK, will be answering to the World Health Organization. This is the Cult network structure that has overridden politicians who 'follow the science' which means doing what WHO-controlled 'medical officers' and 'science advisers' tell them. Gonsalves even said that residents who were 'vaccinated' after the order so they could board the ships would still be refused entry due to possible side effects such as 'wooziness in the head'. The good news is that if they were woozy enough in the head they could qualify to be prime minister of St Vincent.

Microchipping freedom

The European judgement will be used at some point to justify moves to enforce the 'Covid' DNA-manipulating procedure. Sandra Ro, CEO of the Global Blockchain Business Council, told a World Economic Forum event that she hoped 'vaccine passports' would help to 'drive forced consent and standardisation' of global digital identity schemes: 'I'm hoping with the desire and global demand for some sort of vaccine passport – so that people can get travelling and working again – [it] will drive forced consent, standardisation, and frankly, cooperation across the world.' The lady is either not very bright, or thoroughly mendacious, to use the term 'forced consent'.

You do not 'consent' if you are forced – you *submit*. She was describing what the plan has been all along and that's to enforce a digital identity on every human without which they could not function. 'Vaccine passports' are opening the door and are far from the end goal. A digital identity would allow you to be tracked in everything you do in cyberspace and this is the same technique used by Cult-owned China to enforce its social credit system of total control. The ultimate 'passport' is planned to be a microchip as my books have warned for nearly 30 years. Those nice people at the Pentagon working for the Cult-controlled Defense Advanced Research Projects Agency (DARPA) claimed in April, 2021, they have developed a microchip inserted under the skin to detect 'asymptomatic Covid-19 infection' before it becomes an outbreak and a 'revolutionary filter' that can remove the 'virus' from the blood when attached to a dialysis machine. The only problems with this are that the 'virus' does not exist and people transmitting the 'virus' with no symptoms is brain-numbing bullshit. This is, of course, not a ruse to get people to be microchipped for very different reasons. DARPA also said it was producing a one-stop 'vaccine' for the 'virus' and all 'variants'. One of the most sinister organisations on Planet Earth is doing this? Better have it then. These people are insane because Wetiko that possesses them is insane.

Researchers from the Salk Institute in California announced they have created an embryo that is part human and part monkey. My books going back to the 1990s have exposed experiments in top secret underground facilities in the United States where humans are being crossed with animal and non-human 'extraterrestrial' species. They are now easing that long-developed capability into the public arena and there is much more to come given we are dealing with psychiatric basket cases. Talking of which – Elon Musk's scientists at Neuralink trained a monkey to play Pong and other puzzles on a computer screen using a joystick and when the monkey made the correct move a metal tube squirted banana smoothie into his mouth which is the basic technique for training humans into unquestioning compliance. Two Neuralink chips were in the monkey's skull and

more than 2,000 wires ‘fanned out’ into its brain. Eventually the monkey played a video game purely with its brain waves. Psychopathic narcissist Musk said the ‘breakthrough’ was a step towards putting Neuralink chips into human skulls and merging minds with artificial intelligence. *Exactly*. This man is so dark and Cult to his DNA.

World Economic Fascism (WEF)

The World Economic Forum is telling you the plan by the statements made at its many and various events. Cult-owned fascist YouTube CEO Susan Wojcicki spoke at the 2021 WEF Global Technology Governance Summit (see the name) in which 40 governments and 150 companies met to ensure ‘the responsible design and deployment of emerging technologies’. Orwellian translation: ‘Ensuring the design and deployment of long-planned technologies will advance the Cult agenda for control and censorship.’ Freedom-destroyer and Nuremberg-bound Wojcicki expressed support for tech platforms like hers to censor content that is ‘technically legal but could be harmful’. Who decides what is ‘harmful’? She does and they do. ‘Harmful’ will be whatever the Cult doesn’t want people to see and we have legislation proposed by the UK government that would censor content on the basis of ‘harm’ no matter if the information is fair, legal and provably true. Make that *especially* if it is fair, legal and provably true. Wojcicki called for a global coalition to be formed to enforce content moderation standards through automated censorship. This is a woman and mega-censor so self-deluded that she shamelessly accepted a ‘free expression’ award – *Wojcicki* – in an event sponsored by her own *YouTube*. They have no shame and no self-awareness.

You know that ‘Covid’ is a scam and Wojcicki a Cult operative when YouTube is censoring medical and scientific opinion purely on the grounds of whether it supports or opposes the Cult ‘Covid’ narrative. Florida governor Ron DeSantis compiled an expert panel with four professors of medicine from Harvard, Oxford, and Stanford Universities who spoke against forcing children and

vaccinated people to wear masks. They also said there was no proof that lockdowns reduced spread or death rates of 'Covid-19'. Cult-gofer Wojcicki and her YouTube deleted the panel video 'because it included content that contradicts the consensus of local and global health authorities regarding the efficacy of masks to prevent the spread of Covid-19'. This 'consensus' refers to what the Cult tells the World Health Organization to say and the WHO tells 'local health authorities' to do. Wojcicki knows this, of course. The panellists pointed out that censorship of scientific debate was responsible for deaths from many causes, but Wojcicki couldn't care less. She would not dare go against what she is told and as a disgrace to humanity she wouldn't want to anyway. The UK government is seeking to pass a fascist 'Online Safety Bill' to specifically target with massive fines and other means non-censored video and social media platforms to make them censor 'lawful but harmful' content like the Cult-owned Facebook, Twitter, Google and YouTube. What is 'lawful but harmful' would be decided by the fascist Blair-created Ofcom.

Another WEF obsession is a cyber-attack on the financial system and this is clearly what the Cult has planned to take down the bank accounts of everyone – except theirs. Those that think they have enough money for the Cult agenda not to matter to them have got a big lesson coming if they continue to ignore what is staring them in the face. The World Economic Forum, funded by Gates and fronted by Klaus Schwab, announced it would be running a 'simulation' with the Russian government and global banks of just such an attack called Cyber Polygon 2021. What they simulate – as with the 'Covid' Event 201 – they plan to instigate. The WEF is involved in a project with the Cult-owned Carnegie Endowment for International Peace called the WEF-Carnegie Cyber Policy Initiative which seeks to merge Wall Street banks, 'regulators' (I love it) and intelligence agencies to 'prevent' (arrange and allow) a cyber-attack that would bring down the global financial system as long planned by those that control the WEF and the Carnegie operation. The Carnegie Endowment for International Peace sent an instruction to First World

War US President Woodrow Wilson not to let the war end before society had been irreversibly transformed.

The Wuhan lab diversion

As I close, the Cult-controlled authorities and lapdog media are systematically pushing 'the virus was released from the Wuhan lab' narrative. There are two versions – it happened by accident and it happened on purpose. Both are nonsense. The perceived existence of the never-shown-to-exist 'virus' is vital to sell the impression that there is actually an infective agent to deal with and to allow the endless potential for terrifying the population with 'variants' of a 'virus' that does not exist. The authorities at the time of writing are going with the 'by accident' while the alternative media is promoting the 'on purpose'. Cable news host Tucker Carlson who has questioned aspects of lockdown and 'vaccine' compulsion has bought the Wuhan lab story. 'Everyone now agrees' he said. Well, I don't and many others don't and the question is *why* does the system and its media suddenly 'agree'? When the media moves as one unit with a narrative it is always a lie – witness the hour by hour mendacity of the 'Covid' era. Why would this Cult-owned combination which has unleashed lies like machine gun fire suddenly 'agree' to tell the truth??

Much of the alternative media is buying the lie because it fits the conspiracy narrative, but it's the *wrong* conspiracy. The real conspiracy is that *there is no virus* and that is what the Cult is desperate to hide. The idea that the 'virus' was released by accident is ludicrous when the whole 'Covid' hoax was clearly long-planned and waiting to be played out as it was so fast in accordance with the Rockefeller document and Event 201. So they prepared everything in detail over decades and then sat around strumming their fingers waiting for an 'accidental' release from a bio-lab? *What??* It's crazy. Then there's the 'on purpose' claim. You want to circulate a 'deadly virus' and hide the fact that you've done so and you release it down the street from the highest-level bio-lab in China? I repeat – *What??*

You would release it far from that lab to stop any association being made. But, no, we'll do it in a place where the connection was certain to be made. Why would you need to scam 'cases' and 'deaths' and pay hospitals to diagnose 'Covid-19' if you had a real 'virus'? What are sections of the alternative media doing believing this crap? Where were all the mass deaths in Wuhan from a 'deadly pathogen' when the recovery to normal life after the initial propaganda was dramatic in speed? Why isn't the 'deadly pathogen' now circulating all over China with bodies in the street? Once again we have the technique of tell them what they want to hear and they will likely believe it. The alternative media has its 'conspiracy' and with Carlson it fits with his 'China is the danger' narrative over years. China *is* a danger as a global Cult operations centre, but not for this reason. The Wuhan lab story also has the potential to instigate conflict with China when at some stage the plan is to trigger a Problem-Reaction-Solution confrontation with the West. Question everything – *everything* – and especially when the media agrees on a common party line.

Third wave ... fourth wave ... fifth wave ...

As the book went into production the world was being set up for more lockdowns and a 'third wave' supported by invented 'variants' that were increasing all the time and will continue to do so in public statements and computer programs, but not in reality. India became the new Italy in the 'Covid' propaganda campaign and we were told to be frightened of the new 'Indian strain'. Somehow I couldn't find it within myself to do so. A document produced for the UK government entitled 'Summary of further modelling of easing of restrictions – Roadmap Step 2' declared that a third wave was inevitable (of course when it's in the script) and it would be the fault of children and those who refuse the health-destroying fake 'Covid vaccine'. One of the computer models involved came from the Cult-owned *Imperial College* and the other from Warwick University which I wouldn't trust to tell me the date in a calendar factory. The document states that both models presumed extremely high uptake

of the 'Covid vaccines' and didn't allow for 'variants'. The document states: 'The resurgence is a result of some people (mostly children) being ineligible for vaccination; others choosing not to receive the vaccine; and others being vaccinated but not perfectly protected.' The mendacity takes the breath away. Okay, blame those with a brain who won't take the DNA-modifying shots and put more pressure on children to have it as 'trials' were underway involving children as young as six months with parents who give insanity a bad name. Massive pressure is being put on the young to have the fake 'vaccine' and child age consent limits have been systematically lowered around the world to stop parents intervening. Most extraordinary about the document was its claim that the 'third wave' would be driven by 'the resurgence in both hospitalisations and deaths ... dominated by *those that have received two doses of the vaccine*, comprising around 60-70% of the wave respectively'. The predicted peak of the 'third wave' suggested 300 deaths per day with 250 of them *fully 'vaccinated' people*. How many more lies do acquiescers need to be told before they see the obvious? Those who took the jab to 'protect themselves' are projected to be those who mostly get sick and die? So what's in the 'vaccine'? The document went on:

It is possible that a summer of low prevalence could be followed by substantial increases in incidence over the following autumn and winter. Low prevalence in late summer should not be taken as an indication that SARS-CoV-2 has retreated or that the population has high enough levels of immunity to prevent another wave.

They are telling you the script and while many British people believed 'Covid' restrictions would end in the summer of 2021 the government was preparing for them to be ongoing. Authorities were awarding contracts for 'Covid marshals' to police the restrictions with contracts starting in July, 2021, and going through to January 31st, 2022, and the government was advertising for 'Media Buying Services' to secure media propaganda slots worth a potential £320 million for 'Covid-19 campaigns' with a contract not ending until March, 2022. The recipient – via a list of other front companies – was reported to be American media marketing giant Omnicom Group

Inc. While money is no object for 'Covid' the UK waiting list for all other treatment – including life-threatening conditions – passed 4.5 million. Meantime the Cult is seeking to control all official 'inquiries' to block revelations about what has really been happening and why. It must not be allowed to – we need Nuremberg jury trials in every country. The cover-up doesn't get more obvious than appointing ultra-Zionist professor Philip Zelikow to oversee two dozen US virologists, public health officials, clinicians, former government officials and four American 'charitable foundations' to 'learn the lessons' of the 'Covid' debacle. The personnel will be those that created and perpetuated the 'Covid' lies while Zelikow is the former executive director of the 9/11 Commission who ensured that the truth about those attacks never came out and produced a report that must be among the most mendacious and manipulative documents ever written – see *The Trigger* for the detailed exposure of the almost unimaginable 9/11 story in which Sabbatians can be found at every level.

Passive no more

People are increasingly challenging the authorities with amazing numbers of people taking to the streets in London well beyond the ability of the Face-Nappies to stop them. Instead the Nappies choose situations away from the mass crowds to target, intimidate, and seek to promote the impression of 'violent protestors'. One such incident happened in London's Hyde Park. Hundreds of thousands walking through the streets in protest against 'Covid' fascism were ignored by the Cult-owned BBC and most of the rest of the mainstream media, but they delighted in reporting how police were injured in 'clashes with protestors'. The truth was that a group of people gathered in Hyde Park at the end of one march when most had gone home and they were peacefully having a good time with music and chat. Face-Nappies who couldn't deal with the full-march crowd then waded in with their batons and got more than they bargained for. Instead of just standing for this criminal brutality the crowd used their numerical superiority to push the Face-Nappies out of the

park. Eventually the Nappies turned and ran. Unfortunately two or three idiots in the crowd threw drink cans striking two officers which gave the media and the government the image they wanted to discredit the 99.9999 percent who were peaceful. The idiots walked straight into the trap and we must always be aware of potential agent provocateurs used by the authorities to discredit their targets.

This response from the crowd – the can people apart – must be a turning point when the public no longer stand by while the innocent are arrested and brutally attacked by the Face-Nappies. That doesn't mean to be violent, that's the last thing we need. We'll leave the violence to the Face-Nappies and government. But it does mean that when the Face-Nappies use violence against peaceful people the numerical superiority is employed to stop them and make citizen's arrests or Common Law arrests for a breach of the peace. The time for being passive in the face of fascism is over.

We are the many, they are the few, and we need to make that count before there is no freedom left and our children and grandchildren face an ongoing fascist nightmare.

COME ON PEOPLE – IT'S TIME.

One final thought ...

The power of love
A force from above
Cleaning my soul
Flame on burn desire
Love with tongues of fire
Purge the soul
Make love your goal

I'll protect you from the hooded claw
Keep the vampires from your door
When the chips are down I'll be around
With my undying, death-defying
Love for you

Envy will hurt itself
Let yourself be beautiful
Sparkling love, flowers
And pearls and pretty girls
Love is like an energy
Rushin' rushin' inside of me

This time we go sublime
Lovers entwine, divine, divine,
Love is danger, love is pleasure
Love is pure – the only treasure

I'm so in love with you
Purge the soul
Make love your goal

The power of love
A force from above
Cleaning my soul
The power of love
A force from above
A sky-scraping dove

Flame on burn desire
Love with tongues of fire
Purge the soul
Make love your goal

Frankie Goes To Hollywood

APPENDIX

Cowan-Kaufman-Morell Statement on Virus Isolation (SOVI)

Isolation: The action of isolating; the fact or condition of being isolated or standing alone; separation from other things or persons; solitariness

Oxford English Dictionary

The controversy over whether the SARS-CoV-2 virus has ever been isolated or purified continues. However, using the above definition, common sense, the laws of logic and the dictates of science, any unbiased person must come to the conclusion that the SARS-CoV-2 virus has never been isolated or purified. As a result, no confirmation of the virus' existence can be found. The logical, common sense, and scientific consequences of this fact are:

- the structure and composition of something not shown to exist can't be known, including the presence, structure, and function of any hypothetical spike or other proteins;
- the genetic sequence of something that has never been found can't be known;
- "variants" of something that hasn't been shown to exist can't be known;
- it's impossible to demonstrate that SARS-CoV-2 causes a disease called Covid-19.

In as concise terms as possible, here's the proper way to isolate, characterize and demonstrate a new virus. First, one takes samples (blood, sputum, secretions) from many people (e.g. 500) with symptoms which are unique and specific enough to characterize an illness. Without mixing these samples with ANY tissue or products that also contain genetic material, the virologist macerates, filters and ultracentrifuges i.e. *purifies* the specimen. This common virology technique, done for decades to isolate bacteriophages¹ and so-called giant viruses in every virology lab, then allows the virologist to demonstrate with electron microscopy thousands of identically sized and shaped particles. These particles are the isolated and purified virus.

These identical particles are then checked for uniformity by physical and/or microscopic techniques. Once the purity is determined, the particles may be further characterized. This would include examining the structure, morphology, and chemical composition of the particles. Next, their genetic makeup is characterized by extracting the genetic material directly from the purified particles and using genetic-sequencing techniques, such as Sanger sequencing, that have also been around for decades. Then one does an analysis to confirm that these uniform particles are exogenous (outside) in origin as a virus is conceptualized to be, and not the normal breakdown products of dead and dying tissues.² (As of May 2020, we know that virologists have no way to determine whether the particles they're seeing are viruses or just normal breakdown products of dead and dying tissues.)³

If we have come this far then we have fully isolated, characterized, and genetically sequenced an exogenous virus particle. However, we still have to show it is causally related to a disease. This is carried out by exposing a group of healthy subjects (animals are usually used) to this isolated, purified virus in the manner in which the disease is thought to be transmitted. If the animals get sick with the same disease, as confirmed by clinical and autopsy findings, one has now shown that the virus actually causes a disease. This demonstrates infectivity and transmission of an infectious agent.

None of these steps has even been attempted with the SARS-CoV-2 virus, nor have all these steps been successfully performed for any so-called pathogenic virus. Our research indicates that a single study showing these steps does not exist in the medical literature.

Instead, since 1954, virologists have taken unpurified samples from a relatively few people, often less than ten, with a similar disease. They then minimally process this sample and inoculate this unpurified sample onto tissue culture containing usually four to six other types of material – all of which contain identical genetic material as to what is called a “virus.” The tissue culture is starved and poisoned and naturally disintegrates into many types of particles, some of which contain genetic material. Against all common sense, logic, use of the English language and scientific integrity, this process is called “virus isolation.” This brew containing fragments of genetic material from many sources is then subjected to genetic analysis, which then creates in a computer-simulation process the alleged sequence of the alleged virus, a so called in silico genome. At no time is an actual virus confirmed by electron microscopy. At no time is a genome extracted and sequenced from an actual virus. This is scientific fraud.

The observation that the unpurified specimen — inoculated onto tissue culture along with toxic antibiotics, bovine fetal tissue, amniotic fluid and other tissues — destroys the kidney tissue onto which it is inoculated is given as evidence of the virus' existence and pathogenicity. This is scientific fraud.

From now on, when anyone gives you a paper that suggests the SARS-CoV-2 virus has been isolated, please check the methods sections. If the researchers used Vero cells or any other culture method, you know that their process was not isolation. You will hear the following excuses for why actual isolation isn't done:

1. There were not enough virus particles found in samples from patients to analyze.
2. Viruses are intracellular parasites; they can't be found outside the cell in this manner.

If No. 1 is correct, and we can't find the virus in the sputum of sick people, then on what evidence do we think the virus is dangerous or even lethal? If No. 2 is correct, then how is the virus spread from person to person? We are told it emerges from the cell to infect others. Then why isn't it possible to find it?

Finally, questioning these virology techniques and conclusions is not some distraction or divisive issue. Shining the light on this truth is essential to stop this terrible fraud that humanity is confronting. For, as we now know, if the virus has never been isolated, sequenced or shown to cause illness, if the virus is imaginary, then why are we wearing masks, social distancing and putting the whole world into prison?

Finally, if pathogenic viruses don't exist, then what is going into those injectable devices erroneously called "vaccines," and what is their purpose? This scientific question is the most urgent and relevant one of our time.

We are correct. The SARS-CoV2 virus does not exist.

Ickonic is something that has been a dream of mine for the last 5 years, growing up around alternative information I have always had a natural interest in what is going on in the World and what could I do to make it better.

Across the range of subjects and positions of influence occupied mainly by people who don't strive to make things better it's the Media that I have always found the most frustrating and fascinating. Mainly because if the Media did their Jobs properly then so much of the negative things happening in the World simply would not be able to happen, because they would be exposed within a heartbeat.

Free Press and the Opportunities that the internet could have given would mean that the Media are able to expose things like never before and hold people to account for their actions. As we all know there are 'Untouchables' that walk among us, people the Media simply won't touch, expose or investigate and that leads to the dark underworlds that infest the establishment the World over. Well I say enough, it's time for something different, a different kind of Media, where no one is off limits from exposing and investigating. All we're interested in at Ickonic is the truth of what is really going on in the World on whichever subject we're covering.

We hope you enjoy what we have created and take something away from the platform, we aim to deliver information that's informative and most importantly self-empowering, you're not a little person, you're part of something much bigger than that and its time we as a collective race began to understand that and look to the future as ours to take.

It's time...

Jaymie Icke - Founder Ickonic Alternative Media.

DAVID ICKE
THE ANSWER

We live in extraordinary times with billions bewildered and seeking answers for what is happening. David Icke, the man who has been proved right again and again, has spent 30 years uncovering the truth behind world affairs and in a stream of previous books he predicted current events.

The Answer will change your every perception of life and the world and set you free of the illusions that control human society. There is nothing more vital for our collective freedom than humanity becoming aware of what is in this book.
